While the National Intelligence Council provides a forecast of economic changes occurring over the next 15 years, these observations are based on general trends forecasting major economic shifts, strategic materials, and energy.[17] Outside of the Intelligence Community, there is already recognition of the need for new tools to understand and communicate the nature of global economic integration. Timothy Sturgeon highlights that "studies that rely solely on macro-level statistics such as trade and investment cannot help but render invisible the detailed contours of the world economy."[18] The main point here is that while statistics and analysis on global economic information are readily available for purchase over the Internet, there is also strategic intelligence of interest to the Intelligence Community and policymakers in the "contours." The tools and methods used by industry analysts highlighted in the following chapters will enable the all-source analyst to see some of the contours in the world economy and gain strategic intelligence insights of use to national policymakers.

The opening observations from the Council on Competitiveness highlight the major strategic shifts in a *global* economy and their importance to our country. The developing economies of the world are driving these shifts, and their industrial capability is a major component of their success. Analyzing an industry in another country or region of the world can yield strategic insights about a nation's capabilities and strategic intent. Chapter 2 introduces industry analysis and proposes a methodology for applying it in the Intelligence Community.

Chapter Two

Industry Analysis

There are innumerable analytical tools employed in business. Our purpose is to identify and employ the analytical tools that can provide strategic insights into a nation's industrial capability. The industry analysis involves a detailed review of the external and competitive forces that influence the way an industry develops.[19] This is what sets industry analysis apart from an all-source analyst simply performing a keyword search for information sources about an industry. The three analytical tools discussed here are widely used in business. They are the Porter Five Forces Model, the External Environment Model, and the Value Chain Model.

Long-term background preparation for this book—and in particular selection of these three analytical models—stems from various sources: experience as an acquisition officer in the Department of Defense; early exposure to the disciplines of business and industry analysis as part of preparing for a master's of business administration degree; continuing professional education at the Industrial College of the Armed Forces (ICAF), analyzing industry sectors and their importance to national security, as well as learning to look beyond the numbers to appreciate the strategic interplay between government and industry; and teaching industry analysis to graduate-level students at ICAF, where use of the Five Forces Model and the Value Chain Model proved the most valuable for students to appreciate the structure of an industry, and where use of the External Environment Model broadened their understanding of the interaction between industry and government. The open-source methodology and data-collection approaches for this book resulted from that experience at ICAF.

That said, the industry analysis approach introduced in this chapter and elaborated on in the following chapters is easily understood and does not require the intelligence analyst to have a business or technical background. In fact, the intelligence analyst may have a head start in comprehending its application due to his or her training in other analysis techniques, such as the analysis of competing hypotheses. To begin our discussion of the industry analysis models, we will start with a brief look at the nature of a firm or corporation.

Overview of the Financial Activity of a Firm

A firm's performance has two components—survival and profitability.[20] The measure of survival is obvious, but the profitability component is measured by profit maximization, whereby a firm determines the price and quantity of output that delivers the greatest profit. Figure 2.1 provides a top-level view of a firm's financial activity.

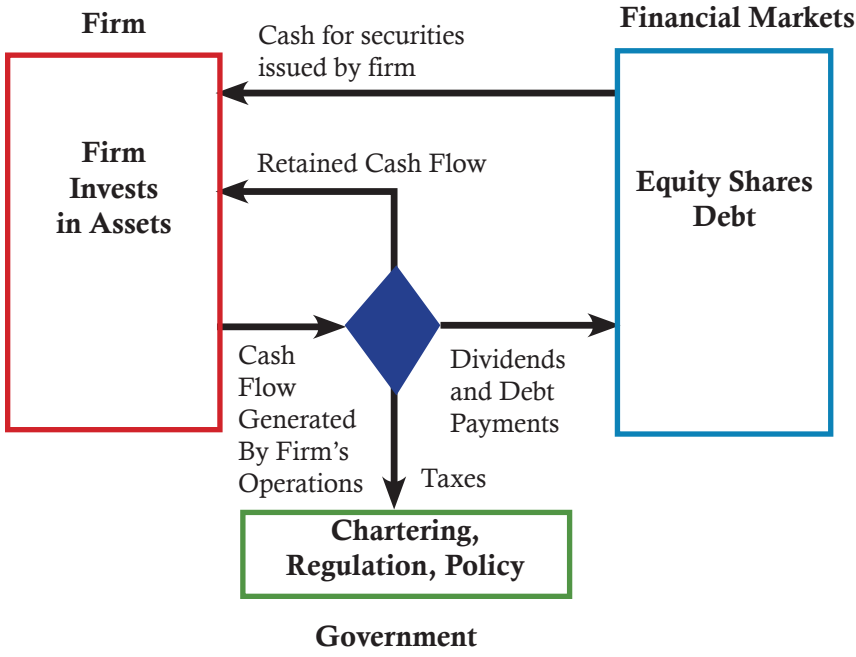

Figure 2.1: Financial Activity of a Firm[21]

Figure 2.1 shows that the firm (red block) generates cash by issuing stocks to or borrowing from financial markets (blue block). The firm uses this cash in developing goods or services and the resulting cash flow generated is then used within the firm (retained earnings), paid out to the financial community (stock dividends, debt repayments), and paid to the government (taxes).

This simple model allows the reader to visualize the effects of a country's public policy, financial, or market announcements that are reported regarding a firm or even an entire industry. For example, when a government announces

a 10-year exemption for the collection of any taxes from a firm that relocates to their country, the firm can now use more of its cash flow, via retained earnings, to fund research and development, buy additional assets, or use it to enhance its standing with the financial community by retiring debt or increasing dividends. The reality is much more complex, but this basic model and the economic maxim of profit maximization are useful for understanding interactions between governments and industry.

Academics studying business and industry economics develop models by observing how firms organize and perform against their competitors and in the marketplace. As the business world changes, these academic communities find some insights to be timeless, while others are modified or even discarded. Businesses also use many of these models to analyze their competitors. The Strategic and Competitive Intelligence Professionals (SCIP) organization bridges the academic and business world and provides good sources for exploring and discussing the methods of competitive intelligence.[22] According to Robert Grant's *Contemporary Strategy Analysis*, one of the most comprehensive industry texts, competitive intelligence has three main purposes:

- Forecast competitors' future strategies and decisions.
- Predict competitors' likely reactions to a firm's strategic initiatives.
- Determine how competitors' behavior can be influenced to make it more favorable.[23]

In academia and the competitive world of business, as long as the models and associated analytical methods are of use, they will survive—although not without some tailoring. The following discussion will describe the key elements of each model. This will help the all-source analyst to understand the industry structure to the extent that it yields, in combination with the other models, strategic intelligence insights regarding a nation's plans and intentions.

Porter Five Forces Model

The first model carries the name of its developer, Michael Porter of Harvard University. Porter arguably produced the seminal text on industry analysis, *Competitive Strategy*, which describes his Five Forces Model.[24] The model is meant to convey the forces acting on an industry. Our usage of the model is

very different from that of the business analyst who is working to understand competitors. For our collection purposes, the Five Forces Model provides a mental construct to use in reviewing and determining which data to keep for further analysis. For example, when reading an article, is it possible to determine who is the buyer and who is the supplier? What is the threat of product substitution if prices rise too high? What are the barriers to entry to the industry? Can a government overcome this barrier to entry through policy decisions? How intense is competition within the industry? Is the intensity of competition inviting government involvement? Today, thirty years later, the business community still uses this model to describe their industry and gain insights into how it is changing.

In economic terms, an industry can be defined as "a group of firms producing products that are close substitutes."[25] The Five Forces Model, shown in Figure 2.2, is meant to convey the primary forces that affect the structure and conduct of the industry. In business, the end result of conducting industry analysis via the Five Forces Model is a description of the industry that the company will use to determine a strategy it will pursue in the future. The main point is that a firm does not want to pursue a strategy that is not going to lead to a competitive advantage. For the intelligence analyst, however, the end result of conducting industry analysis via the Five Forces Model is a conceptual understanding of the industry that will then aid in the collection and analysis of information on the industry in all of its global locations.

Figure 2.2 shows the five forces affecting the structure and conduct of an industry: threat of new entrants, bargaining power of buyers, bargaining power of suppliers, threat of substitute products or services, and rivalry among existing competitors.

The *threat of new entrants* concerns how easily a new competitor emerges from outside the industry. Intense price competition is one sign that it is easy for other firms to enter into the industry. And if it is easy for new entrants to appear, firms already in the industry may choose to pursue future investment opportunities outside of the industry. Examples of barriers to entry are large capital costs for plants and equipment, unique process or product technologies, and government regulation.

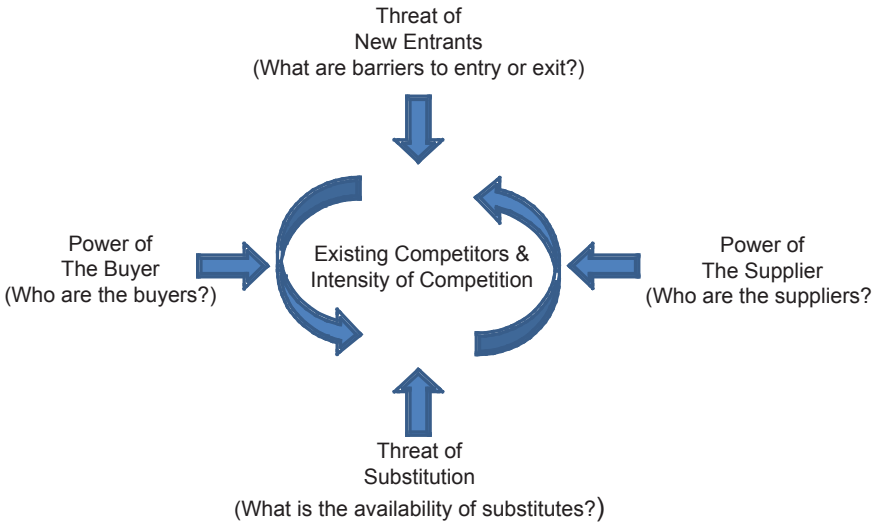

Figure 2.2: Porter Five Forces Model[26]

The *bargaining power of the buyer or supplier* is meant to capture the extent to which the industry determines the prices in their industry. If suppliers to the industry hold a unique material required for an industry to continue, then they may temporarily hold an advantage in setting prices for the industry. Similarly, if the buyers of the industry product or service have a lot of power, they can dictate prices or demand features in the products they buy. The word "temporary" applies in all of these cases, as industry and business operate in dynamic environments.

The *threat of substitution* concerns the potential for buyers to buy substitute products or services if the industry demands high prices or does not respond to buyer requirements.

The *rivalry among competitors* is central to the Five Forces Model. This is the intensity of competition among firms and the characteristics of that competition. One obvious factor in the intensity of the rivalry is market growth (slowing, increasing); a not-so-obvious factor is exit costs. A company in an industry with intense rivalries may find few options for pursuing other ventures (including

exiting) due to large investments in plants and equipment (e.g., automotive industry, oil refining industry). Contrast this last point with the earlier discussion on the threat of new entrants.

In summary, the Five Forces Model captures the key factors that determine the profits earned by firms in an industry, the value of the product to the buyer, the power of the supplier to set prices, and the intensity of competition.

External Environment Model

For the business analyst, the External Environment Model complements the Five Forces Model in support of business planning. But for our purposes, we will use the External Environment Model as our collection framework to gain strategic insights into a nation's capabilities and strategic intent.

The External Environment Model moves our inward-looking frame of reference for the industry outward to the strategic level.[27] The premise behind considering the external environment is simply that firms and industries operate in an environment that can have a large impact on their competitiveness. While the external environment has an effect on the structure and conduct of an industry and the firms within, the specific segments of the external environment for examination will vary according to the user. These different segments are often denoted by the acronyms applied to the External Environment Model in use. For example, "PEST" stands for political/legal, economic, social, and technological segments, while "STEEP" refers to social, technological, economic, ecological, and political/legal segments.[28] Reflecting the increasing emphasis on "green" issues, there is also "STEER," which stands for socio-cultural, technological, economic, ecological, and regulatory segments.[29] The definition of the segments selected is all oriented toward identifying external forces or impacts on the industry. For example, referring to PEST, one aspect of the political/legal segment is looking for the degree to which government regulation directs or influences the conduct of industry. One element of the economic segment is the impact of the global economy on the domestic economy and markets. Another element of the social segment is workforce education and skill levels, and an element of the technological segment is the level and focus of government expenditures for research and development.

While the selection and definition of segments vary, the important point for our purposes is the value of having a framework to guide the collection of information for further analysis. And these models can be combined to make new models, too. For example, Fleisher developed the Nine Forces Model by applying STEEP/PEST factors in conjunction with the Five Forces Model (four PEST segments plus five forces equals nine forces).[30] Similarly, we will also integrate the knowledge we gain from the Porter Five Forces Model with relevant external segments to form a generic overview of an industry from both inside and out. Figure 2.3 shows a framework displaying the segments and elements we will use to collect information (a step discussed later).

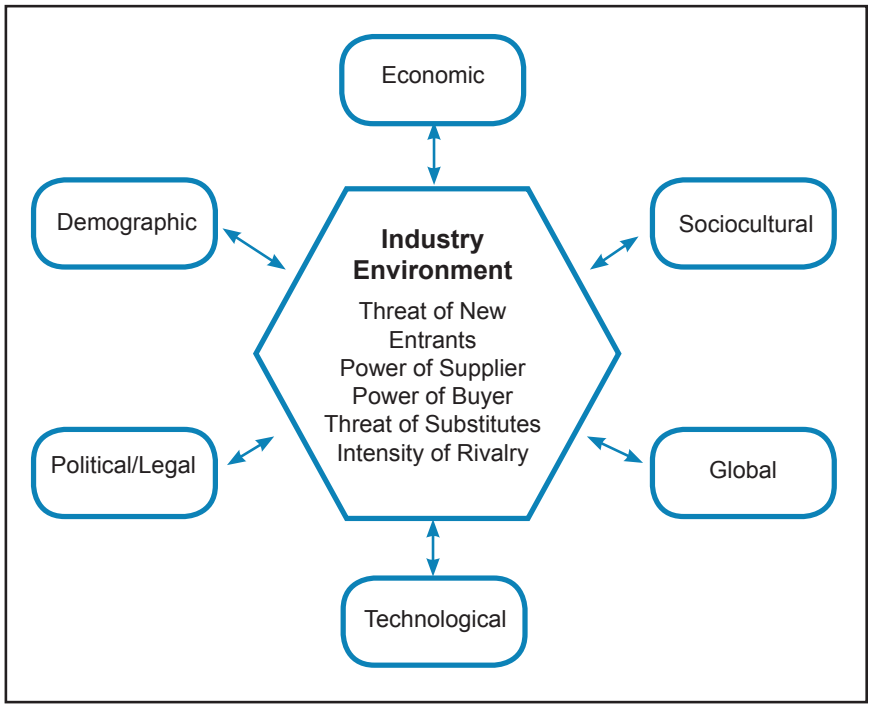

Figure 2.3: Framework for Information Collection[31]

The hexagon in the middle of the figure represents the industry environment and lists the forces described by the Five Forces Model. The segments arrayed around the hexagon represent the external environment that surrounds

an industry. The segments of this framework are not cast in stone, and one does not have to collect information on every element. Appendix A lists the segments and their constituent elements for this framework. When reading about an industry, the analyst should use the segments and elements, and include the five forces, as a template for categorizing, sorting, and saving information. This approach is subjective, but useful, because all of the data will be collated and have source documentation.

In summary, the External Environment Model, which encompasses the Five Forces Model, captures the key external factors that influence the profits earned by firms in an industry and the intensity of competition. For our purposes, analysts should be able to use the External Environment Model to form a mental picture of the industry as they perform data collection and analysis. It is important to clarify that, while in business, the Five Forces and External Environment Models provide a basis for strategic planning, we are focusing on identifying and understanding industry interactions with national governments to develop strategic intelligence insights. Once analysts have internalized their understanding of the industry, they can then quickly perform the day-to-day task of reviewing industry information and extracting any strategic intelligence insights.

Value Chain Model

The final model is the Value Chain Model. This model is important because it identifies the fundamental activities in an industry that influence or control the profitability or growth of an industry. These key activities are also frequently the areas where nations exercise export controls for national-security or national-competitiveness reasons.

The Value Chain Model provides a contextual framework for review and evaluation of information. Are there activities that are not only key (hence are on the value chain), but also determine or control growth or profitability in the industry? For example, a country concerned about national competitiveness may focus its attention on those key activities that determine the growth of that industry.

The Value Chain Model was introduced to the broader business community in the 1980s.[32] The value chain, as originally envisioned, is oriented toward

the firm and, in large corporations, the business unit. The example provided in Figure 2.4 is a visualization of the value chain discussed in Porter's book, *The Competitive Advantage of Nations.*

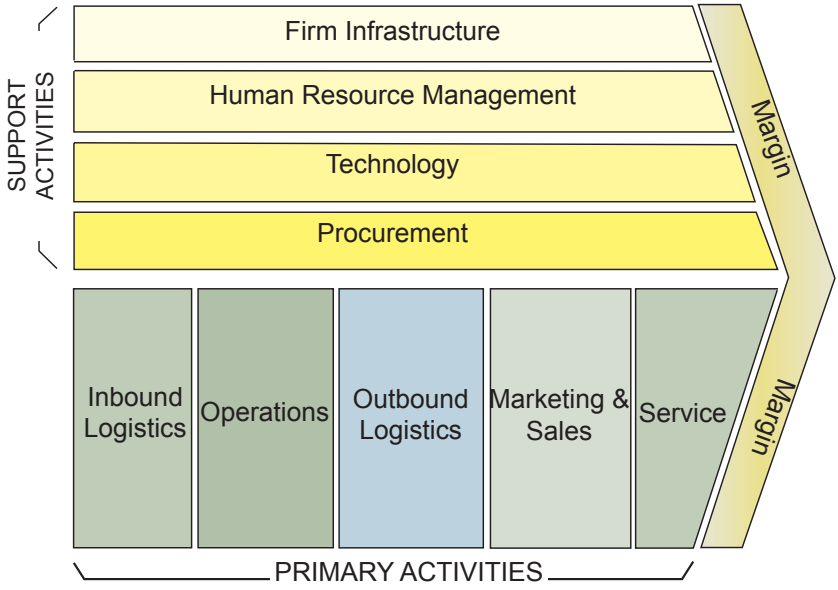

Figure 2.4: Value Chain (© Dinesh Pratap Singh)[33]

A firm using the Value Chain Model will lay out its major activities and then systematically evaluate how each activity adds value to the firm. Business analysts understand that this analysis also includes the relative performance of competitors in executing those activities. This approach supports the firm's strategic planning to achieve competitive advantage.

For Porter's purposes 30 years ago, applying the value chain to anything above the level of the firm (to the industry or sector level) would not shed much light on the unique value that the firm had in creating competitive advantage. Back then, the value chains of U.S. industry were primarily domestic. Multinational firms had overseas subsidiaries in place to deliver products from domestic U.S. value chains. Today, however, multinational corporations base many parts of the value chain, including product development and manufacturing processes,

in many regions and countries. Lifting the value chain to the industry level begins to make sense.

For our purposes, we will exclusively focus on developing the value chain at the industry level. The Intelligence Community is not interested in the competitive advantage of individual firms; our focus is on understanding the structure and conduct of an industry and the strategic intelligence insights its interactions with other nations can provide. Fortunately, there is a body of work in academe that applies the Value Chain Model in describing the scope and scale of globalization, including how industries organize to operate in a global environment.[34] For example, Timothy Sturgeon's work recognizes that development of many products is now the result of global value chains. Academicians seeking to understand the governance of such far-flung industries identify several different types of global value chain governance (Figure 2.5).

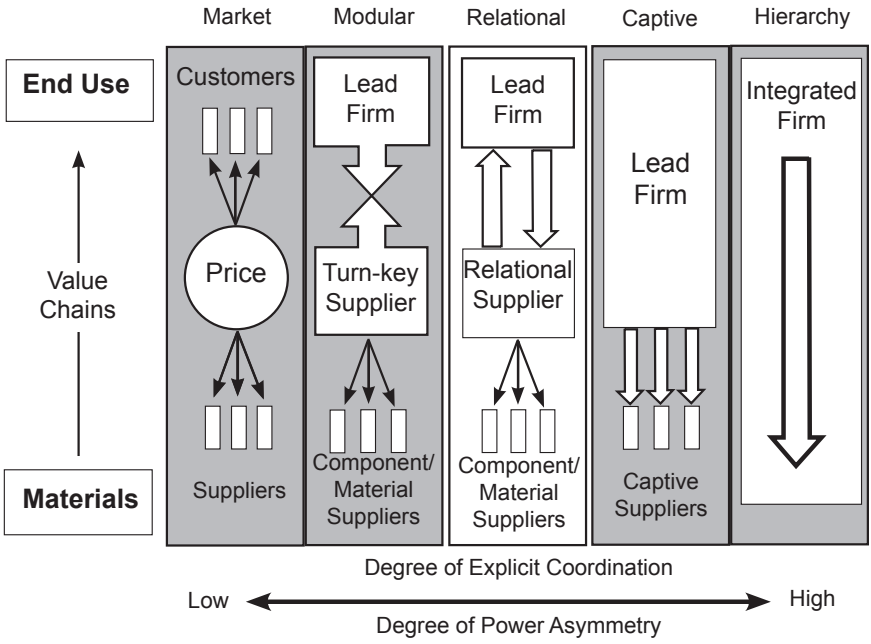

Figure 2.5: Global Value Chain Governance (© Taylor & Francis Group)[35]

Figure 2.5 shows both vertical and horizontal integration by governance type. At the far left, the value chains flow "up" from materials to end use. Arranged horizontally across the bottom is the degree of coordination required between activities and the degree of power asymmetry. Within the value chain examples, the black arrows indicate where price is the only interaction between activities in the value chain, and the solid white arrows indicate where information is included in the interaction. Looking at the far right, the integrated firm maintains competency in all facets of that industries' value chain. At the far left, the most basic value chain, the market, is a price-based market with multiple suppliers and customers communicating only via price. The models in-between show varying complex, symbiotic relationships between suppliers and buyers within the value chain. As one moves from basic to more complex value chains, the development of standards and the ability to exchange information far more complex than pricing information are major facilitators for the development of a global value chain. For now, these global value chain governance models should be kept in the background; they will be of more use when we select and analyze an industry.

In summary, the Value Chain Model captures the key value-added activities of the industry, and the Governance Model shows the level of complexity of the value chain. Developing or being able to interpret the value chain for the industry under analysis is an important early step in understanding the industry. Internalizing an understanding of the industry value chain also contributes to the day-to-day task of reviewing industry information and extracting any strategic intelligence insights.

The firm is the fundamental business unit, and a group of firms that produce similar products are collectively referred to as an industry. This chapter has so far provided three basic models to help the analyst frame the scope of industry analysis. The Porter Five Forces Model helps in understanding the forces influencing the conduct and structure of industry via the power of the buyer and supplier to set prices, the threat of substitution and new entrants to the industry, and the intensity of the existing competition. For our purposes, the analyst can use the Five Forces Model to form a mental picture of the industry. The External Environment Model identifies how and to what extent firms and the industries in which they reside interact with the external environment. For our purposes, the analyst will use the External Environment Model

segments and elements in developing the collection plan (discussed later). The Value Chain Model will become central to the analyst's understanding of the industry under analysis, and also provides a context for reviewing information regarding the industry.

Chapter Three

Putting It All Together—The Five Steps

This chapter discusses how the all-source analyst, covering a region or country desk, includes commercial industry when tasked to provide inputs for an intelligence assessment. There are five steps in the process used by the analyst: (1) select an industry, (2) define the industry, (3) identify sources of information, (4) collect information, and (5) analyze results. The five steps are described below.

Step 1: Select the Industry

For the business analyst, selecting the industry for analysis is straightforward. For the all-source analyst, however, selecting the region or country of strategic interest is even more straightforward. If a nation wants to foster development of an industry with a view toward improving national competitiveness, its domestic firms must become efficient producers of that industry's products. While a nation can subsidize an inefficient industry, that does not mean its segment of the industry will have a comparative advantage over another nation's industrial capability for that product. For the all-source analyst, the policy or resource actions by a nation in fostering development in their industrial capability are of interest for the strategic intelligence insights they may provide.

Criteria for Selecting Industry

Our selection criteria include looking for an industry that is mature, global, and has a large presence in the region or country we are interested in. But first, a couple of new terms—*mature* and *global*—require a brief explanation.

The concept of industry *maturity* is sometimes shown as a stage in the life cycle of an industry. Using the measure of industry sales, the industry life cycle has the following periods: introduction, growth, maturity, and decline.[36] Other industry life-cycle portrayals, using the same measure of industry sales, label the periods of change as fragmentation, shakeout, maturity, and decline.[37] For our analysis, a mature industry is one in which the industry structure is stable and there is little change in the rank of leading firms.

A *global* industry is where an individual firm's competitive position in one country is affected by its position in other countries, and the reverse is also true.[38]

The final criterion, a large presence in the region or country, provides a starting point in selecting and reviewing industry candidates. Potential candidates for industry analysis are available from reviewing the Department of Commerce website for publicly released analysis on U.S. International Trade in Goods and Services. For this example, Department of Commerce International Trade Administration (ITA) publicly released factsheets were used.[39] A March 2009 ITA factsheet states that "capital goods" represent the largest U.S. export category and lists the top capital good export categories as civilian aircraft ($3.8 billion), semiconductors ($2.6 billion), industrial machines ($2.3 billion), telecommunications equipment ($2.3 billion), and medicinal equipment ($2.2 billion).[40] The United States holds a comparative advantage in these industries, where we are the more efficient producer of a product and it is to the advantage of other nations to trade with us to obtain that product or service. Conversely, a list of major U.S. *imports* would indicate where other nations' industries may have a comparative advantage over U.S. industry.

Starting with the ITA export factsheet cited earlier, an Internet search for the worldwide manufacturing rankings for an industry will provide a quick check on that industry's presence in the region or country of interest. This Internet search will also provide initial leads on sources of information regarding the industry.

To illustrate our analysis, the semiconductor industry will be the industry analysis example for the remaining steps. The semiconductor industry is a major export for the United States. It is a *mature* industry with established leaders, and a *global* industry with major outsourcing of manufacturing steps, such that any changes that affect facilities in other countries have an effect throughout a firm's operations. Other countries in the world want to advance in this industry, so industry analysis may yield strategic intelligence insights into another nation's plans and intentions that may affect U.S. comparative advantage in the semiconductor industry and, by extension, U.S. national competitiveness. Finally, the semiconductor industry has a large presence in East Asia, a region of strategic intelligence interest to the United States.

Step 2: Define the Industry

The starting point for the business analyst in formulating industry strategies and plans is to first define the industry and understand its structure. The importance of specifically identifying the industry for analysis is analogous to the task of the all-source analyst in clearly identifying collections requirements. In business, the analyst may have the subject-matter advantage of being in the industry, but there are still limits on the resources available for collection and analysis. The analyst in business may start with the six-digit North American Industry Classification System (NAICS) code for his or her industry and use it to access industry data collected by the U.S. Department of Commerce.[41] While the NAICS code and Department of Commerce data are available to the all-source analyst as well, the ITA factsheet and Internet search results that the previous step provides are more germane to that analyst.

To understand the industry under analysis, the all-source analyst has to research sources of general information on semiconductors and the industry. Appendix B provides the results of open-source Internet research on the basics of semiconductors and their manufacture.

Constructing a Value Chain: Aid to Industry Definition

One way to capture an understanding of this newfound information is to construct a value chain for the industry. The following discussion on developing an industry value chain is based on the information in Appendix B.

An industry value chain is the set of interrelated activities that, taken together, cover the cost of providing the product or service. For the semiconductor industry, the standardization of process steps and information exchange between processing steps led to the globalization of the value chain for this mature industry.[42] The semiconductor or electronic components industry and the term "value chain" are mentioned frequently in academic and industry trade journals. There are even illustrations of value chains for various aspects of the semiconductor industry available on the Internet. For example, in Figure 3.1, the Taiwan Semiconductor Industry Association 2009 Report outlines a semiconductor value chain to indicate the number and distribution of Taiwan firms comprised in its domestic semiconductor industry.

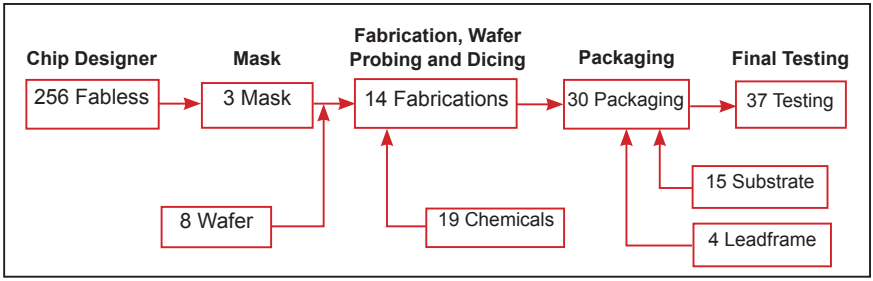

Figure 3.1: Taiwan Semiconductor Industry, 2008 (© Taiwan Semiconductor Industry Association)[43]

The Taiwan semiconductor industry value chain follows the product flow from design to test of the packaged chip. The figure indicates that, in 2008, Taiwan had 256 firms involved in the design of integrated circuits. The term "fabless" denotes firms that create and sell the designs of integrated circuits, but do not fabricate (manufacture) integrated circuits. The figure also indicates 14 firms with fabrication operations and 30 firms with packaging operations.

Academic papers employ value chains to evaluate industries, and those value chains produced in the country of interest can yield insights into how important an industry is to a nation. For example, Figure 3.2 shows a semiconductor value chain reflecting Taiwan's capability in the design of integrated circuits relative to capabilities of other advanced countries. The *Technovation* article from which the figure was derived goes on to discuss the strategy of the Taiwan semiconductor industry and the reasons behind its relative success at that point in time. Although dated, the article still provides background for collection and analysis on the semiconductor industry in Taiwan.

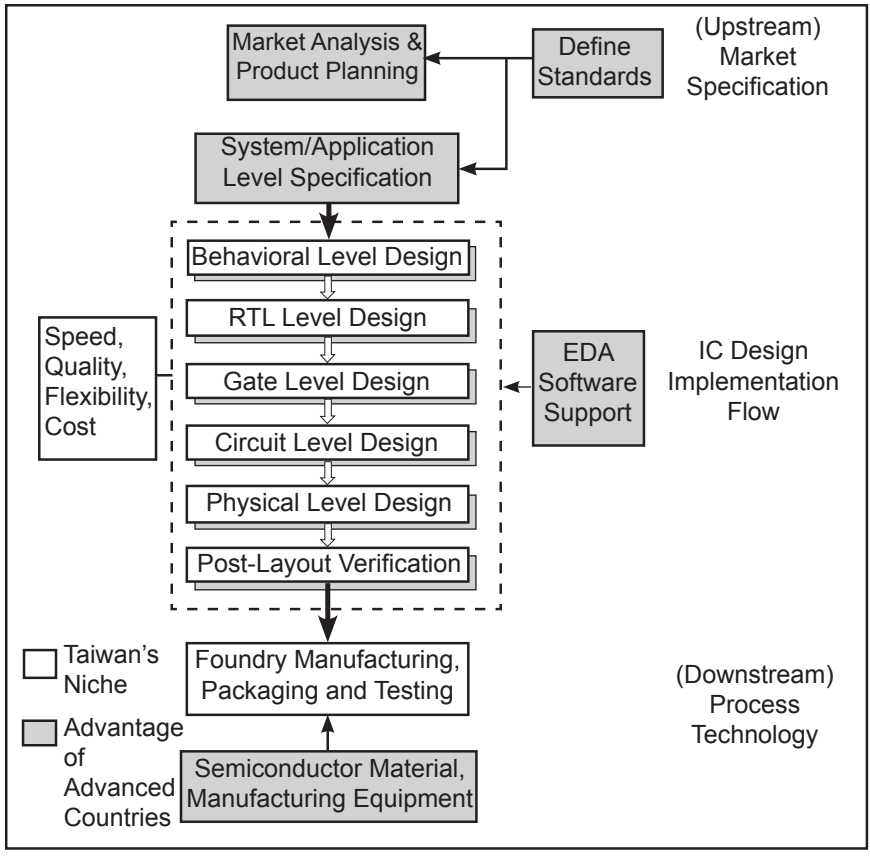

Figure 3.2: Taiwan Integrated Circuit Design Capabilities (© Elsevier)[44]

For our immediate purposes, the value chain in Figure 3.2 confirms the steps and their sequence in the production of semiconductors. The value chain also provides key terms that are encountered in analyzing the semiconductor industry.

Figure 3.3 shows a semiconductor value chain that can be used to illustrate the semiconductor manufacturing process and the globalization of the industry value chain.

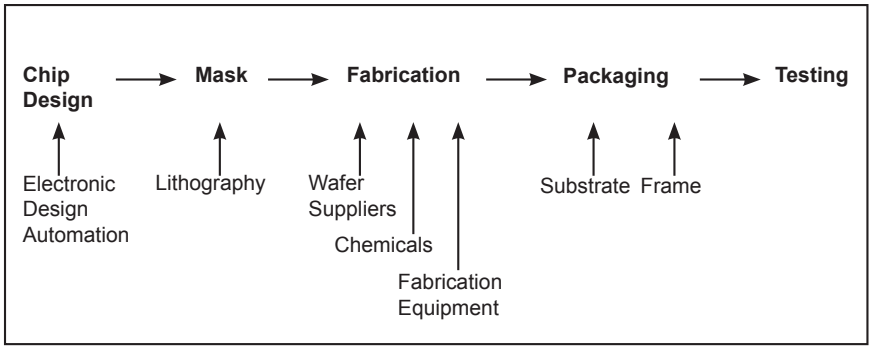

Figure 3.3: Semiconductor Value Chain[45]

Figure 3.3 shows the major value-added activities in the industry (chip design, mask, etc.), as well as the key suppliers to the industry (electronic design automation, lithography, etc.). An important point for analysts to understand is the variation in ownership of the value-chain activities for this mature industry. For example, in Figure 3.4, the top value chain shows the domain of the integrated design manufacturer and refers to a firm that participates in all the steps in the value chain. In terms of global value-chain governance (remember Figure 2.5), this is a hierarchical governance with high degrees of explicit coordination within the firm and power asymmetry over the suppliers. The middle value chain in Figure 3.4 shows the domain of the foundry, and refers to a semiconductor fabrication firm that fabricates the wafers from designs provided by other firms, and then returns the wafers to the customer. Finally, the bottom value chain in Figure 3.4 shows the domain of a fabless firm. This firm creates the integrated circuit design (intellectual property) and sells the design to other companies or subcontracts for fabrication.

In terms of global value-chain governance, both a foundry and a fabless firm are examples of modular value-chain governance. The standardization of design-manufacturing interfaces and information supports a lower degree of explicit coordination and power asymmetry over others. A useful way to think of power asymmetry is in terms of the power of the buyer or supplier in the interchange. The integrated design manufacturer has a lot more power over suppliers than the foundry or fabless firm.

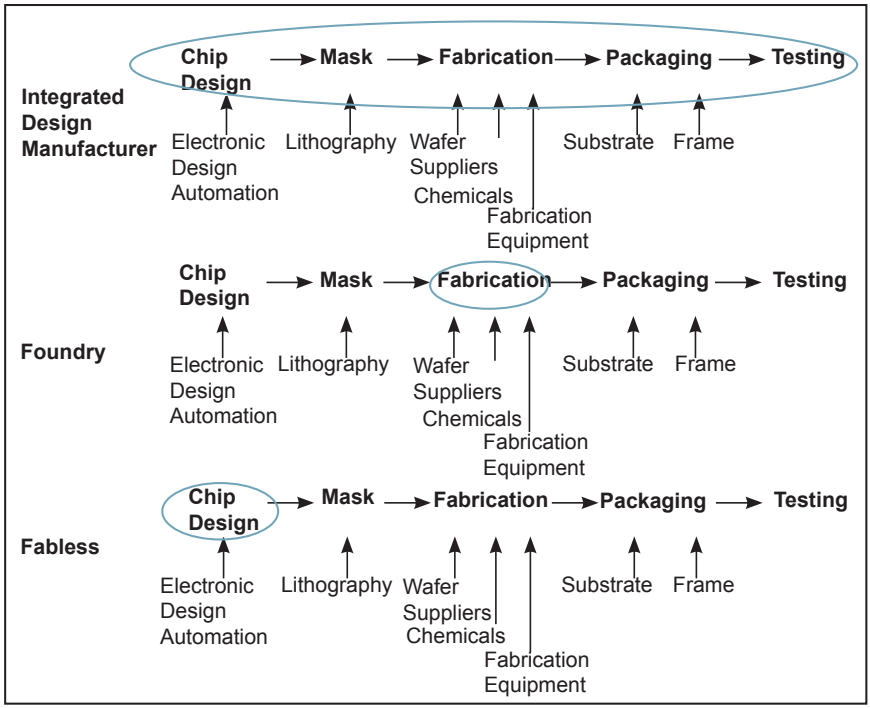

Figure 3.4: Semiconductor Value Chain—Firm Participation[46]

Step 3: Identify Sources of Information

Timothy Sturgeon points out the importance of not focusing on macro-level statistics, such as trade and investment, to understand a country's plans and intentions, because they "cannot help but render invisible the detailed contours of the world economy."[47] Also beware the technophile's focus on "the next big thing" or, at the other end of the spectrum, the engineer's focus on details. Keep these cautions in mind when starting to scan and select topics from the "daily scrape" for further review and analysis.[48]

This section takes the next step of identifying the types of potential open-source data available to support the industry analysis. Appendix C lists, by category, potential data sources specific to the semiconductor industry.

Books

While currency of the data source is a primary consideration, the search should include recent books on the industry.

Reports

The National Academy of Sciences, a nonprofit institution, has a searchable website of its publications, many of which are free to download. While the publication of National Academy reports is unpredictable, you can set e-mail notifications when topics of interest are available. The federal government, particularly within the Department of Commerce, provides a regular stream of trade and industry statistics, but occasionally it will also produce reports on global trade topics that are of interest. For example, the Bureau of Industry and Security (*www.bis.doc.gov/*) provides current news regarding trade issues, and the Defense Industrial Base Programs link provides a list of Defense Industrial Capability and Technology Assessments regarding foreign industrial development that may be of interest.

Trade Associations

Most industries have trade associations, and the associations usually release publications. Trade association websites provide news and documents, although the frequency of their updates and data available can be irregular.

Trade Journals

The most useful sources of current information are the industry trade journals. While there are government policy announcements and occasional analytical articles of use in metropolitan newspapers and business magazines, many of the stories are not much more than news releases from the subject company.

Other Internet Sources

This category concerns the ever-evolving platforms and content of the Internet. A few examples follow.

YouTube

The website YouTube (*www.youtube.com*), although pedestrian to aficionados of social media, can still provide good sources of information.

Blogs

Blogs written by industry analysts, enthusiasts, or employees can be a good source of information.

Twitter

The use of Twitter by the trade journals and even companies is noteworthy, but they typically tweet links to journal or marketing content already accessible via other means.

Webcasts, Virtual Conferences

The increasing use of webcasts and virtual conferences are good real-time sources. Subscriptions to the industry trade journals will lead to announcements of these events. The events offer another avenue for the industry to share information and develop market opportunities. The presenter slides are usually available for download prior to the presentation or the site may allow archival access.

Trade Shows

Trade shows, the best alternative to actually visiting semiconductor companies in other countries, obviously present challenges to the all-source analyst even beyond the requirements of time and funding. Trade association websites and trade journals carry advertisements for upcoming tradeshows. Tradeshows offer sessions in a variety of areas; it pays to read the program beforehand to ensure that the tradeshow is not devoted to a sub-industry topic or technical interchange. Also, unless the analyst is multilingual, it is advisable to ensure that the session is in English or a simultaneous translation is available. A walkthrough of the exhibit halls, including gathering literature, proves useful. One caution is that most corporate booths require a business card or the signing of a register before they provide literature. The purpose of the exhibit hall is to generate business leads for the companies, so the collection of literature may have to be skipped if identification presents a problem.

Step 4: Collect Information

For the purposes of this discussion, data was collected from November 2009 to June 2010, using all of the sources discussed in the preceding subsection. The sources included subscriptions to multiple semiconductor industry trade

journals, two semiconductor industry trade shows (Tokyo and Seoul), and one industry strategy symposium (Half Moon Bay, California). With the Porter Five Forces and the Value Chain Models for context, relevant online information was saved in the program Zotero, organized by folders labeled with the External Environment Model segments. Also available were digital copies of the tradeshow proceedings.

Preparing for Collection

The sources that are included in the "daily scrape" of open-source media require preplanning.

Using E-mail as an Information Portal

For this project, a separate Gmail account was created just to receive industry trade journals and other industry source materials. During the workweek, the trade journals push their content out to subscribers. Via the Gmail account, it was possible to quickly scan the subjects and synopsis of articles in each journal.

Capturing and Sorting Information

There are several ways to capture results. One approach is to use a series of e-mail folders to keep and organize items of interest. The freeware program Zotero was chosen to collect, manage, and cite the source materials.[49] Zotero was active and ready to use whenever the browser was open. Saving a copy of an article entailed clicking the Zotero icon in the toolbar, and selecting "create new item" in the folder designated. Zotero uses a cloud-based storage approach to capture a copy of the specific article, and also puts a copy on the computer. The reviewed trade journal is placed in a folder within the Gmail account that is marked by the name of the journal in case it is necessary to access the journal again. The advantage of Zotero's cloud-based approach is that the analyst can work from multiple computers and keep up with the work. In June 2010, Zotero's annual rate was $20 for 1 GB of storage ($1.67 per month). A plus for Zotero is that it has a plug-in to Microsoft Word, permitting direct transfer of citations from Zotero to a Word document.[50]

Filing Information

The External Environment Model provided the framework for active collection of information on the industry. Folders were created in Zotero and labeled with the names of the segments in the model. Here is the list of virtual folders established in Zotero to capture information:

Demographics
Economic
Global
- *China*
- *Europe*
- *India*
- *Japan*
- *Korea*
- *Singapore*
- *Taiwan*

Political/Legal
Sociocultural
Technological

Note that, within the global element, country-specific folders were also developed for information that pertains only to that country. There is also a folder named Industry Analysis that was used to collect information regarding the structure and conduct of the industry. Figure 3.5 shows a screenshot of the online data collection (Zotero tool) for this industry analysis.

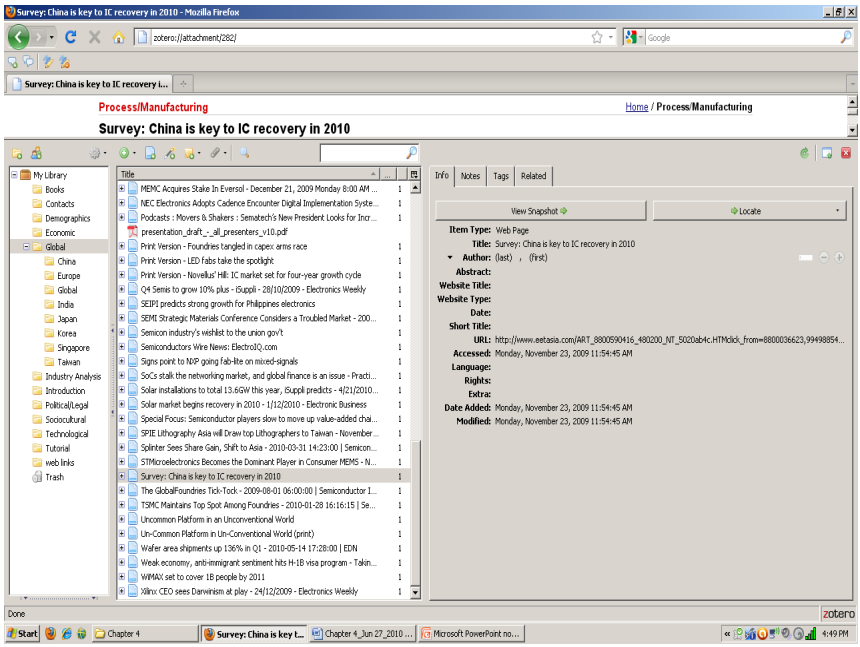

Figure 3.5: Data Collection Using Zotero

In Figure 3.5, the Global folder is highlighted in the far-left column. The middle column lists all the articles saved in that Global folder; highlighted is an article titled "Survey: China is key to IC recovery in 2010." Double-clicking on that title opens up the article in that window for rereading. In the far-right column is a snapshot of the citation, including the date it was accessed and the article's Web address. The review and collection of data in one place with a clear documentation trail will be advantageous during the analysis. Once the data-collection framework is in place, the analyst can start reviewing and collecting information. There will be a large volume of information arriving every day, but it is possible to quickly scan and save information of interest.

Industry Observations from Data Collection

Thus far, we have discussed the first four steps: select the industry; define the industry; identify sources of information; and collect information. In this

subsection, we look at industry observations resulting from the data collection. We summarize observations on the current state of the semiconductor industry based on the results of the open-source collection. The summary will provide a backdrop for step five: analyze results (the following subsection). There, we will review and analyze collection results on East Asia—the focus of our analysis.

At this point, the analyst should be comfortable with reviewing incoming information on the semiconductor industry. The Five Forces Model and the Value Chain Model aid in reading and comprehension during collection. The External Environment Model and the Zotero software tool provide a means to sort and preserve collection results. The observations at this point will be a collection of opinions and facts consistent with how the industry views itself. While the psychology of intelligence analysis is beyond the scope of this discussion, Figure 3.6 provides a conceptual view of applying the industry analysis model for intelligence analysts.[51]

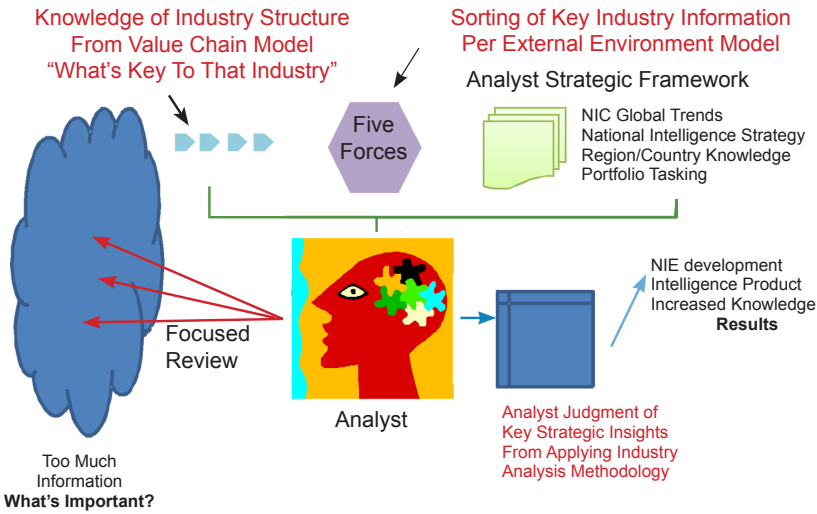

Figure 3.6: Conceptual View of Model Application

Figure 3.6 shows the analyst at the center because he or she is the target audience for this book. On the left side, the blue cloud indicates the large amount of open-source information and the caption "Too Much Information" describes the daily challenge of the all-source analyst. Along the top

are arrayed the various models described in Chapter 2, but it also includes the analyst's strategic perspective and tradecraft experience. The combination of industry analysis models and the strategic framework provides a new lens for the analyst to now perform a "Focused Review" of industry-related data. The "Analyst Judgment of Key Strategic Intelligence Insights" represents the intellectual task of reviewing and assessing the information collected. This is not a serial process; the analyst over time builds a strategic perspective of the industry and draws equally strategic and intelligence insights (or connections) from his or her tradecraft experience. This subsection provides the result of building a strategic perspective on the semiconductor industry. Later in this chapter, under step 5, we describe the result of focusing our newfound perspective on the target region of East Asia and suggest strategic intelligence insights for use in the intelligence products listed in Figure 3.6 as "Results." It is worth stating again that the intellectual process of learning to use the industry analysis models, learning to understand the industry, collecting information, developing observations, and finally generating strategic intelligence insights is not serial.

Summary of Industry Observations

The semiconductor industry faces continuing consumer demand to increase capability and decrease prices. The advances in technology have been impressive; however, achieving each advancement (sometimes referred to as a technology "node") requires enormous amounts of capital, and it is the economics, not the technology, that is becoming the main driver. Four primary observations resulted from the information collection and analysis of the industry:

1. Economics of pursuing the leading edge is in question;
2. "Globalization" of the industry market is not a remedy for profitability concerns;
3. East Asia's emergence as the industry's production center is an outcome of pursuing profitability through globalization; and
4. Industry's active pursuit of alternative markets for avenues of profitability is an outgrowth of the competitiveness within the industry.

Economics of Pursuing Leading Edge Is in Question

A hallmark achievement of this industry has been its ability to regularly deliver increasing capability. However, while there is a lot of discussion of the approaching physical limits of achieving further increases in the number of transistors that can be crammed onto an integrated circuit, industry analysts believe the real barrier may be an economic one. At semiconductor equipment conferences this year, several speakers brought up the point that new technology nodes may not meet the 18-month cycle of delivering new capability per Moore's Law.[52] Figure 3.7 illustrates the industry's fear that the financial hurdles may be too great for delivering new capability.

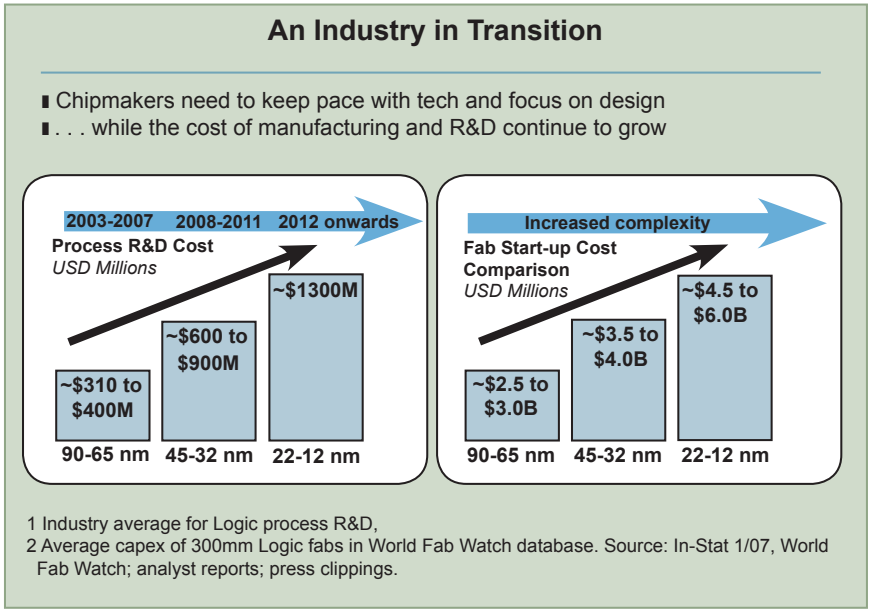

Figure 3.7: Financial Hurdles for Semiconductor Industry (© GLOBALFOUNDRIES)[53]

Figure 3.7 shows the increasing research and development costs required to achieve decreasing feature size. The figure also shows that the industry faces huge costs to build the fabrication facility to render that design into a chip. In terms of Porter's Five Forces Model, both of these factors represent high

barriers to entry for a company interested in joining the industry. These large investments also represent high exit costs for existing firms.

Figures 3.8 and 3.9 illustrate that even the *conceptualization* and *design* of leading-edge chips are becoming cost prohibitive and resulting in fewer new design starts. One result is that many companies within the industry will continue production using older feature dimensions, and will reuse old blocks of design (intellectual property) in order to avoid the enormous costs of leading-edge design and fabrication.

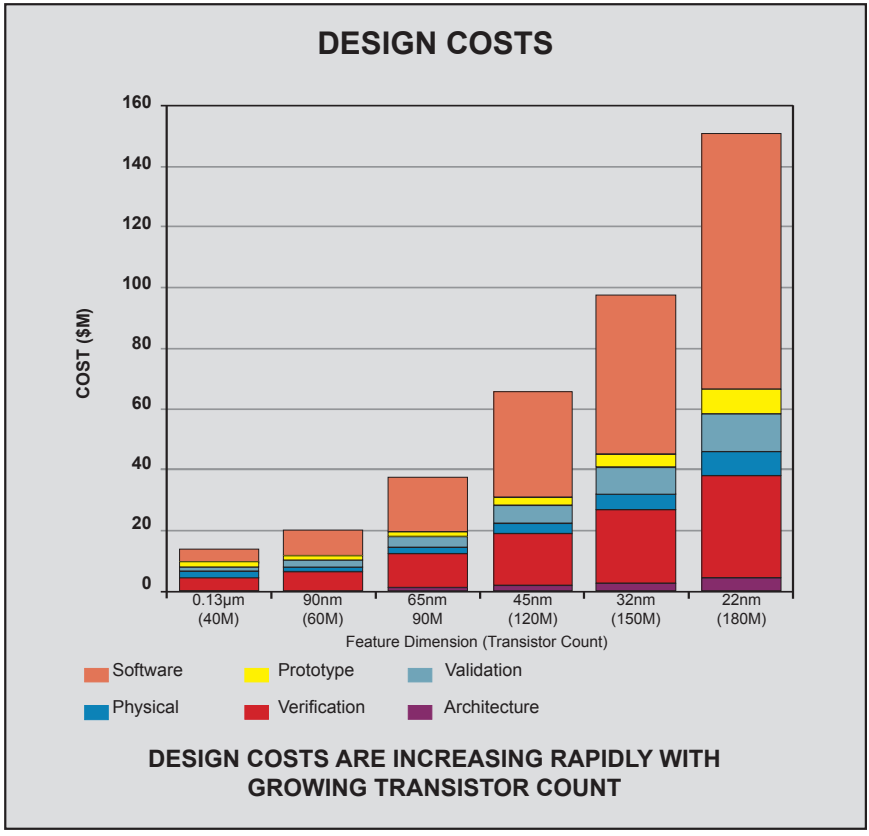

Figure 3.8: Increasing Design Costs (© International Business Strategies, Inc.)[54]

Figure 3.8 illustrates the increasing cost of design in leading-edge integrated circuits. The growing software cost is due to the increase in software required throughout the design process to achieve breakthroughs in the performance of integrated circuits.

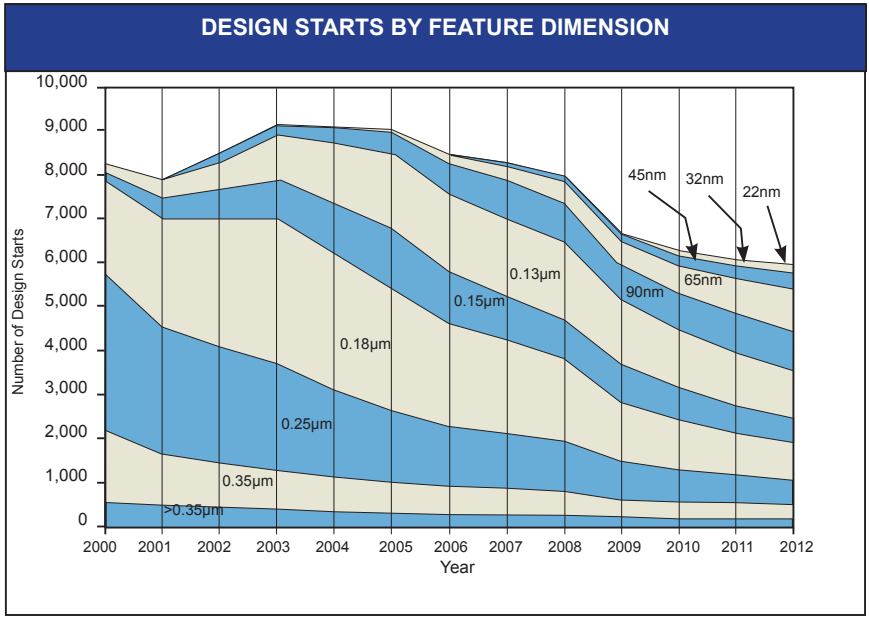

Figure 3.9: Decreasing Design Starts (© International Business Strategies, Inc., 2010)[55]

Figure 3.9 illustrates that increasing costs of pursuing the leading edge in semiconductors are resulting in a slowdown of new starts in leading-edge design. Instead, companies are trying to earn as much revenue as possible from existing designs and fabrication facilities. In terms of the Five Forces Model, the intensity of competition requires a company to commit huge amounts of capital in order to stay at the leading edge of the industry. These capital commitments have led to fewer competitors with clear leaders in each category of the industry. For example, Intel is the world leader in microprocessor units in terms of sales and market share.

When you factor in the huge costs to stay on the leading edge and the industry's claim that the returns on investment are increasingly difficult to find, it is

hard to see why firms even try to pursue the leading edge. Figure 3.10 shows a slide from an industry strategy session that graphically captures this point, but does not provide any answers.

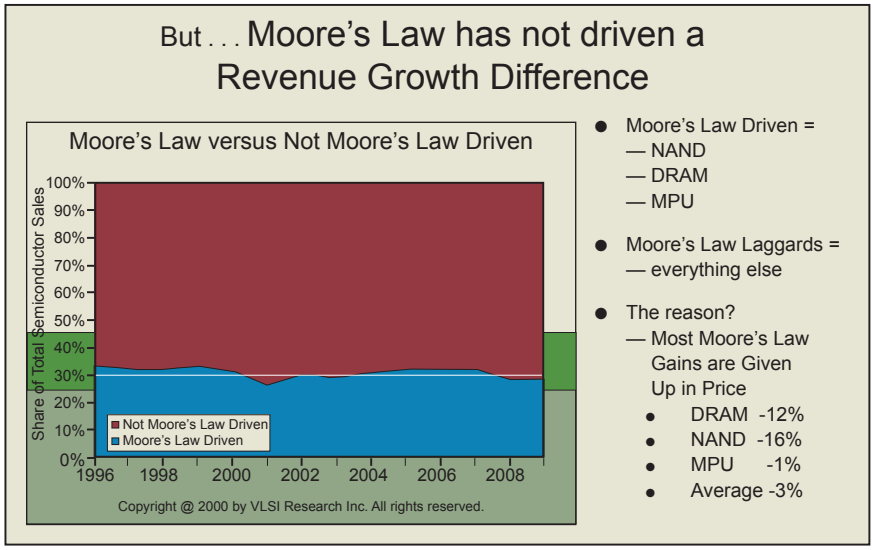

Figure 3.10: Lagging Edge over Leading Edge in Semiconductor Sales (© VLSIresearch. "Economics and Collaboration Panel Discussion" SEMI ISS 2010. Half Moon Bay: SEMI, 2010.)[56]

Figure 3.10 illustrates that, despite all the attention paid to the leading edge (Moore's Law–driven) and the expectation that a leading-edge strategy will result in higher profits, the fact is that the share of total semiconductor sales has remained steady between the leading and lagging edge. The statement "Most Moore's Law Gains are Given Up in Price" illustrates the power of the buyer (in this case, the electronics-equipment manufacturer) in the semiconductor industry. So the semiconductor firm (supplier) has to either find ways to remain competitive or exit the industry, possibly going out of business altogether.

Unfortunately, even if a company steps back from the enormous costs of leading-edge fabrication, it will still face intense price competition in the trailing edge that requires it to carefully select its strategy. Figure 3.11 shows that, while integrated design manufacturers still predominated in the top 20 semiconductor sales leaders (as of 2008), the Taiwan Semiconductor Manufacturing Company, a *pure-play foundry*, is in the top five, and two *fabless*

firms, Qualcomm and Broadcom, registered the highest growth rates. For the remaining integrated design manufacturers to stay at the leading edge, they must continue to leverage their lead in market segments with large amounts of capital investment.

2008 Top 20 Semiconductor Sales Leaders ($M)

Figure 3.11: Integrated Design Manufacturers Still Predominate (© IC Insights)[57]

Figure 3.11 not only lists the leaders in the semiconductor industry, it also shows the international makeup of the industry. One notable absence on the list is mainland China, which is usually portrayed in the media as a juggernaut in manufacturing.

"Globalization" of the Industry Market is not a Remedy for Profitability Concerns

Collaboration and Protection of Intellectual Property

The industry understands the technology challenges ahead, but finds it increasingly difficult to find the capital and business model to fund the necessary research and development for pursuit of the next technology node. One possible solution the industry is exploring is collaborations in research and development between semiconductor firms. The International Semiconductor Technology Roadmap is the best example of this type of collaboration. Participating firms are able to share technology and still achieve differentiation in their product.

A few large firms, such as Intel, still choose to fund their own research and development and keep their technology advantage in-house. Other firms also carefully guard their intellectual property, but do so in a surprising way. For example, within weeks of the release of Apple's iPad, the Canadian company Chipworks released an analysis and cross-section images of the core processor chip and correctly identified Samsung as the designer and fabricator.[58] This practice of reverse engineering and publishing the integrated circuit design of another firm is protected by the Semiconductor Chip Protection Act in the United States, which allows reverse engineering "for the purpose of teaching, analyzing, or evaluating the concepts or techniques embodied in the mask work or circuitry."[59] The industry uses this carefully stipulated openness to share achievements and protect its intellectual property.

Expanding Market, Increasing Competition

Another hallmark of this industry is the growth in unit volume, which drives lower cost per unit of semiconductors. One observation in *EE Times India* stated that "the total semiconductor TAM [total available market] grows because of—not in spite of—the 35 percent per year reduction in the unit price of transistors."[60]

During this past decade, electronics consumption has shifted from business use to personal and home use, and this is growing despite the economic downturn. One supporting figure cited is that 55 percent of the world GDP of electronics is now from personal consumption.[61] The $226 billion

semiconductor industry is a key part of the $1.1 trillion electronics industry.[62] Despite the recent economic downturn, the semiconductor content of electronic systems was forecasted to increase about 27 percent for 2010.[63]

A major portent of the future of the semiconductor market lies in the rising awareness of people in other parts of the world to the use of portable electronics such as cell phones. However, a significant portion of these groups only has an annual per capita income of greater than U.S. $3,000.[64] Industry analysts are warning business to be aware of the tipping point, when 50 percent or more of its demand is in emerging markets.[65] Figure 3.12 illustrates the point that, while the majority of this rising consumer class will have high expectations for capability, they will not have the economic means to afford it, thereby exerting further downward pressure on prices.

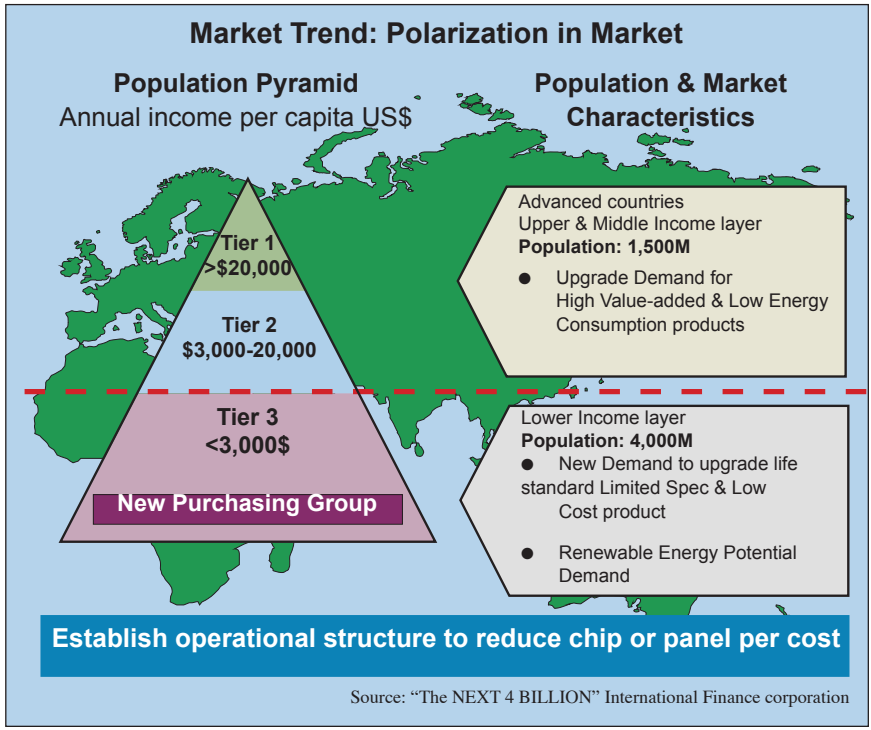

Figure 3.12: Future Market Economics (© Tokyo Electron using information from "The NEXT 4 Billion" International Finance Corporation and "The Fortune at the Bottom of the Pyramid" Strategy + Business, no. 26: 2–14)[66]

Figure 3.12 also provides a sociocultural insight regarding rising living conditions in developing nations around the world. While the industry is struggling with future profitability, demand in developing countries is increasing. This bodes ill for the semiconductor industry, because the power to set prices is still firmly in favor of the consumer.

Ultimately, a semiconductor company has to turn a profit in order to survive in the industry. Turning a profit means being able to sell enough chips over what it cost to develop and produce them. One figure cited at an industry strategy session is that there needs to be a total available market of at least $2 billion in order to justify pursuing a 32 nm advanced chip design.[67] The qualifying 2013 product markets were listed as mobile phones, personal computers, video games, and televisions with set top boxes. The financial community expects that before a semiconductor company invests its capital in a project, the expected value from the project will cover its investment and, in addition, earn a higher return than alternative uses for that capital.

East Asia's Emergence as the Industry's Production Center is an Outcome of Pursuing Profitability through Globalization

It was the drive for profitability that forced U.S. firms to first outsource finished electronic components to Asia for use in producing end items for consumption.[68] The developing standardization of design-to-manufacturing interfaces helped the rise in technical sophistication of Asian countries, and now that region is becoming the fabrication center of this global industry.[69] The global Value Chain "modular" model discussed earlier in this chapter neatly captures the current semiconductor design and fabrication processes.

The establishment of the *dedicated foundry model* in Taiwan is central to understanding the modularity of the industry.[70] While there are variations in scope and organization, in its simplest form, the foundry receives the chip design "intellectual property" from a customer and produces wafers with the integrated circuits. The customer then takes the wafer and either finishes the process or outsources it to yet another firm, so they only handle sales of the finished chip. A pure-play foundry does not fabricate and market its own chips. Sometimes an integrated design manufacturer will contract out its excess production capacity to other firms and produce chips in their fab for them.

The dedicated foundry is a way to transfer portions of the huge costs (and technology risks) of semiconductor fabrication outside of the firm. Some "fab-lite" semiconductor companies are reducing their fabrication capabilities to cover only key technology areas and are relying on foundries for production of the remainder of their product portfolio. Other "fabless" firms have no fabrication capability and are concentrating on generating designs for fabrication or for sale to other companies.

The result of all these changes is a shift in semiconductor manufacturing to Asia, where the majority of the foundries are located. Figure 3.13 shows, by geographic region, the change in installed capacity (use of 200 mm equivalents allows inclusion of all wafer sizes) from 1995 to 2009; it also includes forecasts for 2010 and 2011. The center of gravity for this industry is clearly shifting to East Asia.

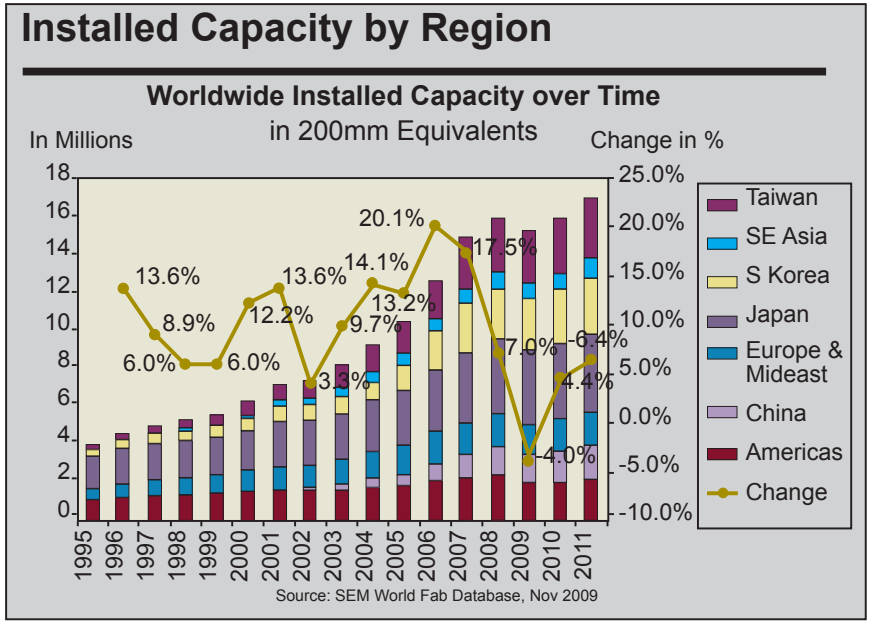

Figure 3.13: Rise of Asia in Semiconductor Manufacturing (© SEMI Industry Research & Statistics)[71]

Industry's Active Pursuit of Alternative Markets for Avenues of Profitability is an Outgrowth of the Competitiveness within the Industry

There are several promising areas for future growth in the semiconductor industry that are not as capital intensive or technologically challenging. These areas are photovoltaic (PV) and light emitting diodes (LED). There is also an emerging and potentially large application area for semiconductors in the biomedical market.

Photovoltaic (PV). Photovoltaic (or solar-cell) fabrication starts with square silicon wafers and uses a simpler—relative to CMOS (complementary metal-oxide-semiconductor)—fabrication process to produce a solar panel. Figure 3.14 shows a simplified version of the process; note the absence of the repeated mask exposures that produce the complex designs of an integrated circuit. The fabrication of the solar cell starts with flat sheets of silicon that are the same size as the finished solar cell. The processing of the silicon into a solar cell is much quicker than the process for fabricating an integrated circuit. While it is important to control the introduction of impurities in the process, solar-cell fabrication does not require the same level of stringent process controls involved in integrated-circuit fabrication.

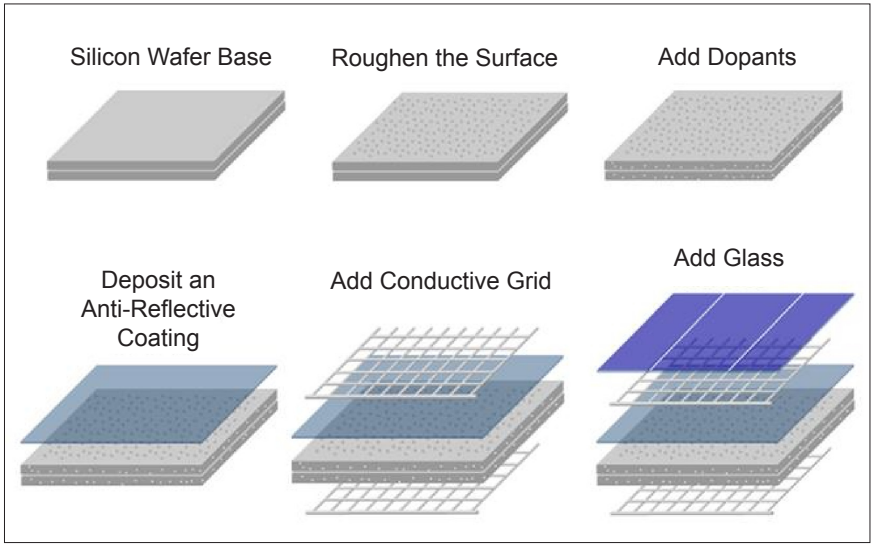

Figure 3.14: Fabrication of a Solar Cell[72]

The PV market is a topic of much discussion, but the business model for widespread adoption is still not in place. As Figure 3.15 indicates, demand in the industry is still heavily dependent on government subsidies for producers and consumers. Until PV can compete economically with conventional power sources, its progress will continue to depend on government subsidies.

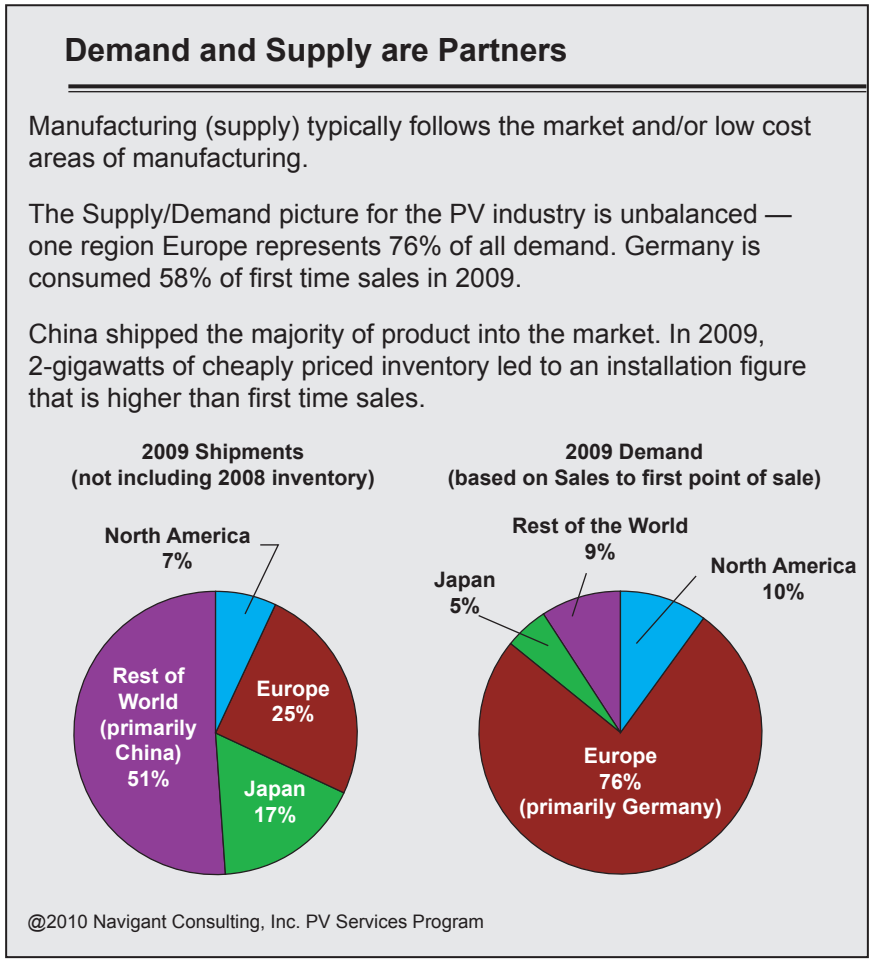

Figure 3.15: PV Market Still Developing (© Navigant Consulting)[73]

It is interesting to note from Figure 3.15 that China is a major producer of photovoltaic devices, but is not a major consumer. The fabrication finding is not surprising, since photovoltaic fabrication is not as complex as integrated circuits, but the future of mainland China as a consumer of photovoltaics remains open to speculation.

Light Emitting Diodes (LEDs). LEDs are another promising growth area. They are based on semiconductor substrates and, in concept, are even simpler than PV cells to produce. The LED industry is characterized as being 10 years behind the semiconductor industry in terms of process control and automation.[74] Figure 3.16 provides a simple view of the fabrication steps.

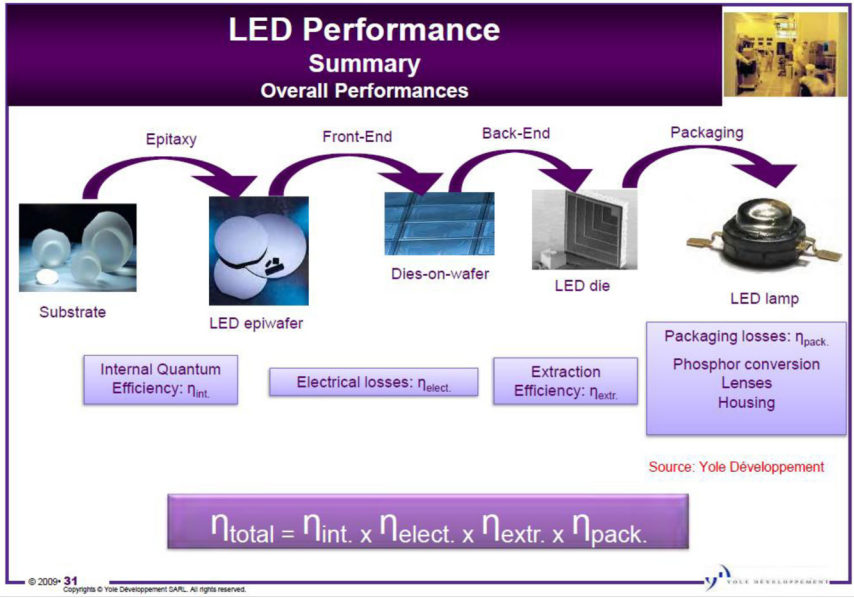

Figure 3.16: LED Fabrication (© Yole Développement)[75]

The fabrication of an LED also begins with silicon substrate. A layer of material is grown on the substrate, and the resulting epiwafer is ready for further processing. The dies are cut out of the epiwafer and packaged in a fixture with electrical connections.

Figure 3.17 shows that the promise of continuing market growth for LEDs is in the consumer-product areas of automobiles, flat-screen televisions and monitors, and energy-efficient applications, such as commercial and residential lighting. These growth projections and low technology barriers are now drawing larger semiconductor companies into this segment. While the consumer will benefit from the increasing competition, only the firms that can quickly scale up production will remain profitable.

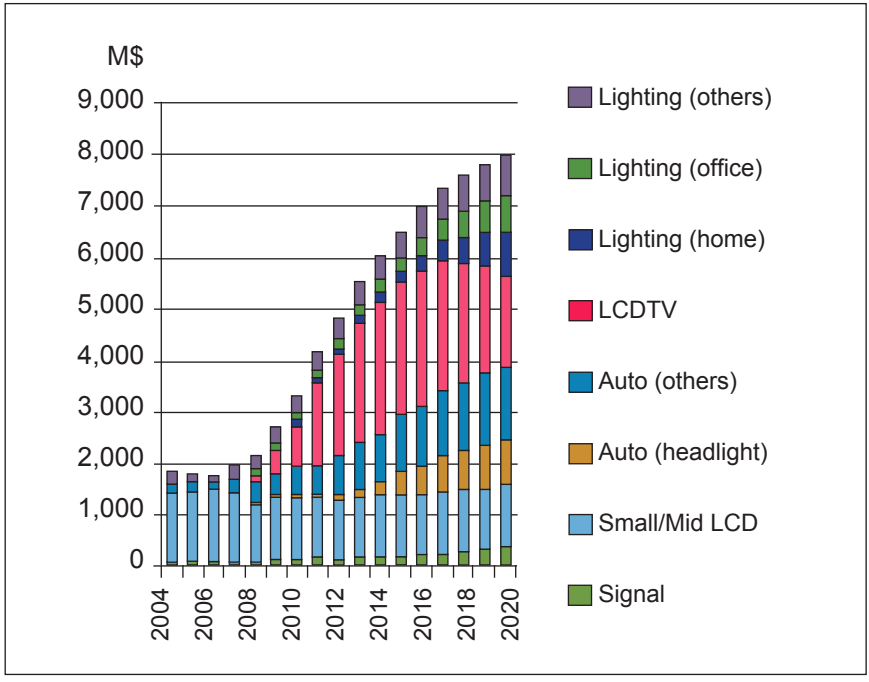

Figure 3.17: LED Market Forecast (© iSuppli)[76]

Figure 3.18 shows that the distribution of LED fabs is the highest in East Asia. The LED fab has a lower barrier to entry, and East Asia is close to the buyer (in this case, electronics and automotive manufacturers).

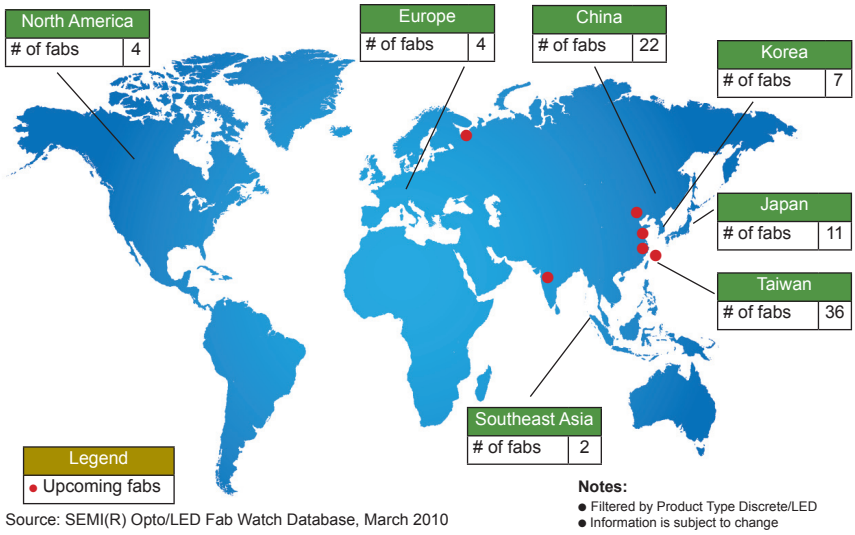

Figure 3.18: LED Fabs Worldwide (© SEMI Industry Research & Statistics)[77]

Biomedical. The semiconductor industry is awakening to the market potential of the application of semiconductors in medicine. During an *EE Times* virtual conference on Medical Systems Design (cited as an example data source in the preceding subsection), the keynote speaker presented a slide (Figure 3.19) listing the drivers and potential for growth in this market segment.

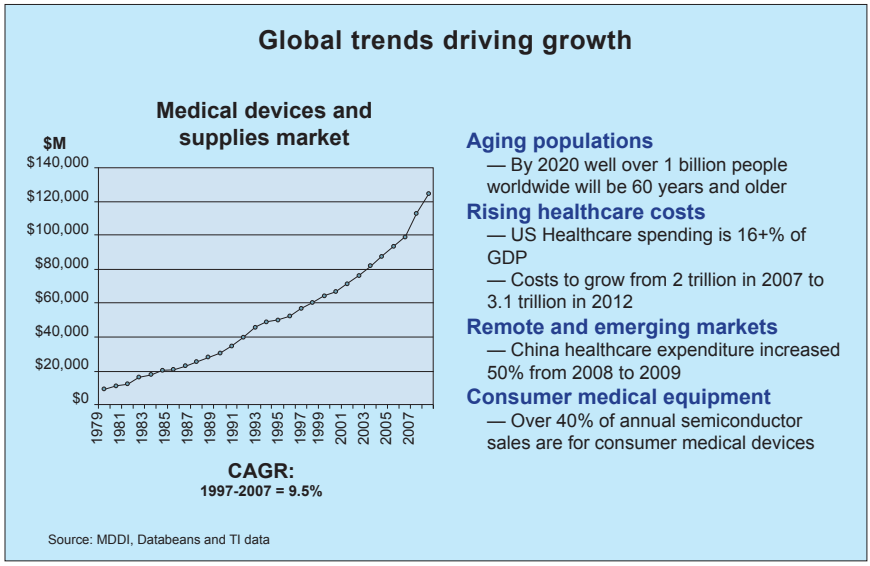

Figure 3.19: Medical Devices Market Potential (© Doug Rasor)[78]

Figure 3.19 provides insights into the drivers for potential demand for semiconductors in medical applications. The aging of populations in developing and developed nations is one driver. Another projected demand driver is rising healthcare costs, even in developing nations.

During a keynote address at SEMICON Korea, Tien Wu, the chief operating officer of ASE (Advanced Semiconductor Engineering), Taiwan (the world's largest provider of semiconductor-manufacturing services in assembly), presented a slide (Figure 3.20) showing that medical applications are part of the next semiconductor life cycle. The speaker went on to say that every single life cycle tends to be larger than the previous one, and champions of one tend to lose in the next life cycle.[79]

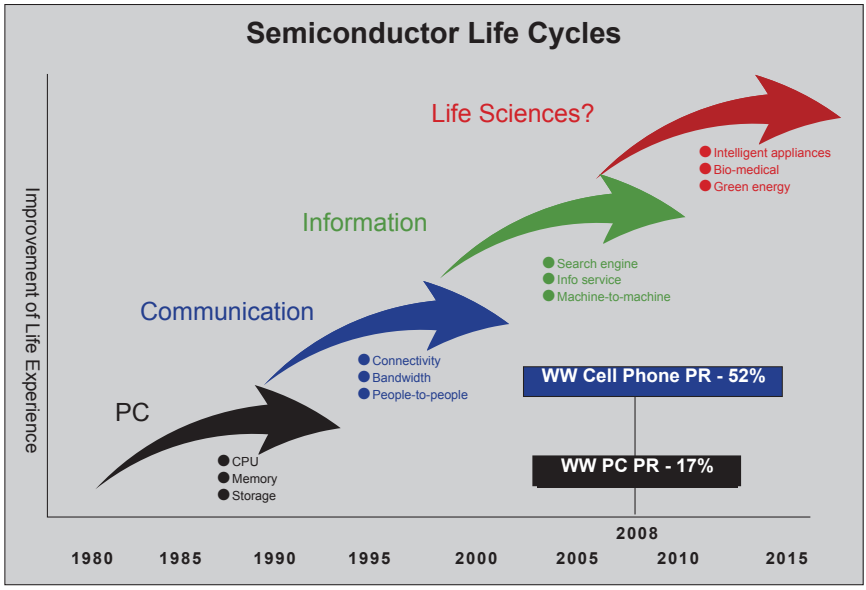

Figure 3.20: Semiconductor Life Cycles (© ASE Group)[80]

The continuing reductions in the size of integrated circuits and power requirements are raising the potential for integration of semiconductors into the human body. As Figure 3.21 illustrates, the applications of semiconductors are poised to become essential to our health and well-being.

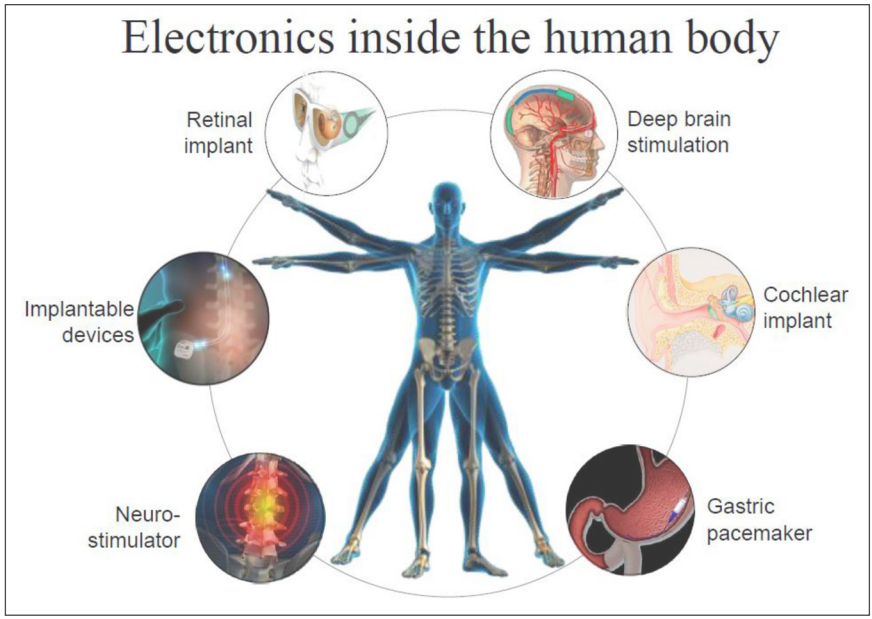

Figure 3.21: Semiconductor Integration into Biomedical Devices (© Doug Rasor)[81]

Summary

This subsection provided the result of building a strategic perspective on the semiconductor industry. The observations are the result of reviewing and evaluating a large body of collected information. The extensive footnoting for each observation provides the means for recalling and verifying the source of these observations. To summarize, particularly with respect to influences on the structure and conduct of relations between this industry and the governments with which they interact: (1) the industry is caught between buyer expectations and skyrocketing development and fabrication costs; (2) this industry-wide challenge at the leading edge is driving a continuing search for funding; and (3) the shakeout in the industry at the leading edge is driving competition in the trailing edge and alternate avenues of profitability (e.g., photovoltaic, LEDs, medical devices).

Step 5: Analyze Results

At this point, the all-source intelligence analyst needs to review the information collected and initial industry insights to make connections beyond the business world to produce strategic intelligence insights. The results of this fifth and final step will round out the all-source analysts' perspective and provide inputs for future intelligence products. We focus our newfound perspective on the target region of East Asia and suggest strategic intelligence insights for use in producing the intelligence products listed in Figure 3.6.

East Asia: Semiconductor Industry

While their approaches vary, the national governments in East Asia all set out to foster the establishment and growth of the industry.[82] But this governmental involvement does not guarantee continuing success. Brown and Linden explain:

> For governments, the years of U.S.-Japan rivalry established the reduced scope for government intervention in an established industry. In the 1970s a range of policy tools such as tariffs and subsidies were available to the Japanese government in its efforts to overtake U.S. chip firms, and international trade agreements forced these to be dropped once Japan's industry was established. The direct policy tools of the past have been sidelined by various agreements under the World Trade Organization (WTO), although developing countries like China are still able to provide subsidies to push their infant industry along.[83]

Figure 3.22 summarizes the state of the semiconductor industry in East Asia. A discussion of each country follows the figure.

	Market Strength	Value Chain Focus	Technology Node	Industry Outlook	Government Involvement	Observation
Japan	Memory	Lithography, Fabrication, Packaging, Testing	Leading Edge	Falling Behind	Minimal, Export Controls	Seeking growth through outsourcing and joint ventures in process R&D
Korea	Memory	Design, Fabrication, Packaging, Testing	Leading Edge	Memory	Trying to Expand Domestic Capability Beyond Memory Sector	One Company dominates. Domestic Industry is still developing.
Singapore	Foundry	Fabrication	TBD	TBD	TBD	Acquisition of Chartered by off-shore investors, outcome still TBD.
Taiwan	Memory, Foundry, PV, LED	Design, Fabrication, Packaging, Testing	Leading Edge	Positive Growth	Decreasing, Export Controls	Strategy emerging to keep Taiwan at leading edge and off-shore trailing edge and associated value chain steps to mainland China.
China	Foundry, PV, LED	Design, Fabrication, Packaging, Testing	Constrained By Export Controls	Positive Growth in Trailing Edge	Very Involved, and Governments at National, State, and Local levels have equity stake in domestic firms.	Chinese government interested in developing capability to address new markets such as PV and LED.

Figure 3.22: Summary of East Asia Semiconductor Industry, 2010

Japan

Japan is still a major competitor in the chip industry, but its domestic economic turmoil and its inability to adapt to the changing semiconductor market have affected its standing.[84] Japan's older established chip firms are pursuing consolidation and are outsourcing design and fabrication outside of Japan.[85] Referencing the semiconductor value chain, Japanese semiconductor-equipment manufacturers (machines that fabricate the chips) are competitive and increasing shipments to China and Taiwan.[86] Japan is home to Nikon and Canon, the number two and number three firms of the top lithography companies in the world.[87] Japanese-headquartered companies are the world leaders in the packaging materials segment of the semiconductor industry, with a 2009 combined market share of 65 percent of an estimated $15.8 billion packaging-materials market.[88] Beyond encouraging energy-saving semiconductor applications, the Japanese government is not playing a major role in their mature domestic semiconductor industry.[89]

Korea

Korea's Samsung is the world leader in memory production and flat-panel displays, but the government is concerned about the concentration of its semiconductor industry in the memory market, continuing dependency on the import of integrated circuits for incorporation into consumer electronics, a slow start in creating a fabless sector, and the rise of China's industrial capability.[90] The Korean news media provides a sociocultural insight into perceptions of China's rise, characterizing Korean workers as avoiding the arduous work in semiconductor and LCD production, while their counterparts in China work at one-fifteenth of the annual salary of a Korean worker. That same article describes Korean firms as seeming to be horrified at the full-fledged efforts of high-ranking China officials to establish a predominant position in the semiconductor industry. The Korean semiconductor industry is concentrated in a few very large companies, of which Samsung is clearly the flagship. Korean-headquartered semiconductor packaging materials companies are increasing their overseas versus domestic sales, but in comparison to Japan, they remain a small player.[91] The remainder of Korea's firms on the semiconductor value chain primarily supply the domestic giants of electronics, LG and Samsung.[92] *EE Times* reports that the Korean government's "System IC 2010" project is an effort to jump-start the nation's fabless community, including analog

start-ups, but it is too early to see the results.[93] Samsung recognizes the risk of the company's concentration in memory and is expanding into the foundry arena, already scoring a significant win by producing the processor for Apple's new iPad.[94] Through its "low carbon, green growth" vision, the Korean government is supporting the industrialization of renewable energy sources as a driver for new employment and economic growth.[95]

Singapore

According to the Economic Development Board of Singapore, there are four 12-inch fabs in operation in Singapore by the world's top three wafer-foundry companies.[96] This island nation is also home to headquarters activities of over 125 electronic companies (including the 50 largest). Recently, U.S.-based Applied Materials opened its first facility in Asia for manufacturing its advanced semiconductor-fabrication equipment, citing that over 70 percent of its business is now in Asia.[97] Singapore's Chartered foundry (once 62 percent owned by the Singapore government's investment agency, Temasek Holdings) struggled to compete with Taiwan foundry's Taiwan Semiconductor Manufacturing Company (TSMC) and United Microelectronics Corporation (UMC), and was acquired in 2009 by the Advanced Technology Investment Company (ATIC), a wholly owned subsidiary of the Abu Dhabi government.[98] This acquisition, folded into the ATIC and AMD Global Foundries venture, creates a first-tier foundry competitor.

Taiwan

Taiwan is home to the world's two largest pure-play chip foundries—Taiwan Semiconductor Manufacturing Company (TSMC) and United Microelectronics Corporation (UMC)—and also has the largest number of LED fabs. Figure 3.23 shows that, in terms of integrated-circuit foundry sales, these two firms are positioned well ahead of their peer competitors.

2009 Major IC Foundries

Figure 3.23: TSMC Top among Foundries (© IC Insights, Company Reports)[99]

Given our previous discussion of the modularization of the semiconductor value chain and the rise of East Asia, it is not surprising to see the preponderance of foundries located there. The foundry model promises to shield a semiconductor firm from the intense capital costs of fabrication. It remains to be seen how far the fabless or fab-lite model will continue to progress.

Despite its history as the first chipmaker in Taiwan, UMC is seen as now falling behind the technology curve, succumbing to the continuing demands for capital to stay at the leading edge.[100] TSMC continues to grow, and expansion

plans garner most of the news regarding Taiwan's semiconductor industry. At the front end of the value chain, TSMC's Electronic Design Automation plans and offerings have led some analysts to identify TSMC as a new integrated device manufacturer (IDM).[101] Also at the front end, TSMC announced its collaboration with MAPPER Lithography (a Netherlands firm) to incorporate a maskless lithography technology in its manufacturing processes.[102]

Akira Minamika, a speaker at SEMICON Japan, presented a slide (Figure 3.24) that reinforces the view that TSMC is going to grow beyond the business model of a pure-play foundry. TSMC's announcement that it is going to open an R&D center and wafer fab to develop and produce LEDs clearly establishes an IDM role for TSMC, as least in optoelectronics, despite its assurances that it will remain a pure-play foundry in the IC market sector.[103] This is significant, because a key selling point of a pure-play foundry is that it does not compete with its customers by producing its own line of chips.

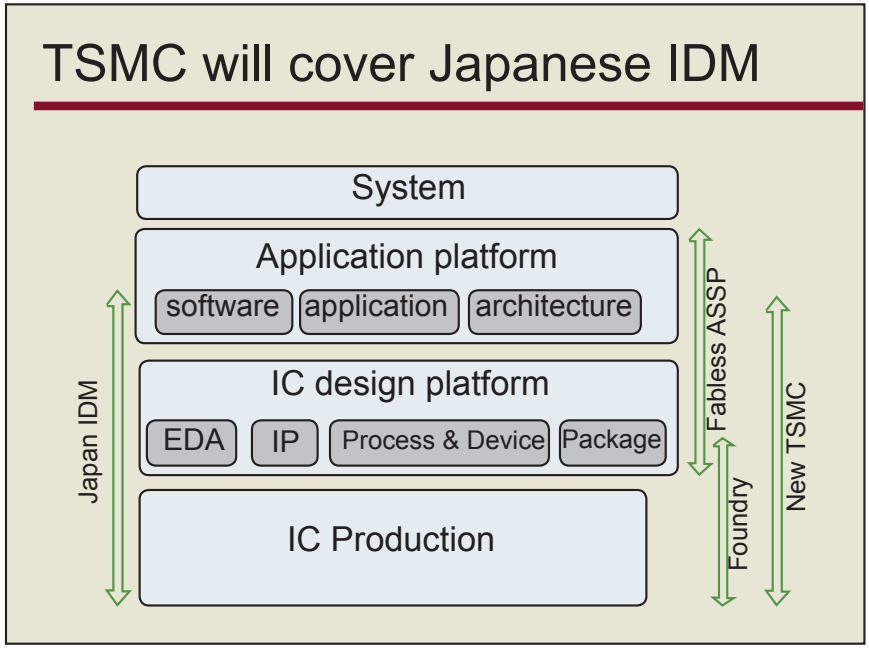

Figure 3.24: TSMC's Expanding Coverage (© IC Insights, Company Reports)[104]

Figure 3.24, provided at an industry tradeshow in Japan, highlights the recognition that TSMC is expanding its coverage of the value chain. This will be an interesting development, since Japanese firms use the foundry capabilities of TSMC and have not viewed TSMC as a competitor.

Although TSMC has a Samsung-like impact in its global stature, Taiwan has a more diverse semiconductor industry, with close ties to domestic and international electronics-manufacturing companies. Reflecting this strength of diversity is a recent legislative resolution that asks the Economics Ministry to discard a restructuring plan for Taiwan's DRAM industry, characterizing it as a waste of resources.[105] However, in the same session, it agreed to cut Taiwan's corporate tax rate from "20 to 17 percent and retain tax breaks targeted at R&D," which will sustain its national competitiveness.[106]

Strategic Intelligence Insight

The most interesting developments from a strategic intelligence perspective are the growing ties between Taiwan's and mainland China's semiconductor industries. In February 2010, Taiwan relaxed restrictions on "high-tech investment in China in another move to help local companies expand their global market shares and competitiveness."[107] The Taiwan Ministry of Economic Affairs will establish a panel to screen proposed investments. Existing regulations still in force prohibit local foundries from setting up 300 mm wafer fabs or foundries capable of processes below 130 nm, but will allow them to invest in or acquire China-based wafer foundries. Taiwan regulations now allow its chip companies to set up a maximum of three wafer fabs in China using processes less advanced than 0.18 micrometers (180 nm). The new rules also apply to low-end IC design and chip set packaging and testing industries, although projects greater than $50 million require screening for approval.[108]

Prior to this announcement, Taiwan's electronic manufacturing firms (the buyers of semiconductor chips) made use of China's labor force and location to build consumer end items. For example, Flextronics International, a Taiwan firm and one of the world's largest electronic manufacturing firms, is expanding its presence in China with a design center and manufacturing facilities in Wuzhong Export Processing Zone. This expansion complements its two existing computing design centers in Shanghai and Wujiang.[109] A government official in Taiwan allowed that the provisions on investments or

acquisitions of Chinese wafer foundries were meant to cover UMC's then-illegal investment in the Chinese foundry firm He Jian in 2006 and TSMC's pending stake in the Chinese foundry SMIC (a result of its successful intellectual property rights dispute with SMIC [Semiconductor Manufacturing International Corporation]).[110] Upon approval, UMC will be able to acquire the remaining 85 percent of He Jian, and TSMC will take a 10 percent stake in SMIC.[111] TSMC's chairman said they have no intent to take any day-to-day role in SMIC, and that they intend to keep their leading-edge fabs in Taiwan in order to take advantage of economies of scale; however, he also said they have submitted a technology-transfer application to produce higher-end circuits on its Shanghai wafer plant (about 200 mm fab).[112]

Smaller companies representing semiconductor value-chain activities are also strengthening ties to mainland firms. Chipbond Technology, a Taiwan firm that provides backend assembly processing for LCD driver ICs (a key component in LCD TVs), is requesting permission from the Taiwan government to increase its current holdings (20 percent) and take a majority share in China-based Chipmore Technology, in order to gain a foothold in China and its growing consumer market.[113] Taiwan's automotive industry, a consumer of ICs, is actively working to establish cross-strait agreements with China's automotive industry. Examples of IC applications include low-cost night vision systems, 360-degree viewing systems, and rain sensors.[114] A final, more conventional indicator of the increasing economic links between the two industries is illustrated by Taiwan's export statistics for May 2010: "[E]lectronics had the largest export value of $6.627B, rising by 47% on year and China (including Hong Kong) represents 43.8% of Taiwan's total export value."[115]

China

China's rise as an economic power is clear, but a subject of continuing debate is China's "openness" to reforms in governance and economics as it continues to develop. A single industry analysis can provide a degree of insight by the nature of its method of inquiry. Using our example of the semiconductor industry, here is the checklist of reasons why strategic insights on China are discoverable:

- The semiconductor industry is a priority for China.
- The technology and manufacturing leadership is centered in companies headquartered outside of China.

- The semiconductor industry has a history of openness in technology roadmaps and achievements.
- Semiconductor companies will not share their intellectual property or relocate manufacturing without openness in how their intellectual property is protected.

These points will be addressed as our analysis of results continues.

Figure 3.25 provides a map of the distribution and types of wafer fabs and foundries in China at the end of 2009.

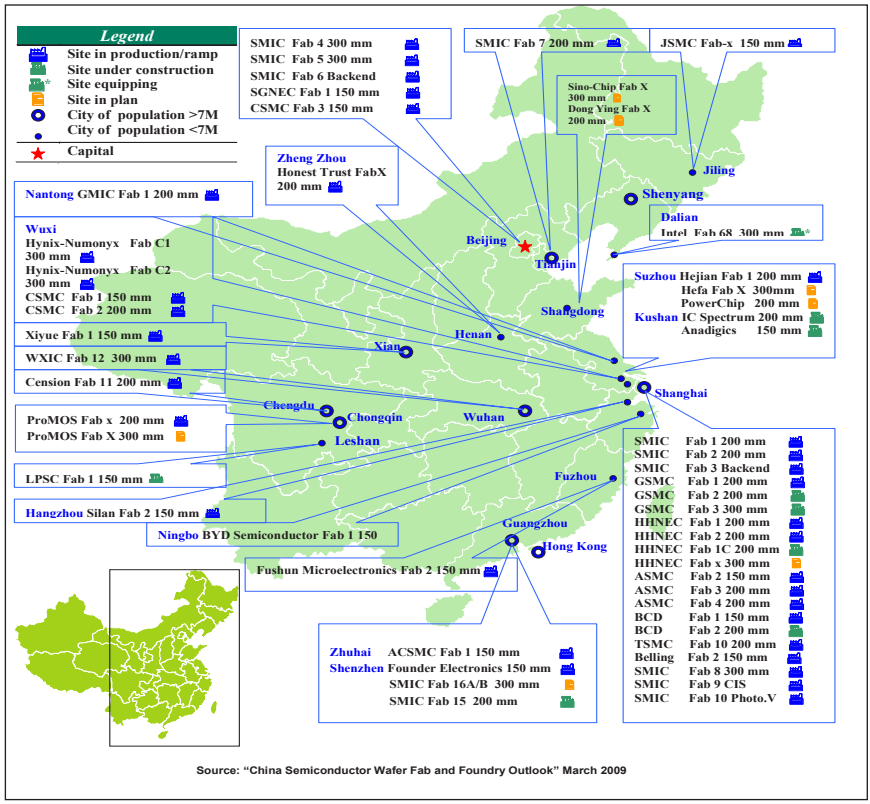

Figure 3.25: China Semiconductor Wafer Fab and Foundry Outlook (© SEMI)[116]

Studying the distribution and wafer-handling size of the semiconductor plants in China reveals several things. First, the majority of their capability cannot process 300 mm wafers, the current state of the art in the industry. Second, the majority of their manufacturing capability is clustered along the coastal areas. One factor driving this is the requirement to have a reliable infrastructure in place to support a semiconductor fab. This infrastructure must include reliable power, water, roads, and suppliers to support the 24/7 demands of a semiconductor fab.

China's government has a great interest in developing indigenous semiconductor fabrication capabilities. SEMI analysis of China includes the following excerpts:

> Since China surpassed Japan and the US in 2007 to become the world's largest consumer of ICs, China policy makers have increasingly voiced concerns about the 'chip gap' between supply and demand. In 2008, China consumed approximately one-quarter of the world's ICs, yet manufactured only $5.6 billion in chips, enough to support only 8% of their domestic requirements. By 2011, the China IC market will grow to $85 billion with domestic production expected to reach $8.2 billion, about 10% (iSupply, IC Insights, CSIA). By 2013, China's share of the global chip market will reach 35%. In the past, in markets such as computers, mobile phones, and automobiles, such an imbalance between supply and demand has prompted increased investments in local production capacity. … [T]he Chinese government also remains the biggest investor in the semiconductor industry in China. In the past five years, the China government influenced the investment of about $7 billion in new fabs. In the next five years, local government will likely continue to be the significant co-investor in strategic IC Fab projects throughout the country. Going forward, the central government may also invest up to $30 billion on semiconductor (semiconductor equipment and material are included), also software and high-end chip hardware industry by 2020.[117]

The profitability of China's leading-edge foundry, SMIC, provides insights into the government's progress. In 2000, the governments of Beijing, Shanghai, Wuhan, Chengdu, and Guangzhou put forward the resources to support SMIC.[118] After 10 years of investment, as Figure 3.26 illustrates, SMIC, China's bid to create a leading-edge foundry, has yet to turn a profit.[119]

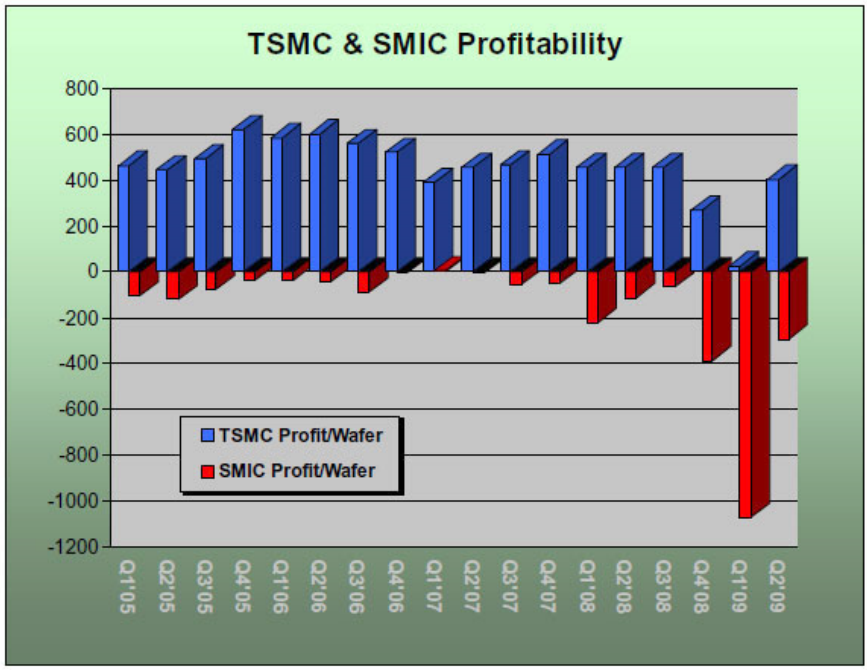

Figure 3.26: Profitability of Taiwan and Mainland China's Leading-Edge Foundries (© VLSIresearch. In "China Leads World Out of Recession, Through Recovery." January 14, 2010, *Semiconductor International*.)[120]

Figure 3.26 shows that, on a profit-per-wafer basis, Taiwan's TSMC has clearly outperformed China's SMIC. In addition to infrastructure requirements, a semiconductor fab has equally demanding process requirements. A high degree of process maturity is required in order to achieve success (both in terms of quality of product and turning a profit) in operating a semiconductor fab. SMIC's profit performance and TSMC's out-of-court settlement with SMIC (due to SMIC's theft of intellectual property belonging to TSMC) led to a turnover in SMIC leadership.[121] All of this indicates

that China's semiconductor industry has not attained the required process maturity required for leading-edge IC fabrication.

Recognizing that the bulk of the semiconductor market is in the trailing edge, taking advantage of the economic downturn, and the migration of the industry to 300 mm equipment, the trade press believes that China will invest billions over the next several years into repurposing and refurbishing 200 mm and 300 mm fabs, and utilizing primarily used and refurbished equipment.[122] Referencing some of the earlier figures showing the relative rankings of semiconductor firms, it is clear that the largest companies still reside outside of China. Also, the research and development expenditures of these industry leaders are much greater than China has been willing or able to invest.

China's intellectual-property laws and their enforcement are still a work in progress. One company characterizes patent enforcement in China as "slightly improved from terrible to bad," and said that China now concentrates enforcement on discovering export items to Europe, Japan, and the United States that illegally use China's intellectual property, recognizing that enforcement within China is not possible.[123] One rationale for TSMC's out-of-court settlement with SMIC is that it did not want to bankrupt SMIC and risk TSMC's intellectual property being acquired or lost entirely.[124] Now, TSMC, with its minority share, can closely monitor SMIC's use of TSMC's technology. The IBM Corporation is very adept at handling intellectual-property licensure for semiconductor processes, only raising eyebrows in the industry by offering technology that may allow Chinese firms to "catch up."[125]

Freescale, a U.S. semiconductor design firm, has five IC design centers in China, and describes its Chengdu center as "the front lines in the development and customization in the networking-chip arena."[126] One approach to protecting intellectual property would appear to be in jointly developing technology with China. Intel Capital, the Intel Corporation's global investment arm, and China Investment Corporation (CIC) announced that they are going to pair CIC's resources with Intel Capital's technology expertise to make strategic investments in pioneering for companies engaged in the next generation of groundbreaking technologies.[127] Although the agreement states that the investments will be outside of China, this is an interesting development to watch in order to understand the extent of the globalization of intellectual property.

As related earlier, many of the largest firms in the industry locate only less important processing or fabrication steps in China, sometimes due to export control laws, but also due to concerns about intellectual-property infringement. For example, Intel continues to run its leading-edge fabs outside of China in order to protect its microprocessor and process technology. Applied Materials operations in China has taken measures to prevent intellectual-property theft, such as "sealing its computers' ports in Xian, to prevent easy use of flash drives"; controlling removal of computers by employees; and maintaining computer passwords and door codes to control technology access.[128] Applied Materials continues to conduct its research and development in laboratories in the United States and Europe, but put its first Asian equipment-manufacturing operation in Singapore, where protection of intellectual property is more developed. Despite the risks of intellectual-property theft, the rising purchasing power of China's population, and governmental trade and tax policies, the semiconductor industry is placing more capability in China.

The example of Applied Materials and the establishment of a laboratory for assembly-line design in Xian illustrate the financial incentives for establishing operations in China. According to an article in the *International Herald Tribune*, first the Xian city government sold a 75-year land lease to Applied Materials at a deep discount, and then it reimbursed the company for about a quarter of the complex's operating costs for five years.[129] Thomas J. Friedman, an op-ed columnist with *The New York Times*, interviewed Paul Otellini, the CEO of Intel, comparing the incentives in the United States with those in China:

> "The things that are not conducive to investments here are [corporate] taxes and capital equipment credits," he said. "A new semiconductor factory at world scale built from scratch is about $4.5 billion—in the United States. If I build that factory in almost any other country in the world, where they have significant incentive programs, I could save $1 billion," because of all the tax breaks these governments throw in. Not surprisingly, the last factory Intel built from scratch was in China. "That comes online in October [2010]," he said. "And it wasn't because the labor costs are lower. Yeah, the construction costs were a little bit lower, but the cost of operating when you look at it after tax was substantially lower and you have local market access."[130]

Incentives to relocate to China are available to many countries, but they are not always financial incentives. An article in *Business Week* stated that Yukio Sakamoto, the president of Elpida Memory Inc., Japan's sole maker of computer-memory chips, announced plans to build factories in Taiwan and China to meet demand and reduce tax payments. Reading further in the article, it is clear Elpida is also relocating to avoid Chinese import tariffs.[131] In the same article, Intel (United States) and Hynix (Korea) set up factories in China "to avoid a 17 percent value-added tax that applies to chips imported into China and used in electronics sold domestically."

Despite China's outwardly successful mix of incentives and tax policies, the original equipment manufacturers (OEMs), assemblers of final end items for consumption, are still very cost conscious and will move to lower-cost areas of the world if it is more profitable. China's rising labor costs, increases in energy prices, quality problems, intellectual-property theft, and a global modular value chain keep other regions of the world as viable alternatives.[132]

When the economic downturn occurred in 2009, many Chinese workers left the coastal area and returned home to inland areas. Now, with the economic recovery and China's stimulus spending, many of these workers find work at home and are not migrating back to the coastal areas—inflating wages in the coastal areas, where electronics manufacturing is centered.[133]

On the environmental-regulatory front, China is planning to implement REACH (Register, Evaluation, and Authorization of Chemicals) regulations similar to the European Union's REACH. The REACH regulations require companies to declare the types and uses of chemicals in production and also include chemicals released during the end products' normal use.[134] The effects and enforcement of these regulations on the semiconductor industry remain to be seen.

China is aggressively pursuing all the new avenues of profitability. As shown earlier, China has a large number of LED fabs in operation. In photovoltaic (PV) production, already noted is Applied Materials' opening of the world's largest solar research center in China. Domestically, China's government is working with their PV Industry Association to assist in setting up a photovoltaic industry alliance for research and standards setting. It might be a strategic insight to say that, in order for China to incorporate the PV industry into its

energy economy, it will need to set standards for PV components and grid connections, improve those grid connections, and resolve the economics of getting PV-generated power (requiring large open areas) to distant population areas.[135] Figure 3.27 illustrates the PV cluster areas in China.

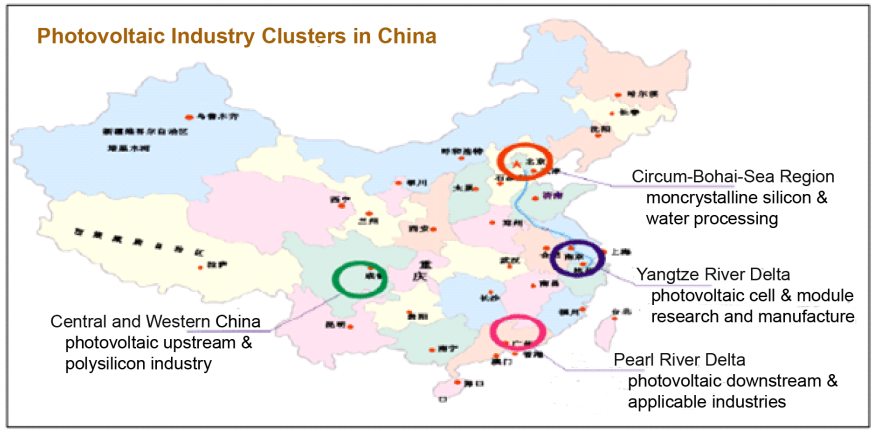

Figure 3.27: China's Photovoltaic Industry (© ResearchinChina)[136]

While Figure 3.27 provides the location of industry clusters for mainland China PV manufacturers, more important is the previous citation that describes the Chinese government's hosting of meetings to set standards and share information among the domestic PV companies.

Medical-device applications provide a sociocultural view into China and why the semiconductor industry is looking at China as a large potential market. An article in *EE Times China* states:

> The portable/home electro-medical device market is enjoying a fast and stable expansion in China due to the government's medical reform, citizens' concern in healthcare, and the unique features the devices are offering.
>
> The CAGR of portable electro-medical device market is expected to go up significantly, with market survey showing rapid expansion from 8 billion yuan ($1.17 billion) in 2006 to 28 billion yuan ($4.1 billion) in 2011. "The market is proven to have a powerful anti-risk capability because the whole

> market is oriented toward China's internal demand and is basically insusceptible to the global financial crises. In China, the market is only in the initial startup phase, so the market demand is huge. In addition, the Chinese have an increasingly high consciousness of health," Zhou Wensheng, senior sales manager of ADI's medical division in Asia-Pacific, said.
>
> Like ADI, the worldwide semiconductor manufacturers cast more eyes on the portable/home electro-medical device market of China. Looking forward to the future, everyone will have multiple portable medical devices rather than just one, making it a more exciting market than the cell phones. After losing the country's huge mobile phone market, numerous Europe and U.S. companies are expected to try their best to get a share of the portable/home electro-medical device market of China. "China and the world have a huge demand for the portable electro-medical devices, and China will enter the list of the largest electro-medical device manufacturers and largest markets," Fan Xujin, chief product marketing engineer of Microchip's medical product division, said.[137]

Summary

While Japan was the leading challenger to the U.S. lead in the semiconductor industry in the 1980s, Japan's domestic economic challenges have slowed the growth of its semiconductor industry. Important is the decline of Japanese firms in manufacturing lithography equipment (the basis for the key value-chain activity, mask creation). Japanese companies Nikon and Canon were the leaders in the lithography-equipment market, but they are now overshadowed by the market leader ASML, headquartered in the Netherlands. If business conditions do not change, ASML will have a virtual monopoly on leading-edge lithography equipment.

The Korean firm Samsung is the world's leader in semiconductor memory, but its enormous size has not translated into development of a broader semiconductor industry in Korea.

Singapore is the leader in hosting the regional headquarters functions of almost all the major semiconductor companies in the world. But Singapore's

divestment of Chartered Semiconductor to outside investors leaves open the question of its future industrial capability.

Taiwan is a success story in joint government and private industry development of an industrial base capability. Taiwan's semiconductor industry is conscious of the challenges of staying at the leading edge and is pursuing cost savings by off-shoring trailing-edge and associated value-chain steps to lower-cost areas, such as mainland China.

Mainland China has a strategy to develop an indigenous capability to supply the chips that they currently must import for both domestic and export industries. Various levels of government in China provide incentives and equity backing to domestic semiconductor firms. After a decade of investing to establish a leading-edge foundry in China, the government is now content to buy up trailing-edge semiconductor fabrication equipment and relocate it to China. In the PV- and LED-fabrication sectors, where there are no leading-edge export controls, China is rapidly building up value-chain elements tailored to these market sectors. Analyzing the semiconductor industry and East Asia provides some strategic insights.

Despite China's juggernaut appearance in technology advancement, the leading edge of semiconductors represents a difficult level to attain and, as a result, China is slowing its indigenous leading-edge development. China's internal market potential, incentives, and tax policies are attracting the placement of semiconductor operations in China, but concerns about intellectual property are still valid. As the foremost consideration, if higher profits can be earned in manufacturing outside of China, then manufacturers will relocate elsewhere, despite China's policies. A sign of China's rising consumer population is forecasted to increase demand for cell phones, LCD TVs, and medical devices within China.

A strategic insight that rises up to the level of strategic intelligence insights is the growing economic ties between mainland China and Taiwan. Taiwan industries are leveraging Chinese industry in pursuit of competitive advantage. China is gaining advanced technology and building its industries through ties to Taiwan and other nations. This insight will be developed and discussed further in the next chapter's concluding discussion and evaluation of the value of industry analysis to the Intelligence Community.

Chapter Four

Conclusion

An all-source intelligence analyst can use the analysis tools of business strategists and competitive intelligence professionals in analyzing an industry in another country or region of the world. By using these tools, an analyst is able to develop strategic intelligence insights about a nation's plans and intentions. The main conclusions to be drawn are as follows: (1) industry analysis is easy to grasp and only a little harder to apply; (2) the results of industry analysis provide a useful lens for intelligence-collection analysis and synthesis; and (3) globalization has become a defining force in the world, and merits more attention from the Intelligence Community.

Applying Industry Analysis

The application of industry analysis is, first and foremost, not a major break with the conduct of all-source analysis. Industry analysis will provide a lens (or frame of reference) that complements the existing repertoire of analysis tools within the Intelligence Community. At a minimum, it offers a better alternative than performing a keyword search on open-source business and industry information.

Follow the Steps

The steps for conducting industry analysis are straightforward and meant to be easily internalized. The first steps of selecting and defining the industry for analysis will be the most difficult. For one thing, selecting an industry that will yield strategic insights automatically excludes countries that, while of interest to the Intelligence Community, do not have a developing industry sector or choose not to participate in the global economy. Second, defining an industry is time-consuming, but its practice (and, concurrently, the exposure to economics and industry structure) will serve the analyst in defining other industries in the future. Using the models described earlier will facilitate a focused review and selection of sources.

The collection and analysis steps are the most straightforward for the all-source analyst. At that point, the analyst will understand the nuances of the

industry information before him or her and have a framework for collection and analysis. The major difference in these steps, between the business analyst and the all-source analyst, is the strategic perspective the all-source analyst brings to the task. In addition, the all-source analyst can synthesize the findings with other Intelligence Community inputs to improve strategic understanding.

Utility of Industry Analysis

In the last chapter, the major strategic-intelligence insight points to the growing economic ties between mainland China and Taiwan. Analysis of the semiconductor industry provides this insight, but also lays the foundation for future analysis of other industries, such as the automotive industry, to see if they are also fostering cross-strait ties.

Another topic for further exploration is mainland China's progress in rebuilding its power-generation infrastructure to handle alternative "green" power generation and applications. The photovoltaic and light-emitting diode industries (subsets of the semiconductor industry) provide a window into a challenge that the United States also faces. It is now clear that mainland China has an interest in developing its indigenous semiconductor industry and is willing to deal with Taiwan in pursuit of that goal. This strategic insight lasers through the unpredictability of nationalism or geopolitical flare-ups.

Utilizing the addition of a new lens for intelligence analysis is achievable at the level of the all-source analyst by examining current national intelligence estimates to see how our strategic insight above "fits" with the prevailing view within the Intelligence Community. The classification of national intelligence estimates leaves this action outside of this book. Ian Bremmer, however, in his book *The End of the Free Market*, offers an interesting strategic assessment independent of our industry analysis in the context of discussing the challenges posed by state-sponsored capitalism:

> Beijing's primary military concern is the risk of a direct or proxy conflict with the United States over Taiwan. But the Chinese leadership is well aware that no U.S. government will support a Taiwanese bid for independence, and why should the Chinese launch a self-defeating invasion of the

> island when it can co-opt most of Taiwan's business elite with privileged access to investment opportunities on the mainland? So far, globalization has been good to China's Communist Party, and wars are bad for business.[138]

It is important to point out that the inclusion of industry analysis is meant to enhance the national-intelligence estimate, not drive startling new conclusions. What is suggested here is that too great a focus on political and military dimensions by the Intelligence Community leads to discounting the influence of economics in international politics.[139] The strategic-intelligence insights we seek come from examining the "contours" of industry interactions with foreign governments, and any contributions to a national-intelligence estimate resulting from these strategic-intelligence insights will be in the "contours" of the estimate. As a result, the final utility or value-added assessment of industry analysis remains within the analysis community.

Increased Attention by the Intelligence Community to Globalization

In the introductory chapter, the background question of the role of the Intelligence Community in assessing the effects of globalization came with a brief historical perspective. A couple of the points from this perspective are worth highlighting. First, the Intelligence Community at one time believed that the way a nation (the Soviet Union) acted in the economic sphere was likely to reveal its intentions. Second, policymakers' interest in the community's industry analysis was motivated by perceptions of the United States potentially being outperformed economically and militarily by the Soviet Union.

The Soviet Union is consigned to the history books, and there is no concern about a renaissance of centralized command economies among the world's nations. But there is a relatively new competitor to the U.S. free-market system, which is a "state-sponsored capitalism" that may spark an interest in reviving industry analysis within the Intelligence Community. State-sponsored capitalism "is a system in which the state dominates markets primarily for political gain."[140] The recent acquisition of Chartered Semiconductor in Singapore highlighted earlier is an example of state-sponsored capitalism at work. The Singapore government's holding company was a major shareholder in Chartered and approved its sale to a joint venture by a holding company of the Abu Dhabi government and the publicly traded semiconductor firm

AMD.[141] This exchange was in part a nation-to-nation business transaction that, in the case of Abu Dhabi, solely benefits the ruling family.

Ian Bremmer notes that state-sponsored capitalism is not protectionism for developing national competitiveness; it is the state "using markets to create wealth that can be directed as political officials see fit."[142] Put another way, the major difference in state-sponsored capitalism vis-à-vis free-market capitalism is that the overriding objective of state-sponsored capitalism is maintaining the party in power, not the prosperity of its people.[143]

The potential for the United States being outperformed economically and militarily is open for debate, but it should not be the threshold for reawakening industry analysis within the Intelligence Community. The global interdependencies between nations are a fact and, in the case of U.S.-China relations, have even earned the catchphrase "mutually assured economic destruction." This play on the Cold War term "'mutually assured destruction' is not to suggest that a new cold war is upon us, but that the battle for the free market is a battle for national competitiveness that must avoid catastrophic outcomes."[144] Even though the current priorities of the Intelligence Community reflect its customers' requirements, there is a need for the community to step up and enhance its intelligence offerings with insights into globalization and its potential effects on national security.

Appendix B

Semiconductor Industry Tutorial

The purpose of this appendix is to provide a brief tutorial on semiconductors, the key activities involved in their development, and the size and composition of their market. Chapter 2 introduces three models to use in industry analysis, and Chapter 3 describes a methodology for selecting an industry for analysis, which, for the purposes of this book, is the semiconductor industry. The next step is to define the selected industry, which in this case requires developing a broad understanding of the semiconductor industry. This understanding will first be put to use in developing a value chain for the industry. The development of a value chain is an iterative process; it reflects and reinforces your understanding of the industry. It is quite possible that a value chain is already available from open sources. If so, it can be used as a guide for sorting out the key activities and processes involved in producing semiconductors. Following the industry definition step, the value chain will be put to further use during the collection and analysis of information on the semiconductor industry.

Since the technology behind semiconductors is over 60 years old, there is a wealth of open-source information on the semiconductor industry, both in print and on the Internet. What will become readily apparent is how far that technology has progressed, especially in process development and applications. There are useful glossaries of industry-related terms available on the Internet. This appendix will cite several for definitions so the analyst has a choice of sources in case a website becomes unavailable.[146] To understand an industry, a basic understanding of its products and markets is necessary. For the semiconductor industry, product knowledge equates to a basic understanding of semiconductors and their development into integrated circuits. Research into the size and composition of the semiconductor market brings into focus the globalization of the industry and its importance to developed and developing nations of the world.

Gain knowledge of semiconductors and their development into integrated circuits.

Devices made from semiconductor materials are the foundation of the computer and communications industries. Also familiar are the multitude of

consumer-oriented electronic devices (such as cell phones) in use in almost every corner of the earth. Semiconductors are also increasingly used in the automotive and medical-devices industries, and form the basis for promising devices for saving or generating energy.[147] One surprising fact is that, although it was the U.S. federal government's funding of basic research and government demand for electronics that fueled the early growth of this industry, today the government constitutes less than 1 percent of the semiconductor market.[148]

The first question to answer is: what are semiconductors? A semiconductor is a material that has the properties of a conductor and an insulator. The exact properties are determined during the production of the silicon crystal and the processing of the wafer that provides the platform for the integrated circuit. The fabrication process described here is referred to as CMOS (complementary metal-oxide semiconductor) and is the industry's main manufacturing platform.[149] Figure B.1 illustrates the process for creating the silicon crystal.

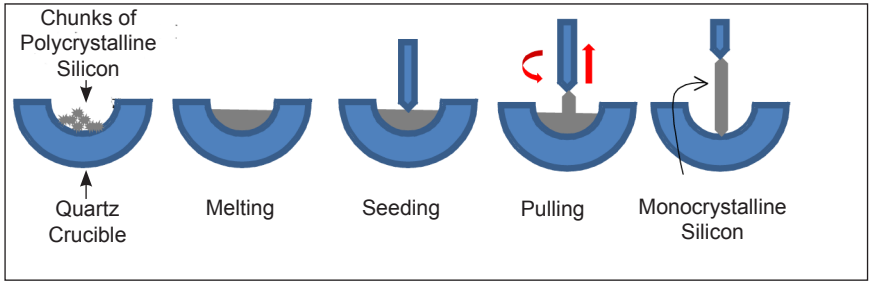

Figure B.1: Crystal Growth[150]

There are several methods for creating the silicon crystal for wafers. The process in Figure B.1 is common and the one most likely to be found in diagrams, pictures, or video on the semiconductor process. The rough silicon material is noteworthy because, while it is a common material, there can be temporary shortages of supply due to the cyclical nature of the semiconductor market. The raw material is melted in a furnace.[151] The next step, called *seeding*, involves lowering a single silicon crystal into the molten material. The molten silicon immediately affixes itself to the seed, forming a single crystal, and while the seed is slowly withdrawn, its simultaneous rotation produces

the resulting cylindrical shape. The cylinder of pure silicon is often referred to as a boule.[152] The process is controlled to produce the desired diameter of the finished wafer. A wafer is defined as "a thin slice with parallel faces cut from a semiconductor crystal."[153] Wafers are produced in a wide variety of sizes and characteristics. The state of the practice now produces up to 300 mm (about 12 inches in diameter) wafers.

To create the wafers, the boule is removed from the furnace and the two ends are sawed off. Figure B.2 shows the entire boule cut into the thin slices referred to as the wafers. Following this, the wafers are run through a lapping process to remove surface irregularities and produce a uniform flat surface. Lapping involves placing the wafer on a revolving surface with a constant stream of a fine abrasive material, and then another surface revolving in the opposite direction placed above. The sandwiching of the wafer between the counter-rotating surfaces and the wet abrasive gradually removes irregularities. The etching step is a chemical process to remove any crystal damage from lapping. Polishing, the final step, smooths the uneven surface left by the lapping and etching and makes the wafer flat and smooth.

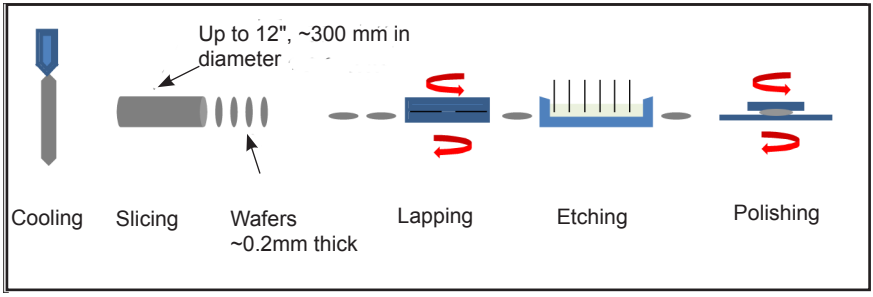

Figure B.2: Wafer Processing

Integrated Circuits

A wafer is composed of a semiconductor material and is the platform for the process that creates integrated circuits, which are then packaged into chips. An integrated circuit, or IC, is created on a wafer, usually made of silicon, and can hold anywhere from hundreds to hundreds of millions of electronic components, such as transistors, resistors, and capacitors.[154]

Transistor Density

The familiar phrase "Moore's Law" is frequently referred to in articles regarding the semiconductor industry. In reality, Moore's Law is not a law at all; it is an observation made by Gordon Moore in the 1960s and later revised in the 1970s. His observation, remarkably prescient, is that the transistor densities on integrated circuits will double every two years.[155] Transistor density is important because more transistors equates to more functions in a smaller space, lower power requirements, and, with economies of scale, lower cost. Figure B.3 provides an example of increasing capability and decreasing price for semiconductor memory.

Reduced Memory Cost Drives New Architecture and Applications

	1979	1984	2001	2005	2007
	SONY WALKMAN	**SONY DISCMAN**	**IPOD ORIGINAL**	**IPOD NANO**	**IPOD TOUCH**
Storage Technology	Cassette Tape	CD	Hard Drive	Flash	Flash
Storage Size	60 MB (20 songs)	700 MB (26 songs)	5 GB (1,000 songs)	4 GB (800 songs)	16 GB (3,200 songs)
Cost	$200	$299	$400	$249	$399
Device Cost per Song	$10	$11.50	$0.40	$0.31	$0.13

Figure B.3: Memory Example (© Mentor Graphics)[156]

All of these are what the industry and its customers have come to expect. Figure B.4 illustrates how Moore's Law is still a driving force in the semiconductor industry:

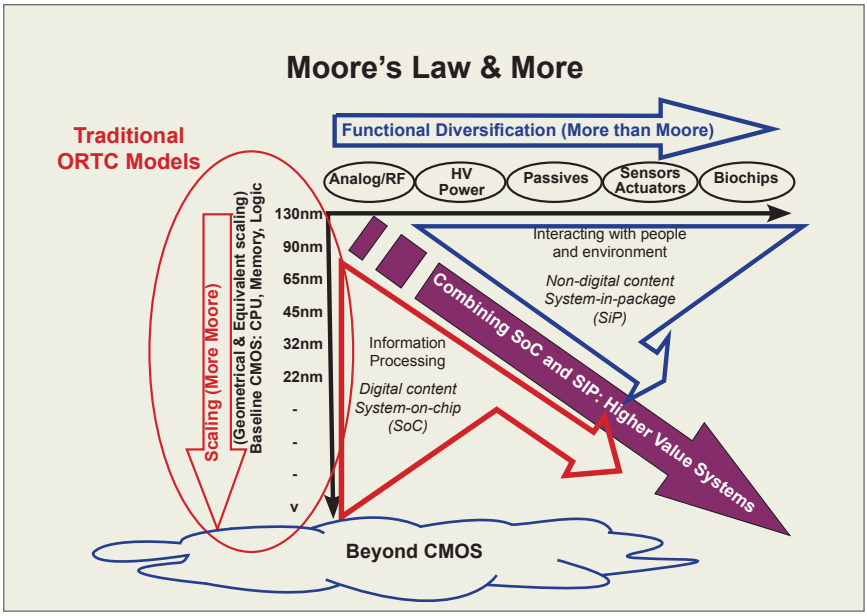

Figure B.4: Beyond Moore's Law (© Semiconductor Industry Association)[157]

Note that the y-axis scale shows decreasing numbers, with "nm"—nanometers, or a billionth of a meter—appended to each. The numbers refer to the width of the smallest feature—"feature size"—on an integrated circuit.

Feature Size

Almost all trade journal issues bring up the topic of feature size, typically by using the shorthand of providing the scale of the integrated circuits in nanometers. Figure B.5 provides a pictorial representation of the comparative size of objects on a nanometer scale.

How many nanometers is ...	Approximately
The width of a hair	100,000 nanometers
The width of a red blood cell	10,000 nanometers
The length of a typical bacterium	1,000 nanometers
The width of a dust particle	800 nanometers
The wavelength of red light	650 nanometers
The wavelength of ultraviolet light	300 nanometers
The length of a typical virus	100 nanometers
The size of a membrane enzyme	10 nanometers
The width of a carbon atom	1 nanometer
The distance between carbon atoms	0.15 nanometers

Figure B.5: Size Comparison (© Northwestern University Nanoscale Science and Engineering Center); Images in Nanoscale (© Dennis Kunkel Microscopy, Inc.); Table by Waldron and Batt (© McNeil-Lehrer Productions)[158]

Referring to Figure B.5, feature sizes below 25 nm are now going into production. This means the size of an individual circuit path on a chip is smaller than the length of a virus and a little larger than a strand of DNA. A topic of much discussion is: what comes after the limits of scaling are reached?

Chip Design

The process for creating chips starts with the design. The software used in designing chips is an entire industry unto itself. It is called the electronic design automation (EDA) industry, and this industry develops and sustains integrated circuit design tools. EDA Consortium, the electronic design automation industry trade association, also has a web-accessible video that quickly describes the entire semiconductor design and fabrication process.[159] The design for

an integrated circuit is captured on digital files that are used throughout the manufacturing process.[160] These digital files are representative of the information exchange that characterizes a modularized value chain.

Chip Fabrication

Figure B.6 provides a simplified view of this process. The design information is first used to create a mask. In simple terms, the mask is a clear piece of quartz, referred to as a reticle, which is etched with one level of the integrated circuits' design. Today's integrated circuits may have many layers, so there would be a reticle for each layer. Using lithography, a process similar to processing photographs, the wafer is coated in a material referred to as "photoresist"; then a light is projected through the reticle, and that layer of the design is transferred via exposure to the wafer. A key step in process planning is maximizing the number of copies of the design layer that can be placed on the wafer. Each of those copies on the wafer is referred to as a "die." Per the design files, the wafer is then sent off to additional processing; one step removes the exposed photoresist, leaving the design of the integrated circuit behind. The wafer is then recoated with photoresist and is exposed using the reticle containing the next level of the design.

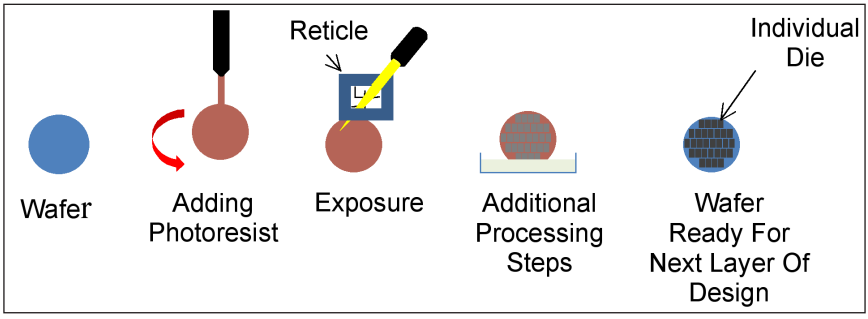

Figure B.6: Fabrication Steps

Referring to Figure B.6, the bare wafer on the left is ready to start the fabrication process. The wafer is coated with photoresist and then moved to the lithography station, where it is exposed to light. The reticle (also referred to as the mask) is a thin piece of quartz that is etched with one level of the integrated circuits' design. The mask holds a layer of the design and, when the wafer coated with photoresist is exposed to a light source, the areas of the

wafer not obscured by the design pattern on the mask are exposed. This wafer is then put through a series of chemical baths that strip away the exposed photoresist on the wafer, leaving the layer of the design untouched. The wafer is then re-covered with photoresist and run through the lithography station, and then put through a series of chemical baths to strip away the photoresist and leave the second layer of the design on the wafer.

To process the wafer with multiple mask sets (one mask for each layer on the individual chip) takes weeks. Since the processing steps for a typical forty-layer chip design take so long, and it is cost-prohibitive to build an additional line, semiconductor companies pursue other options, such as increasing the number of chips they produce on each pass through the process.

One approach for increasing the number of chips produced is to increase the wafer size. The industry standard is currently a 300 mm wafer (roughly 12 inches in diameter). The industry movement from 200 mm to 300 mm wafers provided an increase of 125 percent in surface area on which to produce integrated circuits (dies). For example, this transition means that for a die size of 161.3 square millimeters (approximately ¼ square inches), the fabrication line is processing 376 dies per wafer on a 300 mm wafer versus 148 dies on a 200 mm wafer.[161]

The industries' nine-year transition from 200 mm to 300 mm and the cost of developing an entirely new process line are not lost on the equipment manufacturers. While 300 mm wafer processing continues to deliver productivity improvements, that transition did not translate into higher profit margins for the semiconductor-equipment industry. The industry is currently debating a move to a 450 mm wafer (a 125 percent increase over 300 mm), but only a few of the industry leaders are showing interest, and there is no agreed-to business model that shows funding for the transition and also provides a reasonable return on investment for the semiconductor-equipment manufacturers.[162]

Chip Packaging

Figure B.7 shows the continuation of the fabrication process once all of the integrated circuit design is on the wafer. When all of the design is processed into the wafer, each die on the wafer is tested, and any defective dies are marked. The individual dies are then cut from the wafer and undergo further testing.

The usable dies are attached to frames and, after wire bonding and encapsulation, they are chips ready for placement in their intended application.

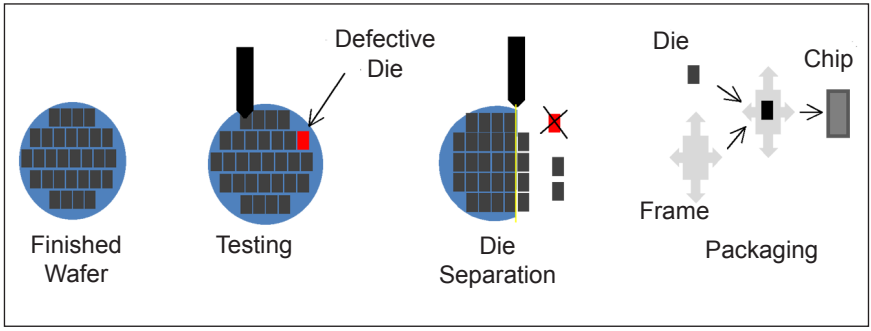

Figure B.7: Die Testing and Packaging

The semiconductor industry is technology driven and requires a continuing investment in research and development to produce the advances observed by Moore's Law. Equipment to produce a leading-edge computer chip costs hundreds of millions of dollars.[163] A basic understanding of the fabrication of semiconductors is possible in a short amount of time. The fact that global industry is trying to figure out how to reduce feature size so it can deliver increased performance in ever-smaller packages is readily apparent without requiring a technical degree or know-how.

Understand the size and composition of the semiconductor market.

Industry trade associations, industry trade press, international trade organizations, market research firms, and government documents are just a few of the available sources for market information. For the semiconductor industry, the World Semiconductor Trade Statistics, a nonprofit corporation, compiles industry trade statistics and provides market forecasts.[164] The data is provided by the member semiconductor companies and is considered to be a reliable source of information. The top-level forecasts are provided free via their website. For 2008, the world semiconductor market was $248.6 billion, and Figure B.8 shows the major market segments and their relative percentage of the total market.

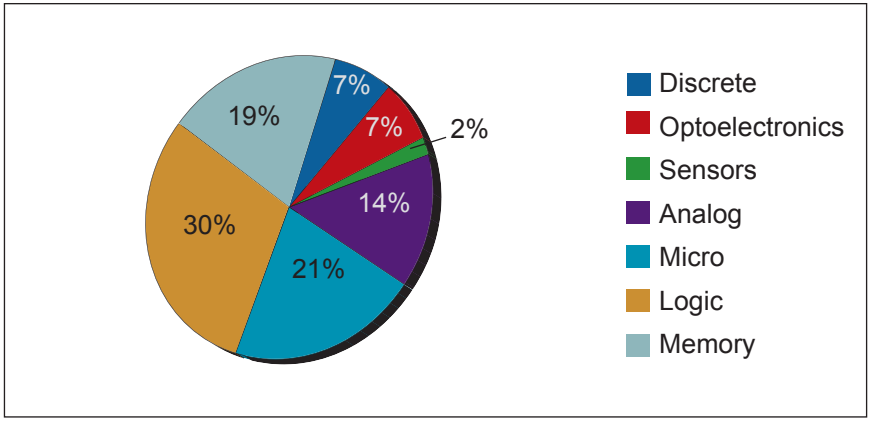

Figure B.8: Total World Semiconductor Market, 2008—$248.6 Billion[165]

A look at the composition of the semiconductor market segments reveals that logic, memory, and micro devices are the largest segments. The IC Insights glossary cited earlier and the Semiconductor Glossary provide the following definitions for the semiconductor market segments shown in the figure:[166]

- **Discrete**—A class of electronic components that includes power transistors and rectifiers, each of which contains one active element. In contrast, ICs typically contain hundreds, thousands, or millions of active elements in a single die.
- **Optoelectronics**—A device that is responsive to or that emits or modifies light waves; for example, LEDs, optical couplers, laser diodes, and photo detectors.
- **Sensors**—A component that provides an electrical signal in response to a specific physical or chemical stimulus, such as heat, pressure, magnetic field, or a particular chemical vapor.
- **Analog**—Integrated circuit realizing analog functions; in analog systems, output signal follows continuously input signal.
- **Micro**—Integrated circuits that are microcomputer related. This category contains three subcategories, that is, microprocessor (MPU), microcontroller (MCU), and digital signal processor (DSP).

- **Microprocessor**—(1) A central processing unit (CPU) fabricated on one or more chips, containing the basic arithmetic, logic, and control elements of a computer that are required for processing data; or (2) an IC that accepts coded instruction, executes the instructions received, and delivers signals that describe its internal status. The instructions may be entered or stored internally.
- **Microcontroller**—A single-chip microcomputer with onboard program ROM and I/O that can be programmed for various control functions.
- **Digital Signal Processor**—Digital circuits used to enhance, analyze, filter, modulate, or otherwise manipulate standard real-world (i.e., analog) functions, such as images, sounds, radar pulses, and other such signals in real-time.

- **Logic**—Integrated circuit performing switching functions; implements logic functions, such as AND, OR, and NOT. Also includes Application Specific Integrated Circuits and Field Programmable Gate Arrays.
- **Memory**—Integrated circuit consisting of memory cells and usually including associated circuits such as those for address selection and amplification. A class of integrated circuits that store digital information, for example, ROM, EPROM, EEPROM, Flash memory, DRAM, and SRAM.

The industry trade press is also a good source of market information. For example, in Figure B.9, *EE Times India* reports the change in semiconductor revenue by end-use from 1995 to 2009. As the figure's title indicates, the only major change in the total available market (TAM) is the incorporation of handheld wireless. The market sectors and percentages have remained relatively steady, which reflects a mature industry. Remember, during this step of building understanding, we are not trying to analyze the semiconductor market and what the above market allocations portend for the industry. It is enough that we understand what major product areas are the buyers of semiconductors.

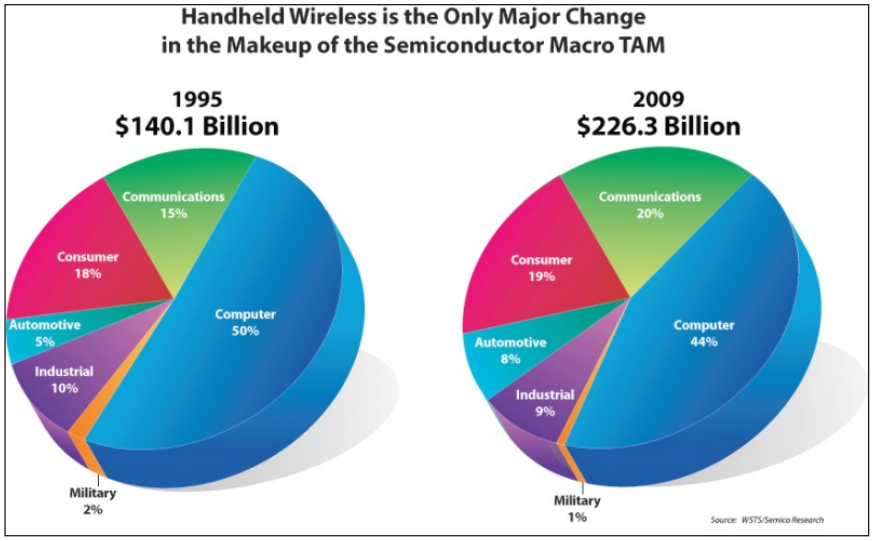

Figure B.9: Semiconductor Total Available Market (TAM) (© Semico Research)[167]

Now that we have looked at the market for semiconductors (power of the buyer), it is also important to understand who are the major producers of semiconductors (intensity of competition). Figure B.10, reported in *EE Times Asia*, shows the top semiconductor vendors ranked by revenue estimates for 2009. These companies will become familiar as information is collected. It is readily apparent that Intel is by far the leading semiconductor producer, with Samsung a distant second, and the remaining companies trailing behind it.

Top 10 Semiconductor Vendors by Revenue Estimates, 2009 (Millions of U.S. Dollars)						
2009 Rank	2008 Rank	Vendor	2008 Revenue	2009 Revenue	2008–2009 Growth (%)	2009 Market Share (%)
1	1	Intel	34,814	33,253	-4.5	14.6
2	2	Samsung Electronics	17,391	17,686	1.7	7.7
3	3	Toshiba	10,601	9,604	-9.4	4.2
4	4	Texas Instruments	10,593	9,142	-13.7	4.0
5	5	STMicroelectronics	10,270	8,510	-17.1	3.7

Top 10 Semiconductor Vendors by Revenue Estimates, 2009 (Millions of U.S. Dollars) continued						
2009 Rank	2008 Rank	Vendor	2008 Revenue	2009 Revenue	2008–2009 Growth (%)	2009 Market Share (%)
6	8	Qualcomm	6,477	6,409	-1.0	2.8
7	9	Hynix Semiconductor	6,010	6,035	0.4	2.6
8	7	Renesas Technology	7,081	5,670	-19.9	2.5
9	11	Advanced Micro Devices	5,298	5,157	-2.7	2.3
10	6	Infineon Technologies (incl. Qimonda)	8,224	4,682	-43.1	2.1
		Others	138,375	122,223	-11.7	53.5
		Total Market	**255,134**	**228,371**	**-10.5**	**100.0**

Source: Gartner (March 2010)

Figure B.10: Top 10 Semiconductor Vendors, 2009 (© Gartner, Inc.)[168]

Figure B.11 shows the top ten semiconductor companies projected by 2010 capital investment; the inclusion of the major product line for each company is also useful. For example, Intel is listed as having the largest revenue of semiconductor companies in 2009, and its major product area is listed as MPU, or microprocessor unit. The microprocessor is the main component in the computers that now come in so many forms and sizes. The large revenue numbers reported by Intel are also consistent with the computer sector of the semiconductor market being the largest of the various sectors. Samsung reported the second-largest revenues, and its major product area is memory. While memory is important to the computer sector, memory applications are also present in the consumer, communications, and automotive sectors. There is also a major product category, foundry, which appears on the list. Referring to the value-chain examples in Chapter 2, a foundry is a firm that does not design and produce its own line of semiconductors. The foundry receives the design information and masks from a customer and fabricates the individual die. In some cases, they do not even separate the die from the wafer, and the customer will either complete the packaging of the die or outsource the task to another vendor. The value chain helps to visualize what activities are being discussed in the trade press.

Top 10 Semiconductor Industry Capital Spenders*										
2010 Rank	Company	2007 ($M)	07/06 % Change	2008 ($M)	08/07 % Change	2009 ($M)	09/08 % Change	2010F ($M)	10/09 % Change	Major Product

Source: IC Insights, Company Reports

Figure B.11: Top 10 Semiconductor Industry Capital Spenders (© IC Insights, Company Reports)[169]

Understanding the size and scope of the market makes it apparent that the semiconductor industry, although mature, is still experiencing growth. It may seem counterintuitive that a mature industry continues to spend large amounts on research and development, but that is because, while the semiconductor process steps are easy to understand, the actual achievement of producing the design is intellectually and capitally intensive. To bring it up to a strategic level, it is also important to note where the leading companies are headquartered and where they are producing their product. This will become apparent as collection begins and will be important in our analysis task. For now, having a list of the key competitors will be useful in the collection and analysis of industry information.

This appendix provides a basic background in the industry we want to analyze. At this point, we have a general overview of semiconductors and the processing of semiconductors into integrated circuits, and insight into the size and composition of the semiconductor market. A test of our understanding is to construct a value chain for the industry. If you have already found one for the industry, use it as a contextual template for the collection and analysis of industry information.

Appendix C

Data Sources Specific to Semiconductor Industry

Books

Since getting the latest data is a primary consideration, it is important to search for recent books on the industry. For example, at the start of research for this study, a 2009 book by Claire Brown and Greg Linden, *Chips and Change*, turned out to be an excellent data source for understanding the origin, development, and future of the semiconductor industry.[170] The book even provides a value chain for the semiconductor industry. A 2008 book on China's high-technology industry, *China's Science and Technology Sector and the Forces of Globalization*, provides an interesting perspective on the prospects and problems for development of China's semiconductor industry.[171]

Reports

The National Academy of Sciences, a nonprofit institution, has a searchable website of its publications, and many are free to download.[172] While the publication dates of National Academy reports are unpredictable, you can request e-mail notifications when topics of interest are available. The federal government, particularly within the Department of Commerce, provides a regular stream of trade and industry statistics, but occasionally they will also produce reports on global trade topics that are of interest. For example, the Bureau of Industry and Security provides current news reports regarding trade issues, and its Defense Industrial Base Programs link provides a list of Defense Industrial Capability and Technology Assessments regarding foreign industrial development that may be of interest.[173]

Trade Associations

The major semiconductor trade association websites provide news and documents, although the frequency of their updates and data available are irregular. The major semiconductor industry trade associations are

- Semiconductor Industry Association (SIA): *www.sia-online.org*.

  They provide an updated factsheet with basic statistics on the worldwide

semiconductor market and also provide issue papers regarding global competition.

- Taiwan Semiconductor Industry Association (TSIA): *www.tsia.org.tw/Eng*.
- Japan Electronics and Information Technology Industries Association (JEITA): *www.jeita.or.jp/english*.
- Korea Semiconductor Industry Association (KSIA): *www.ksia.or.kr/eng/main.*
- China Semiconductor Industry Association (CSIA): *www.csia.net.cn*. (Note: website's language is not translated into English.)
- Singapore Semiconductor Industry Association (SSIA): *http://www.ssia.org.sg*.
- Electronic Design Automation Consortium (EDAC): *www.edac.org.*
- Semiconductor Equipment and Materials International (SEMI): *www.semi.org*. SEMI is an international trade association that represents the suppliers to the semiconductor industry. It also includes suppliers to the display and photovoltaic (solar-cell) industries. The SEMI trade shows are held around the world, with each providing insight into the host country's semiconductor industry. The SEMI international standards forum invites members to collaborate on developing standards. The SEMI industry statistics group presents industry forecasts and invites other organizations to also share their forecasts at SEMI events.

Trade Journals

The most useful sources of current information on the semiconductor industry are the industry trade journals. Trade journals are much better sources than government policy announcements and the occasional analytical articles in metropolitan newspapers and business magazines, because many of those stories are not much more than news releases from the subject company. The industry trade journals, on the other hand, are reflective of the global evolution of this industry, and not only carry articles of interest to the technical community, they also provide analysis and forecasts on industry-wide

issues. The semiconductor trade press is not immune to industry competition, though. For example, during this book's preparation, the parent company for the trade journal *Semiconductor International* ceased operations and removed its content from the Internet. The reality of publishing these days makes it important to capture hardcopies of source articles in order to document the sources of analysis. In the semiconductor industry, most of the trade journals are available as Web subscriptions, some without charge, while others charge a small fee for subscribing or downloading full text articles:

- *EE Times Asia*: *www.eetasia.com.*
- *EE Times India*: *www.eetindia.co.in.*
- *Electronic Design News*: *www.edn.com.*
    - *Electronic Business*—separate subscription available from EDN.
    - *ElectronicNewsToday*—separate subscription available from EDN.
- ElectroIQ—portal for electronics manufacturing: *http://www10.giscafe.com/nbc/articles/1/737191/%3Cem%3Ewww.ElectroIQ.com%3C/em%3E.*
    - *Solid State Technology*—digital edition available from ElectroIQ.
- SEMI Newsletters: *www.semi.org.*
    - *SEMI Global Update*
    - *Semiconductor Manufacturing Newsletter* (simplified Chinese)
- *DigiTimes*, *www.digitimes.com*—provides news summaries free of charge, but to access full articles requires a subscription.

Other Internet Sources

This category concerns the Internet and its ever-evolving platforms and content. The website YouTube (*www.youtube.com*), although pedestrian to aficionados of social media, still provides good sources of information. Using search terms gained from your study of the industry can yield video clips from news organizations, trade associations, and even companies within the industry.[174]

Blogs and Twitter

The blogs by industry analysts, enthusiasts, or employees are embedded or linked into many of the industry trade journals, and can be a good source of information. The EDA Consortium website has a publications page (*www.edac.org/news_publications.jsp*) that provides a list of links to trade journals, but also provides links to news and blog sites, such as EDACafé (*http://www.edacafe.com*), or individual bloggers, such as EDA Confidential (*www.aycinena.com*).

The use of Twitter by the trade journal *Semiconductor International* is noteworthy, but it only Tweeted links to its journal content. This trial experiment went offline with the demise of that trade journal.

Webcasts and Virtual Conferences

The increasing use of webcasts and virtual conferences provide good real-time sources. Subscriptions to the industry trade journals will lead to announcements of these events. These events offer another avenue for the industry to share information and develop market opportunities. The presenter slides are usually available for download prior to the presentation, or the site allows archival access. Figure C.1 shows a recent *EE Times* virtual conference portal that provides all the trappings of a conference with spaces for the auditorium, exhibition, and business meetings.[175]

Figure C.1: Virtual Conference Portal (© UBM Electronics)

Referencing Figure C.1, in a six-hour conference, the listeners can choose the sessions they want and even interact with the presenter via the portal interface. A visit to the exhibit hall provides a view of kiosks for each company exhibiting. Entering the kiosks, the visitor sees a list of company content, such as product presentations and white papers. The virtual conference remains as an archive on the *EE Times* website, but, as with other Internet sources, it is advisable to download the information before it disappears.

Trade Shows

Trade shows are the best alternative to actually visiting semiconductor companies in other countries. Tradeshows will offer sessions in a variety of areas, and it pays to read the program beforehand to ensure it is not devoted to a sub-industry topic or technical interchange. Also, unless you are multilingual, make sure the session is in English or that simultaneous translation is available. Be sure also to take the time to walk through the exhibit halls and gather literature of interest. One caution is that most corporate booths will require a business card or the signing of a register before they will give out literature. The purpose of the exhibit hall is to generate business leads for the companies, so bring appropriate identification if you want to collect

information. As a final note, in the absence of attending the trade show, the trade press usually reports from the show and provides their perspective via the Internet. By way of an example of what is available, the SEMI tradeshows are scheduled a year in advance and occur in a different country each quarter. The SEMI tradeshows provide market forecast presentations, and also offer a copy of the proceedings. The shows provide an outsider's perspective of semiconductor companies (SEMI represents the suppliers to the industry), as well as insight into the future outlook for the industry.

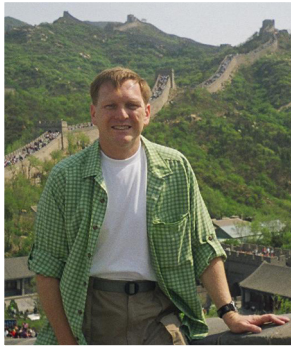
ABOUT THE AUTHOR



Charles (Chuck) Howe serves as Deputy Director to the Assistant Deputy Director of National Intelligence Acquisition organization, which is part of the Acquisition, Technology & Facilities organization within the Office of the Director of National Intelligence. Before joining the Intelligence Community, Mr. Howe served in the United States Air Force for 27 years, retiring with the rank of Colonel. He has a long association with the aerospace industry, and capped off his military career teaching at the Industrial College of the Armed Forces (now Dwight D. Eisenhower School for National Security).

Sensemaking

A Structure for an Intelligence Revolution

David T. Moore

NATIONAL DEFENSE INTELLIGENCE COLLEGE
WASHINGTON, DC

March 2011

The views expressed here are those of the author and do not reflect the official policy or position of any branch of the U.S. Government.

Sensemaking is the inaugural book in our new series, titled The A. Denis Clift Series on the Intelligence Profession. The *Clift Series* will present original research on intelligence analysis and the teaching of intelligence.

In 2009, A. Denis Clift concluded a 50-year career with the federal government. Clift was president of the National Defense Intelligence College from 1994 to 2009 and was instrumental in creating the Center for Strategic Intelligence Research, which houses the NDIC Press.

Sensemaking: A Structure for an Intelligence Revolution, by David T. Moore

Sensemaking, whereby intelligence professionals would work with executive decisionmakers to explain data that are "sparse, noisy, and uncertain," requires an interpreter and experienced champion to bring about a practicable understanding and acceptance of the concept among intelligence practitioners. David Moore has accomplished that feat. Further, he, along with collaborators in chapters 5 and 7, demonstrate how sensemaking can be accomplished as a collaborative enterprise.

The manuscript for this publication was reviewed and cleared for public release by the Department of Defense's Office of Security Review. Clearance does not imply endorsement of opinion nor of factual accuracy. This volume is subject to Title 17, United States Code, Sections 101 and 105. It is in the public domain and may not be copyrighted.

How to order this book. *Everyone* may download a free electronic copy from our website at *www.ndic.edu. U.S. government employees* may request a complimentary copy by contacting us at: *press@ndic.edu*. The *general public* may purchase a copy from the Government Printing Office (GPO) at *http://bookstore.gpo.gov.*

CONTENTS

Foreword ..... **ix**
Gregory F. Treverton

Commentary ..... **xiii**
Anthony Olcott, PhD

Commentary ..... **xvii**
Emily S. Patterson, PhD

Commentary ..... **xix**
Christian P. Westermann

Commentary ..... **xxi**
Phil Williams, PhD

Preface: On Being Mindful ..... **xxiii**
What is Mindlessness? ..... **xxiii**
Attaining Mindfulness ..... **xxv**

Acknowledgments ..... **xxxiii**

Definitions ..... **xxxv**

Chapter 1: Introduction **1**
Where We Are **1**
A Roadmap **4**
Kent's Imperative **6**

Chapter 2: The Failure of "Normal Intelligence" **11**
Intelligence Challenges **11**
Errors and Failures **12**
Considering Standard Models **16**
Types of Problems **17**
A Wicked Look at Wicked Problems in Intelligence **20**
An Intelligence Example: Pandemics as Wicked Problems **29**
Complexity **33**

Chapter 3: From Normal to Revolutionary Intelligence **37**
Evidence-Based Intelligence Creation **37**
Considering the Normal **44**
Paradigm Shift **47**

CONTENTS (Continued)

Chapter 4: The Shape of Intelligence Sensemaking 51
Planning for Tame and Wicked Intelligence Problems. 51
Foraging 54
Marshaling 62
Understanding. 62
Communicating 64
Chapter 5: A Practice of Understanding 69
Intuition 69
Types of Judgment 74
Thinking About Anticipating 79
The Roles of Intuitive Thinking in Intelligence Sensemaking 88
Does More Information Improve Anticipation? 90
Future Vision: Red Brains, Blue Brains? 92
Looking Ahead 93
Chapter 6: Considering Validation 95
Analogies from Other Fields. 95
Replication in Intelligence. 98
Validation in Foresight and Hindsight 99
Validating the Practice of Intelligence Sensemaking. 100
Seeking Validation: Toward Multiple Methods 103
Chapter 7: Making Sense of Non-State Actors: A Multimethod Case Study of a Wicked Problem 105
Introduction. 105
Introducing the Wicked Problem of Non-State Actors 106
Three Approaches to Making Sense of Non-State Actors. 108
Approaches and Methodologies 114
Critical Assessment: Lessons Learned from the Study of Non-State Actors 122
Changes in the Roles of Non-State Actors: An Alternative View 123
Moving Beyond a Proto-Revolution 129

CONTENTS (Continued)

Chapter 8: Establishing Metrics of Rigor 133
Defining Intelligence Rigor 133
Assessing Sensemaking Rigor in Studies of Non-State Actors 138
Observations and Discussion 144
Chapter 9: Implications, Limitations, and Conclusions 149
Considering Foresight 149
Implications 152
Limitations 153
Conclusions 154
References 157
About the Author 181
About the Contributors 183

FOREWORD

Gregory F. Treverton
Director
RAND Corporation Center for Global Risk and Security

Recently, I had the opportunity to work with some very impressive young analysts at David Moore's recent home-away-from-home, the National Geospatial-Intelligence Agency (NGA). Assisting U.S. operations in Iraq and Afghanistan, they understood how much the world of what we still call "imagery" had changed. As they put it: We at NGA used to look for things and know what we were looking for. If we saw a Soviet T-72 tank, we knew we'd find a number of its brethren nearby. Now, though, we're not looking for things. Instead, we're looking for activities or transactions. And we don't know what we're looking for.

In fancier language, the paradigm of intelligence and intelligence analysis has changed, driven primarily by the shift in targets from the primacy of nation-states to trans-national groups or irregular forces. In the world of the national-state, I and others divided intelligence problems into puzzles and mysteries (or variants of those words).[1] Puzzles are those questions that have a definitive answer in principle. How many nuclear missiles the Soviet Union had was a puzzle. So is whether Al Qaeda possesses fissile material. By contrast, mysteries are questions that cannot be answered with certainty. They are future and contingent. Will North Korea reach agreement to cease its nuclear program? No one knows the answer, not even North Korean leader Kim Jong Il. It depends. The question is a mystery, not a puzzle.

For puzzles, intelligence tried to produce *the* answer. In solving puzzles about the Soviet Union, the United States spent billions of dollars, primarily on the technical systems whose fruits were and are analyzed at David's home institution, the National Security Agency (NSA) and at NGA, along with espionage collected by the CIA. For mysteries there was no answer. Instead, analysts sought to frame the mystery by providing a best estimate, along, perhaps, with excursions or scenarios to test the sensitivity of critical factors. If intelligence failed to understand the full picture of Soviet missiles,

[1] For my version of the distinction, see Gregory F. Treverton, "Estimating Beyond the Cold War," *Defense Intelligence Journal* 3, no. 2 (Fall 1994): 5-20. Cited hereafter as Treverton, "Estimating."

and puzzle became mystery, it at least knew something about where to look: there was experience and theory about missile building, plus historical experience of Soviet programs. The mystery came with some shape.

However, today's transnational threats confront us with something more than mysteries. I call these shapeless mysteries-plus "complexities," borrowing Dave Snowden's term. They are sometimes called, as Moore notes, "wicked problems" or simply "messes." The come without history or shape. Large numbers of relatively small actors respond to a shifting set of situational factors. Thus, they do not necessarily repeat in any established pattern and are not amenable to predictive analysis in the same way as mysteries. Those characteristics describe many transnational targets, like terrorists—small groups forming and reforming, seeking to find vulnerabilities, thus adapting constantly, and interacting in ways that may be new.

For complexities, especially, the challenge is to employ sensemaking—the term is from Michigan psychologist, Karl Weick. Exactly how to accomplish sensemaking is a task that still mostly lies before us, which makes this book such an important contribution. Sensemaking departs, as Moore notes, from the postwar tradition of Sherman Kent, in which analysis meant, in the dictionary's language, "the process of separating something into its constituent elements." Sensemaking also blurs America's bright white line between intelligence and policy, for, ideally, the two would try to make sense together, sometimes disaggregating events, sometimes aggregating multiple perspectives, always entertaining new hypotheses, all against the recognition that dramatic failure (or success) might occur at any moment.

Sensemaking is a tall order, but there is no better sherpa for the unfamiliar terrain of this new paradigm than David Moore. He almost uniquely embodies both practice and academic scholarship. Indeed, one of the tantalizing aspects of his academic work is that, as a careful intelligence professional (and one from NSA to boot), he is very careful about classification. That means the visible trails of his practice in his scholarship are sparse, and his cases are mostly familiar ones, albeit ones often spun in new directions.

His approach to sensemaking takes us from information foraging, harvesting and marshalling into understanding. He looks at various forms of tacit knowledge, and he and the contributors report on some intriguing tests of sensemaking. Several of us who looked around the Intelligence Community in the years after September 11th noted how little use it made

of formal methods or machines other than computers for sorting.[2] Worse, in some sense the Cold War practice of analysis sought to turn humans into machines by rooting out judgment, bias, hunch, stereotyping—all the things humans do best. The new paradigm makes the use of machines and method imperative, letting machines do what they do best—searching large amounts of data, remembering old patterns, and the like—while letting humans use the judgment they alone can apply. Yet the tests by Moore and his colleagues remind us that methods are critical but only if they have been tested. It turns out, for instance, that ACH, analysis of competing hypotheses, a method more frequently used now and one that has been tested, isn't all that valuable, at least not for analysts beyond the novice level.

For years I've had at hand a bumper sticker for which I lacked the car. The bumper sticker is: Intelligence cannot truly be reshaped until it reshapes its products. So long as it thinks of products primarily as words on paper (or bytes on a screen) produced by relevant experts and stovepiped by agency it is stuck in the old paradigm. Moore should not be blamed for my bumper stickers, but his emphasis on communication echoes the concern underlying it. I'd be happy if the Intelligence Community began a number of pilot projects trying to develop sensemaking, but Moore is much more ambitious: while recognizing its limitations, he'd make sensemaking the basis of intelligence. It should be.

2 Most striking is the work of anthropologist Rob Johnston, now on the inside: Rob Johnston, *The Culture of Analytic Tradecraft: An Ethnography of the Intelligence Community* (Washington, DC: Center for the Study of Intelligence, Central Intelligence Agency, 2005). My own version is *Assessing the Tradecraft of Intelligence Analysis* (with C. Bryan Gabbard), TR-293 (Santa Monica, CA: RAND Corporation, 2008).

COMMENTARY

Anthony Olcott, PhD
Associate, Institute for the Study of Diplomacy
Georgetown University

David Moore is right to talk of the need for an intelligence revolution. However, as Lenin learned in the 18 years that passed between publication of *The Development of Capitalism in Russia* and taking over the Winter Palace, it takes more than a diagnosis and a prescription to make a revolution. Although his is among the best, Moore's book is also but the latest addition to a groaning shelf of books devoted to intelligence and analytic reform while the companion shelf, for books on how to improve the policy process, sits dusty and all but empty. In that regard, even though Moore's discussion of the processes of analysis and how the ways we answer questions might be improved is one of the strongest in recent memory, the most valuable part of the book could well be the somewhat smaller amount of attention it devotes to the problem of how we formulate our questions in the first place.

As Moore points out, Sherman Kent and the other *ur*-fathers of intelligence took for granted that the "intelligence questions" are self-evident—foreign policy is (Walter Lippmann's words) "the shield of the republic" and strategic intelligence is (Kent's addition to Lippmann) what "gets the shield to the right place at the right time" and what "stands ready to guide the sword."[3] In that metaphor there is no room for doubt about what is threat, what defense, or indeed what receives the thrust of the sword. Even as Kent's book appeared, however, other voices were arguing that policy formation is not so self-evident or straightforward.

Moore quotes one of these voices, that of Kent's contemporary and, for a time, IC colleague, Willmoore Kendall. Kendall did not share Kent's conviction that the job of the analyst was "to stand behind [the policymakers] with the book opened at the right page, to call their attention to the stubborn fact they may be neglecting."[4] Unlike Kent, who was an unabashed elitist, Kendall was a "majoritarian," who believed that, in a democracy, all policy, foreign and domestic, could only be set by the wishes of the "50 percent plus 1" who vote

3 Sherman Kent, *Strategic Intelligence for American World Policy* (Princeton NJ: Princeton University Press, 1949), p. viii. Cited hereafter as Kent, *Strategic Intelligence*.

4 Sherman Kent, *Strategic Intelligence*, p. 182.

for a particular person, platform, or party—and the job of the analyst, therefore, was to help the "politically responsible laymen" whom that majority had elected to bring those policies into being. Although "majoritarianism" led Kendall into some positions which today seem deeply repugnant —for example, he defended racial segregation, on the grounds that this was the wish of the majority—his argument that policy is determined by beliefs, not "objective facts," is one that, had it prevailed, could probably have helped us to avoid a good number of the familiar "intelligence failures" that Moore's book enumerates.

Moore moves some way toward Kendall's position when he describes the potential that sensemaking offers as a means precisely for helping policymakers to improve how they think about policy. The collaborative processes he outlines would help analysts and policymakers alike move from the present fixation on "how things work" (the provenance of analysis) to imaginative exploration of the ways in which things *could* work (the purpose, it would seem, of policy).

It is here particularly that I would encourage Moore's readers to think about how to move this sense-making revolution closer to reality. As philosopher Denis Hilton has remarked, there is a profound difference between "causal attribution" and "causal explanation"—in his words, "attributing the 9/11 attacks to someone is not the same as explaining them to him."[5] Moore has done a deep and convincing job of diagnosing the ills of the IC, and has proposed a rich and promising cure. This, as Hilton points out, is an extended act of cognition. What lies between this book and Moore's revolution, however, is the need to have others come to the same conclusion—which, as Hilton points out, requires *communication*, not cognition.

Sixty years ago a small group of analysts—dubbed "Talmudists" for their pains—worked out a complex, sophisticated method of deriving actionable intelligence from the tightly controlled propaganda outlets of the USSR and Mao's China. This let IC sinologists spot the first signs of the Sino-Soviet split as early as April 1952, and by 1955 Khrushchev had been tagged as the likely winner in the struggle to consolidate power in the Kremlin after Stalin's death. Those early indicators, however, remained scoffed at and un-acted upon precisely because the methodology—which a colleague in the CIA compared to studying "invisible writing on slugs"[6]—was too complex and too weird to

be easily explained to policymakers—*who, in any case, already believed other hypotheses, and had their own "facts."*[7]

The challenge we face is the same as that which faced those Talmudists. Moore has convinced himself, and he is highly likely to convince all the analysts who read his book, that sensemaking is indeed the intelligence revolution we need. The challenge now is to communicate that to policymakers, so that they too will be willing to join David Moore's sensemaking revolution.

A colleague once said that he was dedicated to the vision of having decisionmaking be directly informed by evidence rather than the popularity of the latest fad or pet projects of powerful leaders. The context for his comment was for deciding what innovations to implement in hundreds of Intensive Care Units to reduce risk-adjusted patient mortality. Nevertheless, I believe that this lofty goal could easily apply to United States policymaking. In my opinion, it is an achievable goal for the vast majority of United States policy to be directly informed by evidence that is systematically validated, collated, and synthesized by teams of professional intelligence analysts.

This book is a critical milestone in attaining the goal of analysis directly supporting evidence-based policymaking. This book's primary contribution is to conduct sensemaking on the label sensemaking. Decades of relevant academic literatures have been synthesized into one framework that illustrates how disparate research streams relate to each other and to the framework. Until now, there has not been such an extensive effort to pull together related research on sensemaking from such diverse disciplines as psychology, political science, philosophy, organizational science, business, education, economics, design, human-computer interaction, naturalistic decisionmaking, and macrocognition.

The contributions of this book go beyond a literature review, however, in that an action-oriented stance is taken toward capturing nuggets of insight on how to improve aspects of analysis. The categories themselves are useful in putting some shape and structure to the amorphous value that expertise brings to creating a solid analytic product in an uncertain world: planning, foraging, marshaling, understanding, and communicating. Of particular value is describing different aspects of validation that are relevant to intelligence sensemaking, and distinguishing processes for predicting future events (foresight) from processes for describing past events and assessing their impacts (hindsight).

Another colleague once said that she looks at what is measured operationally to determine how people truly define a concept. Chapter 8, Establishing Metrics of Rigor, is therefore critically important to any discussion of how to encourage improved sensemaking in the Intelligence Community. As David Moore notes, although we believe our rigor metric to be a promising first step, much more needs to be done to ensure that all of the important aspects of rigorous analysis are captured. The application of the rigor metric to a face valid case study in this book is the first such application in intelligence analysis to compare processes by different analytic teams. Whether or not high rigor on all of these inter-related dimensions is possible to achieve under the working conditions for intelligence analysts today is an unresolved debate. Even if high rigor is not possible under extreme time pressure, data overload, and workload conditions, the measure has potential value in supporting negotiations for what aspects are most important to do well for a given task, as well as communicating the strengths and weaknesses of the process behind an analytic conclusion.

COMMENTARY

Christian P. Westermann
Senior Analyst
Bureau of Intelligence and Research
U.S. Department of State

History will tell us if current intelligence reforms are evolutionary or revolutionary, but the Intelligence Community is responding to mandated change brought about by the 2004 Intelligence Reform and Terrorism Prevention Act (IRTPA).[8] In particular, the analytic and collector communities are adjusting to one of IRTPA's pillars—improved information sharing. As reforms unfold, the collector and analyst must adapt to new rules and new analytic standards, and incorporate more methodologies, techniques, and alternatives in their analysis, in collaboration with managers and tradecraft cells in the national intelligence organizations. These new structures and guidelines present an intellectual challenge as well as a bureaucratic maze for the collector and analyst struggling not only to "produce" intelligence in a timely fashion but also to improve their product. This is not easy for the intelligence professional because time is not on their side. This is why improving the way in which all analysts think is so important and why an understanding of sensemaking will help advance the profession beyond the "established analytic paradigm" for complex problems and create greater possibilities for the application of imagination in the IC. The failure to properly assess Saddam Hussein's WMD programs during the lead-up to Operation Iraqi Freedom is the preferred example of this failure to imagine alternatives. The corporate solution to this problem is increased collaboration and information sharing; David Moore is not in disagreement but has suggested that it must go beyond new methodologies or techniques—it must be done with a strong sense of rigor and individualism in one's thinking.

David Moore has written for the Intelligence Community a revolutionary epistemology. His novel construct for intelligence professionals is the foundation for a philosophy of intelligence. He has started where he left off in his work on *Critical Thinking and Intelligence Analysis* with a path forward for analysts and how they can improve their capacity and move beyond the

8 United States Congress, *Intelligence Reform and Terrorism Prevention Act of 2004*, 108th Congress, 2nd Session, 20 January 2004. Cited hereafter as U.S. Congress, IRTPA, 2004.

methods they learn as "good" tradecraft.[9] Moore's prescription is to take the disaggregation of data, commonly referred to as analysis, synthesize it, and then apply to it one's interpretation and communication skills to make sense of the information. Sensemaking therefore is a theory of knowledge for the intelligence professional and also a practice to aid the difficult art of intelligence reasoning.

Current "total" intelligence reform, as described by Director of National Intelligence James Clapper in late 2010, is reform that is focused on "integration, the merging of collection and analysis—particularly at the ODNI level—analytic transformation, analytic integrity, acquisition reform, counterintelligence—and information sharing."[10] This involves a great deal of uncertainty for organizations and analysts, in light of the formation of new intelligence fusion centers reminiscent of Defense intelligence reform of the 1990s—which saw the rise of Joint Intelligence Centers—and presents a challenge to make sense of new security challenges in the post-9/11 world. The time is therefore ripe for analysts to transform their thinking and tradecraft and Moore's new paradigm offers real improvements to their practice of intelligence. His attention to revolutionary change in the art of intelligence thinking grows from his recognition that organizational reform has been ongoing for decades and despite those changes attendant failures have occurred and continue to occur. Therefore the only hope for achieving positive reform rests with changing the practice of intelligence whereby the individual collector and analyst, working together, and accepting the responsibility to think critically but also independently and across the Community, make sense of the 21st century national security environment.

University of Pittsburgh

Moore's Law for Intelligence

Any book that discusses amongst other things, red brains and blue brains, kayaking, information foraging, flashlights as blindfolds, space-time envelopes, and intellectual audit trails, is out of the ordinary. When you throw in the contention by the author that intelligence as currently practiced is akin to medicine in the 14th Century you have a book that will raise hackles, blood pressure, and voices. David Moore's provocative and stimulating analysis of critical thinking and sensemaking for intelligence does all of the above.

This is not an easy read. But the overall thesis is straightforward and compelling: the environment within which the U.S. intelligence community now finds itself is not only highly complex but also full of wicked problems. To provide the kind of intelligence that is useful, relevant, and helpful to policy makers who have to anticipate and respond to these problems and challenges, Moore argues that the traditional paradigm developed largely by Sherman Kent has to be superseded by a new paradigm based largely on ideas initially outlined by Willmoore Kendall, a contemporary critic of Kent. The original Moore's Law[11] was narrowly technical; David Moore in contrast argues that a complex environment full of mysteries, not puzzles, requires holistic thinking (as opposed to simply disaggregation of problems), mindfulness (as opposed to mindlessness which he also elucidates), and a dynamic willingness to change paradigms, shift perspectives, and abandon strongly held perceptions. The book also develops the notion of sensemaking rigor and shows how metrics of rigor can be applied to several studies examining the rise and impact of non-state actors.

David Moore's analysis is important and deserves to be widely read in the intelligence community and in the academic world. Yet, the volume—as

11 Gordon E. Moore, "Cramming More Components onto Integrated Circuits," *Electronics*, vol. 38, no. 8 (19 April 1965), URL: <ftp://download.intel.com/museum/Moores_Law/Articles-Press_Releases/Gordon_Moore_1965_Article.pdf>, accessed 7 November 2010.

he would be the first to acknowledge—is intended as an early word on sensemaking and intelligence, rather than the last word. Indeed, it would have been helpful, for example, if David Moore had considered more explicitly the argument by David Snowden that making sense of a complex environment requires probing the environment. Further thought about this suggests that law enforcement is particularly good at this form of knowledge elicitation and sensemaking: sting operations, controlled deliveries, infiltration of criminal organizations, are all probing mechanisms that can contribute significantly to an increased level of understanding and, concomitantly, to an enhanced capacity for effective action. For many intelligence professionals, especially those who have had a dismissive view of law enforcement, the idea that law enforcement approaches to sensemaking might be ahead of those in the intelligence community, is likely to be as uncomfortable as most of the arguments in David Moore's book. Certainly Moore's volume is designed to shake and to stir. It is a manifesto for an intellectual revolution in the approach to intelligence and, as such, is likely to be both acclaimed and reviled. One suspects that the author will measure his own success by the depth of opposition as well as the levels of support for the revolution he is proposing.

PREFACE
On Being Mindful

What Is Mindlessness?

We are surrounded by errors and they are ours. Intelligence officials at the national level repeatedly use the same excuses for professional errors and for the systemic failures that follow. Despite directives to "fix" the structures, and most recently the means, by which intelligence is created, we insistently fail at our obligation to make early sense of vital threats and opportunities. What is our problem?

We may begin by examining the concept of *mindlessness*. Ellen Langer, summarizing her pioneering social psychology research, finds mindlessness to arise from an over-reliance on "categories and distinctions created in the past."[12] She holds that such categories "take on a life of their own."[13] Seen in this context, the failure to recognize in foresight that an American or a Nigerian man could be a member of Al Qaeda arises from a rigid deductive categorization of who is a member of Al Qaeda and is a case of mindlessness.

Langer also sees mindlessness arising from "automatic behavior." Here, people rely on automatic responses as the basis for their behavior, as when one writes "a check in January with the previous year's date."[14] By extension, intelligence professionals, in assessing sources, may develop a habit of discounting human intelligence sources because some are untrustworthy. As a result, they may miss novel insights because they use certain sources to the exclusion of others.

Finally, mindlessness can result from a failure to take into account alternative information that transcends our comfortable worldview. Langer observes that "[highly] specific instructions…encourage mindlessness" because they define what is acceptable and limit the viability of alternative signals that could lead to more accurate understanding of a phenomenon.[15] During the summer of 1962, CIA and DIA intelligence professionals at the Refugee

12 Ellen J. Langer, *Mindfulness* (Cambridge, MA: Da Capo Press, 1989), 11. Cited hereafter as Langer, *Mindfulness*.

14 Langer, *Mindfulness*, 12.

15 Langer, *Mindfulness*, 17-18.

Processing Center (RPC) in Miami discounted the validity of refugee reports of nuclear missiles on the island because some refugees also went beyond the pale by concocting "farfetched tales of African troops with rings in their noses, lurking Mongolians, and even Chinese troops."[16] There were in fact 100 nuclear-tipped *tactical* missiles deployed on the island months before the arrival of the more infamous strategic missiles.[17] A rigid notion of what constituted a nuclear missile, usually conceived as an offensive weapon, appears to have contributed to the case officers' mindless disregard of the witnesses.

Not only intelligence practitioners, but also those with whom they communicate their understandings, remain subject to the dangers of mindlessness. With respect to intelligence consumers, two faculty members at the International Institute of Management Development (IMD), corporate strategy expert Cyril Bouquet and corporate leadership and organization expert Ben Bryant, suggest that "decision makers often suffer from poor attention management, being obsessed with the wrong types of signals and ignoring possibilities that could significantly improve the fate of their undertakings."[18] They characterize these behaviors as *fixation* and *relaxation*. People who fixate "become so preoccupied with a few central signals that they largely ignore things at the periphery."[19] A deadly example of fixation occurred in 1977, when the KLM 747 flight crew on Tenerife failed to avoid a collision with a Pan Am 747: "they didn't give sufficient attention to the presumably very important communications coming in from air traffic controllers."[20] Naval aviators engaged in night landings on aircraft carriers also fixate and this leads to pilots' ignoring "the obvious and doing the inexplicable" (and

20 Bouquet and Bryant, "Key to Coping." The accident occurred when KLM 747 collided with the Pan Am 747 as the former took off over the latter. In the crash 583 passengers and crew were killed although miraculously, 65 passengers and crew on the Pan Am flight survived.

often dying).[21] Such fixations are goal-oriented—taking off in the former example and landing in the second. The pilots know intellectually what to do but their fixation on an emotional goal mis-focuses them: "knowing [is] no match for emotion."[22] While they are fixated, they are not truly aware. Nor are they living in the moment; instead, they are inadvisably envisioning themselves already in the air or on the deck and expecting the resulting emotional sense of relief.

Bouquet and Bryant identify relaxation as when, after a "sustained period of high concentration," people become unfocused on the task at hand and look to the ultimate goal.[23] A case in point involves the deaths of three climbers on Oregon's Mount Hood in 2002: they were distracted from the matter at hand—that of completing a difficult descent; they took shortcuts.[24]

Both fixation and relaxation contribute to intelligence failures. For intelligence practitioners, focusing on the wrong factors and failing to recognize the significance of novel indicators are examples of fixation that may have been at work in the December 2009 failure to anticipate the attempted bombing of Northwest Airlines flight 253 over Detroit. Sometimes ascribed to intelligence professionals' and national consumers' falling prey to "creeping normalcy," relaxation was also a contributor to Israel's failure to anticipate the attacks by Egypt and Syria in 1973.

In sum, mindlessness too often guides the assessment of affairs in too many domains, leading to errors, failures, and catastrophes. Mindlessness is deemed unacceptable within the larger American society only when the resulting errors do lead to accidents and disasters. However, mindlessness is completely unacceptable within the domain of intelligence. One can never be certain in foresight whether errors will occur, so intelligence professionals must seek to anticipate, recognize and avoid them at all costs.

Attaining Mindfulness

The antithesis of mindlessness is mindfulness.[25] For Langer, a mindful state corresponds with: "(1) [aptitude for the] creation of new categories;

---

21 Laurence Gonzales, *Deep Survival: Who Lives, Who Dies, and Why* (New York, NY: W.W. Norton, 2003), 26. Cited hereafter as Gonzales, *Deep Survival*.

22 Gonzales, *Deep Survival*, 35.

23 Bouquet and Bryant, "Key to Coping."

24 Gonzales, *Deep Survival*, 97-123.

25 One of the origins of the concept of mindfulness lies in the work of the 19th-century U.S. philosopher Charles Sanders Peirce, whose notion of "thirdness" relates to present connotations of "mindfulness" by recognizing thirdness as an observer's self-referenced content of an interpretation. See: Charles Sanders Peirce, "Lowell Lectures (1903)," *Collected Papers of Charles Sanders Peirce*, Volume 1, Charles Hartshorne and Paul Weiss, eds. (Cambridge, MA: Harvard University Press, 1958), para 331-332.

(2) openness to new information; and (3) awareness of more than one perspective."[26] For example, as an intelligence professional considers who might be a member of Al Qaeda, a *mindful* attitude would involve constant reassessment and categorization of who might hold such membership—leaving the path open to new information for making sense of the organization and its membership. Thus, as we apply the idea that "[a] steer is a steak to a rancher, a sacred object to a Hindu, and a collection of genes and proteins to a molecular biologist,"[27] the notion of a Nigerian male or even a blonde woman from Pennsylvania as a possible Al Qaeda affiliate would emerge from a mindful perspective.

Leadership scholar Deepak Sethi sees mindfulness as a "form of meditation" teaching "three simple-on-the-surface yet revolutionary skills: Focus, Awareness, and Living in the Moment."[28] This definition descends from millennia of Buddhist tradition. He argues that rather than an esoteric method it is "very practical, action oriented, and transformational." Sethi believes that one practical way to bring about mindfulness is through the use of daily meditation, first using one's breathing as a focus, and then using "specific daily activities such as meetings with another colleague." However, the "real challenge [of employing mindfulness] is to take it from the meditation chair to the office chair and the real world."[29] Intelligence journeymen face this dilemma from a different perspective. They confront the real world and are challenged to contemplate their own thought processes as they engage it.

Australian expert on argumentation Tim Van Gelder distinguishes mindfulness from critical thinking (which he calls "metacognition"): "Metacognition is concerned with what you are thinking about. Mindfulness is concerned with *how* you think as you go about what you are doing."[30] While Van Gelder accepts Ellen Langer's definition, he argues that metacognition and mindfulness can bear an inverse relationship to one another. As an individual masters one, the need for the other diminishes. To illustrate this point, he asserts that "[in metacognitive terms, a novice] driver needs to pay lots of attention to even the most mundane aspects of driving, such as where the gearshift is. The experienced [mindful] driver pays very little attention to

driving, and can carry on a lively conversation instead."[31] Van Gelder's viewpoint—which derives from his definition of critical thinking—holds a serious implication for the intelligence professional: if one learns to be mindful, and is good at it, the risk of a lapse in critical thinking will have increased.

For example, empirical studies of the level of distraction among drivers who are using cell phones reveal an associated, *diminished* driver capacity.[32] Non-distracted drivers are receiving information—without conscious awareness—from: traffic changes ahead, behind, and along side; various mirrors in and on the car; and weather and light conditions. All these inputs factor into their decisions on how to proceed. They are intuitively "in the moment," that is, *mindful* of what they are doing and what is going on around them. They are, as Sethi notes, focused, aware, and living in the moment. But if, as experienced drivers, they are at ease in carrying on a telephone conversation, are they not more accident-prone as a result of operating with a reduced capability or likelihood to be thinking critically?

Van Gelder notes that novice drivers likely monitor their thinking and actions closely—at least intermittently.[33] The amount of metacognitive monitoring that occurs as they become more skilled probably diminishes under normal circumstances. However, it is the author's experience, drawn from office and classroom observation, that people who are skilled critical thinkers still tend to be able to question what is occurring around them even as they are aware of how they are thinking about it. They are thinking critically, even if it is not obvious that they are doing so.

Drivers who employ critical thinking skills to ensure they remain mindful of the appropriate stimuli continually make sense of the environment in which they find themselves. Being metacognitively aware of their likely diminished capacity to drive safely while engaging in cell phone conversations (as well as texting), they are likely to engage in these dangerous acts less often than one who is mindlessly fixated on the cell phone conversation and not mindfully aware of the environment inside and outside their vehicles. To use Gelder's definitions, they are thinking about what to do as well as how to do it; critical thinking and mindful thinking inform each other.

Ben Bryant and IMD research associate Jeanny Wildi write that mindfulness "involves the ability to accurately recognize where one is in one's

33 Van Gelder, "Mindfulness."

emotional landscape and allows…understanding, empathy, and capacity for accurate analysis and problem-solving."[34] They identify a process of detaching, noticing, and developing "here and now awareness."[35] Detachment, for example, allows a viewer to remember that a movie is really merely a "beam of light passing through a piece of moving celluloid projecting onto a screen with some sound and music that are designed to generate particular emotions."[36]

In intelligence work, detachment involves stepping back from the full sensual experience of an issue to consider the actors involved, their motives, the larger context. Critical thinking as it is taught in the Intelligence Community attempts to make sense of the overall purpose or goal of a phenomenon, the points of view and assumptions of the actors involved, the implications of their acting in certain fashions, and other aspects of the larger context surrounding the issue.[37] Questioning the available evidence and the inferences arising from it brings further detachment from the issue.

Noticing involves remaining open to both internal and external stimuli. Ultimately, situational information is conveyed from external sources through sight, sound, touch, smell, and taste. People can think consciously about these but they tend to process them using more autonomic brain structures, often without noticing they are doing so. The unease one feels about getting into a taxi or onto an elevator in an unfamiliar setting are examples of such input. In intelligence work this might be represented as a hunch about what an adversary will do. As Daniel Kahneman and Gary Klein note, in certain environments—where one can learn the cues—these intuitions may be quite accurate.[38] However, in domains where one has not developed expertise, such intuitions can be *inaccurate*.[39] The challenge is determining which of these situations one is in. This brings us back to the imperative of applying mindful detachment from the situation.

Critical thinking assists noticing as well. Bryant and Wildi observe that because people tend to make immediate sense of stimuli, "We all too often contaminate our perceptions with unexamined assumptions we have already internalized."[40] In other words, from the time when we have already decided what something means, everything we notice tends to confirm that interpretation. However, by challenging critically our assumptions and choices of evidence (and their interpretations) and asking about alternative explanations, we may bring our noticing back to a state where it "contributes to mindfulness by keeping us open to our experiences of the external."[41]

Bryant and Wildi consider "here and now awareness" to involve paying attention to immediate experience—as it happens. Clausewitz observes this phenomenon when he distinguishes between a commander's plan for war and the friction of war.[42] The former must be adapted in light of the latter. Knowing how to do this, and when, requires the situational awareness found in the here and now. As has been noted, critical thinking allows questioning of both what one is doing and how one is doing it. Here again, one can challenge whether one is focused in the present or dwelling in the past or imagining a future. One can ask whether one is relaxed or fixated on a goal; we can also reflect on whether we are acting mindlessly or mindfully. The key is remaining vigilant, as Warren Fishbein and Gregory Treverton note, as "[mindfulness] is the result of a never-ending effort to challenge expectations and to consider alternative possibilities."[43]

Such mindful vigilance can be a lifesaver, as *Foreign Policy* columnist and blogger Thomas Ricks notes about its absence among troops serving in Afghanistan, where Marines wearing iPods while on patrol can (and apparently do) fail to notice changes in the environment they have previously patrolled, and get hit by improvised explosive devices.[44] If they were mindful, they could have noticed that a hole in the road when they went out on patrol has been filled in before their return. Instead, the "turret gunner [is]

watching a movie on an iPod…[and] the back seater [is] listening to music on his [iPod]."[45] Not only are they not mindful, but no one is paying attention. According to Rick's Marine informant, ensuing and repeated iPod-wearing-induced mindlessness led to the unit's losing "15 out of 20 vehicles in about a month."[46] Clearly, the cost of not being mindful is high. However, becoming mindful is not difficult; that cost is relatively low.

Developing mindfulness is not—as Bouquet and Bryant, as well as Sethi, observe—an arcane spiritual practice. The process certainly involves self-reflection—meditation to some—but in fact self-reflection has become a central facet of professional practice in "real-world" security and defense planning.[47] However, mindfulness in operations or in intelligence is neither a panacea nor a formula: Bouquet and Wildi observe that "executives need to meditate in their own way, find ways to step back and reflect on their thoughts, actions, and motivations, and decide which ones are really supportive of their strategic agendas."[48] One of the benefits of such meditation, according to recent experimental findings, is that perceptual sensitivity and vigilance improve in situations requiring sustained visual attention.[49] While perceptual sensitivity and increased vigilance could also be attained, as in the case cited by Ricks, by simply leaving the iPods turned off and actually conducting reconnaissance and surveillance of one's surroundings, the problem of sustained-attention failure remains. Simply put, mindfulness declines over time. However, as MacLean *et alia* have demonstrated, sustained-attention failure can be reduced through formal meditation training.[50] In this case, formal

50 MacLean et al., "Intensive Meditation," 829.

meditation practices appear to sustain longer-term mindfulness—something the U.S. Army hopes will enhance the capabilities of its soldiers.[51]

While the U.S. Military and the Intelligence Community (like business enterprises) can provide environments conducive to developing mindfulness, Bouquet and Bryant remind us that developing mindfulness is "the responsibility of individuals, not companies."[52] The simple expedient of not engaging in mindfulness-reducing activities is one means of enhancing mindfulness; there are many others.[53] Critical thinking provides one self-reflective or *metacognitive* means to ascertain what surrounding phenomena are or are not taken into account.[54] Such mindfulness in turn supports the larger objective of intelligence sensemaking, the subject of this book. The author is aware of the confounding problem that intelligence may need to give attention to the entire domain of human behavior because every sphere of human practice and knowledge can be of interest and of use in the process of sensemaking. To limit this challenge, this book focuses on those areas that in the author's observation and experience appear most germane to the successful practice of national intelligence. The author intends for this book to generate beneficial discussion and further consideration of exactly what it means to engage in intelligence sensemaking and how one can go about it effectively.

53 Cloud, "Meditation."

54 "Metacognitive" as used here refers to a process of critically monitoring one's reasoning about an issue while one is engaged in that reasoning or critical thinking. This makes explicit the process of reasoning. However, the term "metacognitive" refers to much more as will be developed further in the paper that follows.

ACKNOWLEDGMENTS

The author's first notes about what 21st Century intelligence would look like as well as how it might be accomplished were crafted at a 2001 conference on the future of intelligence in Italy. The intervening years brought work on what it takes to be a successful intelligence professional and how critical thinking could aid the consideration of strategic issues and the creation of intelligence knowledge for decisionmakers. These steps, it turned out, led to a larger vision of what the practice of intelligence could be: a process of sensemaking.

Few projects are created without substantial assistance from others. This book is no exception. Elizabeth Moore offered valuable ideas and challenged my thinking. She also once again put up with a distracted husband who worked (very) late into the night and on the weekends. Colleagues and peers read and commented on various drafts, criticizing and offering valuable suggestions that sent the author in new directions. Among them are James Bruce, Science Applications International Corporation (SAIC); Stu Card, Palo Alto Research Center; Steven Carey, NDIC; Bruce Chew, Monitor Group; Jeffrey Cooper, SAIC; Linda Elder, Enoch Hale, Gerald Nosich, and Richard Paul, Foundation for Critical Thinking; Norman Endlich, University of Maryland; Warren Fishbein, Department of State; Robert Heibel, Mercyhurst College Institute for Intelligence Studies (MCIIS); Noel Hendrickson, James Madison University; Richards J. Heuer, Jr., Central Intelligence Agency (retired); Robert Horn, Stanford University; Francis J. Hughes, NDIC; Gary Klein, Klein Associates; Lisa Krizan, National Security Agency (NSA); Martin Krizan, NSA; Mark Lowenthal, president of the Intelligence and Security Academy, LLC; Brandon S. Minnery, IARPA (Intelligence Advanced Research Projects Activity); Esther Neckere, National Geospatial-Intelligence Agency; William Nolte, University of Maryland; Anthony Olcott, Georgetown University; Emily S. Patterson, Ohio State University; Randy Pherson, Pherson Associates; Peter Pirolli, Palo Alto Research Center; Timothy Smith, Office of Naval Intelligence; David Snowden, Cognitive Edge; Mark Stefik, Palo Alto Research Center; Kenneth Stringer, Booze Allen Hamilton; Cathryn Thurston, NDIC Press; Gregory Treverton, RAND; Kristan J. Wheaton, MCIIS; Phil Williams, University of Pittsburgh; Chris Westermann, Department of State; David Woods, Ohio State University; and Daniel Zelik, Ohio State University.

The participants in a number of workshops sponsored by IARPA, the Office of the Director of National Intelligence (ODNI), NSA, and the ODNI Global Futures Forum also provided input and ideas. The staff of the Foreign Denial and Deception Committee's denial and deception program at the National Defense Intelligence College (NDIC) invited the author to defend an early version of the text as part of an advanced studies program.

Contributors Robert Hoffman (Chapter 5) and Elizabeth Moore, William Reynolds, and Marta Weber (Chapter 7) graciously agreed to share their ideas in collaborative efforts to bring those chapters about. Without their assistance those two chapters would have been far less rich. Colleagues of Dr. Reynolds as well as Kristan Wheaton and his students in the MCIIS (acknowledged separately in Chapter 7) provided much of the "heavy lifting" that made the conclusions derived possible.

Russell Swenson, under contract to the NDIC's Center for Strategic Intelligence Research, once again provided the essential input of a good editor. His reviews tightened arguments and focused what follows. He also provided a wealth of new ideas that sent the author off in new directions and enriched the book significantly. William Spracher once more provided the skills of a technical editor. Cathryn Thurston, the Director of the NDIC Center for Strategic Intelligence Research and NDIC Press editor, supported the creation of this project as part of her advocacy that intelligence needs to be recast for this century.

While the author was privileged to receive the assistance of others, this remains his work and any errors are his. The author may be reached via electronic mail at *david.t.moore@ugov.gov*.

Definitions for Making Sense of Sensemaking

Intelligence is a "specialized form of knowledge…[that] informs leaders, uniquely aiding their judgment and decision-making." It is a type of knowledge created through organized activity that adds unique value to the policy- or decisionmaker's deliberations. In the U.S. context, it makes sense of phenomena of interest to national leaders, warfighters, and those that directly and indirectly support them. Intelligence makes sense of phenomena related to the social behaviors of others. It reflects interest in what anyone will do to, and with, others that could affect the national interests of the United States as well as the prosperity and security of its citizens. Intelligence maintains an interest in external phenomena, such as epidemic or pandemic diseases, that impact U.S. national interests. In contrast to some popular portrayals, it really is not voyeuristic: what others do privately and alone is generally of little interest or value except as it affects how they relate to, and behave toward others. In other words, when private behaviors reveal either vulnerabilities or preferences, they may become of value to intelligence practitioners.

Sources: David T. Moore, *Critical Thinking and Intelligence Analysis, Occasional Paper Number Fourteen* (Washington, DC: National Defense Intelligence College, 2006), 2. Cited hereafter as Moore, *Critical Thinking.* Intelligence also refers to activity and organization: See Kent, *Strategic Intelligence.*

Sensemaking as it is used here refers to "a set of philosophical assumptions, substantive propositions, methodological framings, and methods." As Mark Stefik notes (referring to work done with colleagues Stuart Card and Peter Pirolli), it "is how we gain a necessary understanding of relevant parts of our world. Everyone does it." Sensemaking goes beyond analysis, a disaggregative process, and also beyond synthesis, which meaningfully integrates factors relevant to an issue. It includes an interpretation of the results of that analysis and synthesis. It is sometimes referred to as an approach to creating situational awareness "in situations of uncertainty." Gary Klein, Brian Moon, and Robert Hoffman consider the elements of sensemaking and conclude that it "is a motivated, continuous effort to understand connections (which can be among people, places, and events) in order to anticipate their trajectories and act effectively."

These authors conclude that "the phenomena of sensemaking remain ripe for further empirical investigation and [warn] that the common view of sensemaking might suffer from the tendency toward reductive explanation." By reductive explanation Klein, Moon, and Hoffman refer to a tendency to overly simplify explanations—to "reduce" complex phenomena to simplistic models facilitating an apparently needed but shallow understanding.

Leedom, *Final Report: Sensemaking Symposium*, 23-25 October 2001, Command and Control Research Program Office of the Assistant Secretary of Defense for Command, Control, Communications and Intelligence. Gary Klein, Brian Moon, and Robert R. Hoffman, "Making Sense of Sensemaking 1: Alternative Perspectives," *IEEE Intelligent Systems* vol. 21, no. 4 (July/August 2006), 71, 72. Cited hereafter as Klein, Moon, and Hoffman, "Making Sense of Sensemaking 1." Paul J. Feltovich, Robert R. Hoffman, Axel Roesler, and David Woods, "Keeping It Too Simple: How the Reductive Tendency Affects Cognitive Engineering," *IEEE Intelligent Systems* vol. 19, no. 3 (May/June 2004).

Intelligence sensemaking encompasses the processes by which specialized knowledge about ambiguous, complex, and uncertain issues is created. This knowledge is generated by professionals who in this context become known as Intelligence Sensemakers.

These terms are used as defined here throughout this book.

Sensemaking: A Structure for an Intelligence Revolution[55]

David T. Moore

Knowledge welcomes challenges.

— Peter Kosso

Venture boldly into nonsense. Nonsense is nonsense only when we have not yet found that point of view from which it makes sense.

— Gary Zukav

CHAPTER 1
Introduction

Where We Are

How people notice and make sense of phenomena are core issues in assessing intelligence successes and failures. Members of the U.S. Intelligence Community (IC) became adept at responding to certain sets of phenomena and "analyzing" their significance (not always correctly) during the Cold War. The paradigm was one of "hard, formalized and centralized processes, involving planned searches, scrupulously sticking with a cycle of gathering, analyzing, estimating and disseminating supposed enriched information."[56] The paradigm did not stop within the IC, either. As Pierre Baumard notes, it was also imported, unchanged, by corporations.[57] However, the range

55 The opinions expressed are those of the author and do not represent those of the National Security Agency, the Department of Defense, or the Office of the Director of National Intelligence.

56 Philippe Baumard, "From Noticing to Making Sense: Using Intelligence to Develop Strategy," *International Journal of Intelligence and CounterIntelligence*, vol. 7, no. 1 (Spring, 1994), 30. Cited hereafter as Baumard, "From Noticing to Making Sense."

57 Baumard, "From Noticing to Making Sense," 30.

of phenomena noticed by intelligence professionals has broadened from a focus on largely static issues to encompass highly dynamic topics over the two decades since the end of the Cold War. Intelligence professionals are challenged to stay abreast. A growing professional literature by intelligence practitioners discusses these trends and their implications for advising and warning policymakers.[58]

The literature by practitioners embodies a trust that national intelligence producers can overcome the "inherent" enemies of intelligence to prevent strategic intelligence failure.[59] The disparity between this approach and accepting the inevitability of intelligence failure has grown sharp enough to warrant the identification of separate camps or schools of "skeptics" and "meliorists."[60] As a leading skeptic, Richard Betts charitably plants the hopeful note that in ambiguous situations, "the intelligence officer may perform most usefully by not offering the answer sought by authorities but by forcing questions on them, acting as a Socratic agnostic."[61] However, he completes this thought by declaring, fatalistically, that most leaders will neither appreciate nor accept this approach.

Robert Jervis resurrects a colorful quote from former President Lyndon Johnson, who epitomized the skeptical policymaker:

> Let me tell you about these intelligence guys. When I was growing up in Texas we had a cow named Bessie. I'd go out early and milk her. I'd get her in the stanchion, seat myself and squeeze out a pail of fresh milk. One day I'd worked hard and gotten a full pail of milk, but I wasn't paying attention, and old Bessie swung her s[..]t-smeared tail through the bucket of milk. Now, you know

---

58 The author previously explored this topic in David T. Moore, *Creating Intelligence: Evidence and Inference in the Analysis Process*, MSSI Thesis chaired by Francis J. Hughes (Washington, DC: Joint Military Intelligence College, July 2002) and David T. Moore, *Critical Thinking and Intelligence Analysis*, Occasional Paper Number Fourteen (Washington, DC: National Defense Intelligence College, 2006). Earlier work completed with coauthor Lisa Krizan also included such an examination. See, for example David T. Moore and Lisa Krizan, "Core Competencies for Intelligence Analysis at the National Security Agency," in Russell G. Swenson, ed., *Bringing Intelligence About: Practitioners Reflect on Best Practices* (Washington, DC: Joint Intelligence Military College, 2003), 95-132. Other recent work includes the writings of a number of Intelligence Community practitioners collected by Roger Z. George and James B. Bruce in *Analyzing Intelligence: Origins, Obstacles, and Innovations* (Washington, DC: Georgetown University Press, 2008).

59 Richard K. Betts, *Enemies of Intelligence: Knowledge and Power in American National Security* (New York: Columbia University Press, 2007). Cited hereafter as Betts, *Enemies of Intelligence*.

60 Tamas Meszerics and Levente Littvay, "Pseudo-Wisdom and Intelligence Failures, *International Journal of Intelligence and Counterintelligence* vol. 23, no. 1 (December 2009), 134, 135.

61 Betts, *Enemies of Intelligence*, 51.

> that's what these intelligence guys do. You work hard and get a good program or policy going, and they swing a s[..]t-smeared tail through it.[62]

Jervis asserts that policymakers and decisionmakers "need confidence and political support, and honest intelligence unfortunately often diminishes rather than increases these goods by pointing to ambiguities, uncertainties, and the costs and risks of policies."[63] The antagonism is exacerbated when policy is revealed to be flawed and to have ignored intelligence knowledge. For example, in the case of the Bush administration's handling of the Iraq War, intelligence challenges to policy were seen as "being disloyal and furthering its own agenda."[64] Jervis adds that the Bush administration is only the most recent one to exhibit such behavior. He finds that the administrations of Presidents Clinton, Johnson, Kennedy, and Eisenhower also browbeat and ignored intelligence.[65]

Betts, Jervis, and other *skeptics* believe that potential improvements to intelligence processes are limited. Jervis' article on intelligence and policy relations, while it correctly notes the tensions arising from the differing roles of intelligence and policy, over-generalizes the homogeneity of the policy community. It is the author's experience that outside of the highest levels, there are many levels of policymaking that both encourage and welcome the contributions of intelligence. Indeed, some parts of the policy community, beyond the Department of Defense (DoD) where it is the norm to do so, rely strongly on intelligence. Further, disagreements (which Jervis consistently labels conflict) are inherent and typically welcome in the process. Hard questions about the accuracy of judgments must be asked. If we are doomed to such "disagreements," then it is a doom we should be eager to embrace.[66]

The other perspective is that of the *meliorists*—those who feel intelligence processes can be improved. The present authors reside in this camp, preferring to believe that the application of well-informed, mindful expertise, as developed in the present work, can bring positive and substantive value to the fulfillment of the IC's obligations.

---

62 President Lyndon Johnson quoted by Robert Jervis, "Why Intelligence and Policymakers Clash," *Political Science Quarterly*, vol. 125, no. 2 (Summer 2010), 185. Cited hereafter as Jervis, "Why Intelligence and Policymakers Clash."

Much of the community and its supporting contractors have adopted the meliorist position.[67] As a result, intense attention within and outside the IC has focused on the means by which pertinent phenomena are to be understood. So-called intelligence "analytic" methods are being unshelved or developed and taught to novice and experienced intelligence professionals alike. However, less fully considered are the appropriateness and validity of these methods as well as the underlying assumptions they enshrine. Even less well understood is what happens when specific methods are combined and how those combinations may be made. Several ways exist to characterize these methods in terms of their purpose. However, to date, there is no readily available way to characterize methodological appropriateness or effectiveness, nor the limitations of individual methods. We also lack sound guidance on the use of combined methodologies, despite some recent, promising literature.[68]

A Roadmap

Before these deficiencies can be remedied, however, we need to reframe the way in which intelligence is created. Such a re-conceptualization involves critically examining what intelligence practitioners actually do, and why. The examination demands methodological rigor with particular attention to how we might ensure the validity of our approach to the work of intelligence. If the examination indicates that the existing paradigm for intelligence creation is inadequate, then a revolutionary shift in IC habits will be justified.

Despite the existence of legislative mandates for change, the intelligence-creation process remains largely a product of Cold War-era institutions

---

67 It should be observed that it is in the interest of IC contractors to adopt this position. As they lobby IC leadership, their sales pitch rests on the idea that their products are best suited for "fixing" the IC's problems. A contractor who is (honestly) skeptical of the possibility that intelligence can be improved is thus likely to see little IC business.

68 The human species likes to organize knowledge and intelligence professionals are no exception. The list of proposed organizational strategies or taxonomies for intelligence analysis is growing: Morgan Jones developed one such system fifteen years ago in conjunction with his book, *The Thinker's Toolkit: 14 Powerful Methods for Problem Solving* (New York, NY: Random House, Inc., 1995). Babette Bensoussan and Craig Fleisher include taxonomic elements in their catalog of competitive intelligence methods. See for instance, Craig S. Fleisher and Babette Bensoussan, *Strategic and Competitive Analysis: Methods and Techniques for Analyzing Business Competition* (Upper Saddle River, NJ: Prentice Hall, 2002) and *Business and Competitive Analysis: Effective Application of New and Classic Methods* (Upper Saddle River, NJ: FT Press, 2007). The faculty of Mercyhurst College's Institute for Intelligence Studies has issued a taxonomy of methods. Richards Heuer, Jr. developed one on a subcontract to support work performed by Least Squares Software under a contract to IARPA. Another former IC practitioner, Randy Pherson, developed a taxonomy for use in his training programs and subsequently combined his taxonomy with that of Heuer. See Richards J. Heuer, Jr. and Randolph H. Pherson, *Structured Analytic Techniques for Intelligence* (Washington, DC: CQ Press, 2010). To date, none of the taxonomies use cases nor do they ontologize the techniques, that is, show how they are interrelated in process.

and thinking, using the same cognitive frameworks that have been employed for decades. Some argue that what worked in the past is still appropriate. However, as numerous executive and legislative reports confirm, intelligence targets have in fact evolved: adversaries' goals have changed, and their methods have evolved, even if the threats they pose seem very familiar. In sum, the old national intelligence paradigm is woefully out of date.

What is needed now is a discussion of how intelligence can be adjusted to deal with its "traditional" issues as well as new and evolving ones. This book begins that discussion by challenging the standard view of how intelligence professionals do their work. First, as will become clear, intelligence professionals ought *not* be characterized as "analysts." The term is imprecise and inaccurate. If real improvement in intelligence practice is to occur, precision and accuracy in terminology, and thereby in how we think about what we do, are essential first steps.

Intelligence issues are not the same as the issues framed separately by policymakers. To partner successfully with policymakers, intelligence professionals must consider issues from multiple perspectives. This is the role of sensemaking. Yes, the sensemaking process includes "analysis" or attacking issues by "taking them apart." The process also includes synthesis—putting the pieces back together; interpretation—making sense of what the evidence means; and communication—sharing the findings with interested consumers. Essential to these processes is another, that of sound planning or "design."[69] While it could be said that this is what intelligence analysts do, such a statement is epistemologically false. Strictly speaking, intelligence analysts only take issues apart.

So what? Why should we be concerned with a matter of semantics? In short, because the terms we use within the Intelligence Community shape and reflect our practice. If we are to change the culture of intelligence, and be changed by it, our practice of intelligence must also change. New language encourages a new paradigm, and paradigm shifts are revolutionary, not evolutionary. Such a revolution in intelligence is implied in the reform legislation arising out of the 9/11 attacks and the failures to accurately assess the state of Saddam Hussein's programs of weapons of mass destruction.

---

69 Here, the term "design" mirrors the reflective re-conceptualization of the operational planning process being put in place, as noted earlier, by the School of Advanced Military Studies at Fort Leavenworth.

Kent's Imperative[70]

When much of the tradecraft of intelligence was put in place sixty or more years ago, the dominant framework was that of the historian as scientist. The primary intellectual framework for Cold War intelligence at the national level grew from Sherman Kent's seminal work, *Strategic Intelligence for American World Policy*.[71] Kent's legacy remains active in the National Intelligence Council and the Community at large.[72] Although decision theory and other social science thinking began to influence the creation of intelligence in the 1960s and 1970s, these inputs languished until the reform efforts of recent years. More recently, advances in cognitive science, anthropology, decision theory, knowledge theory, and methods and operations research have brought us to the brink of informed, mindful intelligence sensemaking.

Sherman Kent argues that in creating predictive intelligence about its adversaries "the United States should know two things. These are: (1)…*strategic stature*, (2)…*specific vulnerabilities*."[73] These objectives focus on capabilities and draw heavily from the "descriptive and reportorial elements" of intelligence for basic data.[74] In this way, knowledge about what an adversary ought to do is created. The method by which this is accomplished, according to Kent, is "the one which students reared in the Western tradition have found to be best adapted to the search for truth. It is the classical method of the natural sciences."[75] It involves advice from experts but sees as superfluous to these experts the use of designated red teams—which Kent considers "a new high in human fatuity."[76] If estimates developed from expert judgments are erroneous, he sees the remedy simply in getting more and better information to shed more light on foreign decisionmaking.[77]

The Failure of an Analytic Paradigm…

Kent's preference for gathering and disaggregating more and more data to find answers fails today in the face of information volume, velocity, and volatility. Marshaling and disaggregating ever more data does not equate to contextual understanding. Further, the assumption that larger pipes to collect data and larger arrays to store it will then allow us to uncover the hidden, clarifying nuggets, is misleading.

Consider what actually happens when intelligence professionals look for an answer to a problem or question. They do not just disaggregate data. Instead, people inquisitively (and selectively) interpret patterns by comparing observed, newly emergent phenomena to what they already "understand." They make sense of phenomena by asking questions; foraging for information; marshaling it into evidence; analyzing, synthesizing, and interpreting that evidence, and communicating their evidence-based understanding of issues to others. Something makes sense because, based on their experience, its pattern is similar to something they previously have seen and that made sense to them. They may even employ a new, self-generated pattern based on previously learned and remembered patterns if they do not get a good match to an ostensible pattern.[78]

Doing so accurately requires making judgments that correlate, according to Air Force thinker William Brei, to the "external world, as it actually exists, regardless of [one's] desires."[79] In other words, one must be able to convincingly correlate ostensible patterns to the data or information for which one is attempting to "make sense." This is not always possible, especially if the phenomenon or issue is broad, novel, or poorly understood; that is, not easily subject to confirmation by universal human sensory apparatii. Brei invokes Ayn Rand on this point:

> To define the meaning of the color "blue," for instance, one must point to some blue objects to signify, in effect: "I mean this."…To define "existence," one would have to sweep one's arms around and say: "I mean this."[80]

The social, economic and political relationships that characterize the government intelligence milieu mean that severe uncertainty will often remain part of the practitioner's conclusions; telling patterns are at best elusive.

…And a Remedy in Sensemaking

For practitioners to create intelligence knowledge—even with an acknowledged degree of uncertainty—therefore requires much more than mere "analysis." One alternative framework is embodied in the concept of sensemaking. Sensemaking begins with a mindful planning and questioning that leads to foraging for answers. It is true that along the way the resulting relevant assemblage of information—or evidence—is disaggregated into its constituent elements. However, it is also synthesized or combined to form a theory or systematic interpretation of the issue that subsequently must be explained, and convincingly. Throughout sensemaking, a continuous assessment is demanded of both the processes by which the intelligence is created and of the intelligence knowledge itself.[81] Mindfulness—as discussed above in the Preface—coupled with a critical thinking-based approach, provide the vigilance, awareness, and self-reflection needed to assess an issue rigorously. This is a central point: Intelligence does not exist in a vacuum. It must contribute to the understanding of an issue by informing the concerned parties of a perspective or information they did not already know. Ultimately, if no one is concerned about the knowledge sensemakers create, it is not intelligence.[82]

Karl Weick sees sensemaking as a multiple-step process by which someone goes from becoming aware of "something, in an ongoing flow of events, something in the form of a surprise, a discrepant set of cues, [or] something that does not fit," to a useful understanding of the phenomenon.[83] This definition, which allows for a focus on the social and political environments in which sensemaking takes place, applies to the concept as developed in the present book.

82 See Lois Foreman-Wernet, "Rethinking Communication: Introducing the Sense-Making Methodology," in Brenda Dervin, Lois Foreman-Wernet, and Eric Lauterbach, *Sense-Making Methodology Reader: Selected Writings of Brenda Dervin* (Cresskill, NJ: Hampton Press, Inc., 2003), 1-10. The authors consider communicating an essential part of sensemaking.

83 Karl E. Weick, *Sensemaking in Organizations* (Thousand Oaks, CA: Sage Publications, Inc., 1995), 2. Cited hereafter as Weick, *Sensemaking*.

Building on Weick's definition and work he did with Kathleen Sutcliffe, Warren Fishbein and Gregory Treverton observe that sensemaking is about anticipating uncertainty as opposed to reacting to it.[84] This means that the processes of sensemaking, and particularly collaborative sensemaking, are never satisfied with the status quo. Rather, sensemaking institutions constantly admit and raise doubts about what they believe. Because threats—as typified by many 21st century issues—can emerge "at any time, anywhere, and in a variety of forms, analysts need to think more in terms of a broad mental readiness to perceive early warning signs."[85]

IARPA, the Intelligence Advanced Research Projects Activity, employs a definition of sensemaking that is complementary to that developed here.[86] They propose that sensemaking is "a core human cognitive ability [that] underlies intelligence analysts' ability to recognize and explain relationships among sparse and ambiguous data."[87] This book accepts that perspective and develops the psychological, behavioral, and social levels of sensemaking as they apply to intelligence creation. By contrast, IARPA's own program on sensemaking seeks to build upon advances in computational cognitive neuroscience that reveal "the underlying neuro-cognitive mechanisms of sensemaking."[88]

As characterized by Peter Pirolli, the process of sensemaking is highly iterative, involving a foraging loop and a sensemaking loop.[89] In the former the sensemaker seeks information, "searching and filtering it," while in the

Stefik, Peter Pirolli, and Stuart Card, "The Cost Structure of Sensemaking," paper presented at the INTERCHI '93 Conference on Human Factors in Computing Systems, Amsterdam, NL, 24-25 April 1993, URL: <http://www2.parc.com/istl/groups/uir/publications/items/UIR-1993-10-Russell.pdf>, accessed 18 August 2010.

latter an iteratively developed mental model or schema is developed "that best fits the evidence."[90] While the overall flow is "from raw information to reportable results," top-down and bottom-up processes act in concert to reframe issues: information either does or does not fit the hypotheses being considered; hypotheses are refuted or refined, and the larger issue and its context are also reframed, as it comes to be more thoroughly understood.[91] How this can occur within the context of intelligence creation is developed in the following chapters.

To sum up, this book argues that intelligence built around a model of disaggregation as it originated with and developed under Kent, and is still largely practiced today, is at best insufficient. A paradigm based on the concept of sensemaking and employing insights from other knowledge-creation disciplines provides a more appropriate means of skillfully creating intelligence. This book draws a general picture of 21st Century intelligence under a revolutionary paradigm, although it does not explain how all its contours can be fleshed out. We believe that intelligence could be a true profession and moving toward that goal is our desire.[92]

CHAPTER 2
The Failure of "Normal Intelligence"

Intelligence Challenges

Our understanding of everyday phenomena is confounded by everyday strategies employed to mitigate cognitive dissonance, a stressful condition arising when reality clashes with one's perceptions. Two broad strategies, selective exposure and selective perception, can prevent dissonance, but at the expense of sound, mindful reasoning. Through the former, we limit the evidence to that which agrees with or otherwise supports our positions; in the latter, we interpret what we experience in terms of our pre-existing world-view.[93] Examples abound, for these strategies are inherent to the human species. A non-intelligence example appeared in a 2008 broadcast of National Public Radio's *This American Life*, in the story "What Part of 'Bomb' Don't You Understand?" In the broadcast, BBC commentator Jon Ronson juxtaposes the stories of London subway bomb survivor Rachel North and conspiracy theorists who claimed the entire event was fabricated by the British government. The conspiracy theorists even claimed that Rachel North was not an actual person despite her well-documented reality.[94]

Instructive accounts of 9/11 conspiracies and others appear in Farhad Manjoo's *True Enough: Learning to Live in a Post-Fact Society*. One example, related to 9/11, is a belief by some that the second plane that struck the World Trade Center first launched a missile into the building.[95] In both of the above cases, the conspiracy theorists only selected evidence consistent with their conspiracy world-views. What of the situation within intelligence sense-making circles? If the phenomena of both selective exposure and selective

93 For a highly readable discussion of cognitive dissonance, see Carol Tavris and Elliot Aronson, *Mistakes Were Made (But Not by Me): Why We Justify Foolish Beliefs, Bad Decisions, and Hurtful Acts* (Orlando, FL: Harcourt, 2007). For more on selective exposure and selective perception see Farhad Manjoo, *True Enough: Learning to Live in a Post-Fact Society* (Hoboken, NJ: John Wiley & Sons, 2008), especially Chapters 2 and 3. Cited hereafter as Manjoo, *True Enough*.

94 Jon Ronson, "What Part of 'Bomb' Don't You Understand?" *This American Life*, episode 338, 3 August 2008, URL: <http://www.thislife.org/Radio_Episode.aspx?episode=338>, accessed 4 August 2008.

95 Manjoo, *True Enough*, 74-80. Its proponents do not adequately explain the logic of such a claim. One key question is "What purpose would such a missile serve?" The proponents of this notion fail to answer this and a number of other important questions.

perception are common, then their effects on intelligence professionals deserve fuller study. It is not understood, for example, how much selective use of evidence typically occurs in the creation of intelligence assessments and estimates.

However, intelligence professionals cannot afford to consider only information that conforms to their own pre-existing worldview or agreed-upon, collective perspective. It is likely that selective exposure and selective perception contributed to the "failures of imagination" noted by the authors of the 9/11 Commission Report: U.S. intelligence professionals and policymakers in two U.S. administrations failed to make sense of the events leading up to the 11 September 2001 disaster.[96] Failure of imagination was so pervasive a factor that the 9/11 Commission Report found that even those who were oriented toward the threat, such as Richard Clarke, failed to adequately imagine the events of that tragic day.[97]

Errors and Failures

A first step in understanding the lack of sensemaking prior to the 11 September 2001 attacks and other similar events is to understand the differences between "intelligence error" and "intelligence failure." Anthropologist Rob Johnston defines intelligence error in terms of "factual inaccuracies in analysis resulting from poor or missing data."[98] Conversely, intelligence failures are "systemic organizational surprise resulting from incorrect, missing, discarded, or inadequate hypotheses."[99] Thus, the term "failure of imagination" makes sense as a synonym for intelligence failure, where members of an intelligence creating organization fail to imagine in advance the essential outlines of an incident that subsequently occurs.

Additionally, one must consider policy failures. Characterized simply, this failure is seen as the failure to act on intelligence received, and it occurs at many levels. Bruce Berkowitz argues that these errors arise when policymakers "blindside themselves by how they perceive intelligence, by

97 *The 9/11 Report*, 344. Richard Clarke's memo to Condoleezza Rice warning of the aftermath of such an attack understates the consequences. Clarke considers hundreds dead, not thousands. See Dan Eggen and Walter Pincus, "Ex-Aide Recounts Terror Warnings: Clarke Says Bush Didn't Consider Al Qaeda Threat a Priority Before 9/11," *The Washington Post*, 25 March 2004, A01.

98 Rob Johnston, *Analytic Culture in the U.S. Intelligence Community: An Ethnographic Study* (Washington, DC: Center for the Study of Intelligence, 2005), 6. Cited hereafter as Johnston, *Analytic Culture*.

99 Johnston, *Analytic Culture*, 6.

the mental hurdles intelligence must surmount before it can change their perceptions, and in the constraints that limit their ability to act on information…deep down, officials seem to want intelligence to make decisions for them, when in reality, it rarely can."[100] Thus Admiral Husband Kimmel's failure to anticipate the Japanese attack on Pearl Harbor can be attributed (in part) to an inability to overcome a preexisting view about the (in)vulnerability of U.S. forces in Hawaii and particularly at the Pacific Fleet headquarters of which he was in charge.[101] This was exacerbated presumably by a degree of uncertainty in the intelligence. In order to take preventative measures, Kimmel had to *act* based on intelligence reporting, not *react* to it. In considering intelligence-based policy failures, one must consider that despite these explanations, it is the job of intelligence to make sure policy "gets it" and therefore intelligence (or at least its presenters) must also share in the blame. Thus the briefer of a senior policymaker bears a degree of responsibility if the message is not effectively transmitted and acted upon. That this is a difficult task at best must be noted. Policymakers—as is widely noted—often have their own agendas. Would they use intelligence to further them? Fen Osler Hampson argues this was the case in (at least) three separate crises involving Cuba (1962, 1973, and 1979).[102]

Intelligence failures, policy failures and their resulting crises are a regularly recurring theme in U.S. intelligence and policy from at least the mid-20th Century, and likely earlier, to the present. A list of such failures includes:

- Japan's attack on Pearl Harbor (intelligence failure, policy failure).[103]

---

100 Bruce Berkowitz, "U.S. Intelligence Estimates of Soviet Collapse: Reality and Perception," in Francis Fukuyama, ed., *Blindside: How to Anticipate Forcing Events and Wild Cards in Global Politics* (Washington, DC: Brookings Institution Press, 2007), 30. Cited hereafter as Berkowitz, "Soviet Collapse."

102 Fen Osler Hampson, "The Divided Decision-Maker: American Domestic Politics and the Cuban Crises," *International Security*, vol. 9, no. 3 (Winter, 1984-1985), 130. Cited hereafter as Hampson, "The Divided Decision-Maker." The ODNI issued *Intelligence Community Directive Number 203: Analytic Standards* (June 21, 2007), URL: <http://www.fas.org/irp/dni/icd/icd-203.pdf>, accessed 16 October 2010. The second standard is "Independent of Political Considerations" (p. 2).

103 This failure consisted of intelligence policy and errors, as well as intelligence and policy failures. However, hindsight consideration of the events clouds the fact that it was not clear until just before the Japanese attack that an attack was indeed likely. That it was a possibility was, however, discussed. At Pearl Harbor, however, no measures were taken to mitigate the impact of such an attack: Aircraft remained tightly packed on landing areas and ships lacked torpedo nets. The result was strategic surprise at all levels. The best account remains Roberta Wohlstetter, *Pearl Harbor: Warning and Decision* (Stanford, CA: Stanford University Press, 1962).

- North Korea's invasion of the South and China's involvement in the subsequent war (policy failure, intelligence failure);[104]
- The Soviet Union's deployment of IRBM and MRBM nuclear missiles in Cuba (intelligence failure);[105]
- The Vietnamese' Tet Offensive (policy failure, intelligence error);[106]
- The fall of the Shah of Iran (intelligence failure);[107]
- The Soviet Union's invasion of Afghanistan (intelligence failure);[108]

---

104 There is controversy as to whether the invasion of South Korea by North Korea was predicted in advance. Common wisdom considers that no prediction was made. However, Major General Charles A. Willoughby's Korean Liaison Office (KLO) did predict the likelihood of invasion in the spring of 1950 (Kenneth J. Campbell, "Major General Charles A. Willoughby: A Mixed Performance," unpublished paper, URL: <http://intellit.muskingum.edu/wwii_folder/wwiifepac_folder/wwiifepacwilloughby.html>, accessed 5 January 2010). However, according to D. Clayton James, Willoughby had so alienated himself from the CIA and the State Department's intelligence bureau that his warnings apparently were ignored by the civilian intelligence components. The Army's G-2 apparently ignored his warning as well, possibly because the United States Military Advisory Group to the Republic of Korea, and not the KLO, was tasked with such estimating. See also, D. Clayton James, *Years of MacArthur, 1945-1964* (Boston, MA: Houghton Mifflin, 1985), 416. The fact that warnings were issued but ignored adds the policy failure component.

105 DCI John McCone was at first skeptical and then was convinced that there were missiles in Cuba. Refugee reports during the summer of 1962 suggested that the missiles were based in Cuba. However, the Office of National Estimates under the leadership of Sherman Kent predicted the Soviets would not deploy missiles in Cuba. U-2 overflights did not detect the presence of the missiles until mid October, although they had earlier detected the presence of defensive Surface to Air Missiles. Lacking confirmatory technical corroboration, the State Department and the White House were not willing to act based on refugee reports (which had been received since 1960 and up to this point apparently had been incorrect). See Linda K. Miller and Mary McAuliffe, "The Cuban Missile Crisis," *Magazine of History*, vol.8 (Winter 1994), URL: <http://www.oah.org/pubs/magazine/coldwar/miller.html>, accessed 5 January 2010.

106 According to Harold Ford, despite analyses to the contrary, wishful thinking by key policymakers and their political pressure on the Intelligence Community to concur led to an underestimation of the Viet Cong and North Vietnam's military capabilities. Such a view precluded the possibility of a Tet-like offensive. Thus systemic surprise from a policy failure is associated with the Tet Offensive. See Harold Ford, *CIA and Vietnam Policymakers: Three Episodes 1962-1968* (Washington, DC: Center for the Study of Intelligence, 1998), 85-138.

107 In writing about failure, Bruce Berkowitz quotes the CIA August 1978 assessment that "Iran is not in a revolutionary or even pre-revolutionary state." See Bruce Berkowitz, "U.S. Intelligence Estimates of Soviet Collapse: Reality and Perception," in Francis Fukuyama, ed., *Blindside: How to Anticipate Forcing Events and Wild Cards in Global Politics* (Washington, DC: Brookings Institution Press, 2007), XX. Cited hereafter as Berkowitz, "Soviet Collapse."

108 Doug MacEachin writes that the failure to predict the Soviet invasion of Afghanistan "illustrates probably the most recurrent trap for analysts...One part of it might be called the 'model cage.' Once having constructed an intellectual model of how the variables are likely to play out, each new piece of information is weighed in accordance with the components of that model. Evidence that does not fit is far more likely to be explained away than used to question the model's validity. In this case, the actions taken (military preparations) were not used to interpret intentions so much as the conclusions about intentions were used to interpret the actions." See Douglas MacEachin, *Predicting the Soviet Invasion of Afghanistan: the Intelligence Community's Record* (Washington, DC: Center for the Study of Intelligence, 2002), URL: <https://www.cia.gov/library/center-for-the-study-of-intelligence/csi-publications/books-and-monographs/predicting-the-soviet-invasion-of-afghanistan-the-intelligence-communitys-record/predicting-the-soviet-invasion-of-afghanistan-the-intelligence-communitys-record.html>, accessed 5 January 2010.

- The collapse of the Soviet Union (intelligence failure?, policy failure?);[109] and
- Iraq's 1990 invasion of Kuwait (intelligence failure, policy failure).[110]

Similarly, professionals apparently failed to make sense of the precursors of the 25 December 2009 attempt to bring down a U.S. airliner over Detroit. Here again, failures of imagination that accompanied the centrifugal disaggregation of data gathering and evaluation on the "underwear bomber" contributed to the scenario of not performing early cross-checking of no-fly lists and other terrorist-related databases, as well as not accepting the father of a motivated Islamic radical as a credible source.[111]

These intelligence errors and failures have occurred as the IC has continued in the Kent vein of seeking more and better data, but without framing the issues in a way that allows the national intelligence process to use its special capabilities to apply deductive or even abductive logic to foraging for, marshaling and evaluating data. At the same time, intelligence oversight reports by Congressional committees and Special Commissions

---

109 There is considerable disagreement about whether the Community failed to predict the collapse of the Soviet empire. For a summary of both sides of the issue with references, see Gerald K. Haines and Robert E. Leggett, ed., "Introduction and Overview of the Conference Papers" in *Watching The Bear: Essays on CIA's Analysis of the Soviet Union* (Washington, DC: Center for the Study of Intelligence, 2003), URL: <https://www.cia.gov/library/center-for-the-study-of-intelligence/csi-publications/books-and-monographs/watching-the-bear-essays-on-cias-analysis-of-the-soviet-union/index.html>, accessed 5 January 2010. In taking the position that the community *did* warn, Bruce Berkowitz argues the "record suggests that U.S. intelligence provided about as good a product as one could reasonably expect...[It] stipulated a set of conditions...and it notified top U.S. leaders when these conditions were met." If not an intelligence failure, then what? Berkowitz offers clues to this question in noting that leaders blindside themselves by failing to understand intelligence—in this case their failing to "get it" about the intelligence coming out of the IC leads one to conclude the failure was theirs—a policy failure. Additionally, he notes that popular belief in the failure, an example of selective perception, was also the result of key documents remaining classified, a sort of selective exposure. See Berkowitz, "Soviet Collapse," 29-30, xx.

110 Don Oberdorfer, writing in *The Washington Post*, notes that policymakers admitted to being "guilty of a kind of mind-set or framework about Iraq." They failed to consider that the Iraqis would go beyond saber rattling to invade Kuwait. Oberdorfer also quotes administration officials as admitting that they did not focus on Iraq because the "didn't have the time." See Don Oberdorfer, "Missed Signals in the Middle East, *The Washington Post Magazine*, 17 March 1991, 40.

111 The Senate Select Committee on Intelligence released its report on the "underwear bomber" incident on 18 May 2010 (see *http://intelligence.senate.gov/100518/1225report.pdf*). Of 14 points of failure identified, 12 were failures of intelligence process, including interpretation. Failures to correctly interpret source information are a part of the other failures cited above. For example, such failures also occurred in the case of the Cuban Missile crisis where (as we discovered some 40 years later) the refugees were telling us the truth: there were nuclear missiles in Cuba during the summer of 1962; they simply were not strategic missiles. Rather they were tactical, nuclear-tipped cruise missiles. See Raymond L. Garthoff, "US Intelligence in the Cuban Missile Crisis," in James G. Blight and David A. Welch, eds., *Intelligence and the Cuban Missile Crisis* (London, UK: Frank Cass, 1998), 29. Cited hereafter as Garthoff, "US Intelligence."

have repeatedly faulted the Community for its lack of imagination in anticipating at least the grand design of events that, instead, surprised or shocked nearly everyone associated with this Community. This unhappy situation suggests that there are flaws in Kent's model of disaggregating significant amounts of data in order to predict specific events. The etymology of "imagination"—generating images—reminds us of the contemporary critic of Kent, Willmoore Kendall, who suggested that the job of national intelligence is to communicate with decisionmakers in a "holistic" way so as to generate the "pictures [mental models] that they have in their heads of the world to which their decisions relate."[112]

Considering Standard Models

Intelligence failures occur as practitioners employ a "standard model"[113] of intelligence: In it, analysts "separate something into its constituent elements[114] so as to find out their nature, proportion, function, relationship, etc.[115] and "produce reports" based on "collected" information and data. There is a definitional presumption that disaggregation will lead to answers. However, this model *incompletely* describes what the intelligence professional does and its underlying presumption about finding answers may be false.

One problem is that in Kent's data-based analytic framework, analysts need to have all the data available so they can be marshaled into a coherent account. "Dots"—if they exist at all—can be connected in more than one way.[116] In foresight it is difficult at best to determine which combination and order is valid. Such determinations can be further complicated by the fact that adversaries may change their actions if they suspect we have arrived at a certain conclusion.

An additional problem is that with an increased number of signals there is also an increased level of noise. Which signals, which facts, or which inferences the intelligence professional should consider valid becomes a very important consideration. At best, warning of a pending incident is a problem of assembling and making sense of the details of a specific incident in advance. However, many intelligence problems inherently defy such linear

116 Robert Horn prefers to refer to dots as "smudges," suggesting that they are at best imprecise in both existential and contextual frameworks. Robert Horn, conversation with the author, 6 October 2010.

characterization. They are in fact "wicked" problems—a formal designation of a complex issue with myriad linkages. We turn next to an exploration of problem types to see how their nature directs our making sense of them.

Types of Problems

In order to understand "wicked problems," one must first understand the nature of "tame problems."

Tame Problems

In a tame problem there is general agreement as to what or who an adversary is, what the "battlefield area" is, and what an attack is. Such problems, while difficult, exhibit specific characteristics: They are clearly defined and it is obvious when they are solved. Solutions to these problems arise from a limited set of alternatives that can be tested; the correct solution can be objectively assessed. Finally, solving one tame problem can facilitate creating valid solutions to other, similar tame problems.[117]

It is important to note that analysis protocols for tame problems contain little or no room for "emergent" properties. One may not know that the analytic protocol is insufficient until the puzzle has been incorrectly defined, characterized, and solved, if it is in fact solvable. One arrives at one solution that at first appears to have resolved the issue, but in fact, the issue reemerges elsewhere. For example, the implementation of a linear, intelligence-driven solution to crack down on insurgents and their improvised explosive devices (IEDs) in one area may lead to an emergence of IED-caused explosions somewhere else. In such a case, the application of "tame problem protocols" may in fact have been inappropriate—the problem is in fact not tame.

Admittedly, many 21st Century intelligence issues remain puzzles or tame problems. This occurs when the events surrounding the issues have already occurred, appropriate questions are readily identifiable, and answers exist, even if they are difficult to find. For example, in a weapons proliferation puzzle, if we know that missiles have been built, the nature of their warheads and their accuracy "may remain unknown even though they are knowable."[118] Solution is a process of discovery and sensemaking.

Seen in this light, even the attacks on the United States by Al Qaeda on 11 September 2001 could be considered a puzzle or tame problem. Plans

118 Gregory F. Treverton, *Reshaping National Intelligence for An Age of Information* (Cambridge, UK: Cambridge University Press, 2001), 12. Cited hereafter as Treverton, *Reshaping National Intelligence*.

had been made, necessary skills (flying airplanes) learned, surveillance conducted, targets selected, weapons acquired, and terrorists positioned. The issue faced by intelligence professionals—and where we failed—was to sense and then figure out all (or at least enough) of the pieces before the events of that day occurred. We also had to figure out what the "event" was. The difficulty of doing so at both a theoretical and practical level points out how difficult tame problems can be to solve. As noted, in the end we failed, although some pieces of the puzzle—such as the flying skills necessary—at least had been sensed. In this case, the essence of the puzzle itself—the intention to deliberately fly passenger airplanes into structures in the U.S.—remained unidentified.

Wicked Problems

However, seen in a larger context, are such puzzles truly tame? Or are they components—as Russell Ackoff suggests—of something larger: a mystery in Treverton's terms, or a "mess" according to Ackoff.[119] Treverton's intelligence mysteries defy easy definition. They belong to a class of problems defined by social researchers Horst Rittel and Melvin Webber as "Wicked Problems." In describing this domain Rittel and Webber note that in considering wicked problems and systems there are a great many barriers to sensemaking:

> [Theory] is inadequate for decent forecasting; our intelligence is insufficient to our tasks; plurality of objectives held by pluralities of politics makes it impossible to pursue unitary aims; and so on. The difficulties attached to rationality are tenacious, and we have so far been unable to get untangled from their web. This is partly because the classical paradigm of science and engineering—the paradigm that has underlain modern professionalism—is not applicable to the problems of open societal systems.[120]

The adaptive nature of adversaries makes seemingly tame puzzles wicked, moving them into the realm of "unknown unknowables."

By definition, wicked problems are "incomplete, contradictory, and changing."[121] They do not have single answers and in fact, are never truly

answered. In the context of intelligence, the sensemaker may never realize a problem has been resolved. This is because "the solution of one of its aspects may reveal or create another, even more complex problem."[122] The emergent complexity of the problem itself, its adaptive nature, efforts at denial and deception by adversarial actors, as well as cognitive frailties on the part of sensemakers, compound the problem, confounding sensemaking, leading in some cases to disastrous courses of action or consequences.

Table 1. Characteristics of Wicked Problems
Wicked problems have no definite formulation.
Wicked problems have no clear end-point.
Solutions to wicked problems are at best good or bad.
Tests of solutions to wicked problems may not demonstrate their validity and may provoke undesired consequences.
Implementing solutions to wicked problems changes the problem.
Sensemakers can never know if they have determined all the solutions to wicked problems.
Each wicked problem is essentially unique.
Every wicked problem is embodied in another one.
How wicked problems are resolved is determined by the means and methods used to make sense of them.
Sensemakers have no right to be wrong.

Source: Derived from Horst W. J. Rittel and Melvin M. Webber, "Dilemmas in a General Theory of Planning," *Policy Sciences* 4 (1973), 155-169.

Rittel and Webber note that all wicked problems share at least 10 characteristics in common (summarized in table 1). Wicked problems so framed allow us to proceed with discussions into their nature. The two men argue, however, that our standard "basis for confronting problems of social policy is bound to fail, because of the nature of these problems." The means that we typically have at hand for cognitive handling of these problems "is not applicable."[123]

123 Rittel and Webber, "Dilemmas," 162.

A Wicked Look at Wicked Problems in Intelligence

Characterizing intelligence issues in terms of their problem type—admittedly somewhat vaguely (in keeping with their nature)—reveals just how prevalent wicked problems are within the domains of intelligence.

Wicked problems have no definite formulation. To Rittel and Webber, "the process of solving the problem is identical with the process of understanding its nature, because there are no criteria for sufficient understanding."[124] In other words, making sense of problems deemed sufficiently complex so as to be considered wicked is equivalent to characterizing them in the first place; the description encompasses all possible solutions.

For example, one wicked problem could be "how best to stem the growth of terrorism in the Middle East." An assumption in considering this problem is that if intelligence professionals can understand what motivates people to become terrorists in the first place, intervention might be possible. Mitigating the creation of new terrorists could aid in reducing both their numbers and by extension, their attacks. Do people become terrorists because they are dissatisfied with what they see as contradictions and hypocrisies in their lives? If so, what then are the specific roots of dissatisfaction and contradiction? One commonly cited is a lack of economic opportunity for males within societies. In that light, Rittel and Webber ask, "where within the…system does the real problem lie? Is it deficiency of the national and regional economies, or is it deficiencies of cognitive and occupational skills within the labor force?"[125] The possible solutions to this problem extend the domain of questions, spreading ever outward.[126]

Our ignoring domains that seem irrelevant (either for practical or political reasons) is a strategy of selective exposure and perception. Admittedly, some domains may be inconsequential. On the other hand, one of the interesting features of complex systems is that small perturbations can produce large impacts. So, a decision to eliminate factors from consideration may result in discarding seemingly inconsequential elements, with as yet unknown but major impacts. Such possible impacts cannot be known in advance, as they are a part of the noise surrounding the issue. Indeed, as Nicholas Taleb notes,

> [Our] track record in predicting those events is dismal; yet by some mechanism called the hindsight bias we think that we understand

124 Rittel and Webber, "Dilemmas," 162.

125 Rittel and Webber, "Dilemmas," 161.

126 Such domains include (among others) economics, culture, history, geography, roles of language, religion, or law, singly or in combinations.

> them. We have a bad habit of finding "laws" in history (by fitting stories to events and detecting false patterns); we are drivers looking through the rear view mirror while convinced we are looking ahead.[127]

Seemingly unimportant factors also are not considered by sensemakers due to a failure to adequately address assumptions about the issue at hand, as noted in official reviews of recent "intelligence failures." For example, the Senate's report on the prewar assessment of weapons of mass destruction in Iraq specifically notes that analysts' assumptions were not challenged in the creation of the estimate.[128]

Even with the addressal of major assumptions, there remain additional underlying factors that do not get questioned—almost an endless succession of assumptions that must be peeled off the problem much as one peels layers off an onion. There is an added complication that individual layers are not sequential and in fact may lead (to continue the analogy) to other onions or other vegetables, or even fruit. In intelligence, such assumptions are themselves a *mess*: a complex system of interrelated experience, knowledge, and even ignorance that affects reasoning at multiple levels sequentially and simultaneously. There is an old English children's nursery rhyme that neatly characterizes this: "For want of a nail the shoe was lost. For want of a shoe the horse was lost. For want of a horse the rider was lost. For want of a rider the battle was lost. For want of a battle the kingdom was lost. And all for the want of a horseshoe nail."[129] Clearly, such a sequence implies a logical progression, whereas in dealing with wicked problems, the order may be mixed up. Some of the links may even be unknown—either missing or unknowable.

Wicked problems have no clear end-point. With tame and well-structured problems one knows when the solution is reached. In wicked problems this is not so, as Rittel and Webber make clear:

> There are no criteria for sufficient understanding and because there are no ends to the causal chains that link interacting open systems, the would-be planner can always try to do better. Some additional investment of effort might increase the chances of finding a better solution.[130]

130 Rittel and Webber, "Dilemmas," 162.

This is not a new consideration. Writing in the 1930s, John Dewey observed that "the 'settlement' of a particular situation by a particular inquiry is no guarantee that *that* settled conclusion will always remain settled. The attainment of settled beliefs is a progressive matter; there is no belief so settled as not to be exposed to further inquiry."[131] Intelligence sensemakers routinely confront this challenge. Reports and assessments often update or revise previous conclusions. Often the previous reporting is consulted *before* the new report is written so that the author can determine the preexisting point of view on the issue. Such consultations at best determine whether the current situation deviates from the norm. Unfortunately, sometimes such consultations lead to the rejection of the new evidence, opening the way to intelligence errors and failures. One goal of an adversary's denial and deception activities is to facilitate rejection of the novel deviation. It was in this way that the possibility of nuclear missiles deployed to Cuba was rejected amid outlandish noise during the summer of 1962, and military exercises along the Suez Canal lulled Israel into a sense of creeping normalcy prior to October 1973.

Solutions to problems may be implemented for "considerations that are external to the problem" itself: problem solvers "run out of time, or money, or patience."[132] In intelligence, sensemakers may only be able to work for a given time on a problem before they have to issue their report. Changes in funding may mean that an effort to understand a phenomenon has to be discontinued. The practicalities of resource limitations force changes in sensemakers' foci. However, this does not mean that the problem does not continue to exist and perhaps, threaten. Rather, an answer has been developed to a distilled problem, communicated, and now other things must be done.

Solutions to wicked problems are at best good or bad. Some problems have true or false, yes or no answers. These are not wicked problems. Wicked problems have no such answers. Differing perspectives applied by different problem solvers, differing sets of assumptions, and differing sources of evidence are several of the factors that lead separate groups to come to different judgments about wicked problems. The impossibility of exhaustively considering all the factors and solutions of the problem also contributes to a multiplicity of solutions. At best these can be ranked as good or bad solutions. In most cases, according to Rittel and Webber, the solutions are expressed as "better or worse" or "satisfying" or "good enough."[133]

132 Rittel and Webber, "Dilemmas," 162.

133 Rittel and Webber, "Dilemmas," 163.

Given, for example, the problem of stemming the growth of terrorism, there is no one simple solution that suffices. Instead, a number of differing solutions exist, depending upon (among other things) the perspectives about the domains at work in the problem. Focusing on the economics surrounding the growth of terrorism leads to different proposed solutions than does focusing on the demographics involved in the issue. Religious considerations or broader cultural considerations also create different solutions. Each of these perspectives in turn optimizes multiple points of view with differing, good and bad solutions. Overlap is possible and even desired. Good solutions encompass multiple domains.

Tests of solutions to wicked problems may not demonstrate their validity and may provoke undesired consequences. Implemented solutions to wicked problems "generate waves of consequences over an extended—virtually an unbounded—period of time."[134] Further, these consequences may themselves prove so undesirable as to negate any and all benefits of the original decision—*and this cannot be determined in advance*. Thus an intelligence-based decision to invade a country's possessions may create circumstances that offset any gains initially won, as the Argentineans discovered in 1982 when they—unwisely in retrospect—seized the British-owned Falkland Islands. From the perspective of the Argentine regime, the initial "victory" was offset when Britain forcibly retook the islands. The Argentine Navy lost a capital ship and many died; the regime lost power and was ultimately ousted. Seen from the perspective of the Argentine people this was, in the long term, of benefit. The government-condoned disappearances (torture and murder) of its foes ceased. Democratic processes were restored. However, things could easily have gone in another direction. One repressive regime could have been replaced by another. None of these outcomes was knowable in advance.

Implementing solutions to wicked problems can change the problem. In intelligence problems, real solutions cannot be practiced; there are no "dry runs." True, sensemakers and their policy-making customers can (and should) consider what *might* happen or the "implications" of the decisions or solutions of the problem at hand. Doing so might increase the likelihood that the decision selected is the best or the less bad of a set of bad alternatives.

Modeling the situation is one common means of assessing the implications of a potential action. However, models must by their very nature limit the factors considered. This raises the question of how one might know in advance if the eliminated factors are in fact significant. Further, modeling or any other means of generating solutions does not guarantee that the selected

134 Rittel and Webber, "Dilemmas," 163.

decision is the right decision. Once implemented it cannot be undone. It is noteworthy that at this point "implications" that do arise are actually "consequences" and hopefully they have been considered. But additional consequences and responses to those consequences by the actors in the problem as they respond to the "solution" will change, transform and evolve the problem. Taking down a terrorist's "safe house" may not reduce the threat, but does change where and how the remaining terrorists operate. This applies as well to attempts to reverse decisions. As Rittel and Webber note, "every attempt to reverse a decision or to correct for…undesired consequences poses another set of wicked problems,"[135] as sensemakers and planners involved in the U.S.-led "war on terror" have discovered. Actions, once taken, may mitigate the threat, or may not, which leads to the next facet of wicked problems.

Sensemakers can never know if they have determined all the solutions to wicked problems. They can expect, however, that they almost certainly *have not* determined all the solutions. In developing the range of alternatives within scenarios, two goals predominate: mutual exclusivity and collective exhaustion. In other words, each alternative must preclude the simultaneous possibility of the others, *and* the entire set of known alternatives must be considered. In practical terms, this is much more difficult to achieve than it sounds. Intellectual frameworks and so-called "biases" such as vividness, anchoring, confirmation, and others combine to prevent people from being able to consider all the alternatives. Adding to this is the fact that issues evolve in unpredictable ways. All the solutions simply are not knowable because they lie in the future. This does not justify not trying to completely assess the alternatives but rather provides recognition that some alternatives elude consideration.

Each wicked problem is unique. While it is true that common elements can be found between problems, there remain additional and unique properties of "overriding importance."[136] In other words, wicked problems cannot be characterized into "*classes*…in the sense that principles of solution can be developed to fit *all* members of a class."[137] For example, there are common elements or patterns in proliferation that allow recognition by sensemakers: acquisition of certain materials, construction of facilities, and the like. However, denial and deception—if applied—may obscure these commonalities. Knowing specific details of a weapons development program can be elusive. Another element, the *intentions* of the proliferators or the

135 Rittel and Webber, "Dilemmas," 163.
136 Rittel and Webber, "Dilemmas," 164.
137 Rittel and Webber, "Dilemmas," 164.

recipients of the proliferated systems are also of critical importance; they may be unique, and perhaps intractable. What Rittel and Webber have to say about this consideration is germane to intelligence: "Despite seeming similarities…one can never be *certain* that the particulars of a problem do not override its commonalities with other problems already dealt with."[138]

Every wicked problem is embodied in another one. Rittel and Webber describe problems as

> [discrepancies] between the state of affairs as it is and the state as it ought to be. The process of resolving the problem starts with the search for causal explanation of the discrepancy. Removal of that cause poses another problem of which the original problem is a "symptom." In turn, it can be considered the symptom of still another, "higher level" problem.[139]

What policies and actions, for example, are necessary to "fix intelligence?" Answering this involves asking what is causing intelligence to fail. One place to start is to consider why analysts are wrong and how intelligence errors lead to intelligence failure.[140] Yet such considerations lead one to consider how consumers may ignore intelligence, and how adversaries may in fact be "more capable" than expected. These in turn lead to what Jeffrey Cooper considers "analytic pathologies" that decrement both individual and corporate efforts to make sense of issues (table 2). Each of Cooper's specific pathologies is furthermore at least partially embodied in the others, giving rise to error-producing systems.[141] For example, Cooper argues that intelligence professionals' pathological focus on both "the 'dots' analogy and the model of 'evidence-based' analysis…understate significantly the need for imagination and curiosity."[142] Related to this is what he calls the myth of "Scientific Methodology." Analysis is *not* [hard] science and is *not* about proof. Rather it is about discovery.[143] These are embodied in the protocols he refers to as the flawed "Tradecraft Culture,"—a guild system of potential sensemakers and their historically unchanging ways of working.[144]

143 Cooper, *Analytic Pathologies*, 28-29.

144 Cooper, *Analytic Pathologies*, 30.

Table 2. Cooper's Analytic Pathologies
An intelligence account system whereby institutions and individuals "own" issues is inefficient. The return on investment for having accountability is too low when compared to the lack of cooperation, collaboration, and sharing such a system promotes. (30-31)
A cultural "evidence-based scientism" that prevents anticipatory consideration of policy and military intelligence consumers' needs. (31)
An overemphasis on current intelligence to the detriment of the "long view" resulting from a chaotic post-Cold War environment of emergent issues and crises. (32)
A production-oriented model that focuses on collecting, and processing massive quantities of data, and producing routine reports without the capability to adroitly refocus resources for ad hoc reports. (32)
A use of previous judgments as the starting point for all subsequent reporting. A corollary is a belief that "finished intelligence" is anything more than a snapshot in time, that it conveys larger "truth." (33)
A neglect of deep research about issues brought about by short-term tasks. (34)
A neglect of anticipatory intelligence arising from attempts by intelligence sensemakers to emulate the other (current) intelligence sources—such as news networks—on which their consumers also rely. (35)
A loss of "keynote species," mid-level sensemakers with deep domain expertise who create the in-depth assessments that convey what specific issues are all about. (36-37)
An inaccurate focus on results instead of processes leads to a failure to develop, validate, and promulgate methods of intelligence sensemaking. (37)
A security mindset leads to a lack of cooperation between intelligence sensemakers, and domain experts and their knowledge regardless of who and where they are. (38)

Source: Derived from Jeffrey Cooper, *Curing Analytic Pathologies: Pathways to Improved Intelligence Analysis* (Washington, DC: Central Intelligence Agency, Center for the Study of Intelligence, 2005), 30-38.

Rittel and Webber posit "incrementalism" as a not uncommon approach to mitigating these effects. Related to Kuhn's concept of "normal science," incrementalism may actually compound the specific problem further because incrementalism

> [advertises] a policy of small steps, in the hope of contributing systematically to overall improvement. If, however, the problem is attacked on too low a level (an increment), then success or resolution may result in making things worse, because it may become more difficult to deal with the higher problems. Marginal improvement does not guarantee overall improvement.[145]

In considering Cooper's pathologies, summarized in table 2, fixing selective individual pathologies—insofar as possible—produces organizational changes that may inhibit further "fixes" by making them monetarily or organizationally too expensive. For instance, "solving" technological problems associated with Cooper's identified pathologies imposes infrastructures that may inhibit other necessary transformations such as developing a more agile workforce.

How wicked problems are resolved is determined by the means and methods used to make sense of them. In other words, how problems are perceived determines the kinds of solutions that are proposed. Point of view becomes essential in defining what a problem is and how it is to be resolved. Complex, wicked problems (as well as many "tame" ones) cannot be defined from one point of view. Defining the causes of terrorism is a case in point. As considered by the participants at the 2005 International Summit on Democracy, Terrorism, and Security, sponsored by the *Club de Madrid*, terrorism's causes lie in five broad domains: psychology, politics, economics, religion, and culture. Yet, as Martha Crenshaw notes in the conference report on the causes of terrorism, such considerations may be invalid:

> Explaining terrorism in terms of background conditions (social, economic, demographic, political, or cultural) is insufficient at best, and wrong at worst. Focusing exclusively on underlying structures provides little predictive capacity. "Root causes" may, in fact, influence the subsequent trajectory of terrorism more than its onset since they determine the extent of social support for violence by justifying grievances.[146]

---

145 Rittel and Webber, "Dilemmas," 165.

146 Martha Crenshaw, "Political Explanations," in Kim Campbell, ed., *Addressing the Causes of Terrorism: The Club de Madrid Series on Democracy*, vol. 1 (Madrid, SP: Club de Madrid, 2005), 13.

Yet these considerations are used to develop "solutions" to terrorism. Methods that consider and "solve" underlying economic or demographic issues, we may discover, only partly explain the phenomena.

How Are Wicked Problems Disruptive?

Disruption, as developed by Clayton Christensen, emerges from technologies that, while they may under-perform established technologies, open new markets and change the ways people do things. Enlarging the definition, disruptive intelligence problems threaten to change the way people interact. They proffer or impose new paradigms—both "good" and "bad"—for non-governments and governments alike. The disruption occurs because the incumbent is doing the *most rational thing it can do* given its circumstances. Doing the right thing generates the opportunity for disruption. For example, among the disruptions arising from a pandemic could be an easing of population pressures (if enough people die). This could lead to a freeing-up of energy resources for the survivors. Alternately, such a population die-off might cause a breakdown of societal infrastructures leading to riots and chaos. Both outcomes (and others)—as seen in anticipation—share likelihoods: all are likely. None of them can be reliably calculated (and therefore predicted) with any certainty.

See Clayton Christensen, *The Innovator's Dilemma* (Cambridge, MA: Harvard University Press, 1997).

Sensemakers have no right to be wrong. One of the first things many visitors to the CIA first see is the aphorism, "You shall know the truth, and the truth shall set you free."[147] As retired CIA veteran Ray McGovern comments,

> [T]he primary function of the Central Intelligence Agency is to seek the truth regarding what is going on abroad and be able to report that truth without fear or favor. In other words, the CIA at its best is the one place in Washington that a President can turn to for an unvarnished truthful answer to a delicate policy problem.[148]

This aphorism may have validity in the domain of tame problems where the truth is known or knowable. However, it has much less (if any) validity in the world of wicked problems where many truths can coexist,

147 John, 8:32 (King James' Version).

148 Will Pitt, "Interview: 27-Year CIA Veteran," *Truthout*, 26 June 2003, URL: <http://www.truthout.org/docs_03/ 062603B.shtml>, accessed 12 March 2007.

depending on the point of view expressed, the context can be simultaneously true and contradictory, and may in fact be unknowable.

The goal of assessing wicked problems may be to "improve some characteristics of the world where people live. Planners are liable for the consequences of the actions they generate; the effects can matter a great deal to those people that are touched by those actions."[149] Intelligence error, regardless of what causes it, is considered intolerable as U.S. policymakers and Intelligence Community sensemakers most recently discovered with their inaccurate estimate on the state of Iraq's programs to develop WMD. Earlier policymakers and sensemakers faced similar situations regarding the intentions of Japan, North Korea, China, Cuba, the Soviet Union (repeatedly), and India. In other words, restating part of Rittel and Webber's quote above yields this guideline: "*intelligence professionals* are liable for the consequences of the intelligence they generate."

An Intelligence Example: Pandemics as Wicked Problems

One of the threats faced by intelligence organizations and their professionals is that of an emergent global pandemic. What kind of a threat is a pandemic? Is it a tame or wicked problem, or something in between? Such considerations matter because they define what approaches are suitable for alleviating or mitigating the threats to national security that pandemics pose.

Historically, pandemic infectious diseases disrupted societies over wide regions of the world. Of these, the bubonic plague pandemic of the mid 14th Century, also called the "Black Death," is perhaps the best known. By killing off approximately one-third of Europe's population, it is credited with ending serfdom in most of the region. There was tremendous disruption, with both good and bad effects, and it is no coincidence that the Renaissance arose in its aftermath.[150] According to Norman Cantor, "[the] Black Death was the trauma that liberated the new."[151] The rational things to do in the

149 Rittel and Webber, "Dilemmas," 167.

150 Other developments such as the invention and use of the legal contract (by the Italians), which spurred trade; and a widening use of water wheels, which facilitated manufacturing, also were significant factors.

151 Norman F. Cantor, *In the Wake of the Plague: The Black Death & the World it Made* (New York, NY: The Free Press, 2001), 202. Cantor observes that this idea is controversial, citing work by Medieval historian Dom David Knowles arguing that the Black Death had little or no impact on Europe, and that of historian David Herlihy, which argues that it was highly significant. See David Knowles, *Great Historical Enterprises and Problems in Monastic History* (London, UK: Thomas Nelson and Sons, 1962); and David Herlihy, *The Black Death and the Transformation of the West*, Samuel K. Cohn, Jr., ed. (Cambridge, MA: Harvard University Press, 1995).

14th Century were to join concentrated populations in cities with regular inter-city trade routes to move goods. These conditions provided the disruptive opportunity for the pathogen.

Pandemics are by their nature adaptive and possibly recurring. Seen in hindsight, pandemics may appear to be tame problems, seemingly clearly defined and understood. But the requirement to deal with pandemics (and other wicked problems) is not to address them merely in hindsight—rather our well-being depends on foresight. This is, after all, how intelligence enterprises and their professionals work their issues. Rittel and Webber's criteria for a wicked problem provide a means of characterizing pandemics?[152]

- *Wicked problems have no definite formulation*. Ninety years after it occurred, the 1918 influenza pandemic remains only partially understood. As Edwin Kilbourne notes, "the origin of this pandemic has always been disputed and may never be resolved."[153] Seen as it emerged, the pandemic was even less clearly understood. While germ theory was known in some places, we did not know how to apply it to the pandemic nor how to protect ourselves. Similarly, while today the causes of Avian Flu are known to be the H5N1 virus, if, when, how, and where it (or some other as yet unknown virus) mutates from an animal-to-animal (and occasionally an animal-to-human form) to a human-to-human form remains unknown. Further, the exact nature of the mutation—necessary for the formulation of a vaccine—is and remains unknown. Most recently the difficulty in determining these factors with regard to the 2009-2010 H1N1 "Swine Flu" pandemic may have led to an overestimation of the severity of the pandemic by the U.S. Centers for Disease Control.[154] While this is a problem for epidemiologists and others tasked to create vaccines, it is also a problem for the sensemakers—who have to estimate the impact of having or not having a vaccine—and the policymaker who has to consider the implications of various courses of action (with or without a vaccine).
- *Wicked problems have no clear end-point*. Specific pandemics do have an end. The disease, having run through the population,

152 It is germane to note that if pandemics truly are a wicked problem (as is argued here) then characterizing them as such only partially and inexactly describes them.

153 Edwin D. Kilbourne, "Influenza Pandemics of the 20th Century" *Emerging Infectious Diseases*, vol. 2, no. 1 (January 2006), 9. URL: <www.cdc.gov/eid>, accessed 28 March 2007. Cited hereafter as Kilbourne, "Influenza."

154 Carl Bialki, "Swine Flu Count Plagued by Flawed Data," *Wall Street Journal*, online edition, 23 January 2010, URL: <http://online.wsj.com/article/SB10001424052748704509704575019313435804 60.html>, accessed 2 February 2010.

dissipates or abates. However, the diseases recur as the viruses evolve and mutate. In the case of the 1918 pandemic, the second wave of the virus apparently was more lethal than the first. Yet, similar, less deadly influenza occurs annually and subsequent pandemics are repeating phenomena.

- *Solutions to wicked problems are at best good or bad*. Vaccines are typically the solution to the annual influenza epidemic. In some years they are good—they are effective against the specific strains of the virus—and in some years they are not good (bad)—they are less effective against the specific strains.
- *Tests of solutions to wicked problems may not demonstrate their validity and may provoke undesired consequences*. Tests of pandemic plans and preparedness for cities and even countries provide a degree of comfort but no guarantee they will be effective against either the pandemic against which they were developed or another unexpected pandemic (such as that of the 2009-2010 H1N1 pandemic). It simply is not known nor knowable in foresight whether the measures will work, or the degree to which they will work until they are tested by the actual event. Furthermore, the proposed measures—once made—close off governments, corporations, and people from considering other options. If major adjustments are needed against the actual pandemic, it will take time to overcome the understandable resistance. Thus, testing and planning may have undesirable consequences in a real pandemic emergency.
- *Implementing solutions to wicked problems can change the problem*. One means of dealing with a pandemic in its early stages is quarantine. At the national level, this means closing international borders, preventing people as well as goods from entering or leaving the country. Doing so compounds the pandemic problem by adding economic issues. Companies relying on imported goods or on the ability to export goods may fail. Essential food items may not be available. Entire sectors of an economy may fail. The effectiveness of closing the borders depends (in part) on timing. Fewer people may die in the short-term but the longer-term economic disruptions may in fact increase mortality from other causes. The "problem" is no longer (just) the pandemic itself. Sometimes highly beneficial consequences arise out of catastrophes brought about by wicked problems. For example, as related by David Morens and Jeffrey Taubenberger, the Phillips Collection of Art in Washington, DC, owes its creation to the response of Duncan Phillips to the deaths

of his father and especially to the death of his brother James.[155] Phillips "as a direct consequence of the death of his brother James from influenza…dedicated his life…to establishing one of the finest public museums of modern art in the world."[156]

- *Sensemakers can never know if they have determined all the solutions to wicked problems.* Developing a collectively exhaustive list of options is difficult even when a complex issue is well understood. When the issue is not well understood, or is emerging, such lists become almost impossible to complete. In the case at hand, vaccinations, quarantines, and border closings all are suggested as means of mitigating a pandemic. However, it remains unknown what else is necessary to prevent or stem the spread of viruses and their impact on populations. While steps such as closing the borders, closing the schools, curfews, and ensuring that people wash their hands can be put in place, they can easily reach a point of unmanageability.
- *Each wicked problem is essentially unique*. While there are some commonalities between them, each influenza pandemic of the 20th Century essentially was unique. As Kilbourne notes, "Each differed from the others with respect to etiologic agents, epidemiology, and disease severity."[157]
- *Every wicked problem can be embodied in another one*. Influenza typically arises from close contact among animals and humans in agrarian settings. Thus, the influenza problem overlaps social problems that overlap economic problems and so on…
- *How wicked problems are resolved is determined by the means and methods used to make sense of them*. Means and methods of problem solving carry embedded assumptions about their appropriateness, the degree to which they are suited to the problem at hand, and of what they actually attempt to make sense. In examining a pandemic, vaccination strategies lead to certain results, whereas border closures lead to other ones.
- *Sensemakers have no right to be wrong.* Nor, in the case of pandemics or other global threats, do their policymaking consumers. When the stakes are the lives of many people, sensemakers

and policymakers who miscalculate or underestimate or are otherwise wrong about a pandemic and its impact on their countries or region can expect vilification at best. A fear of such vilification from the public and the media might contribute to the situation whereby pandemic-tracking organizations such as the U.N. World Health Organization or the CDC *overestimate* the severity and threat posed by a pandemic such as the 2009-2010 Swine Flu pandemic.[158] For intelligence professionals this phenomenon is not unknown. Common wisdom among intelligence sensemakers is that it is far better to warn and be mistaken (and nothing happens) than to not warn and be mistaken (something happens).

Complexity

Rittel and Webber's notions of wicked problems can also be characterized through the lens of complexity theory. As developed by Jonathan Rosenhead, "systems of interest to complexity theory, under certain conditions, perform in regular, predictable ways; under other conditions, they exhibit behaviour [sic] in which regularity and predictability is lost."[159] This is exceptionally true of intelligence. Certain kinds of issues, including the interpretable indications of a build-up to armed conflict, can be extremely predictable. For example, if one observes a mass of troops approaching a national border and knows that the means by which these troops were trained includes a doctrine of "mass and attack," then one might legitimately adduce that an attack is likely and imminent. One could even use the past as a means of prognosticating the future with some degree of legitimate confidence.

However, in other situations, there may be a number of unknowable, unpredictable, and unanticipatable outcomes. Thus, reliable prognostication is simply not possible.[160] For instance, if a coalition of nations removes an oligarch in another nation from power, the specific outcomes of that action cannot be known in foresight. While alternative outcomes can be modeled

158 Whether overestimation occurred was argued in the European Parliamentary Assembly, although the WHO denied that it occurred. See "WHO Rejects Accusations It Mishandled H1N1, Updates Worldwide Stats," Kaiser Family Foundation, URL: <http://globalhealth.kff.org/Daily-Reports/2010/January/25/GH-012510-Swine-Flu.aspx?utm_source=feedburner&utm_medium=feed&utm_campaign=Feed%3A+kff%2Fkdghpr+%28Kaiser+Daily+Global+Health+Policy+Report%29>, accessed 2 February 2010.

160 More on this below.

and simulated, they remain valuable only as discussion points: there is no guarantee in advance that they have captured the reality that will occur. Modeling and simulation are feasible because complexity science shows that the "indeterminate meanderings of these systems, plotted over time, show there is pattern in the movements…the pattern stays within a pattern, a family of trajectories."[161] Unfortunately, because intelligence must address the "real" world, rather than its modeled or simulated semblance, events often are unique and therefore their patterns also are unique.[162] Thus, there exists an inability to guarantee a future reality; even probabilities may be suspect.

Analysis as here defined is insufficient to address complexity. Disaggregation simply does not reveal future alternatives. That this is so becomes obvious if one finds that it is the emergence of unique and novel behaviors arising from different and minutely differing initial conditions that characterize many 21st Century intelligence issues. In these circumstances, the whole of an issue is *greater* than its parts. But, in analysis, the issue is by definition and practice the *sum* of its parts.

Given these complex issues, the concept of "analysis" is simply insufficient for sensemaking. Instead, greater conceptual accuracy and precision of terminology is required. To achieve the needed accuracy and precision requires more than semantic invention. It also demands that underlying concepts, known as assumptions or premises, be identified and accounted for. Therefore, in developing the case for considering new paradigms for intelligence, certain terms require explicit (re)definition.

Implications of Complexity

Viewed from a larger context, complexity stymies the entire "standard model" of intelligence creation. With regard to Kent's concept of knowledge, or how intelligence is created, complexity—as viewed from the framework of wicked problems—confounds the consideration and mitigation of such problems. Kent's model of predictive and specific warning seems more miss than hit. Complexity further confounds the collaborative processes contained

161 Rosenhead, "Complexity Theory."

162 It should be noted that some intelligence-associated phenomena do exhibit general patterns that may be indicative. Observations of military preparations are an example, although caution is necessary when one extrapolates what those observations mean. For example, while one may make certain conclusions about a massing of troops on a border in light of who trained those troops (as was the case with Iraqi troops massed along the Kuwaiti border in 1990), what the indicator means may be subject to error. This latter point is illustrated by CIA Director John McCone's conclusion that SA-2 deployments in Cuba indicated strategic nuclear missiles were also being deployed. McCone's conclusion—although it turned out to be correct in the Cuban case—ignored the deployment of SA-2s without (presumably) the accompanying strategic nuclear-armed missiles to Egypt and Syria that was taking place at the same time. See Moore, *Critical Thinking*.

within Kent's notions of Activity and Organization, by which intelligence professionals are tasked to interact. How does the intelligence professional know in advance whose imagination will be most helpful in making sense of the problem at hand in time to prevent a catastrophe or even imagine one? For example, viewed in hindsight, the Drug Enforcement Administration (DEA) might have had a key piece of knowledge that would have been useful in the early apprehension of the December 2009 "underwear bomber." Certain illegal drugs—marijuana is one—are often "stashed" in a traveler's underwear.[163] In retrospect, one question becomes, "what else could be carried in this fashion?"

Asking such questions in retrospect is irrelevant. The question should have been asked in foresight—but how does an intelligence professional or even an airline security official know to ask the question in advance? Here again, complexity confounds the necessary collaboration. An intelligence professional might ask, "Which agency or agencies can help me make sense of this issue?" With 17 intelligence agency partners, there are up to 131,071 possible collaborative combinations—any of which (in various combinations) might be valuable.[164] This number presumes the searching intelligence professional knows which person—and there is only one person—in each agency who can help. The number grows at least exponentially when more than one individual at each agency might be helpful. While this situation presumes that the intelligence professional does not know who that person is in advance, in fact the professional does have a likely list of contacts, reducing the number of possible combinations dramatically. Still, this collaboration exercise may be a wicked problem. There may be sets of better collaborative combinations. The key imagination—as characterized by the DEA in the example above—may not be part of the collaborating group. One challenge is to determine a best collaborative combination prior to the event and develop believeable scenarios of what might transpire.[165] Finally, it

---

163 The author presumes the DEA is aware of this practice and would think of it if asked "how might one transport something without its being detected." The author's youthful observations while growing up in the American Southwest as well as discussions with state and local law enforcement officials engaged in intelligence-led policing training suggest the practice is fairly widespread.

164 The formula for such calculations is 2 raised to the power of the number of variables, in this case intelligence agencies, or 17, minus 1 ($2^n - 1$). See David T. Moore and William N. Reynolds, "So Many Ways To Lie: The Complexity of Denial and Deception," *Defense Intelligence Journal*, vol. 15, no. 2 (Fall 2006): 95-116. While the author and William Reynolds discuss complexity calculations in the context of denial and deception, the same notions apply to collaboration.

165 Peter Schwartz and Doug Randall, "Ahead of the Curve: Anticipating Strategic Surprise," in Francis Fukuyama, ed., *Blindside: How to Anticipate Forcing Events and Wild Cards in Global Politics* (Washington, DC: Brookings Institution Press, 2007), 94. Cited hereafter as Schwartz and Randall, "Ahead of the Curve."

must lead to an action. As Peter Schwartz and Doug Randall write, "Achieving believability and action requires a depth of insight and understanding that is rare."[166]

Given the challenges of both tame and wicked 21st Century intelligence problems and their inherent complexity, what are intelligence professionals to do? One avenue open to them, and presented below, is the development and validation of methods of reasoning about key evidence.

166 Schwartz and Randall, "Ahead of the Curve," 94.

CHAPTER 3
From Normal to Revolutionary Intelligence

Evidence-Based Intelligence Creation

Intelligence sensemakers use more than context-less data and information. They employ assemblages of *evidence*—at a minimum, collections of data and information determined through marshaling to be relevant to the issue under consideration—in other words, contextualized to specific issues. Evidence reveals alternative explanations through pattern-primed, induced inferences about what is going to happen or what has happened already in the past.[167] While the inferences are typically uncertain, they do justify beliefs about phenomena. Justifying beliefs (or theories or hypotheses) presents a case for their accuracy but does not guarantee ground (or any other) "truth." Rather, as Peter Kosso notes, justifying beliefs is "about meeting the standards of evidence and reason [to] indicate [the] likelihood of accuracy."[168] Sensemakers go further and seek to demonstrate that the knowledge of tendencies they establish provides for "a correlation between being more justified and being true."[169] For example, during a recent exercise in which the author was a participant, one team reached an inferential conclusion about a likely explanation of the phenomenon being examined. The participants were presented with a set of previously determined alternative conclusions and a set of supposedly relevant evidence and asked to assess which (if any) conclusions were justified and true. After reaching an initial position they then were required to consider an alternative conclusion that presumed their original conclusion was false. In so doing they found that while the original conclusion initially

167 Reasoning about past events remains easier than reasoning about the future. In the former case, the evidence may be contradictory, deceptive, and subject to more than one interpretation. However, it tends to be more complete and marshaled (or at least discoverable). When looking to the future the important consideration is that much of the evidence does not yet exist. The events described by precursor information may not have occurred. Additionally, the tests of the information that transform it into evidence necessarily remain incomplete.

168 Peter Kosso, "Introduction: The Epistemology of Archaeology," in Garrett G. Fagan, *Archaeological Fantasies: How Pseudoarchaeology Misrepresents the Past and Misleads the Public* (London, UK: Routledge, 2006), 4. Cited hereafter as Kosso, "Epistemology."

169 Kosso, "Epistemology," 4.

appeared more accurate, the latter one was in fact "true." This was in part because they made wishful assumptions about the evidence they used to justify their conclusions. As Kosso observes, "more justification is better, since it raises the likelihood of accuracy. But it is certainly possible for a well-justified belief to be false."[170] This realization on the part of the participants subsequently led to a more critical assessment of the evidence, much of which was found to be false. They discovered that "justification comes in degrees, but truth does not."[171]

It is arguable whether greater evidentiary justification demonstrates the likelihood of a strongly accurate correlation with truth. As Kosso makes clear, even with abundant justification, there is no certainty of truth. Therefore, according to Kosso, it "is the task of the systematic disciplines…to refine carefully the content of justification, the evidence and the network of theoretical beliefs, to bring justification into ever closer correlation with truth."[172] If intelligence is to "speak truth to power" it must first ensure its words are well and critically justified.[173]

As figure 1 illustrates, intelligence sensemaking is conducted in service of a number of goals, including describing states of affairs, explaining phenomena, interpreting events and actions, and estimating the likelihood and impact of a foe's future actions As intelligence professionals move from describing events, explaining patterns of behavior, and grasping underlying factors and intentions, ever more justification of beliefs about the phenomena under scrutiny is required. Yet, as intelligence professionals attempt to apply greater scrutiny in this sequence, their capability to do so decreases as they face greater ambiguity.

Additionally, we may expect that sensemakers will more often be wrong in offering *estimations* about phenomena than when they are merely describing them. This is in part because of an interesting reality characterized by Taleb: To predict the future we must already know the future.[174] What Taleb means is that one has to already have visualized what the future will be in order to estimate it. Kosso, in writing about epistemic science, elaborates:

---

170 Kosso, "Epistemology," 4.

171 Kosso, "Epistemology," 4.

172 Kosso, "Epistemology," 5.

173 The aphorism "speak truth to power" is variously (and wishfully) ascribed to Sherman Kent. Research by the author and discussions with former intelligence officers who knew and worked with Kent fails to reveal this to be the case. Intelligence strives to ensure its findings are factual and—to the best knowledge of its creators—"true."

174 Nassim Nicholas Taleb, *The Black Swan: The Impact of the Highly Improbable* (New York, NY: Random House, 2007), 173. Cited hereafter as Taleb, *The Black Swan*.

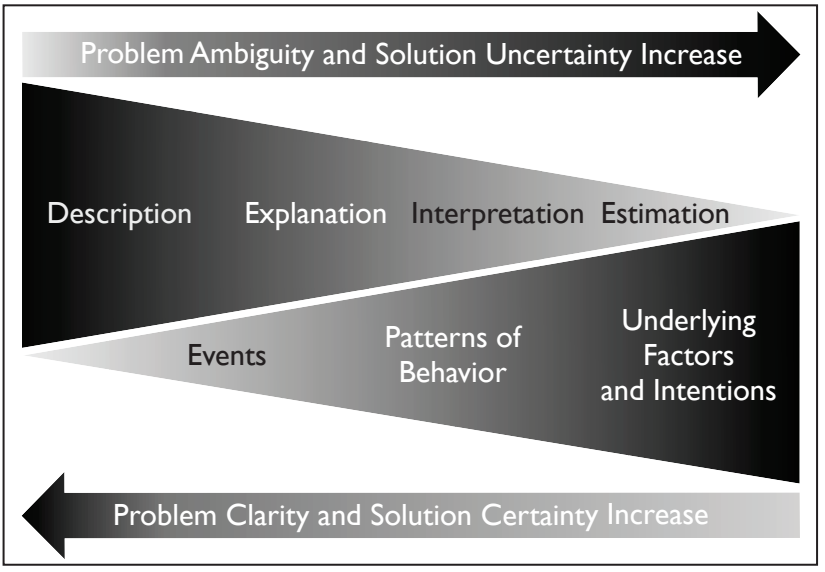

Figure 1. Types of Intelligence and the Phenomena They Characterize. Complexity, ambiguity, and uncertainty increase as one moves from Descriptive to Estimative Intelligence.

Source: Author.

> [The] knowledge claims are more ambitious in that they stray further from what is immediately observed…The theoretical descriptions are based on observation and evidence…But it is important to note that the observations themselves are based on theory. Scientific evidence, after all, is neither haphazard nor uninterpreted, and some prior conceptual understanding of nature will inform decisions about what to observe, which observations are credible, what the observation means, and how what is observed is causally (and hence intentionally) linked to what is not observed. Theory is necessary to turn mindless sensations into meaningful evidence.[175]

While Kosso writes in the language of science, his argument applies as well to Manjoo's "post-fact" world of which intelligence often attempts to make sense.[176] Intelligence is created ultimately from human, sensory-mediated observations of phenomena. Further, intelligence evidence, while

175 Kosso, "Epistemology," 5.

176 By "post-fact" Manjoo refers to a tendency to ignore evidence in favor of predetermined conclusions. Common examples include the arguments of pseudosciences such as astrology or intelligent design. A more serious example is manifested by parents who refuse—due to pseudoscientific (and disproved) conclusions—to vaccinate their children. Within the IC this tendency manifests itself when intelligence professionals let predetermined conclusions drive their intelligence creation efforts rather than let evidence go in search of hypotheses.

it may appear to remain "haphazard," is the result of systematic foraging, gathering and interpretation. The past tells intelligence practitioners what to look for in the future. This poses dangers when those indicators are no longer (if indeed they ever were) valid. As Baruch Fischoff suggests, "searching for wisdom in historic events requires an act of faith—a belief in the existence of recurrent patterns waiting to be discovered."[177] Yet, while general patterns may exist, "the past never repeats itself in detail."[178] In other words one might detect indicators suggesting that an upcoming event similar to one in the past is possible, likely, or even reasonable. On this basis, one could, for example, have anticipated that sooner or later foreign terrorists would again attack the United States by targeting some high-value building or event, such as the World Trade Center.[179] This is a far cry from predicting that Al Qaeda terrorists would fly airplanes into the World Trade Center and the Pentagon on the morning of 11 September 2001.[180] Finally, intelligence practitioners making sense of issues rely heavily on theories, which if unacknowledged, essentially are unexamined assumptions.

If using the past to gain wisdom about what the future holds is not feasible, what about studying the past to avoid folly? Tversky and Kahneman's work on *availability* leads one to suspect (as Fischoff also notes) that focusing on misfortunes "disproportionately enhance[s] their perceived frequency."[181] Another challenge to considering the past as a teacher of what not to do is that one may not properly understand the problem. While understanding may be possible (or even easier) when dealing with Tame Problems—as has been discussed above, when considering Wicked Problems, such understanding is elusive at best and is dependent on the methods chosen to deal with the problem; in other words, woefully incomplete.

---

177 Baruch Fischoff, "For Those Condemned to Study the Past: Heuristics and Biases in Hindsight," in Daniel Kahneman, Paul Slovic, and Amos Tversky, *Judgment Under Uncertainty: Heuristics and Biases* (Cambridge, UK: Cambridge University Press, 1982), 338. Cited hereafter as Fischoff, "Condemned to Study the Past."

178 Fischoff, "Condemned to Study the Past," 336.

179 On 26 February 1993, a truck bomb placed by Islamic terrorists exploded below one of the buildings of the World Trade Center and was apparently intended to topple both towers. For a discussion of the security implications, see Laurie Mylroie, "Who is Ramzi Yousef? And Why It Matters," *The National Interest*, 22 December 1995. Available at URL: <http://www.fas.org/irp/world/iraq/956-tni.htm>, accessed 12 October 2010.

180 Such an attack had been *anticipated*. As Schwartz and Randall comment, "many people did anticipate the terrorist attacks of September 11 [2001]...Yet most Americans, as well as officials in both the Clinton and Bush administrations, focused their attention elsewhere while the inevitable grew imminent." Schwartz and Randall, "Ahead of the Curve," 94.

181 Fischoff, "Condemned to Study the Past," 339. See also Amos Tversky and Daniel Kahneman, "Availability: A Heuristic for Judging Frequency and Probability," *Cognitive Psychology*, vol. 5 (1973): 207-232.

With the intention to improve evidence-based intelligence creation, recent legislation "reforming" intelligence goes so far as to require that "alternative analysis" be conducted.[182] The IC, at least through its schools, interprets this to mean that *multiple* hypotheses be considered. The relevant act mentions "red teaming: a means by which another group of intelligence professionals consider alternative explanations for an issue being scrutinized.[183] The legislation leaves unexamined the question of whether the criteria for sensemaking will be met in examining tame problems and especially wicked problems arising from consideration of adversarial intentions.

If, for example, one estimates that a particular country whose policies one's own government generally opposes will develop both a long-range missile capability and a nuclear weapons capability and then marry the two together, one has to have already imagined, in the context of the target country's political and technological environment, what a long-range missile capability is, what a nuclear weapon is, what a weapon of mass destruction is, and a strong sense of the will to combine these threat elements. Policymakers may challenge the target country's actions, making their leaders more adversarial. Thus, at a minimum, intelligence and policy create the future—or a version of it. Done poorly, this can lead to unintended and dangerous implications.

Emerging from this mélange are hypotheses that are ripe for disconfirmation, although a tendency to compound uncertainties on the part of intelligence professionals and their consumers my serve to prevent this from occurring. If in fact, in the example above the assessment is wrong, and the nuclear capability assessed to be for weapons really is intended to provide an alternative to the nation's dependency on a dwindling supply of increasingly more expensive petroleum as a source of energy, and the missiles support a nascent space program designed to orbit telecommunications satellites that can fulfill the country's needs and those of their neighbors as well as generate income for the government, then sensemakers and policymakers on all sides will have extrapolated inappropriate patterns arising from a misunderstood present. In a tense bilateral or even multilateral environment, rhetoric and actions can precipitate events so as to create a future consistent with those pattern-derived conclusions, driving the target country to produce the weapons. Each side then blames the other nation's government for having "caused" the crisis.

182 U.S. Congress, IRTPA, 2004, 33.

183 U.S. Congress, IRTPA 2004, 33.

There are a number reasons why such faulty causal networks occur. Honest evidentiary considerations demand a degree of agnosticism about the theories being justified. Evidence-based knowledge, as Peter Kosso's epigraph at the beginning of this book acknowledges, is not absolute; justified evidence *changes* theories and not the other way around. In other words, when interpretations of the evidence lead to coherent alternative inferential conclusions, then the existing or accepted theories require changing. What must not happen is to reinterpret the evidence to support the prevailing preexisting theory, as is the case in the above example.

However, this is exactly what happens all too often. People are often unwilling to abandon their cherished positions. This occurs in part because they are not dispassionate as they reason about evidence. In other words, positions are influenced by various worldviews or cognitive approaches, particularly selective perception and selective exposure. These combine to steer how people recognize issues, the phenomena that comprise them, and how they go about making sense of them.[184] These influences or theoretical frameworks shape the patterns people use to interpret new phenomena. The benefit is that these frameworks make people smart and do so quickly.[185] However, this benefit depends on the existence of a repetition of observed phenomena. In order to work successfully, an intuitive framework for understanding requires at least a similar situation, a condition that may not occur with intelligence phenomena.

In an information-rich environment brought about by technical collection, intelligence professionals can select inappropriate patterns to use in making sense of new phenomena. In intelligence work, if such patterns conspire to affect the search for and the selection of the evidence sensemakers use, and that they and their consumers then accept, selective perception and selective exposure set the stage for intelligence error and failure.

Evidence always requires a context, and as the missile example illustrates, there may be more than one explanatory context that makes sense. In intelligence, "evidence is [particularly] rarely self-sufficient in information or credibility."[186] Additionally, the dispassionate nature of evidence itself, when

184 For more information on frameworks or "heuristics" that people employ to cope with judgments about which they are uncertain, the reader should consult the works of Daniel Kahneman, Paul Slovic, and Amos Tversky, *Judgment Under Uncertainty: Heuristics and Biases* (Cambridge, UK: Cambridge University Press, 1982) and Thomas Gilovich, Dale Griffin, Daniel Kahneman, *Heuristics and Biases* (Cambridge, UK: Cambridge University Press, 2002).

185 This is the premise of Gerd Gigerenzer's book *Simple Heuristics That Make Us Smart* (Oxford, UK: Oxford University Press, 1999). These patterns of behavior evolved as survival mechanisms and by and large they have sufficed—the human species survives to the present.

186 Kosso, "Epistemology," 8.

viewed outside its political and social context, contributes to a failure to adequately explore issues. In other words, unless the correct context is known, evidence—if its constituent information can even meet that threshold—is subject to many different interpretations. Without context the person assessing the evidence has no way of knowing which interpretation is correct. Multiple contexts further confound the situation, for different contexts often lead to alternative conclusions as was illustrated in the missile development scenario just described. Finally, as Hampson's essay reveals, the political context of the policymaker may skew the actual context conveyed by intelligence.[187]

What is occurring in the contextual consideration of evidence is a process of epistemological justification and as Kosso notes the "key concern is to distinguish knowledge, on the one hand, from mere belief, opinion, dogma, and wishful thinking, on the other."[188] In relation to intelligence, knowledge depends on contextual justification of evidence and, as noted earlier, the "business of epistemology is to show that there is a correlation between being more justified and being more likely to be true."[189]

Despite their inherently greater inaccuracy, predictions seem to garner more interest from consumers than do explanations. In biology, predictive hypotheses require accommodation to valid background information in order to be useful.[190] Is this true in intelligence? As illustrated by two National intelligence Estimates (NIE's) dealing with weapons of mass destruction (WMD) that were subsequently found to be wrong, *incorrect* predictions certainly garner considerable attention. In these cases, the incorrect predictions perhaps resulted in part from a lack of time available for their preparation. In the first case, the estimate on whether or not the Soviets would place strategic nuclear missiles in Cuba in 1962 was written in a week.[191] In the case of Saddam Hussein's WMD programs, the preparation time was three weeks. Such short time frames for preparation would seem to prevent new information and data

187 Hampson, "The Divided Decision-Maker."

188 Kosso, "Epistemology," 4.

189 Kosso, "Epistemology," 4.

190 Kathrin Stanger-Hall and others, "Accommodation or Prediction?" Letter in response to Peter Lipton, "Testing Hypotheses: Prediction and Prejudice," *Science*, vol. 308, no. 5727 (3 June 2005), 1409.

191 Admittedly this is hindsight analysis. Sherman Kent, writing in 1964, asserts that in retrospect the authors *did* have sufficient time to assess the evidence. See Kent, "A Crucial Estimate Relived," *Studies in Intelligence*, vol. 8, no. 2 (Spring 1964):1-18. Originally classified SECRET, it was declassified and reprinted in *Studies in Intelligence*, vol. 36, no. 5 (1992): 111-119. Kent carefully considers the reasons why the estimate was wrong and why it was not revised. Among the reasons cited was the presumption that past precedents of Soviet foreign policy would continue into the future. Thus, no offensive missiles would be deployed in Cuba.

from being collected and made relevant to the issues (i.e. marshaled as evidence), and prevented alternative perspectives from being fully explored.[192]

A lack of time typifies one context of intelligence sensemaking. This context in which intelligence professionals work and the constraints imposed upon them facilitate their successes but also their failures. As the above examples demonstrate, intelligence sensemakers are often under pressure to consider massive amounts of data and information in a short time. These same professionals must marshal the data and information into evidence even as they attempt to understand, and then explain, the associated complex issues to policy- and decisionmaking consumers.

Finally, the current and past practice of intelligence in the U.S. is consistent with a focus on prediction rather than explanation as its ultimate purpose. This has not been without critique. Willmoore Kendall, in reviewing Kent's book in 1949 for *World Politics*, criticized Kent's "compulsive preoccupation with *prediction*."[193] Given the experience of Kent and others during World War II, it is not surprising that the desire to prevent another Pearl Harbor dominated their practices; such a desire naturally would have led to an activity organized around the creation of surprise-preventing predictive knowledge.[194]

Considering the Normal

The process described in the preceding section can be thought of as "normal intelligence." As conceived by Thomas Kuhn, "normal" refers to "the relatively routine work…within a paradigm, slowly accumulating detail in accord with established broad theory, not actually challenging or attempting to test the underlying assumptions of that theory."[195] We can thus see that "normal intelligence" is an activity of expanding knowledge in which most intelligence professionals engage and which incrementally increases knowledge about targeted phenomena.[196] The professionals work within a model

---

192 The Senate report on the Iraqi WMD noted that alternatives were not explored although this is not the case with the aluminum tubes alternately argued to be for centrifuges and rockets. In this case a groupthink framework seems to have shaped the results. See United States Senate, *Report on the U.S. Intelligence Community's Prewar Intelligence Assessments on Iraq*, Select Senate Committee on Intelligence, 108th Congress, 7 July 2004, 18, 21.

193 Kendall, "Function of Intelligence," 549.

194 Given a "worst-case" perspective about WMD such a perspective perhaps also partially explains points of view about Iraq's alleged WMD programs leading up to the 2002 estimate. It does not, however, explain the apparent 9/11 "failures of imagination."

195 Wikipedia, entry under "Normal Science," URL: <http://en.wikipedia.org/wiki/Normal_science>, accessed 26 September 2007.

196 Thomas Kuhn, *The Structure of Scientific Revolutions* (Chicago, IL: University of Chicago Press, 1962), 10-42, Cited hereafter as Kuhn, *Structure*.

or "paradigm" of reality forged during the Second World War and reinforced throughout the ensuing Cold War. The perceived and recalled successes of the past contribute to the repeat use of unvalidated tradecraft. The paradigm presumes state-level adversaries — eventually with mutually destructive capabilities.

As used in this context, "normal intelligence" is to "intelligence" as Thomas Kuhn's "normal science" is to "science." In both domains newly created knowledge incrementally adds to an increasingly established paradigm; new knowledge does not easily redefine the paradigm. Even the anomalous and truly unknown are only considered in terms of what is known. Normal science or normal intelligence does not seek to revise significantly the paradigm by which new phenomena are known and understood. This may be seen in the way new intelligence personnel adopt existing job accounts. A common practice involves their reviewing previous reporting on the account, with a tendency for new reporting to stay within the conceptual boundaries of what has gone before. Knowledge increases only incrementally.

Intelligence practitioners working within the paradigm of normal intelligence attempt to describe, explain, or predict phenomena *coherently*. In this case, the term refers to another concept developed by Kuhn: A common framework for understanding the phenomena is sought or presumed. New knowledge is understood in the context of the dominant paradigm. For example, normal intelligence of the latter half of the 20th century understood events in relation to the missions and goals of U.S. adversaries, principally the former Soviet Union and to a lesser degree, China. World affairs were understood in the context of the state-based adversaries' hegemonic competition with the United States.

Normal paradigms prevail until previously unnoticed and unnoticeable discrepancies create sufficient inconsistencies in explaining and understanding phenomena so as to cause errors that cannot be ignored. For Kuhn this means a necessary change in scientists' perception of the realities as characterized by science. Kuhn illustrates this with an example of the

> transition from Ptolemaic to Copernican astronomy. Before it occurred, the sun and moon were planets, the earth was not. After it, the earth was a planet, like Mars and Jupiter; the sun was a star, and the moon was a new sort of body, a satellite. Changes of that sort were not simply corrections of individual mistakes embedded in the Ptolemaic system…they involved not only changes in laws of nature but also changes in the criteria by which some terms in those laws are attached to nature. These criteria, furthermore,

were in part dependent upon the theory with which they were introduced.[197]

In the physical sciences, the phenomena themselves do not change (although newly noticed phenomena could make it appear so). In the cultural environment of human interaction, the *new perceptions* of reality can be enough to force a reconsideration of the *old*. In social scientific terms, a new paradigm not only explains the new, it does *better* at explaining the old. Further, even the language previously employed to describe a phenomenon is inadequate because—as Kuhn notes—"scientific development cannot be quite cumulative. One cannot get from the old to the new simply by an addition to what was already known."[198]

Failures to consider discrepancies lead prospective intelligence sensemakers to retain an invalid understanding of phenomena even as the phenomena themselves change. This larger discrepancy leads either to intelligence error or intelligence failure. Once again, within the Kentian paradigm, intelligence errors derive from "factual inaccuracies in analysis resulting from poor or missing data."[199] Conversely, as has been noted, intelligence failures refer to "systemic organizational surprise resulting from incorrect, missing, discarded, or inadequate hypotheses."[200] Within the former concept there is a presumption that if more data are available or better understood, errors can be prevented. In the latter, intelligence practitioners or their policymaking customers have misunderstood the issue and its context.

The existence of particular intelligence errors *does not* necessarily indicate a paradigm has changed. However, repeated intelligence errors *do*. As is the case with science, small errors in adequately characterizing phenomena lead to the emergence of "corrective constants." The sensemaker may have made a perceptual or interpretive error. However, left unchecked, errors eventually combine to cause systemic failures. Intelligence practitioners and policymakers repeatedly may come to incorrect conclusions from faulty sensemaking, leading to policy failures, defined by Rob Johnston as "systemic organizational surprise" resulting from a mixture of practitioners' lapses and policymakers' ignoring proffered intelligence.[201] The more

germane interpretation offered in the present work is that intelligence failure stems from inadequacies on the part of both policymaker and intelligence professionals to recognize a fundamental, revolutionary shift of the intelligence context.

The state-as-adversary paradigm for intelligence creation is obsolete. Two decades now separate the interpretable intelligence context from that of the Cold War: the adversaries and issues are now strikingly different.[202] The power of the Soviet Union waned dramatically after 1990 as that of China increased. But even more central to the intelligence context, novel phenomena also appeared that were non-state based: emerging non-state actors posed new challenges by threatening traditional state structures. Emerging phenomena such as disease and climate change imposed new complexities. The anomalies these new phenomena have created illustrate how and why normal intelligence is no longer adequate: it could no longer characterize these phenomena within the threat and opportunity framework of strategic intelligence. The "normal" means by which error is explained remain inadequate. As documented in the various Congressional and independent commission reports, intelligence no longer adequately describes, explains, or predicts with respect to the phenomena its consumers need to understand. Thus, intelligence change is necessary—revolutionary change.

Paradigm Shift

Revolutions in science, politics, and military affairs occur because crises reveal the insufficiency of the reigning paradigm. As Kuhn notes, an existing paradigm can "cease to function adequately in the exploration of an aspect of nature to which the paradigm itself [has] previously led the way."[203] Kuhn argues further that science does not evolve smoothly. Rather, periodic revolutions change how phenomena are perceived and understood.[204] Crises are a precursor of such paradigm shifts. Analogously to Kuhn's notions, the (officially) serious failures of the Intelligence Community to predict the attacks of 11 September 2001 and the state of Saddam Hussein's programs of

202 It should be noted that the traditional adversaries of the Cold War remain threats. While an argument can be made that other issues overshadow the dangers they pose, it can also be claimed that emerging threats simply compound the traditional ones. 21st Century dangers are complex; one of their dangers *is* their complexity.

203 Kuhn, *Structure*, 92.

204 Kuhn, *Structure*, 92-110.

WMD (both in 1990 and prior to the 2003 invasion of Iraq) are examples of systemic reframing crises.[205]

If we review these failures through their official re-examinations, certain phrases recur: mind-sets, politicization, and faulty analysis. Across the same period, there are repeated attempts to impose methods of "[social] scientific study…to analysis of complex ongoing situations and estimates of likely future events."[206] What is lacking is any sort of a systematic approach across the Intelligence Community. As long-time practitioner and observer Jack Davis noted a decade ago, no corporate standards for how intelligence is created, including the methods employed, exist.[207] Although sound practice does not ensure that intelligence assessments will be correct, its absence, by definition, contributes to flawed conclusions. Contributing to this scenario is the fact, as Aris Pappas and James Simon observe, that "[potential] opponents [are] often…driven by emotional agendas that [make] them unpredictable."[208] While effective practice might not drive the production of sound estimates from ambiguous evidence, it would routinely alert practitioners to the prospect that these same opponents' actions are unpredictable or at best, that they are predictable within a range of behaviors.

In short, U.S. intelligence professionals operate in an environment similar to an unfolding Kuhnian revolution: the epistemology of normal intelligence is insufficient and new knowledge is needed. The recent failures highlight the necessity for change, as does the graying of the intelligence sensemaking workforce—new people faced with new and emerging issues should be comfortable with finding new ways to systematize their work. The changed contexts and data, once they confront practitioners with problems that are

---

205 The argument that these were crises in reframing rests on the observation that intelligence practitioners were as shocked at the inaccuracy of their estimates as were the surprised policymakers. In the case of the 2000 estimates of Iraqi WMD, the CIA *underestimated* the state of Iraqi WMD, leading to a claim that the apparent overestimation in the 2002 estimate was compensation for that earlier error. While admitting to the underestimation, a CIA press release adds, "in no case were any of the judgments [in the 2002 estimate] 'hyped' to compensate for earlier underestimates." See, Central Intelligence Agency, "Iraq's WMD Programs: Culling Hard Facts from Soft Myths," *Press Release*, 28 November 2003, URL: <https://www.cia.gov/news-information/press-releases-statements/press-release-archive-2003/pr11282003.html>, accessed 9 December 2009.

unintelligible in normal intelligence, will reflect the idea that a Kuhnian-style revolution in intelligence is underway.

However, a caveat is necessary. Not all "old school" intelligence practices are without continuing value. Several significant state-level adversaries remain as threats to the security of the American nation although they too are challenged by the new non-state actors and issues that populate the paradigm of the new intelligence—something that compounds any estimate of how they are likely to engage the United States. Further, in many circumstances and in dealing with certain issues, the tacit expertise of highly experienced intelligence professionals is appropriately tapped for "recognition-primed" sensemaking.[209] These "old hands" possess both current knowledge and a highly evolved skill set. Years of innovative and critical thinking mean they are skilled in looking at issues from a variety of perspectives and have the wisdom of deep context. It is no accident, therefore that the contributors to Roger George and James Bruce's recent book, *Analyzing Intelligence*, are very senior intelligence practitioners.[210] The challenges involve *knowing* when such expertise is valuable and needed in the first place, and encouraging the intelligence enterprise to *develop* and *retain* the cognitive and organizational flexibility that such thinking requires.

Indeed, a part of successful and revolutionized intelligence work involves gleaning new meanings from old patterns that have remained hidden to those who have stopped short of sensemaking. One challenge is that the "fresh" eyes lack the knowledge of potentially relevant patterns while the "old" eyes cannot see things as new. Each lacks the other's strength. Experience acquired by newer professionals who engage in the practice of traditional "analysis" jaundices their once-fresh viewpoints even as they start to acquire the relevant and necessary experience.

One solution may be to adopt a model of core competencies broken out according to task analyses of existing intelligence missions and functions. Such a model identifies what is needed and has been at least partially implemented in the IC's Analytic Resource Catalog developed during the tenure of former Director of Central Intelligence George Tenet.[211] Rewarding the successful use of some of the most important competencies may also encourage

their retention in the catalog. Among these are curiosity, perseverance, and pattern recognition.[212]

A necessary first step in a revolution in intelligence work is looking in depth at what it is intelligence professionals do, must do, and how they do it. Simply put, intelligence practitioners create knowledge to support their customers. As used here, intelligence practitioners are presumed to be contributors to government plans and policies at a variety of levels where they have the opportunity to share broad strategic perspectives with national leaders as well as ensure that deployed warfighters have at hand the fruits of technical collection and marshaling of tactical data.

Finally, it should be noted that intelligence *Knowledge* is only one component of a strategic, operational, and tactical intelligence triumvirate.[213] *Activity* and *Organization* are the other two. It is the author's belief that Activity and Organization also are in need of new paradigms. However, such a discussion hinges on what intelligence Knowledge is and how it is created—in short, the sensemaking involved. Insofar as Activity describes how the precursors of intelligence are hunted, gathered, made sense of, and transformed into knowledge, it is considered here. However, the uses of intelligence (also an activity) and how intelligence professionals are grouped, led, and managed to act and create knowledge—the realm of Organization—lie beyond the scope of this book.

212 For more on core competencies for successful intelligence work see David T. Moore and Lisa Krizan, "Core Competencies for Intelligence Analysis at the National Security Agency," in Russell G. Swenson, ed., *Bringing Intelligence About: Practitioners Reflect on Best Practices* (Washington, DC: Joint Intelligence Military College, 2003): 95-132. Cited hereafter as Moore and Krizan, "Core Competencies."

213 Kent identified and developed three concepts related to strategic intelligence: Knowledge or what is produced and disseminated; Activity, or how such knowledge is produced and disseminated; and Organization, or how people are grouped to produce and disseminate such knowledge. Kent, *Strategic Intelligence*. Moore and Krizan advocated this approach in their competency work. See Moore and Krizan, "Core Competencies" and David T. Moore, Lisa Krizan, and Elizabeth J. Moore, "Evaluating Intelligence: A Competency-Based Approach," *International Journal of Intelligence and CounterIntelligence*, vol. 18, no. 2 (Summer 2005).

CHAPTER 4:
The Shape of Intelligence Sensemaking

Intelligence Sensemaking involves a number of overlapping high-level activities. First, intelligence professionals engage in planning or design and then hunt for and gather the materials they require in order to understand issues, answer questions, or explore new ideas. They can be externally motivated by the needs of a customer or they can be self-motivated as a result of an observation, or both. Second, these professionals disaggregate and then reassemble relevant information, trying to determine what it means. At every stage in their work they assess critically their processes and results, seeking to validate both how they are engaged and the outcomes of their engagements. These overlapping activities can be characterized as Planning, Foraging, Marshaling, Understanding, and Communication. They are supported by Questioning and Assessing. Although these elements are discussed separately, it is of course only through their applied interaction that they describe sensemaking.

Planning for Tame and Wicked Intelligence Problems

Making sense of either tame or wicked problems is predicated upon planning. Plans, according to Gary Klein, are "prescriptions or roadmaps for procedures that can be followed to reach some goal, with perhaps some modification based on monitoring outcomes."[214] Creating plans requires "choosing and organizing courses of action on the basis of assumptions about what will happen in the future."[215] Known as *planning*, this process characterizes the "contingencies and interdependencies such as actions that must occur first as a precondition for later actions."[216] When we add the concept that practitioners—through critical thinking—also engage in reflective thinking and learning, both singularly and collaboratively, we may similarly label this process "the art of intelligence design."

214 Gary Klein, "Flexecution as a Paradigm for Replanning, Part 1," *IEEE Intelligent Systems*, vol. 22, no. 5 (September/October 2007), 79. Cited hereafter as Klein, "Flexecution 1."

215 Klein, "Flexecution 1," 79.

216 Klein, "Flexecution 1," 79.

With tame problems, where answers and solutions can be anticipated, algorithms can calculate actionable probabilities and repeatedly make sense of the problem.[217] The design of useful algorithms may be complex and they operate well only in finite and specific environments. How, on the other hand does one plan or design for wicked problems? One answer is to re-imagine the wicked problem as a tame one. However, the repeated occurrence of "unintended consequences" in past scenarios suggests that this is not a good option. Disaggregating what are assumed to be tame problems into their component parts, regardless of the actual problem type, often proves inadequate, as unintended and unforeseen consequences make clear.

Yet planning must occur regardless of problem type. Otherwise, dealing with problems becomes a process of trial and error with no means of agreement on assessing the solutions or even on what are the solutions. Klein considers—along with Rittel and Webber—that planning is an emergent process: Goals are clarified and revised as understanding of the problem grows.[218] He notes,

> Goals can be dynamic and can change completely as a function of changing circumstances. Goals can conflict with other goals in ways we can't anticipate or resolve in advance. Goals can carry implications we can't perceive or anticipate until events transpire.[219]

In terms of intelligence creation, this means that larger, strategic goals can—and perhaps must—emerge as sense is made of the problems under scrutiny. Thus, a tasking from an intelligence consumer changes as mindful sense is made of the tasking itself, of the resources that are available for understanding it, and the mix of actors involved.

Klein refers to this reflective problem planning as "flexible execution" or "Flexecution."[220] Within the framework of intelligence sensemaking, it provides a self-reflective process—at the individual and organizational levels—that monitors the goals and whether what is understood or being done is consistent with those goals, modifying those goals as understanding emerges. For example, in examining the situation in Cuba during the summer of 1962, the understanding of the intelligence professionals at the Refugee Processing Center in Miami developed as the summer progressed. A new understanding emerged of what the Soviet forces deployed to the island might be doing.

Accountability	Clear	Unclear

Source: Gary Klein, "Flexecution as a Paradigm for Replanning, Part 2," *IEEE Intelligent Systems*, vol. 22, no. 5 (November/December 2007), 112.

Intelligence planning took place as sense was being made of the situation, (finally) monitoring what they were observing and what it meant. Such deliberations apparently led two analysts to conclude that the indicators for strategic nuclear missiles deployed in Cuba might be valid, resulting in the U-2 overflight of 14 October 1962 and the "discovery" of the missiles.[221] Unfortunately, as has been noted, the intelligence professionals were not sufficiently flexible in their planning to consider that other types of nuclear missiles also might be (and in fact were) deployed on the island.

As summarized in table 3, flexecutive planning seems ideally structured for making sense of wicked problems and taking advantage of the peculiar capability that intelligence has to initiate information actions and then clandestinely determine the adversary's reactions to it. Intelligence professionals are well placed to learn of changes in planning or strategy on the part of adversaries as well as of their own decisionmakers. One can never be certain that all potential planning options are known, but by focusing on "alternative goals and priorities" to which an adversary might migrate, and the potential actions both at the onset of the sensemaking process and as

221 Garthoff, "US Intelligence," 23.

a part of an ongoing, mindful critical reflection, one comes to understand the alternative goals and priorities of one's own actors as well as those of the adversary.[222]

Foraging

Hunting and Gathering

If, as Baumard asserts, "Intelligence, a continuous human activity, gives sense to the stimuli received from the environment [then] these stimuli [must] be passively or actively sought."[223] This requires hunting and gathering. They comprise foraging, which in turn refers to "a wide search over an area in order to obtain something."[224] Whether it describes birds seeking life-sustaining berries, bees scouting for pollen, or people searching for information, foraging describes how animals go about satisfying their needs. For intelligence professionals, foraging describes the means by which the raw materials needed to notice and make sense of phenomena are acquired.

An apt analogy for the foraging activities of intelligence professionals can be drawn from anthropology, where the activities of the hunter-gatherer have been immortalized. In nonagricultural societies people both hunt for specific game and take advantage of what the local environment provides.[225] Similarly, intelligence professionals may seek specific information, often tasking collection systems as part of the search. They also take advantage of existing repositories of information. Neither approach is wholly satisfying nor provides for all of the sensemaker's needs all of the time. However, without the basic act of foraging there can be no sensemaking as there is nothing from which to make sense.

Information foraging is a rich subject about which Peter Pirolli has done extensive work, some of it sponsored by the Intelligence Community's Novel Intelligence from Massive Data research project funded by IARPA's predecessor, ARDA (Advanced Research and Development Activity). Known

---

222 Within the domain of wicked problem consideration there is a means, known as morphological analysis, that may come close to at least identifying all possible planning options. Invented and developed by astrophysicist Fritz Zwicky, the paradigm has been further developed by the Swedish Morphological Society (URL: <www.swemorph.com>, accessed 10 October 2010), and for the U.S. Government by William N. Reynolds, Least Squares Software. Combined with a model of Flexecution, it seems a promising approach for intelligence (re)planning.

223 Baumard, "From Noticing to Making Sense," 31.

224 *New Oxford American Dictionary*, Apple Computer Edition, 2005, entry under "foraging." Cited hereafter as *New Oxford American Dictionary*.

225 This remains such a culturally (and perhaps psychologically) essential human activity that the practice remains part of seasonal life in modern post-industrial societies.

as "Information Foraging Theory," Pirolli's work makes use of the optimum foraging strategies of animals as a basis for assessing the human acquisition of information. Underlying information foraging theory is the idea that "humans actively seek, gather, share, and consume information to a degree unapproached by other organisms" and therefore, "when feasible, natural information systems evolve toward stable states that maximize gains of valuable information per unit cost."[226]

Pirolli's research and experimentation devotes special attention to foraging efficiency. Efficiency derives from optimizing the time necessary to achieve a goal, the quality of the achievement, and the satisfaction obtained in doing so.[227] In application to the human information foraging scene, the theory becomes "a rational analysis of the task and information environment that draws on optimal foraging theory from biology and…a production system model of the cognitive structure of [the] task."[228]

Toward a Practice of Intelligence Foraging

Developing an optimal foraging model for information acquisition requires the subject to consider whether to remain at a source that provides a superabundance of information of questionable value, or to seek another, more valuable, source.[229] Pirolli and colleague Stuart Card observe that for human foragers, this involves "a tradeoff among three kinds of processes": exploring, enriching, and exploiting.[230]

These three foraging steps will not seem foreign to traditional intelligence practitioners. "Exploring" is a breadth activity whereby a sensemaker broadly examines a wide variety of information that may or may not be relevant to the issue. The premise is that when one considers a broad variety and volume of data, there is less opportunity to miss "something novel in

---

Cited hereafter as Pirolli and Card, "Sensemaking Process."

the data."[231] Speaking in traditional intelligence terms, exploring is like reconnaissance. By contrast, "enriching" is a depth activity. Here the sensemaker identifies areas of interest and focuses attention on those areas. As Pirolli and Card note, this is "a process in which smaller, higher-precision sets of documents are created."[232] Reconnaissance has become more narrowly focused, but highly targeted "surveillance" is not yet in play. Finally, the practitioner "exploits" the results of foraging by thoroughly examining what is found and extracting information as needed. This activity extrapolates from tacit sensemaker behaviors and information-based patterns to create hypotheses about what the information means. At this point, foraging evolves to sensemaking.

The appropriate amount of exploration depends on the context. However, there appears to be a limit after which more information does not increase accuracy although it does increase the sensemaker's overall confidence. One example of this phenomenon was discovered by Paul Slovic in an experiment with odds makers who, when predicting the winners of horse races, were not significantly more accurate if they used 40 variables or only 5 (out of sets of 88 possible variables).[233] What Slovic additionally observed, however, is that the odds makers' confidence did increase directly with the number of variables considered.[234] Slovic's findings about accuracy and confidence are reproduced in Figure 2.

The discussion of how much exploration is needed is germane because in the Pirolli-Card framework the sensemaker may believe she controls the amount of foraging. In a sense this is true. The sensemaker will stop foraging once she believes she has what she needs. But how much information is sufficient? Slovic's results and Heuer's subsequent discussion suggest that practical sufficiency is achieved at lower levels of exploration than expected.[235]

Further, contrary to the beliefs of the sensemaker, it is often information itself that controls the processes. Intelligence professionals are overwhelmed with more and more information that arrives faster and faster and may be valuable for shorter and shorter periods of time. This information flood challenges the sensemaker to efficiently find the information needed in order to make sense of the phenomena or issue under scrutiny in a timely

manner. Does one need to peruse all the information received? Would a different source be more productive by providing more focused information? These are examples of the difficult questions the sensemaker must consider. Compounding her deliberations further is the fact that she must answer this question in foresight; hindsight is too late.

Referring to the animal foraging analogy that underlies information foraging theory, one asks, is the nutrition gained of sufficiently low quality (even though there is lots of it) to justify seeking another source of unknown (but possibly higher) nutritional value? Failure to make the right decision may result in starvation. For the sensemaker this means she may never find what she needs. An implication is that her lack of information may contribute to an error leading to a catastrophic failure. To make such a decision wisely requires something she currently lacks: a practice of foraging. Such a

practice puts her, not the information, in control of foraging practice. It provides her with a systematic means of reducing her uncertainty.

Foraging practice begins with an understanding of what it is the sensemaker seeks to know, the foraging resources available, and the urgency of the issue. But how can an intelligence sensemaker know what to look for? To what degree does she need to explore, enrich, or exploit the information? Further, how does she know if she is getting what she needs?

A first step is to think critically about the issue itself and the resources needed. Using a metacognitive, process-focused critical-thinking model such as that adapted from Richard Paul, Linda Elder, and Gerald Nosich, the practitioner can dissect the issue and her thinking on the issue.[236] She makes assumptions explicit, explores relevant points of view, starts to consider the ramifications of the issue, and she asks important questions about what resources will best inform her about the issue; she considers the context in which she is working, and ponders the alternatives to her reasoning about where and how to forage. This critical thinking defines her foraging activities. She may engage in all three strategies at once or at different times as she engages in the analyses that produce her syntheses and the interpretations necessary to generate knowledge. A well-developed understanding of exploited information may direct her back to do additional exploring or enriching (or both).

In intelligence foraging as it traditionally has been practiced, there is a tendency to linger at a fruitful source rather than to explore elsewhere for the required information. This is a function of the confidence one gains in those systems that previously have supplied information, and the available tools for ferreting out the information. The danger, of course, is that the practitioner may limit the information she acquires and the relevant perspectives it informs. If, for example, the practitioner has a belief that two parties in whom she has an interest communicate via one means and she can acquire technical collection that captures the communications via those means, she may ignore the fact that they also use other methods to communicate. She may subsequently fail to task systems that collect those other communications in the belief that what she is getting suffices. Should the parties suspect that their communications are being targeted, they may engage in deceptive practices over that collected means and use the other non-collected methods for their real exchanges.

Foraging Challenges

Ongoing research at University College London offers a view of how younger sensemakers likely search for information. The researchers report that people foraging for information spend four to eight minutes viewing each resource.[237] Thus, a great many resources may be consulted but none of them very deeply. Within the context of intelligence, such foraging strategies may facilitate broad searches but leave open the question of whether deeper searches are also accomplished. As Nicholas Carr observes in the July/August 2008 *Atlantic*, Internet search strategies, as epitomized by the operation of search tools such as Google, will put in place a new behavior of foraging and consuming information. Carr notes:

> It is clear that users are not reading online in the traditional sense; indeed there are signs that new forms of "reading" are emerging as users "power browse" horizontally through titles, contents pages and abstracts going for quick wins. It almost seems that they go online to avoid reading in the traditional sense.[238]

From the perspective of actually making sense of issues, these strategies imply that the manner in which issues are understood is also likely to change. Are such new foraging practices suitable to meet the needs of intelligence consumers? Will they be better at satisfying those needs for knowledge than the paradigm previously practiced?

An additional challenge with information foraging is that if the practitioner misses the opportunity to acquire something, it may never again be obtainable. Like the elements of a fleeting interpersonal conversation, the original foraging behavior, if left un-captured, can never be recaptured. Indeed, there may be no indications that such a conversation even occurred.

A further consideration for the practitioner is the "self-marketing" of the information. Vivid stories market themselves much better than do flat ones. Exploited information that supports a favored hypothesis may be preferred over information that does not; an unfortunate reality is that little motivation remains for further exploration. The practitioner is human—she will not likely have a truly agnostic attitude about what she seeks and why.

Compounding this is the idea that sources and means for foraging are self-protective. For example, there is a presumption that sources will continue

238 Nicholas Carr, "Is Google Making Us Stupid?" *The Atlantic*, Online Edition (July/August 2008), URL: <http://www.theatlantic.com/magazine/archive/2008/07/is-google-making-us-stupid/6868>, accessed 27 May 2010. Cited hereafter as Carr, "Google."

to communicate via specific means. The methods that capture those communications and the people that support them tend to seek justification. Assets may be kept active after their usefulness expires. The practitioner returns to the same sources over and over because they have been useful in the past and such attention helps keep those sources actively collecting.

Critically assessing what she is doing is one way the sensemaking practitioner may be able to overcome these limiting tendencies. By constantly asking herself how she is thinking about the issue, what she seeks, other perspectives, her assumptions, as well as relevant concepts such as self-deception or adversarial deception, the practitioner may diminish the impact that her preferences play on her foraging decisions.

Another part of this critical assessment is the consideration of the costs of foraging. As Herbert Simon notes,

> What information consumes is rather obvious: it consumes the attention of its recipients. Hence a wealth of information creates a poverty of attention, and a need to allocate that attention efficiently among the overabundance of information sources that might consume it.[239]

Simon in fact anticipates the conclusions of Carr: The superabundance of information available on the Internet (and elsewhere) creates a "poverty of attention" to any one source. Rather, people skim across a great many sources.[240]

Questions the sensemaker must ask include whether or not she can afford to explore an issue's information field further. She needs to consider how certain she is that she has sufficient exploitable information to make sense of the issue. Further, if the issue is inadequately understood, opportunism may affect the foraging as a hunting analogy illustrates. A predator may go out seeking one type of prey and find none of it *but* there may be an abundance of some other kind of game. Within the context of intelligence such opportunism may or may not be appropriate (or even legal) when a technical system or an asset is tasked to provide information for intelligence. Lacking the desired information, a human source might opportunistically substitute what might be perceived as desired or desirable, even if it is not closely related to the issue at hand—or for that matter, even "true." It is used because it satisfices for the immediate term.

240 Carr, "Google."

Harvesting[241]

A special case of foraging involves "harvested" information. Technical agencies that field systems to gather information also can be characterized by a different model, that of harvesting. The systems employed simply harvest that which lies within their purview, then process it and store it in silos—data repositories from which sensemakers subsequently must forage.[242] Such systems are efficient at creating broad collections; they tend to be inefficient and unreliable when very narrowly focused. Thus, *directed* rather than broad collection of specific phenomena is needed.

Technical collection systems tend to provide—even in the negative—what sensemakers want to find. This can create a potentially dangerous confirmation of an idea that may be invalid. This tendency is exacerbated in the post-Cold War world. Although previously, certain intelligence targets did remain relatively unchanged over considerable periods of time, this is no longer the case.

The harvesting system automatically explores a subset of a larger reality based on a collective agreement among sensemakers that the subset is relevant. The sensemakers subsequently enrich their knowledge and in a best-case situation can exploit the information to provide themselves with the necessary information to make sense of the issue. A challenge is that it is impossible to collect everything. Yet, uncertainty about whether or not one *really* has collected what is necessary remains unresolved. While some technical systems are more usable for "random" exploration than others, most require a preexisting idea about what one seeks. Such preconceptions limit exploration.

Automated retrievals from information repositories typically provide sensemakers with what they believe to be the needed and relevant information—in short, their evidence. The evidence pertaining to specific issues arrives at the sensemaker's desk and reports are issued. At first, the evidence is carefully scrutinized and the system that provides it assessed. As the process repeats, however, as it certainly did in the Cold War era, complacency may set in. Critical assessment of *quality* and *quantity* may cease. And, one day, the evidence that a specific sensemaker requires no longer appears. The reporting on that specific issue withers. If sufficient evidence valuable to *other* sensemakers still is harvested, the value of the continued tasking of the system may

241 The author is indebted to Martin Krizan for raising this idea.

242 It should be noted that "reaping" and "threshing" both manipulate the collected information into usable formats. The processed information must be compatible with U.S. law and specific agency procedures for handling such information.

not be questioned. The failure is not noticed and may even be rationalized—perhaps as a failure to forage adequately—*if* it is noticed in the first place. Even when it is noticed, it may be impossible to determine *why* it occurred. Finally, no amount of foraging can discover valuable information if it has not been collected by some system—human or technical—in the first place.

Marshaling

What can be done to revolutionize the way information foraging is accomplished so as to overcome or at least mitigate these problems? Some answers lie in an understanding of marshaling. Part of the sensemaker's practice is to turn foraged and gleaned information into evidence. Doing so requires sifting and other organizing activities to determine which information is relevant to the issue. This is a broad activity, for if the issue has multiple explanations or future possibilities, then evidence will be information relevant to any, many, or even all of those explanations or possible outcomes. In order to make that determination, the sensemaker will need to have identified what those alternatives are and to have collected information (both disconfirming and confirming) about them.[243] This may require foraging from additional resources with all the attendant challenges discussed above. Conceivably this could overwhelm the sensemaker. However, questions such as "if this alternative were true, what would be the evidence for it?" can lead one to identify what she needs to know. Then asking whether or not she sees it, or where she might forage for it (and can do so), starts the process of marshaling. This activity represents a change from traditional practices because the intelligence professional goes beyond what she knows into what she knows she does not know.

Understanding

If we presume that foraging has yielded relevant and valuable information—evidence—on the issue under study, the next step is to determine what it means. This is the heart of sensemaking: evidence is dissected, reassembled

243 Disconfirming alternative explanations (or hypotheses) is one means of avoiding confirming a favored (and possibly wrong) possibility. This disconfirmatory approach is one of the strengths of Richards Heuer and Morgan Jones' independent work with hypothesis testing (Heuer calls it alternative competing hypotheses). How effectively this approach actually works is subject to debate. Another challenge is to define foraging strategies that yield disconfirming (i.e. negative evidence). An absence of evidence is insufficient. See Heuer, *Psychology*, Chapter 8, and Morgan Jones, *The Thinker's Toolkit* (New York, NY: Three Rivers Press, 1995), 178-216. For discussion about whether or not the method effectively disconfirms, see Brant A. Cheikes, Mark J. Brown, Paul E. Lehner, and Leonard Adelman, *Confirmation Bias in Complex Analyses*, Mitre Technical Report, MTR 04B0000017 (Bedford, MA: Mitre, 2004). Cited hereafter as Cheikes and others, *Confirmation Bias*.

with other evidence, and its meanings determined by analyzing, synthesizing, and then interpreting the evidence.

Analyzing

The intelligence issue or question itself requires analytic scrutiny. Different foraging disciplines represent different points of view. In other words, signals intelligence or SIGINT; human sources embodied in HUMINT; images and geospatial data (known as GEOINT), and others tell different stories about a phenomenon. Each story requires dissection. Similarly, within a foraged source, the different perspectives of the sensemaker require dissection. For example, is the sensemaker focusing on individual actors, the actions of a collection of actors, the beliefs that guide the activity, or the processes that determine the actions of the collective?[244]

The disaggregation of each of these perspectives and their associated stories provides a rich brew for sensemaking. For example, in the Cuban Missile Crisis of 1962, such a dissection reveals the intentions and underlying beliefs of the principal actors (Castro, Kennedy, and Khrushchev), as well as the roles and procedures of their larger collectives, in this case the Cuban and Soviet governments (specifically the Soviet Politburo and General Staff) as well as Kennedy's Executive Committee (EXCOM) and indeed the much larger American political collective. However, as rich as these stories become, they remain inadequate in assessing what is likely to happen. Dissecting the evidence is insufficient. Pulling the pieces together becomes the next step.

Synthesizing

Synthesizing is "the combination of ideas to form a theory or system."[245] Even as the intelligence professional analyzes the individual pieces of information, they are synthesized into a mental picture of the larger issue. Pieces of information are implicitly combined even when the sensemaker works within the yield of a particular foraging discipline or within a frame or reference. Such synthesis drives further foraging and analysis.

Synthesis needs to be explicit. In the example developed above, the intelligence professional is required to synthesize the differing trajectories

---

244 These four groups form the basis of a novel sensemaking approach developed by Monitor 360 for the National Security Agency and incorporated into a course on multi-frame sensemaking. As characterized in the course, the four groups or frames are the "empowered actor," "cooperation and conflict," "beliefs and affiliations," and "roles and procedures." The author is a champion of this approach, and worked with the senior course developer, Bruce Chew, in creating the course.

245 *New Oxford American Dictionary*, Apple Computer Edition, entry under "synthesis."

of the three principal actors, considering how their beliefs harden or soften their positions and how they are vulnerable to the actions, influences and processes of the groups. Doing so in a systematic fashion leads the intelligence professional to new insights about the situation: what is going on in Cuba and (from the U.S. perspective) what to do about it.

Interpreting

Issues can be dissected and reconstructed in a variety of ways, creating different meanings. Sense must be made of these different meanings. Interpreting, or "the action of explaining the meaning of something," is another component of sensemaking.[246] We may say that whereas analysis and synthesis establish the *what*, interpretation establishes the *so what*.

Depending on the frameworks involved, the interpretations of common information vary widely, as the above referenced experience of London subway bombing victim Rachel North illustrates. An evolving practice within intelligence of establishing competing teams of intelligence professionals to develop different aspects of an issue is an example whereby differing interpretations compete in an effort to establish "ground truth" about issues. A revolutionary approach to sensemaking now being undertaken by analysts from DIA, State, and CIA, is to engage in "adversarial briefing" of principals, where briefers adopt opposing perspectives for a thorough airing of the issue, complete with the participation of the principals themselves.

Communicating

New models of knowledge transfer recognize change in both message and medium. Social networking, peer-reviewed shared multimedia, and interactively blogged communications are examples of these new mediums. The message is short and subject to change by different contributors. Authority is based on consensus. The distinction—if it exists at all—between formal and informal communication is blurred. There are dangers here as authority and truth are no longer necessarily linked. One risk is that the "wisdom of a crowd" can in fact be the "madness of a mob"—a phenomenon occurring in both the public arena and within the IC's blogosphere. In both arenas the loudest voices strive to bludgeon into silence those who would disagree, all the while advancing their egocentric or sociocentric positions. Scientific knowledge and empirical facts matter little in such cases. The danger in both

246 *New Oxford American Dictionary*, Apple Computer Edition, entry under "interpretation."

arenas is, of course, that people make poor decisions based on information that later proves to be false.[247]

However, communications within the Intelligence Community remain firmly embedded in traditional formats of printing and briefing. It is true that blogging and informal communications are utilized, but these are used by intelligence practitioners to discuss the issues they make sense of *before* they craft their traditionally formatted assessments, briefings, and reports. The ultimate Intelligence Community report, the President's Daily Brief, remains primarily a hard copy document. While it has been updated incrementally over the years, the presentation remains similar to the summary that was nicknamed "Truman's Newspaper."

As has been noted, newer Intelligence Community directives provide for presenting alternative hypotheses as well as documenting confidence levels in sources and in intelligence assessments. Is this guidance sufficient and valid for sensemaking? In summarizing the "introspective works responding to…intelligence failures," Charles Weiss agrees that intelligence practitioners' failures include a lack of proper attention to hypotheses and data collection efforts that are contrary to what they regard as the most likely interpretation of available information."[248] One danger is that the very judgment about which the sensemaker is least confident might be the one that turns out to be correct. The fallacy of depending on the communication of confidence levels relates to the fact that each assessment or report only fills in some unknown portion of the gaps in the sensemaker's and policymaker's knowledge.

Presenting a novel hypothesis and interpreted argument about which one is uncertain, along with an assessment based on a more likely premise, also carries dangers. A policymaker might disregard the alternate possibility because of the declared lack of confidence (which might stem merely from a lack of evidence) and choose the evidentiarily better-supported hypothesis.[249] Here, a carefully considered, standardized metric of uncertainty could provide one means of assessing and communicating confidence independently

---

247 The "Swift Boat" controversy of 2004, the matter of autism-caused vaccines, and the uncivil discourse between the major political parties are several non-intelligence examples. These are different from debates, which advance knowledge through open discussion. These are about having one's way. Whoever can shout the longest and loudest wins. See also Peter Miller, *The Smart Swarm: How Understanding Flocks, Schools, and Colonies Can Make Us Better at Communicating, Decision Making, and Getting Things Done* (New York, NY: Penguin Books, 2010), chapter 5. Miller explores the transformation of the crowd to a mob, as well as the self-destructive behavior of the mob, through the example of locusts.

249 Weiss, "Communicating Uncertainty," 62.

from the sensemaker. Weiss suggests that either Kent's scale[250] or its more recent instantiation by the Office of the Director of National Intelligence offers an appropriate means by which the uncertainty could be systematically captured.[251] The challenges inherent in such metrics are twofold. First, the evidentiary statistics necessary for their use are "typically unavailable to intelligence analysts—or it they are available, must be based on small samples of past events."[252] Additionally, scoring the conclusions from such small samples across production lines and even from day to day by a single intelligence professional can be observed to be inconsistent. Steve Rieber discusses calibrating sensemakers as a solution.[253] To date no such strategy has been implemented.

Peer-reviewed, discussed and argued findings published in blogs (as a formal means of communicating) would be a novel means of communicating results. If they are readily available to the policy community, they would enhance the capabilities of intelligence practitioners and policymakers alike to collaboratively make sense of the issues that policy faces. Intelligence could truly speak truth to power and policy could speak truth to intelligence. As an alternative communications medium where body language and other nonverbal cues can be read, the adversarial briefing initiative mentioned earlier offers an intermediate solution to the problem of communicating intelligence needs and perspectives.

At the same time, the blogosphere certainly provides an effective locus for discussion of developments surrounding ongoing issues. This is manifest in the IC's implementation of "A-Space" or Analysts' Space, a blogosphere where intelligence professionals can communicate among themselves regarding topical and methodological issues.[254] This new model for managing intelligence practitioners that respects their expertise and capabilities is an integral part of the ongoing revolution in communicating intelligence. A useful future step might be the inclusion of the consumer as part of the discussions; such a step would truly be revolutionary.

In the end, how these actors actually go about understanding the issues they consider is a complex process involving both the foraged and marshaled evidence as well as the beliefs and assumptions of the parties involved. Making sense of this requires both deliberative reasoning and intuitive approaches. Exploring how this works is the subject of the next chapter.

CHAPTER 5
A Practice of Understanding

David T. Moore and Robert R. Hoffman

We begin this chapter by considering intuition, trying carefully to define this nebulous term, and exploring the benefits and hazards of intuitive judgments. In order to accomplish this, an understanding of exactly what is meant by the similarly nebulous term 'judgment' is also needed. We develop our position from the work of Daniel Kahneman and Gary Klein as we explore skill-based and heuristic-based intuitive judgments and how they affect forecasting.[255]

Judgment in intelligence sensemaking, as in a number of other domains, likely improves as one progresses to higher levels of proficiency and expertise. However, prediction is both difficult and inherently unreliable because events of different kinds vary considerably in their inherent predictability. A common view is that prediction has these three features:

- It is the act of forecasting a specific future occurrence,
- It has some associated degree of probability and/or confidence, and
- It is linked logically to one or more specific courses of action that the predictor might take to achieve one or another specific goal.

We believe that another paradigm for shaping how we think about prediction is needed, along with fresh terminology. We present a view centered on the notion of "anticipation of ranges" and the concept of the "course of action envelope" as we begin to envision an alternative model of the phenomenon. We turn next to the implications of intuition and predictability for intelligence sensemaking. We conclude by looking ahead at some preliminary research into how the circumstances for sound reasoning may be improved, and we raise some questions about future directions for the Community.

Intuition

It is difficult to wrap appropriate words around the concepts that are at hand, thus care should be taken to make certain distinctions. Sometimes, judgments can be rapid, non-conscious, non-deliberative, and almost seem as if they are immediate perceptions and feelings rather than judgments. These

255 Kahneman and Klein, "Intuitive Expertise."

immediate attitudes can blend seamlessly into more deliberative or conscious reasoning, which in turn can, even if fleetingly, maintain the emotion and immediacy normally associated with intuition. Thereafter, we might say that purely deliberative and non-intuitional thinking might transpire. None of these distinctions is clear-cut in the social science approach to mental phenomena or in the annals of philosophy.

The process of intuitive thinking refers—according to psychologist David Myers—to the ability of individuals to fly "through life mostly on autopilot" even as they function effectively.[256] Neurologist Robert Burton observes this phenomenon in the actions of batters who can hit a ball (or miss it) in advance of their being able to consciously perceive it.[257] Burton also highlights a danger of such non-conscious thinking: People can misinterpret the input, leading us to think twice about relying on intuition for important decisions.[258] After all, as in the batter's case, it seems that intuition-based accuracy is limited to extremely rapid events.

At the same time, in fear and flight behavior, a certain level of inaccuracy can be tolerated. If early hominids misinterpreted, for example, the presence of certain shadows in the tall grass and reacted by running away, and the shadows were in fact benign, then the error had few consequences. Similarly, while one's "gut" may advise one not to get into a particular elevator late at night, people nonetheless tend to board the next one. Is there some stimulus of which one is not consciously aware—perhaps a shadow in the elevator—of someone who might be a mugger or worse? If one listens to one's "gut" and does not get on the elevator car, one will never know. Consequently, one will rationalize, "while I may have been wrong, at least I did not get mugged (or worse)."[259]

Intuitive, or, as it is sometimes called, *automatic* thinking forms the basis for much of our personal sensemaking.[260] It allows us to process

257 Robert A. Burton, *On Being Certain: Believing You Are Right Even When You're Not* (New York, NY: St. Martin's Press, 2008), 75. Cited hereafter as Burton, *On Being Certain*.

258 When and how we intuit accurately (and inaccurately) is one of the themes of this chapter.

259 Only if one gets on the elevator, does not get mugged, travels safely to the desired floor, and then safely exits the elevator does one know that the instinct was incorrect. And even then, one merely has one anecdote's worth of experience contrary to that intuition. That nothing untoward occurred in this *specific instance* is no guarantee of the outcome in any future situations.

260 See Douglas J. Herrmann, and Roger Chaffin, "Memory before Ebbinghaus," in David S. Gorfein and Robert Hoffman, eds., *Memory and Learning: The Ebbinghaus Centennial Conference* (Hillsdale, NJ: Erlbaum, 1982), 35-56 and George A. Miller, "The Magical Number Seven, Plus or Minus Two: Some Limits on Our Capacity for Processing Information," *Psychological Review*, vol. 63 (1956): 81-97. Cited hereafter as Miller, "Limits."

complex inputs that far exceed the "span of immediate apprehension" of approximately seven "chunks" or elements that individuals can consciously process in working (or short-term) memory.[261] Such thinking, for example, explains how people (mostly) drive successfully. Recent research revealing a correlation between cell phone use (especially texting) and accidents leads one to extrapolate that attention-requiring activities such as engaging in professional-level office conversation or dialing and conversing while mobile respectively impede otherwise effective automatic activities such as ten-finger typing or absent-mindedly but safely driving an automobile. In one study sponsored by the British Royal Automobile Club Foundation's Transport Research Laboratory, researchers found that texting while driving contributed to impaired driving more than either moderate alcohol or cannabis consumption.[262] From these and other similar studies it becomes clear that conscious reasoning can distract and thus decrease the effectiveness of "automatic thinking," leading to flawed and sometimes fatal decisions.

With other combinations of activities, people can simultaneously and very successfully perform more than one task. Many people are able, for instance, both to chop vegetables and converse casually. It seems that the mechanics of these two simultaneous activities are more automatic than deliberate. Further, we would expect that driving and conversing emotionally—arguing—would impair one's ability to negotiate traffic, for arguing requires deliberation, whereas the usual affective responses in conversation can be very rapid, or "pre-cognitive." In sum, humans are limited with respect to their mental resources for conscious and non-conscious thinking when engaged in complex tasks.[263] Psychological research has shown that with extensive practice and training one can learn to perform two tasks at once, even apparently incompatible tasks such as taking dictation while reading.[264] On the other hand, in most day-to-day "multitasking," performance generally suffers, even

Boehm-Davis, "The Effect of Interruption Duration and Demand on Resuming Suspended Goals," *Journal of Experimental Psychology: Applied*, vol. 14 (December 2008): 299-313.

for individuals of the Web generation who are widely believed to be skilled at multitasking.[265]

There is another side of intuitive reasoning that sometimes works in opposition to one's survival. Intuitively reasoned responses to stress are often highly focused and narrow. Laurence Gonzales notes that in such reactions "the amygdala…in concert with numerous other structures in the brain and body, help to trigger a staggeringly complex sequence of events, all aimed at producing a behavior to promote survival."[266] But, in many cases, behavior is also locked down. Citing the cases of Navy and Marine Corps pilots who fly their aircraft into the "round down" or stern of aircraft carriers as well as his own experience of nearly crashing while landing a private plane, Gonzales observed that other vital input becomes "irrelevant noise, efficiently screened out by the brain."[267] However, unless such input is accounted for, accidents happen and people die. Non-intuitive input, then, needs to be considered; however, it may take too long to accomplish.

Intuitive or automatic thinking is a survival mechanism.[268] Gonzales notes that such mechanisms "work across a large number of trials to keep the species alive. The individual may live or die."[269] But over time—and in reference to humans—generally more live than die, leading to evolution and the genetic transmission of the "reflex." If a particular set of behaviors confers a survival value, that set can become more widespread in the population. Seen in this light, unease at entering an elevator at night could be a modern instance of sensing shadows in the tall grass.

On a shorter time horizon, people use experience-based intuitive patterns or mental models. These patterns or models direct how situations are perceived and how they are responded to. Mental models provide

rapid shortcuts to determining the nature of situations and the appropriate responses.[270]

The challenge is that some intuitive mental models can ill-serve the individual. They can be incomplete or can contain incorrect concepts. As Gonzales notes, they can impede our "ability to use working memory properly, to process new information from the world, and to integrate it with long-term memory. And there's plenty of evidence that while they're not always lethal, such lapses are perfectly normal and happen all the time."[271]

In a recent article, Daniel Kahneman and Gary Klein engage in a surprising collaboration to clarify the roles of intuition in human decisionmaking, particularly in the realms of expert judgment.[272] Their collaboration is surprising because Kahneman and Klein come from different communities of practice. That Kahneman, as a recognized leader in the "judgment under uncertainty" decisionmaking community, and Klein, as a recognized leader in the naturalistic decisionmaking movement, find they agree on intuitive expertise opens new partnering opportunities for adherents of both paradigms to seek other common ground, enhancing our understanding of decisionmaking and judgment.

Their shared concern is with how "skilled intuitive judgment develops with experience" and the nature of "the activities in which experience is more likely to produce overconfidence than genuine skill."[273] The authors note that the "judgments and decisions we are most likely to call intuitive come to mind on their own without evoking cues and of course without an explicit evaluation of the validity of those cues."[274] Intuition and intelligence sensemaking are linked by the very concept of judgment as developed by Kahneman and Klein.

We turn next to an examination of types of judgment, distinguishing between those that are skill-based and those that rely on "heuristics," or learning through personal discovery whether rules of thumb are valid shortcuts to understanding an issue. We then link this dissection of judgment to the work of intelligence professionals.

Types of Judgment

First we must clarify the meaning of "judgment." A judgment can be an observer's belief, evaluation or conclusion *about* anything—one can form a judgment about anything of interest, including one's own reasoning.[275] Judgment also describes a *process*, surely more than one kind of mental process, by which one reaches a decision. Judgment can be expressed as affective evaluation (example: That is a good thing), objective evaluation (It looks like a cat, but it is just a stuffed cat), or categorical assignment (My judgment is that this is a case of highway robbery). Judgment as process can also be described as apodictic, modal, or oral, among others.[276]

Kahneman and Klein relate judgment to intuition with these diverse examples:

> The firefighter feels that the house is very dangerous, the nurse feels that an infant is ill, and the chess master immediately sees a promising move. Intuitive skills are not restricted to professionals: Anyone can recognize tension or fatigue in a familiar voice on the phone.[277]

A standard approach to understanding a phenomenon invokes categorization. For example, judgment can be seen as taking one of two forms: skill-based intuitive judgment, and heuristic-based intuitive judgment.

Skill-Based Intuitive Judgments

A simple example of skill-based intuitive judgment is the act of parallel parking by an experienced driver. The experienced driver has repeatedly parked in a similar manner over years of operating a vehicle and has become familiar with its dimensions; also, parking spaces are fairly uniform in size. These factors lead to a likely successful conclusion—dent-free parking.

Examples of skill-based intuitive judgment also seem to occur routinely in sports where repetition facilitates learning. A particular move becomes a habit, a reflex, or as we would say, automatic. The author (Moore) has repeatedly and deliberately capsized and righted his kayak in a similar manner over years of paddling on the Chesapeake Bay, nearby rivers, and elsewhere. He is intuitively familiar with his boat, how it behaves under various circumstances, and what it can be made to do (its "affordances"). He is also familiar with the supporting capacity of various paddles, and the motions

277 Kahneman and Klein, "Intuitive Expertise," 519.

of his body and paddle. The upshot of such skill-based practice is that in an emergency, the author does not have to deliberate about what to do. Instead, he *knows* how to position himself and "roll up," righting the kayak. In actuality, intuition allows him to paddle in such a manner that post-capsize action is typically unnecessary. He knows the things he can do with his own body, his paddle, and the kayak to prevent capsize—his own "effectivities."[278]

Successful skill-based intuitive judgment presumes "high-validity environments and an opportunity to learn them." such as those found in parallel parking and kayak rolling.[279] This process only works when the environment surrounding the issue "provides adequately valid cues," and the sensemaker "has time to learn those cues."[280] Kahneman and Klein note that in intuition of this sort, "[no] magic is involved. A crucial conclusion emerges: Skilled intuitions will only develop in an environment of sufficient regularity, which provides valid cues to the situation."[281]

In terms of intelligence sensemaking, successful intuitive judgment arises from the tacit knowledge of experts who assess "normal" (in Kuhnian terms) situations, or as has been discussed above, the tame, familiar or regularly occurring kinds of problems (although they may be quite complex). Situations involving state-based actors or others for whom events tend to follow from earlier, observable indicators are an example of environments suitable for the operation of skill-based, expert intuitive judgment.

Heuristic-Based Intuitive Judgments

Heuristic-based intuition relies on "rules of thumb" in order to make sense of situations.[282] Rather than making judgments based on deliberation, the experienced sensemaker can at times recognize when a case fits a nominal type; that is, it is similar in many respects to a well-known instance of the situation. Based on recognition that a given case fits a type, the practitioner knows immediately what principles to apply or actions to take. Heuristic-based intuition, as Klein and Kahneman define it, is rapid and automatic,

280 Kahneman and Klein, "Intuitive Expertise," 520.

281 Kahneman and Klein, "Intuitive Expertise," 520.

282 The term "rule of thumb" has unclear origins in antiquity, likely related to the idea of using the thumb as a measurement device. In computer science and cognitive science, heuristic rules are distinguished from algorithms. The latter are known to give precise answers in finite time. A heuristic is any short cut that is not guaranteed to give precise answers, but takes less time than required to use an algorithm.

almost like skill-based intuition. There is no pause to reason through a decision or judgment, but there is an act of recognition. The sensemaker recognizes that actions learned or developed in one context—rules of thumb—are appropriate in another situation. Where the environment is sufficiently unstable so as to preclude recognition and learning of appropriate cues (or the time to do so is too short), heuristics operate similarly to make sense of the situation and offer solutions. Often accompanying such judgment is an "unjustified sense of confidence," a concept Kahneman terms the "illusion of validity."[283] Under such circumstances, the success of intuitive judgment in such conditions may be limited.

However, it should be noted that the combination of skill-based and heuristic-based intuition confers a benefit to mindful experts: a sense of when a case seems typical at first glance, yet there is something not quite right about it. While the less experienced person may be lulled into believing the case fits a certain type, expert decision makers react differently. They note some worrisome clue that raises questions. "Maybe this is not a typical case," they venture. Eventually they may come to see that the case is in fact atypical. So informed, they make a different judgment, sometimes in disagreement with other experts. As we will now see, intuition certainly becomes a part of the intelligence process when practitioners make, or fail to make, useful and accurate predictions.

The Question of Predictability

Some in the IC argue that the pertinent aspects of all intelligence problems can be adduced, "if we only knew more" or "had the right algorithm or method." However, we mislead ourselves if we believe that any messy problem can be resolved with a probability-juggling program. The authors are reminded of the observation, "There are the hard sciences and then there are the difficult sciences." It is both impossible and inappropriate to attempt to remake social and cognitive sciences into emulations of calculational physical sciences. If the reduction were possible, someone would have achieved it, or would have at least made demonstrable progress toward its realization, in the 200-plus years during which psychology and the other "social sciences" have called themselves "sciences." If reduction was appropriate, and we could get "the right information to the right person at the right time," we would not need that right person—"truth" would be self-evident.

By contrast, sensemaking is all about creating and recognizing proximate knowledge and meaning through human cognition. A useful question is not "How can cognitive work be automated?" but "In what ways and to what

283 Kahneman and Klein, "Intuitive Expertise," 517.

extent might technology and software amplify and extend the human ability to engage in cognitive work?" In other words, the unexpected happens, even on a large scale, as is illustrated by the inaccurate predictions offered by a number of books published in the 1995-2001 period that addressed the issues of the looming 21st Century and missed climate change—and more importantly from the U.S. perspective—the likelihood of attacks such as those by Al Qaeda on the World Trade Center and the Pentagon on 11 September 2001.[284]

The IC's flagship, publicly available forecasting reports, the National Intelligence Council's (NIC) quinquennial "global trends" reports, also missed the opportunity to bring attention to a "global war on terror," although effects of climate change did receive consideration in the report published in 2000.[285] Inclusion of this latter driver is not surprising considering that the NIC's brief examination of climate change occurred at least a decade into the discussion and debate about "global warming," suggesting that the phenomenon was known even if the impact was not clearly predictable. One could argue that the likelihood of a war on terror was also knowable. At least one intelligence adviser, Richard Clarke, warned of what would come to be known as the 9/11 attacks during the spring and summer of 2001; that is, prior to the events of that tragic day.[286] The fact that some people did anticipate these trends and events relates to a conclusion of Kahneman and Klein, namely, that "widely shared patterns of association exist, which everyone can recognize although few can find them without prompting."[287]

Interestingly, *The Atlantic Monthly* did warn in a speculative piece published during the summer of 2005 of a looming economic crisis.[288] It blamed the crisis in part on people using home equity to buy stocks—at least getting "right" the fact that the then-future 2009-2010 crisis was (at least in part) about real estate.[289] The real culprit—as has become clear—was the

---

284 Peter Schwartz's *The Art of the Long View* (New York, NY: Doubleday, 1996) is an example. An irony here is that previously Schwartz headed the forecasting (scenario planning) unit at Royal Dutch Shell, which was (at least according to Schwartz) often correct in their predictions. Schwartz, conversation with the author, September 2006.

It should be noted that climate change was already a discussed topic at the time.

286 As also did others according to Berkowitz (referenced above). While a failure to alert and warn was part of the tragedy, so was a failure to *believe and act*.

287 Kahneman and Klein, "Intuitive Expertise," 520.

288 See James Fallows, "Countdown to a Meltdown," *The Atlantic Monthly*, July/August 2005, URL: <http://www.theatlantic.com/doc/200507/fallows>, accessed 15 February 2010.

289 As seen from hindsight. Mr. Fallows had no way of knowing in foresight which parts of his speculative piece would come "true."

behavior of banking institutions, not individual investors. In both cases greed was a motivating factor.[290] However, the same *Atlantic* piece also speculated on the impending death of Fidel Castro, expected in 2008.[291]

Some examples of mindful, heuristic-based decision making, especially pertinent because they involve the thinking habits of senior U.S. civilian and military officials as well as of their strategic advisors, are discussed in Neustadt and May's *Thinking in Time*.[292] The authors point out that a sensemaker's awareness of historical decision making in even loosely analogous situations helps to keep at bay the further unsettling idea that the present circumstances constitute a "crisis." Even in the absence of politically or militarily identical precedents as a guide, they note that George Marshall, Chief of Staff of the U.S. Army, read history and possessed "the kind of mental quality that readily connects discrete phenomena over time and repeatedly checks connections."[293] Decisions, as informed at times by the IC, might benefit from Neustadt and May's recommendation that heuristic-based decisions can grow from "imagining the future as it may be when it becomes the past."[294] This advice would seem to be useful in making decisions on a strategic basis rather than a more tactical, reactionary plane. From a national intelligence perspective, where proactive decisionmaking in the face of impending change in the national security environment ought to reign supreme, Neustadt and May's heuristic advice about "thinking in time" becomes apt: "You may even [achieve] headway toward identifying changes that might be *made* to take place."[295]

However, like all strategies for framing and re-framing, caution is needed, perhaps especially in considering Neustadt and May's specific method of heuristic reasoning. An awareness that some current occasion or event repeats one that occurred in the past, or that the patterns bear some similarities or symmetries, can serve as either a flashlight or a blindfold. The pattern suggests where to look in finding evidence, but it might also prevent one from looking for other possibilities and particularly for the unique elements of the situation at hand. The characterization by some of the 1991 Gulf War as "another Vietnam" cognitively blinded them to the specifics of the

case at hand. Similarly, those who considered the second Gulf War as one that completed the first apparently missed key unique elements of that situation. Even so, there are instances when such reasoning is possible and valuable, particularly when expertise can be acquired and is useful.[296]

The two types of intuition suggested here—skill-based and heuristic-based—arise from a number of cognitive processes, including "the operations of memory."[297] While Kahneman and Klein disagree on the frequency and utility of non-skill-based intuitive judgment, they do agree that intuitive judgment may be limited in situations when the decisionmaker is either unskilled or the environment fluctuates irregularly and therefore cannot be learned. "Anchoring," which is the biasing of a judgment because of the framing of the initial question, and "attribute substitution," arising from replacing a difficult question with an easier one, are two contributors to such flawed intuitive judgments.[298]

If venturing predictions is too uncertain for intelligence professionals, what can be done? We address this in our next section as we consider in more detail both why intuitive predictions fail, and when they may succeed. We also present an alternative paradigm for assessing the future.

Thinking About Anticipating

Jurisprudence, clinical psychology, and economic forecasting are all examples of domains where accurate prediction is difficult or impossible, and it is not terribly clear what it means for a person to be an expert in any of those fields. In the realm of jurisprudence, studies of the low rate of successful intuitive predictions about future recidivism among paroled offenders serves as one of many pieces of evidence showing that even highly experienced professionals in certain domains may be no better than laypersons at making intuitive judgments. As recounted by Myers, a 1998 Canadian Solicitor General research team found that the experts—in this case the clinicians—were one of the "*least* accurate predictors of future criminality."[299] Researchers at the University of Minnesota found such "expert" predictions were on average 10 percent less accurate than ones made with "mechanical" i.e. statistical, actuarial, or algorithmic techniques, although they did

296 We discuss this below in more detail along with a means of making use of the past to better understand the present and explore the future.

297 Kahneman and Klein, "Intuitive Expertise," 521.

298 Kahneman and Klein, "Intuitive Expertise," 520-21.

299 Myers, *Intuition*, 173; emphasis in original.

observe that in 63 of the 134 cases they studied, clinical predictions fared as well as mechanical ones.[300]

Admittedly one explanation (at least in the latter case) is that lack of timely feedback inhibits the acquisition of the skills needed for successful prediction. Psychologist James Shanteau observed that domains where the practitioner's task is to predict human activity have few "experts."[301] Indeed, the expertise may lie in tasks other than those that are assumed to be the principal task goals. Thus, for instance, we might think that to be an expert clinical psychologist, one would have to be able to correctly diagnose and then correctly predict the likelihood of recovery, and then correctly treat the client, but the true skill might lie in being a very good listener. Human activity often fails to provide the needed cues for timely feedback, and at a collective level is subject to too many unpredictable events and decisions at the same time as it is subject to known trends and forces. The viral spread of unsubstantiated ideas on the World Wide Web through such mechanisms as YouTube offers an example of how weak feedback at the collective level breeds low intrinsic predictability.

These domains contrast with those where it is relatively easy to identify experts on the basis of operational definitions that specify what it means for a person to be an expert, in terms of performance at principal task goals. Examples would be medicine, weather forecasting, piloting, musical performance, and industrial process control. These latter domains are known by convenience as "Type 1." They contrast with the formerly described domains, known as "Type 2."

How professionals fare in estimative judgments in these domains has been studied. The results of one study of members of the intelligence unit of the Canadian Privy Council Office, carried out by Defence Research and Development Canada, concluded that with ample time and resources the "quality of analytic judgments was 'good to excellent' across [a series of] various indices."[302] The researchers noted, "[experts] that perform well tend to work in areas that provide timely, unambiguous feedback on their performance"—in other words, in stable, Type 1 domains.

302 David R. Mandel, Alan Barnes, and John Hannigan, "A Calibration Study of an Intelligence Assessment Division," PowerPoint Presentation, Defense Research and Development Canada, Toronto, CA, n.d. Cited hereafter as Mandel, Barnes, and Hannigan, "Calibration Study."

For Type 2 domains, however, the evidence points the other way: we can expect intelligence professionals to be poorer at point prediction unless the predictions are very near term. This tendency is confirmed by the NIC long-range predictions contained in the *Global Trends* papers. In a related example, *The Economist* found greater accuracy in their control group than among the experts in a set of economic point predictions spanning 1984 to 1994.[303] About this experiment, the members of the U.S. Commission on National Security observed that of four groups of people—"finance ministers, chairmen of multinational corporations, Oxford University economics students, and, as a control group, four London garbage collectors"—"[every] group did poorly; the garbage collectors, as it happened, turned out to be the most accurate."[304] In commenting about its own study, *The Economist* concluded, "The contents of dustbins could well be a useful leading economic indicator."[305]

A Space-Time Envelope of Anticipation

What actually occurs when we think about an event or trend lying in the future? Hoffman suggests that causality arises from what he refers to as long-term forces and abstractions, rather than near-term events and decisions. We project past events, decisions, and perceived forces and abstractions forward in space and time toward the present effect or event as we begin trying to make sense of the future. Then we envision the reach and consequence of that effect or event further, into the future; we extrapolate future forces and abstractions from ongoing events and decisions. We therefore convert events of the present moment into a "specious present."

This all occurs in foresight. But we subsequently look at events in backward fashion. Someone got onto an airliner with a bomb in their underwear. What explains this? We can reason backward across actual time from effects and aftereffects (the attempt by the bomber to detonate his explosives and the successful preventative intervention) to causal explanations. And we

303 The United States Commission on National Security, *New World Coming: American Security in the 21st Century*, Study Addendum, Phase 1 (July 1998-August 1999), 1. Cited hereafter as Commission on National Security. Since the National Intelligence Council has an "Economics" portfolio, one safely can surmise that economics is an intelligence issue. Therefore the results from the experiment by *The Economist* study has relevance to the practice of intelligence.

304 Commission on National Security, 1. One might well wonder how a group of four intelligence professionals might have fared. Hoffman suspects that the researchers probably only looked at prediction hit-rate and did not drill down into the reasoning and knowledge content relied upon. It is there, he suspects that the expertise of the "experts" would have emerged. Still, because economics is a Type 2 domain, the results are not implausible.

305 *The Economist*, "Garbage In, Garbage Out," (U.S. Edition), 3 June 1970, 70.

always find those causal explanations; we're certain they're the right ones. For Type 1 domains we may be good at this. The very nature of Type 2 domains precludes any reasonable expectation of accuracy on our part about causal explanations. But, as Kahneman and others point out, people are nonetheless certain they are right: the "illusion of validity" prevails. Such cogitation in hindsight is a quite rational kind of sensemaking, as it is the reconsideration of a case after one has obtained more information about it. It works because we only consider what we knew afterward and what we could or should have known afterward. We do not consider the event from the perspective of what we knew *before* the event occurred, and this feeds into the blame game.

Such human thinking may be illustrated as a series of interlocking triangles set across a "space-time envelope of indeterminate causality" as shown in figure 3. "Effects" or events are predicated upon other events and decisions that are themselves influenced by forces and abstractions. They in turn give rise to new (or continuing) events and decisions that are in turn embodied in

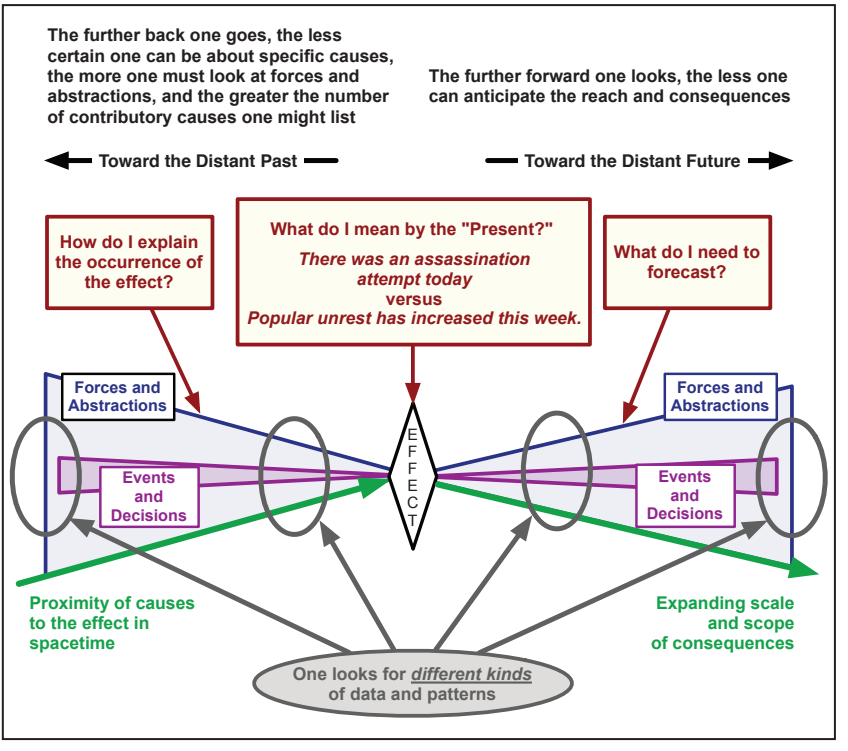

Figure 3. Space-Time Envelope of Indeterminate Causality.
Source: Robert Hoffman.

new (or continuing) forces and abstractions. These predicate and subsequent factors can be viewed from a variety of scales. Using a model of weather forecasting (from which this "envelope" was developed), we observe that at each scale, there are particular dynamics having particular space-time parameters. As one progresses from higher scales to lower, each scale provides the "boundary conditions" or forcing events for the scale below it. Each scale requires the examination of different kinds of data and emergent patterns as well as differing meanings. For example, at a microscale in weather forecasting, one might simply look up and observe what is going on locally over a period of a few minutes; at a continental or "synoptic" scale one makes sense of radar or satellite images showing events that transpire over a period of hours; at global scale observations consider the actions of the jet stream and the worldwide effects of phenomena such as *El Niño* over time spans of months. Dynamics are coupled to space-time, and because time is a factor, there is an explicit expression of increasing uncertainty the farther one is from the effect or event—either in the past or in the future. Placing an episode of intelligence sensemaking into this framework might help keep the thinking honest.

Let us consider that the point of view of the observer is one of an "unspecific present." This is not a single point in time but a range of time, a little in the future and a little in the past, depending on the context or events under analysis. Hoffman's model allows for the factors—at differing scales—to be mapped out conceptually as is shown in figure 4.

At the conclusion of making such a diagram, one has mapped out a path of reasoning—forward in foresight, backward in hindsight—identified the drivers, and placed them in one of three space-time envelopes: past, present, or future. The creation of diagrams of this sort has been useful in charting analyst reasoning and knowledge, making it explicit for discussion and also contributing to knowledge capture and preservation.[306] The diagram facilitates sensemaking by making explicit what one knows and when one knows it as well as how the various trifles of information are related and contribute to one another.

Anticipating Deception: Applying the Space-Time Envelope

A recurring worry within alert intelligence services is whether they are being deceived by their adversaries. From Troy, in the second millennium BCE, through to mis-direction schemes in World War II, and on to the lead-up to the Iraq invasion of 2003, adversarial deception has played a strong or decisive role in final outcomes.[307]

World War II's Operation Mincemeat is of particular interest for the opportunity it affords for counterfactual examination, and thus for a sensemaker's anticipation of future strategic deception.[308] The premise of the Mincemeat deception was to employ a stratagem known as the "lost dispatch case," a sort of portable Trojan Horse, to mislead the Germans about where the Allies would invade as they moved from North Africa onto the European continent. To both sides, Sicily was the logical candidate for the initial landings. Thus, the English proposed floating a corpse ashore at Huelva, Spain, with a dispatch case containing letters and other references to invasion points through the Peloponnese, and Sardinia and Corfu; Sicily was to be a diversion. As both Montagu and Macintyre make clear, the Germans decided the recovered documents were authentic and redeployed troops to strengthen their positions in the incorrect locations. Subsequently the Allies faced considerably less resistance when they landed on Sicily.[309]

However, could the Germans have come to a different conclusion? Such counterfactual questions normally leave us with a less than satisfying answer. But in this case, in light of first-hand and well-founded knowledge of decisionmaking on both sides, we can marshal the authentic beliefs, events, and drivers that led to a decision to make a well-informed estimate of what could have evoked an opposing decision. As shown in figure 5, key evidence and beliefs, when laid out in the space-time envelope of anticipation, would facilitate the counterfactual process by indicating what underlies the German belief that the documents were authentic. Behind each "event" are in fact chains of evidence that could be explicitly included in a more detailed

---

307 For a very interesting take on the many layers of Iraqi deception see Kevin Woods, James Lacey and Williamson Murray, "Saddam's Delusions: The View From the Inside," *Foreign Affairs* (May/June 2006). It seems that Hussein was himself deceived even as he strove to convince his neighbors that he had weapons of mass destruction (WMD) and strove to convince the United States that he had gotten rid of his WMD—which apparently was the ground truth.

308 See Ewen Montagu, *The Man Who Never Was: World War II's Boldest Counterintelligence Operation* (Annapolis, MD: Naval Institute Press, 2001, reprinted from 1953 original). Cited hereafter as Montagu, *The Man Who Never Was*. The story, a first-hand account by Montagu as one of its planners, is also told in the 1956 movie of the same name. Also see Ben Macintyre, *Operation Mincemeat* (New York, NY: Harmony Books, 2010). Cited hereafter as Macintyre, *Operation Mincemeat*.

Source: Authors.

version of this sensemaking approach.[310] Had the Germans employed this cognitive tool, a different decision regarding the authenticity of the documents and therefore the location of the invasion *might* have been reached. The Allies might have been repulsed and the events of the remainder of the War would have been different.[311]

Implications of Visualizing Anticipation

Diagramming using Concept Maps (and related kinds of diagrams called causal maps and cognitive maps) has been used as a de-biasing technique for analysis under uncertainty. This use is well known in the field of business and strategic management:

> Causal maps allow the map maker to focus on action—for example, how the respondent explains the current situation in terms of previous events, and what changes he or she expects in the future. This kind of cognitive map is currently the most popular mapping method in organization theory and strategic management.[312]

And in the pages of *The Journal of Strategic Management*, Gerard Hodgkinson and his colleagues added:

> In addition to providing a useful means for gaining insights into the nature and significance of cognitive processes underpinning strategic decision making, this dynamic emphasis on antecedents, behaviors and consequences, renders causal cognitive mapping techniques particularly attractive as a potential means for overcoming the effects of framing (and possibly other cognitive biases) in situations involving relatively complex decision scenarios.[313]

Hodgkinson *et alia* investigated "the extent to which judgmental biases arising from the framing of risky decision problems [could] indeed be eliminated

Pearman, "Breaking The Frame: An Analysis Of Strategic Cognition And Decision Making Under Uncertainty," *Strategic Management Journal*, 20 (1999): 979. Cited hereafter as Hodgkinson and others, "Strategic Cognition."

through the use of this particular cognitive mapping technique" and found cognitive mapping to be "an effective means of limiting the damage accruing from this bias."[314]

Because Hoffman's approach is generalized from weather forecast modeling—which has become increasingly accurate at certain scales—it would be reasonable that against Type 1 domains this may be a useful approach. But, what of Type 2 domains? Given the appeal and excitement that come with attacking such mysteries, innovative experimentation remains the surest way to learn about how causality mapping might contribute to positive advances in intelligence sensemaking about Type 2 domains. Given the conclusions reached by Hodgkinson, it appears likely that intelligence professionals making sense of type 2 domains might mitigate framing effects through such diagramming.

The Roles of Intuitive Thinking in Intelligence Sensemaking

Given these considerations, what are (or should be) the roles of skills-based intuitive and heuristic-based intuitive thinking in intelligence sensemaking? Many, if not most, intelligence professionals have had a "feeling" about an issue and what is going to happen. Sometimes those intuitions are correct, particularly if the requirement entails real-time observation and situational awareness. When it comes to anticipatory sensemaking, however, the authors suspect that intelligence professionals may fare no better than does the average citizen in predictive situations.[315]

There are a number of reasons for this, not the least of which has to do with the availability of evidence, or relevant information. A somewhat persistent myth about intelligence is that its professionals have access to all the information they need and that they can get any and all other necessary information. This not only simply is not true but is likely highly undesirable. While it is true that intelligence professionals must make their assessments based on incomplete, often faulty, and sometimes deceptive information, at least they can do so. Forcing them to try to make sense of *all* the relevant information relating to an issue would likely burden them sufficiently so as to preclude anything but the most general findings being issued—if anything

314 Hodgkinson and others, "Strategic Cognition," 977, 979. Framing problems differently has been empirically shown to dramatically change the decisions people make. See Amos Tversky and Daniel Kahneman, "The Framing of Decisions and the Psychology of Choice," *Science*, vol. 211, no. 4481 (10 January 1981), 453-458.

315 A near synonym is "prediction." However, the term implies a future that can be anticipated along with the establishment of the likelihood (probability) that it can be determined. Rather than such probability juggling, what people really do is to anticipate ranges of situations. This is the meaning attributed to "anticipatory sensemaking."

can be issued at all. Finally, as was discussed above in relation to figure 1 (see Chapter 3), complexity, ambiguity, and uncertainty increase as one moves from Descriptive to Estimative (or Anticipatory) Intelligence.[316]

It is true that a so-called "smoking gun" may exist from time to time. For example, the images of the Soviet SS-4 MRBMs in Cuba collected on 15 October 1962 left little doubt as to what they were—but such occurrences are rare. Further, intelligence professionals compete against other foreign intelligence organizations whose professionals may be as skilled at obfuscating what their factions, groups, or nations are doing as we are at making sense of what they are doing. Sometimes that other side is, in fact, better. And, like a closely matched sports event, the difference between valid and true sensemaking versus invalid or untrue sensemaking—or even no sensemaking at all—might be the result of luck.

Whether or not intelligence professionals do indeed have any better predictive skills than non-professionals should be a testable question; however, it remains one of many questions about intelligence sensemaking that remain open because of gaps in the empirical foundation for a psychological theory of performance of intelligence sensemaking.[317]

Many intelligence professionals work in one or more Type 2 domains where it is far from easy to come up with good operational definitions to identify experts. For example, how does one determine that an intelligence professional is an expert? In Type 1 domains, as discussed above, this can be clear. Among the defining features are years and breadth of experience, but also measurable performance, and status within social networks (i.e., the expert is the "go-to" person for dealing with specialized problems).[318]

However, as Kahneman and Klein note, such is not the case when "experts" must work outside their favored domains or within ones that are unstable and do not provide the cues and feedback necessary for calibration.[319] Since such Type 2 domains are ones in which the primary task goals involve the understanding and prediction of the activities of individuals or groups, accuracy and precision are elusive. Consequently, as has been noted, Type 2 domains are also characterized by tasks involving a lack of timely feedback and a paucity of robust decision aids. Further, if the object of study

316 How much information is truly necessary is discussed in more detail below.

317 Robert R. Hoffman, "Biased about Biases: The Theory of the Handicapped Mind in *The Psychology of Intelligence Analysis*," Panel Presentation for "Designing Support for Intelligence Analysts," S. Potter, Chair, in *Proceedings of the 48th Annual Meeting of the Human Factors and Ergonomics Society* (Santa Monica, CA: Human Factors and Ergonomics Society, 2005), 409.

318 Robert R. Hoffman, "How Can Expertise be Defined?: Implications of Research from Cognitive Psychology," in Robin Williams, Wendy Faulkner and James Fleck, eds., *Exploring Expertise* (New York, NY: MacMillan, 1998), 85.

319 Kahneman and Klein, "Intuitive Expertise," 521.

does not know what she or they will do, how can someone else predict it reliably? Therefore, is it any surprise that in such domains, intuition is limited in its usefulness? What are intelligence professionals to do?

It should be reiterated that although over-estimative errors in intelligence sensemaking, as has been noted, are unacceptable, under-estimative errors are even less tolerated. It is better to have warned and been wrong than not to have warned and been wrong. False alarms are better than misses. A warning about an attempt by another individual to set off a bomb on a subway system—which subsequently does not occur—generates far less uproar (if any at all) than does a failure to warn of an individual who in fact plans to blow up an airliner, and through anticipatory sensemaking, being able to catch him preemptively. In the former case, the fact of the warning may even be viewed as the measure by which the attack was prevented. The would-be terrorist was scared off because his plans were publicized.

Unfortunately, this bias toward false alarms feeds into the blame game that demoralizes intelligence professionals. This creates a perception of an inevitability of failure perhaps captured by the water cooler joke, "How many analysts does it take to change a light bulb?" For which the answer is three: "One to not notice it is burned out, one to not change it, and one to take the blame."

Does More Information Improve Anticipation?

What about foraging for more information? Paul Slovic's 1973 research into the impact on the reliability of bookmakers as they brought more information into consideration noted that it did not increase their accuracy (figure 2, above).[320] Myers, in commenting on the Minnesota meta-study, notes further that providing clinicians with additional information from files or interviews actually reduced their accuracy.[321] The question becomes how much information is *enough*? A related question is, "how does one know that in advance?" It must be concluded that even with more information, Type 2 intuition remains of uncertain validity.

It is by no means obvious that simply throwing more information at a problem will make solving it any easier. For instance, to investigate the question of apparent under-utilization of information, Phelps and Shanteau (1978) used two methods to examine the strategies of livestock judges. In one situation, judges were presented with photos of female pigs (gilts) and asked

320 Slovic, "Behavioral Problems"; also Fischoff, "Condemned to Study the Past."

321 Myers, *Intuition*, 173-174. See W. M. Grove and others, "Clinical Versus Mechanical Prediction: A Meta-Analysis," *Psychological Assessment*, vol. 12 (2000): 19-30. Paul Slovic came to the same conclusions in 1973; see Slovic, "Behavioral Problems."

to rate each on breeding quality (their usual task). The results revealed the same sorts of limitations reported by other research, with each judge apparently relying on only a few of the 11 possible cues (e.g., weight, length, ham thickness, heaviness of bone structure, freeness of gait, etc.). In the second condition, judges were presented with verbal descriptions of the gilts (supposedly based on a telephone conversation) that listed the levels of the 11 attributes for each animal. In this case, analysis of the judgments of breeding quality revealed a subtle pattern: Judges used between nine and eleven cues, which tended to interact. Combined with results from a post-experimental interview, the judgments revealed an underlying strategy involving two waves of information integration: Measures are collapsed into intermediate judgments including size and meat quality; these judgments are then combined into an overall judgment.

The difference in results for the two tasks is striking. With the pictures of gilts, the relevant stimulus attributes were naturally correlated and perceptually chunked (e.g., tall gilts tend to be heavier and wider). Thus, even though a judge may have perceived all of the cues, only one significant cue might be needed explicitly to generate a given intermediate judgment. With the verbal descriptions, on the other hand, the cues were presented separately, the expert had to work through them explicitly, and the effects of cue intercorrelations revealed.

Benjamin Kleinmuntz obtained a similar result using the "Twenty Questions" game and a set of test cases to add structure to interviews with intern and resident neurologists.[322] Experience made a big difference in diagnostic accuracy, of course, but also in the number of questions asked about symptoms in each test case. In order to diagnose a case, the advanced experts asked fewer questions but they also spent less time pursuing incorrect hypotheses. Indeed, experts tended to ask about symptoms that yielded the greatest amount of diagnostic information relative to their hypothesis, reflecting "economy of effort."[323]

323 The field of expert reasoning has a particularly rich literature. See, for example Sylvia Scribner, "Studying Working Intelligence," in Barbara Rogoff and Jean Lave, *Everyday Cognition: Its Development in Social Context* (Cambridge, MA: Harvard University Press, 1984), 9-40; and Sylvia Scribner, "Thinking in Action: Some Characteristics of Practical Thought," in Ethel Tobach, Rachel Joffe Falmagne, Mary Brown Parlee, Laura M. W. Martin, and Aggie Scribner Kapelman, eds., *Mind and Social Practice: Selected Writings of Sylvia Scribner* (Cambridge, UK: Cambridge University Press, 1997), 319-337; K. Anders Ericsson, Neil Charness, Robert R. Hoffman, and Paul J. Feltovich, eds., *Cambridge Handbook of Expertise and Expert Performance* (Cambridge, UK: Cambridge University Press, 2006); and Robert R. Hoffman and Laura Grace Militello, *Perspectives on Cognitive Task Analysis: Historical Origins and Modern Communities of Practice* (Boca Raton, FL: CRC Press/Taylor and Francis, 2008).

Future Vision: Red Brains, Blue Brains?

Given the discussion to this point, it is not enough to continue to ask whether expertise hinders judgment, or whether more information improves prediction. One might ask more productively about how we might improve the circumstances for sound reasoning. A partial answer may lie in the work of a group of Southern California political scientists whose recent neurocognitive research addresses how people behave and make predictions. For example, Darren Schreiber *et alia* used functional MRIs (magnetic resonance imaging tests) to assess how people associated with the U.S. Republican and Democratic political parties deal with risk. The researchers discovered that members of the two groups used distinctly different portions of their brains when making "winning risky versus winning safe decisions."[324] The authors note that the different portions of the brain play different roles in human cognition and conclude that

> it appears in our experiment that Republican participants, when making a risky choice, are predominantly externally oriented, reacting to the fear-related processes with a tangible potential external consequence. In comparison, risky decisions made by Democratic participants appear to be associated with monitoring how the selection of a risky response might feel internally.[325]

While neurocognitive paradigms for intelligence sensemaking have not yet formally been identified or established, implications of this work—to the degree that intelligence professionals can speak to the concerns of decisionmakers who are, after all, particular political partisans—may be significant. The research to date shows that the cognitive mechanisms and especially the emotion-based attitudes of partisan sensemakers shape their reasoning as they assess uncertain and risky phenomena.

Additional research could explore biologically based differences that correlate with the strong intuitive tradition by which sensemakers (and others) analyze, synthesize, and interpret intelligence phenomena. For example, in what situations are the skills and services of externally oriented intelligence professionals required and in what situations are those of internally oriented professionals needed? Similarly, in communicating intelligence results to

While it is too soon to determine the impact of their (and similar) work, it may prove revolutionary to political affiliation studies.

325 Schreiber and others, "Red Brain, Blue Brain."

consumers, are briefers more effective if their neurocognitive "risk" strategies match those of their consumers?[326]

Looking Ahead

Intuitive reasoning is something that we do naturally, all the time. It cannot be prevented, is not easily neutralized, and it is sometimes useful and necessary in sensemaking. While it can be reliable when employed as the sole basis for actionably valid, predictive intelligence creation in Type 1 domains, it is highly fallible when used for intelligence creation in Type 2 domains.

What can be done to challenge and validate the surety one has about an intuitive intelligence judgment? Employing approaches to reasoning such as those found in critical thinking seminars and courses, especially as currently offered across the IC's educational institutions, and developing skills that aid mindfulness (as discussed in the Preface), offer possible means of accomplishing calibrated reasoning.[327] Diagramming such as was done in figure 4 may challenge and certainly will augment the reasoning. But what else can be done to increase certainty that derived conclusions are valid? This becomes the subject of the next chapter.

---

326 An important caveat is that just because one person exhibits a particular "style" of dealing with risk does not make them unsuited for other situations where a different approach may seem to be warranted. Such reasoning smacks of "biological determinism" and is no more appropriate in intelligence work than it was in the domains discussed in Richard Hernstein and Charles Murray's *The Bell Curve: Intelligence and Class Structure in American Life* (New York, NY: The Free Press, 1996). For a history and in-depth discussion of scientific determinism (sometimes also referred to as scientific racism) see Stephen J. Gould, *The Mismeasure of Man* (New York, W. W. Norton & Company, 1996).

327 That these approaches will be effective admittedly is a hypothesis in need of testing in real-life situations. In experiments with students, Jennifer Reed (among others) finds that critical thinking does improve the quality of judgment and decision-making. The handy difference between the world in which intelligence professionals find themselves and Reed's classroom setting is that while there are no answers in foresight in the former, truth can be known in advance in the latter. See Jennifer H. Reed, *Effect of a Model For Critical Thinking on Student Achievement In Primary Source Document Analysis And Interpretation, Argumentative Reasoning, Critical Thinking Dispositions, And History Content in a Community College History Course*, PhD Dissertation, College of Education, University of South Florida, December 1998, URL: <http://www.criticalthinking.org/resources/JReed-Dissertation.pdf>, accessed 2 February 2010.

CHAPTER 6
Considering Validation

How does one know if the knowledge that intelligence sensemakers create is itself valid? Does accuracy alone ensure validity? What was accurate when findings were communicated may not be accurate subsequently. This flux suggests a strong procedural basis for validation. For example, were steps followed to avoid perceptual errors and cognitive traps? Was the process documented? Were alternatives adequately explored? Given the inherent uncertainty in intelligence judgments, it remains possible that all the appropriate processes may be sufficiently applied and yet the judgment is wrong—cold comfort for relatives of the victims and the survivors if the result is a terrorist attack on a scale of those in September 2001. By exploring validation perspectives from cognate fields, we may advance our parochial understanding.

Analogies from Other Fields

Medicine

Medical practice is at times presented as having notable similarities to intelligence practice. For example, with respect to validation, an ultimate metric for failure in medicine is that the patient dies. But is medicine successful if the patient lives? At what quality of life and for how long are two additional questions. Perhaps death with a minimum of suffering is the most favorable medical outcome—is this a success? Depending on the specifics of the case, maybe it is. Is there a difference if the patient is very old or very young? The author's own experience with the death of his mother is that elderly, somewhat frail patients—in practice—do not seem to receive the same level of treatment as do younger but equally severely ill patients. In the former case the patient, the author's mother, died within about 72 hours without what appears to be undue suffering but also without significant treatment of the condition, only an easing of the symptoms. In the latter case, the child recovers. Are both treatment regimes successful? Does the inevitable or perhaps the perceived inevitability of death by the attending physician become a factor in determining the treatment?

In medicine, success is measured post-facto. Early organ transplants were successes if the patients lived only for a brief period afterward. Other

factors include quality of life, longevity, and costs. A recent T-cell-based, bioengineered trachea is considered a significant success not only because it succeeds but also because it dramatically improves the patient's quality of life:

> the successful outcome shows it is possible to produce a tissue-engineered airway with mechanical properties that permit normal breathing and which is free from the risks of rejection seen with conventional transplanted organs. The patient has not developed antibodies to her graft, despite not taking any immunosuppressive drugs. Lung function tests performed two months after the operation were all at the better end of the normal range for a young woman.[328]

If, a year later, however, the patient dies (from a related cause) was the expense worth it? Certainly, her family can be expected to indicate this is the case. But what of the cost to the larger society and perhaps other patients suffering from other ailments, who cannot get necessary resources because they are tied up in this specific treatment? Viewed in an intelligence context, if a terrorist attack is thwarted (characterized as a success) but a year later a larger and more devastating attack occurs, and it does so *because* the earlier attack was prevented, was the earlier disruption a success?

Jurisprudence

Jurisprudence is an adversarial system in which the ultimate confrontation is a trial wherein two advocates make inferences about evidence to argue opposite sides of a case before an impartial third entity or body (often of non-experts). This is the system at its best. In practice, the skill level of the advocates may vary. One may be more skilled or more proficient than the other. The impartial body (judge, jury) may be misled to a decision. Were this not the case then there would never (or very rarely) be cases where innocent people are convicted, imprisoned, and sometimes executed.[329]

While such failures appear to be rare, they may be examples of a limited consideration of evidence where only one side of an issue is examined. The fallacy is not new. Diagoras of Melos (5th Century BCE) was confronted with votive offerings carved by sailors in gratitude to the gods at their safe return from the sea. Diagoras unpopularly observed that only those who had

---

328 University of Bristol, "Adult Stem Cell Breakthrough: First Tissue-engineered Trachea Successfully Transplanted," *Science Daily*, 18 November 2008, URL: <http://www.sciencedaily.com/releases/2008/11/081119092939.htm>, accessed 21 November 2008.

329 For more on exonerations see Samuel R. Gross and others, "Exonerations in the United States, 1989 through 2003," *Journal of Criminal Law and Criminology* 95, no. 2 (2005): 523-560.

returned carved the votives; those who had not returned [the missing class of evidence] carved none.[330]

A success metric involving law would be one where either no challenge was made or it was repudiated and the convicted person was in fact guilty. But, what if the person is found innocent, or at least not guilty? They may be truly innocent. However, the prosecuting attorney may be incompetent, the evidence circumstantial or otherwise incomplete. In this case the actual innocence of the person may be independent of the findings of the court.

So, how does one measure success? There are at least five points of view involved in jurisprudence: That of each of the advocates, the judging entity (a jury or judge) the accused person, and the community or government. Each party, depending on the verdict, has a different metric for success. In certain types of cases such as those involving child molestation or alleged terrorism, the accused person tends to be deemed guilty by the community, prosecuting advocate, and government even if exonerated. In all cases where an opinion—particularly in the media—runs counter to the majority's views, the conclusion may be made that the court failed to render the "right" verdict as was also seen in the highly publicized cases of motorist Rodney King and the murder trial of O.J. Simpson.

Science

Science involves a number of metrics that include a sound method of documenting both process and results, as well as replication. Work is considered preliminary and non-definitive if it has not been replicated. As a typical example, in writing about the need for studies of the genetic bases of fidelity among humans, the editors of a collection of articles on genetics of behavior in *Science* refer to a comment by Australian psychologist, Simon Easteal, that despite the intellectual appeal of theories about genetic links to specific behaviors, "there are few replicated studies to give them heft."[331] In other words, the underlying theories may not be sound.

Science depends on refutation of alternative hypotheses, and replication studies attempt to refute that which has been shown. It is quite acceptable to be wrong so long as one admits it when the fact becomes apparent. Indeed, one model for science is that of competitive cooperation. Scientists attempt to tear down the new work of colleagues—without resorting to personal attacks. This dialectic approach may last generations or longer. In the process new knowledge is discovered and—if it cannot be refuted—validated.

Replication in Intelligence

The inability to replicate much of the process of sensemaking in intelligence limits the application of this indispensable practice of science. The pressures of real-time production inhibit the re-visitation of past judgments, although with at least one recent National Intelligence Estimate, the repetition of "alternative analysis" led to the questioning and revision of the original conclusions. Essentially, any meaningful replication of intelligence phenomena can only be accurately made in foresight, as in a National Intelligence Estimate. It is not replication if one group of practitioners performs sensemaking of an event before it happens and another group does so afterward.[332] Therefore, replication needs to occur *before* an event occurs.

When replication of methods against the same problem occurs it is typically in the intelligence school setting. It is the author's experience that such efforts yield a common set of explanations with some outliers.[333] For example, when intelligence students faced with a scenario involving three fictitious nations at odds with each other develop a common set of hypotheses regarding who will initiate a war and with whom, and are then given a finite set of evidence and a common method such as the Analysis of Competing Hypotheses, they come to similar conclusions as to which hypotheses are the least likely and therefore which eventualities can be expected.[334] Unfortunately there does not yet exist a similar body of results for real intelligence problems interpreted through the lenses of different intelligence disciplines and sources.

Yet, replication remains an important metric of the intelligence sensemaking process. As Caroline Park notes, "[the] basic reason research must be replicated is because the findings of a lone researcher might not be correct."[335] In the context of intelligence, un-reviewed and even reviewed conclusions of an intelligence professional may simply be incorrect. Admittedly a supervisory review process that grows more stringent as increasingly significant

---

332 The problem is that latter group has the benefit of being aware of what actually happened, a factor they are unable to ignore in their deliberations. Since the two groups therefore are working in different contexts, replication has not occurred.

333 The author observed this over a period of eight years of teaching new intelligence professionals at the National Security Agency in both a new employee orientation program and in the author's critical thinking and structured analysis course. At least 1,000 individuals have participated in the two courses the author offers. For more information on the course see Moore, *Critical Thinking*.

334 It is the outliers that are truly fascinating in this classroom experience. Unfortunately, given the context imposed by a classroom setting and operational constraints, it has so far not been possible to capture why some students offer the outlying positions.

335 Caroline L. Park. "What is the Value of Replicating other Studies?" *Research Evaluation* 13. No. 1 (December 2004), 198. Cited hereafter as Park, "Value."

implications emerge from the intelligence conclusions minimizes the likelihood of error. Still, errors do occur. One replicative method known within the IC, that of "Team A – Team B," appears not to be widely practiced although it has been used on specific issues.[336]

But what of the methods employed in the intelligence sensemaking process itself? Intelligence sensemaking can involve both quantitative and qualitative methods. As Park observes, quantitative research "can be replicated with great accuracy and precision."[337] Intelligence conclusions that result from counting observed phenomena such as aircraft located around an airfield can easily be repeated. But repeatedly and consistently measuring the intentions of the owners of those aircraft—the object of qualitative sensemaking—is more difficult although, as has been noted, not impossible.

Of note, however, is a danger of repetition confirming false results. Lynn Hasher, David Goldstein, and Thomas Toppino concluded that confidence in assertions increases through repetition of the assertions in situations when it is impossible to independently determine their truth or falsity.[338] Since intelligence evidence harbors a degree of uncertainty, repetition of evidence or even findings in proceedings designed to *confirm* their validity will only increase confidence that they are valid *irrespective of whether this is actually the case*. Ralph Hertwig, Gerd Gigerenzer, and Ulrich Hoffrage further show this "reiteration effect" is also part of evaluations made in hindsight.[339]

Validation in Foresight and Hindsight

People—and intelligence practitioners and their customers are merely people—evaluate judgments they have made in hindsight. They believe, according to Mark and Stephanie Pezzo, "that one could have more accurately predicted past events than is actually the case."[340] Thus, hindsight occurs at least in part because as people make sense of "surprising or negative" events,

"the reasons in favor of the outcome [are] strengthened, and reasons for alternative outcomes [are] weakened." Further, in hindsight all the relevant facts may be known whereas in foresight this is not the case. But evaluating "mistakes" in hindsight obscures an important point made clear by Taleb: Mistakes can only be determined as such by what was known at the time they were made and then only by the person making the mistake.[341] In other words, mistakes need to be evaluated from the points of view held in foresight. And seen from that perspective they may not be mistakes at all.

Applied to intelligence sensemaking, this means that many so-called intelligence errors and failures may, in fact, be well-reasoned and reasonable judgments based on what is known prior to the decision. Certainly, when viewed in hindsight they were wrong. But in foresight they were accurate and valid to the best of the sensemaker's abilities. How can this enduring problem be mitigated? One means involves making the process of sensemaking as deliberate and thorough as possible.[342] Doing so may reduce mistakes and failures as more alternative possibilities are considered and assessed. However, achieving this objective requires that the underlying practice be valid. Finally, it assumes that key evidence is knowable and known.

Validating the Practice of Intelligence Sensemaking

What else contributes to bringing about validated sensemaking? If a method does not do what it is commonly purported to do, is it invalid? This is one question that has been raised with regard to the Analysis of Competing Hypotheses, or as it is commonly known, ACH. Richards Heuer, Jr. initially developed the method for the detection and mitigation of attempts at adversarial denial and deception.[343] ACH forces consideration of alternative explanations for, or predictions about, phenomena.[344] It forces consideration of the entire set of evidence, not "cherry-picked" trifles that support a favored hypothesis. A common belief is that ACH mitigates what is sometimes known as the "Confirmation Bias," whereby people seek to prove a favored

341 Nassim Nicholas Taleb, *Fooled by Randomness: The Hidden Role of Chance in Life and in the Markets*, 2nd revised edition (New York, NY: Random House, Inc., 2004, 2008), 56.

342 One means of accomplishing this is discussed below in Chapter 8.

343 Heuer did not invent this method. The earliest use of multiple hypotheses in examining phenomena was by Thomas C. Chamberlin prior to 1890. See Thomas C. Chamberlin, "The Method of Multiple Working Hypotheses," *Science*, vol. 15 (old series), no. 366 (7 February 1890): 92-96. Another former CIA employee, Morgan Jones, offers a version of ACH he calls hypothesis testing. See Morgan D. Jones, *The Thinker's Toolkit: 14 Powerful Techniques for Problem Solving*, revised edition (New York, NY: Crown Publishing, 1998). Jones' book also introduces the concept of and phrase "structured analysis."

344 Heuer, *Psychology*, Chapter 8.

hypothesis through (among other things) selective exposure and selective perception. Allegedly it does so by asking people to think in a disconfirmatory fashion. They are to use the available evidence to disprove as many of the existing hypotheses as possible. However, a study by MITRE failed to show that it does eliminate the confirmation bias.[345] Both the MITRE study and an earlier one by NDIC student Robert Folker do suggest that ACH is of value when used by novice intelligence professionals. However, Folker tentatively concluded that experts seem not to be aided by the method.[346] Is it still a valid method for intelligence sensemaking?

Perhaps it is. The method provokes detailed consideration of the issue and the associated evidence through the generation of alternative explanations or predictions and the marshaling of the evidence. It asks the sensemaker to establish the diagnosticity of each piece of evidence. In some versions of the method, evidence is weighted based on source and relevance. Some computer-assisted versions of ACH under review for application in the IC consider the likelihood that the sensemaker has omitted a relevant—and perhaps the correct—explanation. Therefore, it can prompt a broader yet more detailed *sensemaking* of the issue than might otherwise occur.

ACH further makes explicit the fact that evidence may be consistent with more than one hypothesis. Since the most likely hypothesis is deemed to be the one with the least evidence against it, honest consideration may reveal that an alternative explanation is as likely or even more likely than that which is favored. The *synthesis* of the evidence and the subsequent *interpretations* in light of the multiple hypotheses is also more thorough than when no such formalized method is employed.

Indeed, Robert Folker's "modest" experiment in applying qualitative structured methods—specifically ACH—to intelligence issues showed that "analysts who apply a structured method—hypothesis testing, in this case—to an intelligence problem, outperform those who rely on "analysis-as-art," or the intuitive approach."[347] Simply put, Folker experimentally showed that method improves the quality of practitioners' findings. Folker's study offers evidence that "intelligence value may be added to information by investing some pointed time and effort in analysis, rather than expecting such value to arise as a by-product of 'normal' office activity."[348]

348 Folker, Experiment, 2.

One variation on ACH implementation provides a structured means of developing issues. As applied by the faculty and students of the Institute for Intelligence Studies at Mercyhurst College, practitioners begin with a high-level question and use sequential iterations of ACH to eliminate alternative explanations.[349] The next phase takes the "non-losers" and develops them further. Another round is conducted and again the "non-losers" are selected and further developed. While this could generate a plethora of branching explanations, in reality it is the author's experience that it tends to disambiguate the issue fairly efficiently. At worst the structuring inherent in the method leaves the sensemaker with an in-depth understanding of the issue; at best, a couple of eventualities and their likely indicators are determined. Assets can then be tasked, foraging conducted, and more exact determinations made as the issue develops.

The question remains: Is the method valid? This question generates considerable discussion among practitioners. When used honestly, the method certainly prompts a more thorough assessment of the issue.[350] Evidence is considered singularly and severally. Alternative explanations for the phenomena are taken seriously. New possibilities are discovered. Even the skeptical MITRE team noted some validity in the method, whereby

> participant assessment of new evidence was significantly impacted by beliefs they held at the time evidence was received. Evidence confirming current beliefs was given more "weight" than disconfirming evidence. However, current beliefs did not influence the assessment of whether an evidence item was confirming or disconfirming.[351]

Appropriateness, flexibility, and ease of use are other criteria that need to be established with respect to the various sensemaking methods. Whether the method facilitates foraging, analysis, synthesis, interpretation or some combination of the foraging and understanding processes, some means is needed to operationalize validation procedures so that intelligence practitioners can increase their efficiency and accuracy.

Since Congress (in 2004) directed the Intelligence Community to employ "Alternative Analysis" in its intelligence deliberations, structured analytic methods now are taught to all new intelligence sensemakers.[352]

---

349 Kris Wheaton and others, *Structured Analysis of Competing Hypotheses* (Erie, PA: Mercyhurst College, 2005).

350 The issue of "honest use" is nontrivial. Less-than-scrupulous sensemakers are certainly free to cherry-pick favorite evidence and go through the motions of considering alternative hypotheses. Then, once they have eliminated competing alternatives, their favorite remains. The difficulty for them is what to do with the audit trail the method produces.

351 Cheikes and others, *Confirmation Bias*, iii.

352 U.S. Congress, IRTPA, 2004, 33. The phrase "Alternative Analysis" is interpreted as meaning structured analytic methods.

Many more experienced professionals also receive education and training in such methods.

Johnston observed that the IC has at its disposal "at least 160" [analytic methods]…but it lacks "a standardized analytic doctrine. That is, there is no body of research across the Intelligence Community asserting that method X is the most effective method for solving case one and that method Y is the most effective method for solving case two."[353] As referenced here, such a doctrine arises out of knowledge that the specific methods are valid, in other words it has been demonstrated *empirically* that they actually do what they claim to do. Such a doctrine proffers a menu of sensemaking options dependent on the goals of the sensemaker. The current model, where validity is presumed by intelligence professionals because they are taught the method(s) in the community's training schools, is insufficient because—at the most basic level such a metric is insufficient for determining validity. Further, there is little sense of what methods are appropriate in what situations. A claim of "we always do it that way," is known to be insufficient but remains part of the "corporate analytic tradecraft."

Heuer noted that "intelligence [error] and failures must be expected."[354] One implication of this assertion is that intelligence leadership cannot fall back on a "lack of skills" excuse when the next major intelligence failure occurs. However, without validating a canon of method and a taxonomy to characterize its use, intelligence professionals will remain hamstrung in their efforts to make fuller sense of threatening phenomena, increasing the likelihood of error and failure. It is reasonable to presume Congress will not let the Community commit failures similar to those of the past nine years without severe repercussions.[355]

Seeking Validation: Toward Multiple Methods

Within the canon of social science method lies an approach to sensemaking that may offer intelligence practitioners a means of disambiguating the wicked mysteries as well as the hard puzzles they face daily. Even in current practice, intelligence practitioners employ this approach when they do not rely on merely one method for sensemaking. Multi-method intelligence

353 Johnston, *Analytic Culture*, xviii.

354 Heuer, *Psychology*, 184.

355 As has been noted, such an *intelligence* failure occurred on 25 December 2009 in the skies over Detroit, Michigan (see URL: <http://intelligence.senate.gov/100518/1225report.pdf>). Two days after the release of the Senate report, 20 May 2010, partly as a result, Director of National Intelligence Dennis Blair left office at the request of the President. Even though the attempted attack was thwarted, it is reasonable to expect that intelligence professionals will be required to consider more possibilities and examine more information in the hopes they will notice its evidentiary value. They will need to be more imaginative.

sensemaking explores complex issues from multiple perspectives. Each method used—such as ACH—provides an incomplete understanding of the issue, leaving the intelligence professional the task of making sense of the differing sensemaking conclusions. While the results of different methods may converge, reinforcing a particular understanding of a phenomenon, they may also diverge and yield different interpretations. It is up to the intelligence professional to resolve and make sense of the differences.

For example, intelligence professionals who engage in a "multi-frame" sensemaking approach consider issues from multiple points of view created from the intersections of action- and process-focused vantage points and the perspectives of the individual and the collective. As developed by Monitor 360 for the National Security Agency's Institute for Analysis, it facilitates sensemakers' developing different answers to the intelligence question at hand.[356] They must combine the differing results, in other words, synthesize and interpret partial answers, in order to better understand the issue underlying the question and to determine a best (at the time) understanding of the issue.

The lexicon of multi-methodology provides a term for this combinatorial activity: triangulation, or pinpointing "the values of a phenomenon more accurately by sighting in on it from [the] different methodological viewpoints employed.[357] This is a process of measurement—which to be useful (accurate) "must give both consistent results and measure the phenomenon it purports to measure."[358] In other words, triangulation requires that the methods employed are repeatable and valid. Intelligence creation requires that those methods be applied with rigor.

Fortuitous circumstances allow the authors to present in the next chapter a multi-method case study of sensemaking in a Type 2 environment that illustrates the interplay of intuition, logic, analysis, synthesis and interpretation of an issue of interest to the National Intelligence Council.

---

356 While the approach is unclassified, it was first presented at an NSA (CLASSIFIED) conference on analysis. The author subsequently worked with a team from Monitor 360 to create a training course through which intelligence professionals could learn and apply this approach.

CHAPTER 7
Making Sense of Non-State Actors: A Multimethod Case Study of a Wicked Problem[359]

David T. Moore, with Elizabeth J. Moore, William N. Reynolds, and Marta S. Weber

> *A foolish consistency is the hobgoblin of little minds, adored by little statesmen and philosophers and divines. With consistency a great soul has simply nothing to do. He may as well concern himself with his shadow on the wall.*
>
> — Emerson, *Essay on Self-Reliance*

Introduction

In the pragmatic U.S. tradition invoked by Emerson, we question the utility of consistently following the Sherman Kent model where one or many solitary scholars try to work out the solution to problems. We also recognize that team-based intelligence production suffers from inherent drawbacks.[360] However revolutionary it may be, we find that a diversely practiced, multimethod approach that does incorporate a specific process, organizing principles, and an operational structure can fulfill the need for 21st century intelligence sensemaking. Such an approach reflects a Kendallian approach to intelligence sensemaking: It collaboratively paints a picture for a decision-maker rather than presenting a "scientific fact."

---

359 The authors would like to thank the following individuals for their assistance in the research that led to this chapter: David Colander, Richards J. Heuer, Jr., Robert K. Hitchcock, James Holden-Rhodes, Donald McGregor, Suzanne Sluizer, Joseph Tainter, Kristan J. Wheaton, and students in the 2007-2008 cohort of the Mercyhurst College Institute for Intelligence Studies. Thanks are also due to the participants of the Eurasia Group-sponsored conferences for their insights.

Work done by Least Squares Software was funded by IARPA under AFRL Contract Number FA8750-07-C-0312.

360 Johnston, *Analytic Culture*, 68-70. Johnston finds that "without specific processes, organizing principles, and operational structures, interdisciplinary teams will quickly revert to being simply a room full of experts who ultimately drift back to their previous work patterns."

The case study of sensemaking presented here is not merely a thought-experiment. It rests on a shortfall in understanding the security implications of non-state actors. In this instance, an original National Intelligence Council study prompted a further examination by an academic intelligence studies department and a government contractor. In all three studies partial sense of the issue was made. As we explore their independent work, we seek to apply intelligence rigor and discuss—admittedly in hindsight—how separate parts of the problem could benefit from a triangulation of concepts and approaches to provide a coherent, larger view of the security role of non-state actors.

Introducing the Wicked Problem of Non-State Actors

It is commonly thought that non-state actors are emerging as a dominant global force in the realm of national and international security, yet conclusive evidence confirming this belief is lacking. Part of the challenge is that non-state actors fit the profile of a wicked problem. While it is true they can be identified (the name accomplishes this — they are *non-state* versus *state* actors), there is no commonly accepted definition.[361] In other words, non-state actors are defined by what they are not, leaving room for disagreement as to what they are. Further, some non-state actors can be characterized as "good" and others as "bad." Differing points of view about whether a particular non-state actor is "good" or "bad" leads to varying characterizations of their activities. Attempting to "solve" a non-state actor problem leads to good or bad solutions that may provoke unanticipated (and undesired) consequences. For example, U.S. attempts to eliminate threats posed by Al Qaeda gave rise to a different and unexpected problem, that of a globally distributed network of Al Qaeda and Al Qaeda "wannabes." An argument could also be made that the apparently unique globalization of a terrorist organization was also unpredictable in foresight.[362]

---

361 National Intelligence Council, "Nonstate Actors: Impact on International Relations and Implications for the United States," Conference Report, August 2007, URL: <http://www.dni.gov/nic/confreports_nonstate_actors.html>, accessed 10 May 2010, The Conference Report suggested that "**Nonstate actors** are non-sovereign entities that exercise significant economic, political, or social power and influence at a national, and in some cases international, level. There is no consensus on the members of this category, and some definitions include trade unions, community organizations, religious institutions, ethnic groupings, and universities in addition to the players outlined above" (p. 2, emphasis in original)

362 In hindsight it seems obvious that, in an era when globalization is a driving force, a terrorist organization would naturally become a globalized phenomenon. However, we must adopt the point of view we enjoyed prior to 11 September 2001. At that time what occurred was largely unlooked for and unpredicted. Most of us simply could not conceive of such a group as being globalized or taking advantage of globalized resources. Therefore, in that context, it was unpredictable and we were surprised.

Issues involving non-state actors lack clear definitions and are resistant to traditional intelligence approaches due to their open-ended nature; potential solutions to problems are neither clearly right or wrong; and difficult-to-discern and complex inter-linkages exist, although drivers for issues involving non-state actors can be identified (see figure 6).

Once an insurgency or terrorist campaign (or any other non-state actor activity) begins, the issue shifts from being a merely wicked problem to a combination of wicked and tame problems. Some aspects of the issue remain wicked—ill-defined, no right or wrong solution, open-ended, and so on. However, other aspects of the issue are tame, although difficult to make sense of. For example, the tactics likely to be used in an insurgency are finite and understandable and making sense of them is a tame, bounded process. Yet countering them invokes a series of new wicked problems encapsulated in the larger issue and likely to lead to unanticipated consequences (many of them wicked problems in their own right)—as the United States discovered with its post-9/11 dealings with Al Qaeda.

Three Approaches to Making Sense of Non-State Actors

The starting point for this case study was a 2007 National Intelligence Council (NIC) Desktop Memorandum that analyzed key findings from a series of seminars co-hosted with the Eurasia Group, a global political risk research and consulting firm.[363] The Memorandum observes that non-state actors are of interest "because they have international clout, but are often overlooked in geopolitical analysis." The implicit but demanding questions of why and how much non-state actor "power" and "influence" have increased worldwide was not answered.[364] In light of this limitation, two follow-on projects were undertaken to complement the NIC study. First, the Mercyhurst College Institute for Intelligence Studies examined the impact of non-state actors in Africa. Then, a social science workshop convened by Least Squares Software of Albuquerque, New Mexico, under the auspices of IARPA, considered whether the influence and impact of non-state actors on international relations can actually be measured.

Key Findings of the NIC Study on Non-State Actors

A series of NIC-Eurasia Group seminars in 2006 and 2007 discussed in exploratory fashion how the proliferation of non-state actors since the end of the Cold War "is transforming international relations."[365] As a collaborative, prospective assessment, the study found that

> a globalization-fueled diffusion of finance and technology has enabled non-state actors to encroach upon functions traditionally performed by nation-states. This has facilitated their evolution into a

363 See the Eurasia Group web site, URL: <http://www.eurasiagroup.net/about-eurasia-group>, accessed 14 May 2010.

364 National Intelligence Council, "Nonstate Actors: Impact on International Relations and Implications for the United States," Conference Report, August 2007, URL: <http://www.dni.gov/nic/confreports_nonstate_actors.html>, accessed 27 April 2010, 2. Cited hereafter as NIC, "Nonstate Actors."

365 NIC, "Nonstate Actors," 1. The NIC study focused on so-called benign non-state actors—non-governmental organizations, multinational corporations, and super-empowered individuals—although it was impossible to have the discussions without frequent reference to terrorists, warlords, and other "malign" actors. The word "benign" is relative, but in this case refers to entities that at least give a nod to national and international institutions, laws, and norms. Nearly a decade earlier political scientists Philip Schrodt and Deborah Gerner derived similar conclusions about the post-Cold War explosion of *violent* non-state actors as agents of complex humanitarian crises. See Philip A. Schrodt and Deborah J. Gerner, "The Impact of Early Warning on Institutional Responses to Complex Humanitarian Crises," Paper presented at the Third Pan-European International Relations Conference and Joint Meeting with the International Studies Association, Vienna, Austria, 16-19 September 1998. Cited hereafter as Schrodt and Gerner, "CHC."

form unheard of even a few years ago. For example, "philanthrocapitalist" charities such as the Gates Foundation have greatly expanded notions of what a charitable NGO should look like.[366]

The discussions found that few non-state actors are completely independent of nation-states, and they do not have uniform freedom of movement. Further, non-state actors have the most latitude in either weak, or, at the other end of the spectrum, post-industrial states. The bulk of the world's population, however, lives in so-called "modernizing" states such as China, India, and Russia.[367] They remain entrenched in the class state system: firmly sovereign, centralized, and bureaucratic; using nationalism (including suppression of minorities) as an instrument of state power; and defining national security in terms of force. These nations have been highly effective in suppressing non-state actors or co-opting them through deployment of state-controlled substitutes including a subset of state-owned multinational corporations and enterprises (sometimes referred to as the mind-bending GONGO (government-operated non-governmental organization). The NIC-Eurasia Group discussions determined that the entity (aside from terrorists and criminals) that is most problematic for the United States is not technically non-state at all. It is instead the state-owned enterprise, often a front for advancing the interests of a modernizing-state government.

Finally, the NIC-Eurasia Group effort posited that the significance of "benign" non-state actors was that they propagated Western values in regions where these were absent. In this case, the problem was not that such actors were too powerful. Rather the opposite was the case: "in many parts of the world [benign non-state actors'] influence is limited—a factor that is contributing to the tilting of the global playing field away from the United States and its developed-world allies."[368]

Key Findings of the Mercyhurst Study on Non-State Actors

Students in the Mercyhurst College Institute of Intelligence Studies (MCIIS) focused on the roles non-state actors play and their expected impact in Sub-Saharan Africa over the next five years (*results*), and on building a multi-methodological paradigm for considering the issue (*process*).[369] Within this context, three additional questions were raised:

366 NIC, "Nonstate Actors," 1.

367 NIC, "Nonstate Actors," 1.

368 NIC, "Nonstate Actors," 1.

369 Mercyhurst College Institute for Intelligence Studies, "Terms of Reference: The Role of Non-State Actors in Sub Saharan Africa," Wikispaces.com, URL: < https://nonstateactorsafrica.wikispaces.com/Terms+of+Reference>, accessed 28 April 2010. Cited hereafter as MCIIS, "Terms of Reference."

- What is the likely importance of [Non-State Actors] vs. State Actors, Supra-State Actors and other relevant categories of actors in Sub-Saharan Africa?
- What are the roles of these actors in key countries, such as Niger?
- Are there geographic, cultural, economic or other patterns of activity along which the roles of these actors are either very different or strikingly similar?[370]

With respect to the first question, their research found that Africa can be organized into three geographical regions based on the roles that non-state actors play (figure 7): In Western Sub-Saharan Africa there are no clear trends in the roles played by non-state actors; in Central Sub-Saharan Africa, anti-government non-state actors are most active and likely to remain so over the next five years; and in Southern and Eastern Sub-Saharan Africa government

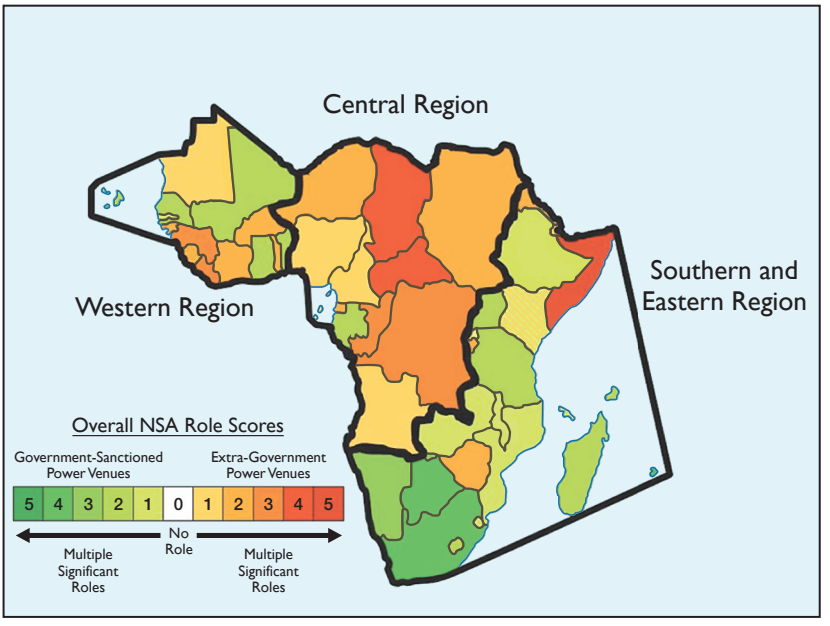

Figure 7. Composite Non-State Actor Role Scores for Africa.

370 MCIIS, "Terms of Reference."

sanctioned non-state actors are likely to wield the most influence.[371] Additionally, there appeared to be a strong correlation between the number of government-sanctioned multinational corporations and the number of NGOs. Finally, it seemed that terrorist organizations in Africa preferred operating in "countries with relatively more than less state control."[372]

The students developed a scoring system for both lawful and unlawful non-state actors, in terms of the socio-political environment, and applied this index to all 42 Sub-Saharan African countries (figure 7). The scoring characterized the roles of non-state actors vis-à-vis government and non-government interactions based on four drivers: An "ease of doing business" variable and a contrasting "corruption perception" variable; a democracy variable and a contrasting failed states variable.[373] Stable and failing states were revealed to have differing interactions with non-state actors. In the former, non-state actors were lawful actors who tended to have government-sanctioned role potentials, whereas in the latter they were typically unlawful actors engaged in anti-government roles. Botswana (a stable state) and the Central African Republic (a failed state) were representative of each (shown in figure 8). Of greater interest were the indicators for Kenya (figure 9), because they signaled or *anticipated* stability issues. The assessment was born out by the events that occurred during and after the early 2008 elections.[374]

Mapping significant multinational corporations, NGOs, and terrorist organizations to specific countries as representative of non-state actor activity revealed correlations between role potential spectra and geospatial data, whereby each generally supported the other.[375] Thus, geospatial sensemaking tended to confirm the conclusions derived from the non-state actor role spectra.

---

371 Mercyhurst College Institute for Intelligence Studies, URL: <http://nonstateactorsafrica.wikispaces.com/Key+Findings>, accessed 2 March 2008. Cited hereafter as MCIIS, "Patterns of Activity."

372 MCIIS, "Patterns of Activity."

373 MCIIS, "Process and Methodology." The roles of non-state actors were tracked on a scale anchored by scores from six sample totalitarian states: North Korea, Cuba, Iran, Syria, Myanmar, Laos, and Libya.

374 Kristan J. Wheaton, email to the author, 4 March 2008. Such foresightful activity by students is not unknown. Schrodt and Gerner report a similar result involving student predictions about the state of the Iraq-Kuwait crisis in December 1990. Kahneman and Klein's remark about some individuals being able to discern correctly patterns that others miss (Chapter 5) is probably relevant in explaining both phenomena. See also Schrodt and Gerner, "CHC", 5.

Key Findings of the Least Squares Study on Non-State Actors

The Least Squares study of non-state actors began with the hypothesis that "non-state actors emerge in vacuums and voids."[376] Their study focused on the issue of violent and non-violent non-state actors but also explored a set of contingent methodological approaches. The inquiry sought to contribute novel understanding of non-state actors by

> synthesizing available data and disparate taxonomies,…by generating and testing hypotheses concerning the key dynamics driving the transfer of power from states to [non-state actors] and favoring the emergence of novel [non-state actors] under globalization; and…by investigating the development of methodologies that might be most useful for future research.[377]

Two key findings revealed the critical role of environmental knowledge and of public expectations in motivating non-state actors, both as individuals and as members of the collective. Such findings were found to be

376 Marta S. Weber, William N. Reynolds, James Holden-Rhodes, and Elizabeth J. Moore, *Non-State Actors in the Post-Westphalian World Order: A Preliminary LSS Inquiry*, Final Report for Air Force Research Laboratory (AFRL) Contract FA8750-07-C-031, March 2007, 6. Cited hereafter as Weber and others, *Non-State Actors*.

377 Weber and others, Non-State Actors, 6.

significant to efforts aimed at mitigating the recruitment of specific Al Qaeda-associated individuals to assail the United States. Additionally, the team found that an approach based on critical thinking led to reasoning pathways that likely would not have been noticed or explored had a more intuitive and less rigorous approach been employed.[378]

Approaches and Methodologies

Thinking Critically about the Issue

In order to impose structured thinking on a highly unstructured problem, the NIC advisor to, and the members of LSS first inventoried their own understanding of the non-state actor issue using the "eight elements of reasoning" developed and espoused by the Foundation for Critical Thinking and used throughout much of the IC.[379] These elements include:

- Question at issue (What is the issue at hand?)
- Purpose of thinking (why examine the issue?)
- Points of view (What other perspectives need consideration?)
- Assumptions (What presuppositions are being taken for granted?)
- Implications and consequences (What might happen? What does happen?)
- Evidence (What relevant data, information, or experiences are needed for assessment?)
- Inferences and interpretations (What can be inferred from the evidence?)
- Concepts (What theories, definitions, axioms, laws, principles, or models underlie the issue?

A summary of several of the NIC and LSS perspectives on non-state actors based on this exercise are provided in table 4. Both groups agreed that a critical thinking approach was useful in developing a common understanding of the problem as it helped to ensure that the participants questioned their own thinking about non-state actors, rather than relying on previously held presumptions.

---

378 These points are derived from William Reynolds' observations of and discussions with fellow LSS Workshop participants.

379 Moore, *Critical Thinking*, 8-9; Richard Paul and Linda Elder, *The Miniature Guide to Critical Thinking: Concepts and Tools*, Sixth Edition (Dillon Beach, CA: Foundation for Critical Thinking, 2009), 3-6. Some practitioners in the U.S. Intelligence Community (among them one of the authors) in late 2008 expanded these eight elements of reasoning to ten based on the work of Gerald Nosich. Included were "alternatives," which makes explicit the fact that there are other ways to view an issue; and "context," which considers the fact that most issues or problems are themselves a piece of some larger issue or problem: There is a broader background for the issue that must be explored. See Nosich, *Learning to Think Things Through*, 96-98.

Table 4. Comparing NIC and LSS Critical Thinking Perspectives: Purpose, Points of View, and Assumptions	
Purpose	
NIC Perspective	***LSS Perspective***
To test whether the influence and impact of non-state actors on international relations can be measured; if so, whether they are serious competitors for power with nation-states; and the implications for US foreign policy.	ID role of non-state actors; Determine influence of non-state actors compared to state actors; Assess utility of sensemaking methodology/Multimethodology (MM) mechanisms of non-state actors role/influence; Develop/Define the concepts of non-state actors Influence/Impact; ID MM's useful for assessing impact/role of non-state actors; ID MM's/problem motifs of general interest to other research contracts;
Points of View	
NIC Perspective	***LSS Perspective***
Although non-state actors seem to be more powerful than ever before in history, few of them act in total independence from nation-states and their influence and impact are highly dependent upon which part of the world is under discussion. Another (and common) point of view is that powerful non-state actors are universal and a serious threat to nation-states.	"Victims"/Beneficiaries of non-state actor impact: Policy Makers Minimizing Risk Achieving Agenda Other non-state actors Analyst—understand/advise Methodologist/Researcher—Identify techniques for understanding Useful methods Understand/advise Sub interest structures within non-state actors and States

Table 4. Comparing NIC and LSS Critical Thinking Perspectives: Purpose, Points of View, and Assumptions (Continued)	
Assumptions	
NIC Perspective	***LSS Perspective***
Our point of view: implications for the US of the rise of powerful non-state actors depend upon which part of the world is under discussion. At times, our main concern may be that benign non-state actors are excluded from, or usurped by, certain states. The common point of view: all non-state actors in all parts of the world have serious implications for national governments (including that of the US).	Relation between nature of country and nature of economy—concept of *industrial* as an important discriminator; That we can induce truths from examples — commonalities -> analogy -> truth; Normative idea that pursuit of self interest a driver in observed outcomes: The frame of a value system—suicide bombing makes different sense in different frames; Idea of a pro/con/fix or ACH type approach to value outcomes in different frames; *International* means "between nations." Are we only concerned with "international" phenomena?

Source: Participant notes, edited by the authors.

Literature Consultation

Concurrent with their critical thinking, MCIIS, LSS, and others examined key academic and applied-academic works related to the assessment of non-state actors. Notable among them, work by Bas Arts and Piet Verschuren describes a qualitative method for assessing the influence of stakeholders in political decision-making.[380] The "triangulation" referred to in their title encompasses "(1) political players' own perception of their influence; (2) other players' perceptions of the influence brought to bear; and (3) a process analysis by the researcher."[381] Arts and Verschuren tested this method through an assessment of the influence of NGOs on the 1992 Climate Convention. Their

380 Bas Arts and Piet Verschuren, "Assessing Political Influence in Complex Decision-Making: An Instrument Based on Triangulation," *International Political Science Review*, vol. 20, no. 4 (1999): 411-424. Cited hereafter as Arts and Verschuren, "Assessing Political Influence."

381 Arts and Verschuren, "Assessing Political Influence," 411.

work remains significant because attempts to measure or associate numbers with non-state actor power or influence have been so rare.

Another contribution in the applied realm came from recent work by a new generation of military (and ex-military) authors who see the rise of non-state actors as a seminal event that will drive U.S. national security strategy. Among these sources is *Warlords Rising: Confronting Violent Non-State Actors*, whose authors anchor their work in open systems theory (the concept that actors and organizations are strongly influenced by their environment).[382] In particular, they ask what environments give rise to violent[383] non-state actors, what sustains them, and how changes to those environments might disrupt them.

Application: Indicators of Non-State Actor Power in Africa

The project afforded the Mercyhurst team an opportunity to develop a promising new method for intelligence sensemaking and to catalogue its advantages and disadvantages (table 5). The students were able to validate their findings employing three different methods as well as different evidence sets and also assess their methodological validity. This kind of meta-sensemaking could constitute a bridge between now-traditional IC efforts and a revolutionary approach to building a sensemaking argument in official circles.

Of note is a remark by project supervisor Professor Wheaton: "The big advantage [of the multimethodological approach] was the ability to see similar patterns crop up again and again by looking at the data in different ways. This increased their [the students'] confidence enormously."[384] Additionally, given the temporal context (short) and the scale of the project (large) a multimethodological approach was perhaps the only means of tackling the problem. Finally, as Wheaton also notes,

> we may well be wrong about Liberia or some other country in the current study but we are unlikely to be wrong about every country and highly unlikely to be wrong about every country in the same direction. Assuming the model is reasonably accurate and given

Table 5. Advantages and Disadvantages of Each Method	
Role Potential Spectrum Analysis	
Advantages	***Disadvantages***
Created a standardized foundation to measure environmental influences on the roles of non-state actors to produce comparable findings across Sub-Saharan Africa states. Created a prediction model for the roles of non-state actor in a country. The state centric environmental approach allowed the analysts to effectively consider key factors across the entire socio-political environment of individual Sub-Saharan African countries Able to represent both government sanctioned and extra government role potentials for non-state actors. Guided further efforts to efficiently identify and assess significant indicative characteristics of the socio-political environments in Sub-Saharan Africa.	The major indices in unaltered states are unsuited for measuring the role of non-state actors. The matrix required several weeks to finish, and took time away from starting and completing other types of analysis. Would be difficult for other analysts without statistical background to successfully complete.
Geospatial Analysis	
Advantages	***Disadvantages***
Created a visual representation allowing the team to identify patterns and correlations among different sets of data, particularly with the statistical matrix. Independent from other analyses. Information retrieved from uniform databases; not truly random, but relatively objective sample. Simple and easy to do with the information being imported from Excel Spreadsheets directly into Community Walk.	Much of the available information on NGOs, terrorist groups, and businesses was not in English, which made it difficult to collect a larger sampling of the information. The team limited the NGO map to development, women's rights, HIV/AIDS, human rights, and environmental issues. This was not an exhaustive list of all the different NGOs operating within the region.

Table 5. Advantages and Disadvantages of Each Method (Continued)	
Analysis of Competing Hypotheses	
Advantages	***Disadvantages***
Able to detect an increase or decrease in the roles of non-state actors. Uniform sources throughout. Easy for team to complete (received in-class instruction on this type of analysis).	Dependent upon completion of the matrix analysis. Evidence selected tends to be subjective. Susceptible to confirmation bias and the anchoring effect.

Source: Mercyhurst College Institute for Intelligence Studies, "Teams' Non-State Actors Process and Methodology Report," Wikispaces.com, URL: <https://nonstateactorsafrica.wikispaces.com/Process+and+Methodology>, accessed 2 March 2008. Cited hereafter as MCIIS, "Process and Methodology."

> the sample size, then, we can have more rather than less confidence about the broader conclusions and are likely right about the overall picture.[385]

Such a conclusion is significant for the larger IC. Through this still-experimental application of methods and models we may be able to develop a means of increasing the accuracy of intelligence sensemaking when time is short and the scope is large.

Application: A Multi-Disciplinary Workshop on Non-State Actors

In February 2008, LSS brought together a methodologist, an economist, a political scientist, two psychologists, an anthropologist, and a computer scientist to test the *Warlords Rising*, open-systems approach against a real-life problem: the roles of three sets of non-state actors (representing the three major ethnic groups) in Iraq: Shi'a militia, Sunni sheiks, and Al Qaeda in Iraq (AQI). Participants used three frameworks to consider the environment within which the three groups exist and operate.

- ***Points of segmentation*** are the boundaries or borders between and among groups of people, where the degree of disagreement on

385 Wheaton, email to Reynolds, 15 November 2007.

issues is indicated numerically.[386] Points of segmentation can track inherent characteristics such as gender or ascribed cultural differentiators such as Sunni or Shiite. The set of points distinguishes one individual or group from another and identifies possible points of cooperation and conflict that can be exploited. Specific values for points of segmentation are derived from an expert assessment of the strength of the actors' expressed attitudes, reinforced by observable behavior. They distinguish one individual or group from another, and identify the points most suitable for exploitation by the protagonist. Numbers were elicited from experts, calibrated against one another for consistency, and used to quantify expert consensus. Computer modeling by Least Squares addressed five pertinent actors: two state-associated, the Iraqi government and the U.S.-led coalition forces; and three non-state-associated actors, the Shi'a militia, the Sunni sheiks, and AQI. The modeling was conducted along five points of segmentation: Arab versus non-Arab; Islamicist versus non-Islamicist; rural versus urban; Sunni versus Shi'a; and strength of tribal allegiance. These issues form a 5-dimensional space — the cells in figure 10 depict the distance between players in this issue space.[387] One especially revealing point of segmentation centers around the question of expected attitudes and behavior in Anbar Province found AQI and Coalition forces on one side, with Shi'a militia, Sunni sheiks, and the Iraqi government on the other side.

As noted by one of the workshop participants, there are three significant implications to segmentation for policy and decisionmakers: First, projects proceed most smoothly *within* a segment. Second, segments that are neglected or discriminated against will push back. Finally, brokers mediating inter-segmental projects need to be viewed as impartial.

---

386 Points of Segmentation is an anthropological term referring to the natural pattern of social divisions within kinship-based societies, in which kinship units form as internally cooperative units. Conflict occurs between segments composed of distinct kinship lines. Segmentation is also used to describe the anthropological analysis of societies into kinship-based units. See Rudolph J. Rummel, *Understanding Conflict and War: War, Power, Peace* (Beverly Hills, CA: Sage Publications, 1991); Benoit Rihoux, "Constructing Political Science Methodology: From Segmented Polarization to Enlightened Pluralism," Joint Chair, Standing Group on Political Methodology. IPSA Conference, Montreal, Canada, 2008; George De Vos and Lola Romanucci-Ross, eds., *Ethnic Identity: Cultural Continuities and Change* (Palo Alto, CA: Mayfield, 1982); and William S. McCallister, "COIN and Irregular Warfare in a Tribal Society," *Small Wars Journal, Blog and Pamphlet, 4 February 2008*, URL: <http://www.smallwarsjournal.com/documents/coinandiwinatribalsociety.pdf>, accessed 31 May 2010.

387 The technique can be further refined by weighting the different issue axes using expert knowledge. We have omitted this part for brevity.

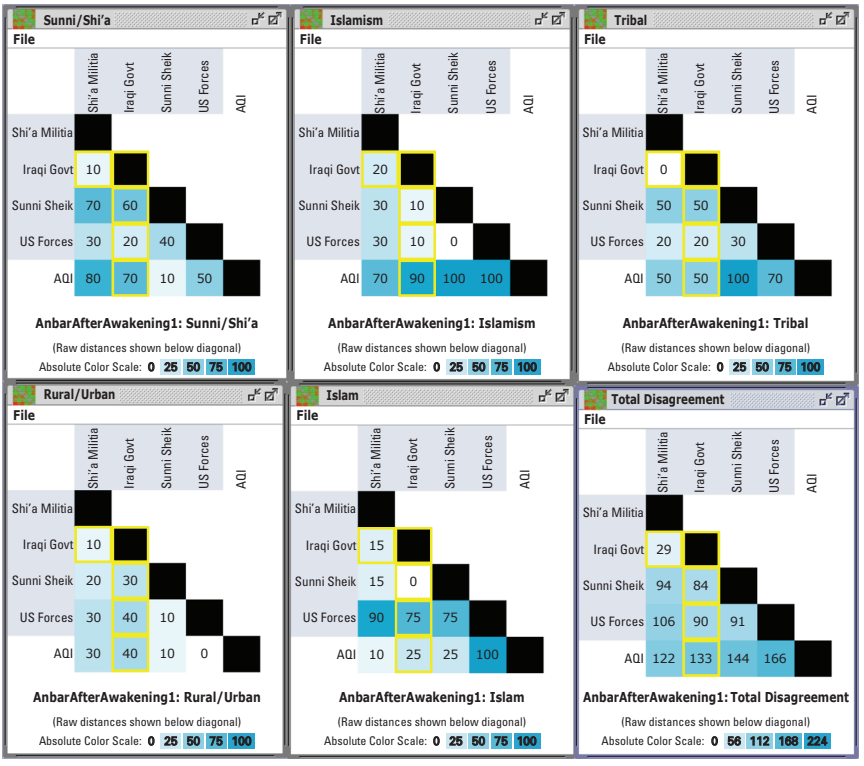

Figure 10. Iraqi Points of Segmentation.

Source: William Reynolds *et alia*, "Social Science Modeling Workshop: Understanding Iraqi Non-State Actors," Workshop Proceedings, Least Squares Software, Albuquerque, NM, 15 February 2008.

- ***Prospect theory***, originally developed by Kahneman and Tversky, posits that "people tend to be risk-preferring when facing long shot risks involving significant gains, such as betting on race horses, and are risk averse when facing significant losses: [in other words, when] buying a home or car insurance" respectively."[388] Workshop participants concluded that in Iraq, expectations contribute to environments where individuals (and communities) are likely to support or to become non-state actors. Assessment of findings from

388 "Why do People 'Play the Longshot' and Buy Insurance? It's in Our Genes," *Genomics and Genetics Weekly*, 29 January 2010, 184. For a technical description of prospect theory see Daniel Kahneman and Amos Tversky, "Prospect Theory: An Analysis of Decision Under Risk," *Econometrica*, vol. 47, no. 2 (March 1979): 263-291; and Amos Tversky and Daniel Kahneman, "Advances In Prospect Theory: Cumulative Representation of Uncertainty," *Journal of Risk and Uncertainty*, vol. 5 (1992): 297-323.

the application of prospect theory to the Iraqi environment are ongoing, and will be published in forthcoming studies.

- ***Institutional interactions*** is the name associated with a systematic model that allowed workshop participants to explore the complex roles non-state actors play as they influence (and are influenced by) overlapping institutional capabilities and needs.[389] The participants concluded that even a simple model of institutional networks has enormous complexity—or high entropy—making it a good candidate for a subsequent in-depth modeling project. Due to imposed time constraints, development and application of the modeling was not completed.
- ***Morphological Analysis*** was identified as an additional approach through the institutional interactions method. Morphological analysis considers an entire space of possible implications opening the way for follow-on disambiguation (perhaps using additional multimethodological approaches) in order to abductively and soundly derive the kind of judgments that become useful knowledge.[390]

The workshop participants were unable to formally triangulate the results from the three approaches, also because of insufficient time. Their discussions and modeling, however, supported the *Warlords Rising* thesis: that environment is a critical factor in understanding the emergence and roles of non-state actors. Additionally, the modeling appeared to provide a promise of metrics that, with further development, can be applied against the non-state actor problem.

Critical Assessment: Lessons Learned from the Study of Non-State Actors

No matter what the methodological approach, project participants emphasized that close attention to environmental factors remains a key to understanding non-state actors. Nonetheless, even those approaches that emphasized environmental factors fell prey to certain inadequacies.

---

389 The application of this model is exemplified in Robert Gibbons and Andrew Rutten, "Institutional Interactions: An Equilibrium Approach to the State and Civil Society," *IQ* online journal, The Institute for Quantitative Social Science at Harvard University. URL: <http://www.iq.harvard.edu/files/iqss/old/PPE/gibbons+rutten.pdf>, accessed 14 May 2010.

390 Morphological Analysis is an approach for considering all the factors and their interrelationships in non-quantifiable, multidimensional problems. Developed by Swiss astrophysicist Fritz Zwicky, morphological analysis begins with the premise that "within the final and true world image everything is related to everything, and nothing can be discarded *a priori* as being unimportant." [Fritz Zwicky, *Discovery, Invention, Research—Through the Morphological Approach* (Toronto, CA: The Macmillan Company, 1969), 44.] It is particularly well suited (and often used) to make sense of non-quantifiable wicked problems.

Both the Mercyhurst and the LSS teams adopted multimethodologically rich approaches to making sense of non-state actors; both quantitative and qualitative methods were employed. While novel insights were generated as has been noted, no means emerged to quantify a specific increase or decrease in non-state actor roles worldwide. Although the multiple methods framed the issues in both complementary and contradictory ways, none, singly or in combination, answered the question of "how much non-state actor 'power' and 'influence' have increased worldwide."[391]

That the members of each study group were working independently supports the contention that the groups were not somehow engaged in a confirmation exercise of each other's work; the conclusions were independently derived. What cannot be determined, however, is the extent—if any—to which specific methods employed in the specific efforts may have impacted conclusions derived from subsequently employed methods (especially in the cases of the MCIIS and LSS teams).

Serendipitous conclusions such as the possible indicator of state instability as illustrated in the case of Kenya by the Mercyhurst team, and the interesting points of segmentation found by the LSS team, suggest further avenues of intelligence research and modeling. The division of Africa reflecting three zones of non-state actor influence was also interesting. But these conclusions, while novel, did not satisfy the initial requirement, a quantification of phenomena associated with change in the power positions of various non-state actors. While all three teams clearly engaged in critical thinking about the issue, as viewed in hindsight, different purposes (specifically as expressed by the NIC/LSS team) led to conclusions different from those of the original, albeit implied, question. That these purposes were different could have been seen as an indicator that the teams were working on different problems within the issue of non-state actors. Coming to a consensus of what the actual tasking was could be expected to have narrowed the divergent results and provided a more specific answer about how the roles of non-state actors have changed.

Changes in the Roles of Non-State Actors: An Alternative View

A systematic review of what was done and not done in the three non-state actor studies provides insights into how critical thinking can combine with multimethodological, mindful sensemaking, to provide a paradigm for 21st Century intelligence creation and its active communication to

391 NIC, "Nonstate Actors," 6.

policymakers in a fashion that transcends the Sherman Kent tradition. This review is facilitated by employing the ten elements of reasoning noted above.

- **Question:** the beginning question of the NIC-Eurasia Group seminars was, "If non-state actors are emerging as a dominant global force, where is the evidence?" In other words, while there appears to be a consensus that they are a dominant global force, where is the formal evidence? For example, given the premise that we are experiencing an emerging phenomenon, is there evidence that non-State actors wield more power in 2010 (or in 2007 when the original study was made) than they did a decade earlier? A key question, and really the central question, to be answered is first, how does one measure the relative power of non-state actors? A follow-on question to this becomes, "Is such power therefore sufficient to render them dominant global forces?"
- **Purpose:** Determine whether or not there is evidence that non-state actors are emerging as a dominant global force. This problem is one of basic research to determine if the evidence in fact exists. However, the underlying issue of how we might measure relative power must first be conceptualized and addressed.
- **Points of View:** As we consider the original and complementary studies, there are two predominant points of view at issue: first, that of the NIC and its customers—who may believe that non-state actors are an emerging global force and want to quantify this shift in influence and power. The other, unavoidable point of view is that of non-state actors—some of whom would believe they are an emerging force and some who would not believe they are. For example, Al Qaeda, as a non-state actor, might want to believe (and might be justified in believing) that they are a significant global force. On the other hand, a super-empowered individual might believe she or he is not a significant global force (and yet, might be one).

  Each group that considered the issue also reflected different points of view. The NIC-Eurasia Group study focused on three broad categories of "benign" non-state actors: non-governmental organizations, multinational corporations, and super-empowered individuals. Mercyhurst focused on all categories of non-state actors and the LSS workshop focused primarily on violent non-state actors in Iraq. Among other things, this differentiation of what constitutes a non-state actor also reflects different interpretations of the key question. Each group brought its own perspectives about its larger focus as well. For example, both the Mercyhurst and LSS approaches to the

issue reflected a strong reliance on structured methods as the means of making sense of issues. The Eurasia group imparted a more intuitive approach by subject matter experts. A more explicit accounting of the points of view embodied at each stage of an ongoing study would help both intelligence producers and their policymaking counterparts maintain a focus on their respective stakeholders' concerns and opportunities.

- **Assumptions:** The use of the term "non-state actor" as an apparent all-encompassing term in the initial problem question and statement presumes an initial understanding and consensus about what is or is not a non-state actor. This is actually inaccurate as the differing foci of the three groups make clear. However, the differences in this case become evident in hindsight although measures could be taken in foresight to at least check the understanding of different groups engaged in collaborative assessments.

  Greater precision of the term non-state actors is needed. Differentiating between benign and non-benign non-state actors is a first step. Subsequent refinements of "benign non-state actors" into non-governmental organizations, multinational corporations, and super-empowered individuals is also useful. A similar set of distinctions within the set of violent non-state actors is also necessary. Then, a crosscheck among the teams must be accomplished so that consensus on the meaning and use of these terms is achieved.

  Another assumption involves what is meant by the term "dominant global force." Again, both greater precision and clarity is needed in coping with this assumption. One key question is, "Exactly what does dominant global force mean?" One answer to this could be that everywhere on the planet non-state actors are *the* force affecting politics and life. Such a simplified and simplistic view is likely inaccurate, and a range of political process models—among them those of the "rational actor," of "bureaucratic politics," and of "organizational process," need to be parsed.

- **Implications and Consequences:** The consideration of implications and consequences means to anticipate and explore the events that follow a decision, and to put in play especially the interpretive aspect of sensemaking. In the context of non-state actors, it means to explore what happens if non-state actors are (or are not) emerging as dominant global forces and we are right or wrong about their power. Regardless of whether non-state actors are a dominant global force, if their influence is underestimated then surprises can

be expected: Some non-state actor is likely to act in a fashion that is completely unexpected and with unanticipated results. On the other hand, overestimating the influence of non-state actors might create self-fulfilling prophecies. If, though, the influence of non-state actors is accurately measured it may be possible to mitigate that influence (where the non-state actors are acting on interests at odds with those of the United States). Alternately, where non-state actors are acting in consonance with the interests of the United States or are able to exploit opportunities put in place to get them to be helpful, the United States fulfills its goals.

Finally, the sensemakers' interpretation of likely actions or events allows the implications and consequences of those actions to be considered, even if absolute prediction is elusive. Here, in the context of collaborative sensemaking through the communication of intelligence to a policymaker, we understand the admonition of Sherman's Kent's contemporary critic, Willmoore Kendall, that intelligence most critically "concerns the communication to the politically responsible laymen of the knowledge which…determines the 'pictures' they have in their heads of the world to which their decisions relate."[392] This vision suggests communication of intelligence as an "insider" rather than offering "intelligence input" at arms length in the Kent paradigm.[393] Kendall faults Kent's equation of wartime and peacetime intelligence, insisting that peacetime intelligence represents a more strategic calling that requires intelligence to consider the course of events as something one must influence, by making what he distinguishes as "contingent predictions."[394] An issue in the case at hand is whether interactions of the United States with non-state actors represent those of war or peacetime intelligence frameworks. Additionally, given the wicked nature of the issue, Kendall's more tailored, "insider" paradigm may prove better in assisting the policy customer in grasping the issue and its contingent predictions.

---

392 Kendall, "The Function of Intelligence," 550. One might guess that Kendall had in mind the clear depiction of what we now typically call "scenarios."

393 Richard K. Betts, in *Enemies of Intelligence* (chapter 2), argues for a modulated "politicization" of intelligence. He identifies Secretary of Defense and former Director of Central Intelligence Robert Gates as an effective leading exponent of the "insider" approach. Ultimately, Betts declares, "Taxpayers hire intelligence analysts not to produce truth for its own sake but to produce useful truth," 78.

394 Kendall, "The Function of Intelligence," 549.

- **Evidence:** What evidence is needed to determine that non-state actors are, and as importantly, are *not* an emerging dominant global force? As we have seen, each group gathered and sifted considerable information on non-state actors, some of it highly relevant to the central question and some not. To the best knowledge of the authors, each of the three groups chose and evaluated evidence only with inductive logic. They did not take advantage of a means, available in particular to a community with robust intelligence capabilities, to deductively eliminate one of the two possibilities.

  A seminal essay by an Israeli intelligence practitioner, Isaac Ben-Israel, explains how a technique, viewed in retrospect, would have led the Israelis to dismiss deceptive indicators of Arab preparations and to expect the coordinated attack in October 1973.[395] His finding rests on the idea that intelligence foraging and marshaling capabilities can be used efficiently to focus on a greatly reduced information stream if the reports that support both options (in this case Arab war preparations or exercise) are simply set aside. Reports that are incompatible with either war preparations, on the one hand, or with activity being only an exercise on the other, are few enough to explore with special intelligence means.[396] A focus on detecting evidence of deception in either of those sets would at least bring efficiency to the sensemaking process. In the case of the emerging roles of non-state actors, examining evidence that neither is happening and why would yield alternative views and might also force a disconfirmatory framework allowing better disambiguation of all the hypotheses. The application of this method to intelligence issues is likely not as difficult or inconvenient as practitioners may guess.[397]

---

395 Isaac Ben-Israel, "Philosophy and Methodology of Intelligence: The Logic of Estimate Process," *Intelligence and National Security*, vol. 4, no. 4 (October 1989): 660-718. Cited hereafter as Ben-Israel, "Philosophy and Methodology of Intelligence."

396 Ben-Israel, "Philosophy and Methodology of Intelligence," 709.

397 The challenge of "one-off" prediction is especially inviting to proponents of applying deductive logic to the collection and analysis of evidence. Practitioners who consciously employ this technique can demonstrate to later investigators or inquisitors the logical as well as intuitive steps they took with respect to evidence, such as often occurs in intelligence. In other domains (such as weather forecasting) predictions are constantly updated as inputs to atmospheric models change and as new inputs are revealed. Further, if only an inductive approach to evidence collection and processing is used, when intelligence predictions change, intelligence customers and overseers are often quick, in their own inductive and intuitive way, to criticize either the original or revised results (depending on which set of results they agree with). Thus, a 21st Century approach to forecasting must adopt a constantly updated, deductive paradigm if it is going to be accurate against constantly shifting adversaries and issues.

- **Inferences and Conclusions:** With three different and independent efforts, the challenge lies in ensuring a useful triangulation of the results of those potentially disparate efforts. The Mercyhurst approach (internally triangulated) found that non-state actors, both legal and extralegal, are least effective in authoritarian states. Using Iraq as a case study, the Least Squares workshop demonstrated that within the context of either failed or failing states, expectations and perceptions of the public, or the political environment, are key drivers in anticipating the likelihood of actions by (violent) non-state actors. Strident or acrimonious expression of dissent that arises when domestic and international political/economic issues reinforce each other within the United States and Europe suggest a possible correlation in post-industrial states. This leads to a general conclusion that when expectations are at odds with situational reality, non-state actor activity increases.

  Together, these findings may assist in anticipating the likelihood of future actions by non-state actors. As Schrodt and Gerner note, "political predictions tend to be short-term rather than long-term."[398] Yet, as they also note, effective warning (of a complex humanitarian crisis, for example) requires a fairly long lead-time:

  > Warnings of less than three months provide insufficient lead time for most non-military organizations to react; in other words, the responses to a warning of less than three months will look pretty much the same as a response to a situation that develops without warning.[399]

- **Concepts:** Not only the assumptions, but other concepts as well were in play at multiple levels in the non-state actor case studies. The very notions of "non-state actor" and the ideas of democracy, authoritarianism, and anarchy needed clarification, ideally through well-grounded, empirical as well as theoretical research, to ensure common understanding.
- **Alternatives:** If non-state actors are not emerging as a dominant global force, then what can we say about their global role? Is their influence staying the same? Is it diminishing? Given a credible means of measuring change in the influence and power of non-state actors, the next step in this study of non-state actors would be to examine hypotheses generated from these alternative questions.

398 Schrodt and Gerner, "CHC," 4.
399 Schrodt and Gerner, "CHC," 4.

Such follow-on studies also examine and attempt to make sense of instances where non-state actor influence has waned. As was noted by the Eurasia group, in some situations, pro-Western non-state actors actually shift influence away from themselves and the United States and its allies.

- **Context:** As has been repeatedly noted, non-state actors present both a challenge to U.S. interests and an opportunity for advancing those interests. The U.S. would like to mitigate the challenges and take advantage of the opportunities. How to make that happen in domains and regions of little existing U.S. influence or of waning U.S. and Western influence becomes a key concern as the United States strives to carry out a meaningful global role. Future attempts to make sense of the role of non-state actors may benefit from tapping into the larger context of recent policy-relevant literature on the problem of fragile states in applied academic journals.[400]

Moving Beyond a Proto-Revolution

Microcognition and Macrocognition in the Study of Non-State Actors

There emerge two very general domains of which intelligence professionals must make sense: that of the relatively static, state-based system and that of the much more dynamic non-state actor. Of course, these do not exist in isolation from one another. There are boundaries, interstices, and points of segmentation; there is considerable overlap when one usurps or adopts the actions of the other. Further, the separate domains of domestic and foreign areas of interest and action, embraced by the Kent model of intelligence creation and communication, have been superseded by an indivisible, worldwide web of personal and organizational relationships. Broadly speaking, the "classic" model of intelligence sensemaking largely sufficed and perhaps continues to suffice when issues remain clearly tied to the political entities associated with the Westphalian system of state-based power. However when dealing with non-state actors, a new, revolutionary paradigm becomes essential for making sense of issues as well as their interactions with the states of the other paradigm. In the former, a traditional, intuitive and expert-supported approach was largely adequate. In the case of the latter, as is glimpsed in this case study, a more rigorous approach is required.

400 For example, see Kenneth Menkhaus, "State Fragility as a Wicked Problem," *Prism*, vol. 1, no. 2 (March 2010): 85-100. URL: <http//:www.ndu.edu/press/lib/images/prism1-2/6_Prism_85-100_Menkhaus.pdf>, accessed 14 May 2010.

Such an approach is "macrocognitive" in the terminology developed by those who study naturalistic decisionmaking.[401] In national intelligence terms, practitioners and their customers work in a macrocognitive environment as they manage the uncertainty they face in dealing with wicked problems.[402] Macrocognition, then, includes a focus on process as well as results—what we have labeled mindful, self-reflective sensemaking.

Klein *et alia* observe that intelligence professionals and decisionmakers traditionally are "microcognitively" focused. That is, like those who follow in the Sherman Kent tradition, they are concerned with solving puzzles, searching, and "estimating probabilities or uncertainty values" for different phenomena of interest.[403] As has been discussed, such an approach still may be suitable for solving tame problems or those of the Type 1 domain. Thus, microcognition describes the reductionist foci of the current intelligence "analysis" paradigm. However, this is not sensemaking, which requires another approach.

The transition or shift to macrocognition requires a focus on "planning and problem detection, using leverage points to construct options and attention management."[404] Elements of the foregoing case study exemplify this strategy. Both the Mercyhurst Role Spectrum Analysis and the Least Squares Points of Segmentation identified potential leverage points that revealed truths about non-state actors, leading to more robust problem detection. A next step would have been to take the triangulated results from all the deployed sensemaking methods and use the results to construct options for dealing with nonstate actors in multiple environments. Such a macrocognitive approach would allow more persistent attention to the *anticipation* of the broad course of events (in this case involving non-state actors), in contrast to a microcognitive focus on *predicting* more isolated and specific future incidents.

Next Steps in Revolutionary Sensemaking about Non-State Actors

The foregoing elaboration of non-coordinated sensemaking activities, even with its limitations, moved beyond the traditional model of intelligence creation. It specifically identified the multiple approaches taken by

401 Gary Klein and others, "Macrocognition," *IEEE Intelligent Systems*, vol. 18, no. 3 (May/June 2003), 81. Cited hereafter as Klein and others, "Macrocognition."

402 Pietro C. Cacciabue and Erik Hollnagel, "Simulation of Cognition: Applications," in Jean-Michel Hoc, Pietro C. Cacciabue, and Erik Hollnagel, eds., *Expertise and Technology: Cognition and Human-Computer Cooperation* (Hillsdale, NJ: Lawrence Erlbaum Associates, 1995), 55-73.

403 Klein and others, "Macrocognition," 82.

404 Klein and others, "Macrocognition," 82.

independent teams who used alternative schema and methods that, perhaps unsurprisingly, resulted in a broader understanding of the problem. Much of the multimethod work was based on differing perceptions of the task at hand. Triangulation was largely informal both within and between the groups. Thus, the work met the criteria for a *transitional* intelligence sensemaking project. The participants in all three efforts engaged in critical thinking to one degree or another. All were also mindful of the wicked issue of non-state actors and its significance.

To move farther toward a revolutionary paradigm for intelligence, these approaches need to be formalized beyond the transitional phase provided here into a new paradigm of sensemaking. This does not mean that the structured methods of "science" are to be imposed blindly on an issue.[405] Rather than leading to a scientific approach, this could lead to scientism, wherein meaning accrues only to measurable phenomena for which our understanding rests on hypothesis testing and refutation.[406] Instead, the adoption of the new paradigm for sensemaking depends on bringing into play a cooperative spirit of science and scientific inquiry to the process of intelligence creation and communication. Mindful, critical thinking-based, multimethodological approaches to analysis, synthesis and interpretation are one means of doing this. Additionally, a means needs to be found to ensure that this approach to sensemaking remains rigorous. This becomes the subject of the next chapter.

405 Here, one is reminded of a quote attributed to Secretary of Defense Robert McNamara: "We need to stop making what is measurable important and start making what is important measurable."

406 Friedrich August Hayak, a Nobel Prize-winning economist, developed the distinction between science and scientism. See Friedrich August Hayak, *The Counter-Revolution of Science: Studies on the Abuse of Reason*, 2nd Edition (Indianapolis, Indiana: Liberty Fund, Inc., 1979), 19-25.

CHAPTER 8
Establishing Metrics of Rigor

Defining Intelligence Rigor

> I know the distinction between inductive and deductive reasoning. An intelligence officer is inherently inductive. We begin with the particular and we draw generalized conclusions. Policymakers are generally deductive. They start with the vision or general principle and then apply it to specific situations. That creates a fascinating dynamic, when the intelligence guy, who I call the fact guy, has to have a conversation with the policymaker, who I tend to call the vision guy. You get into the same room, but you clearly come into the room from different doors. The task of the intelligence officer is to be true to his base, which is true to the facts, and yet at the same time be relevant to the policymaker and his vision. That's a fairly narrow sweet spot, but the task of the intelligence officer is to operate in that spot.
>
> — GEN Michael V. Hayden (Ret.),
> former Director of the Central Intelligence
> Agency and the National Security Agency[407]

Michael Hayden's view that the intelligence officer needs to operate in the "sweet spot" linking intelligence and policymaker cognitive worlds coincides with the aim of the sensemaking paradigm. To bring these two worlds together, intelligence professionals can take advantage of the opportunity to meld their fact-based inductive tendencies with the visionary, deductive model of policymakers through the application of collective rigor to well-conceived questions. This approach allows intelligence professionals to embrace a triangulation on wicked problems from their professional perspective, and to improve their chance to communicate with policymakers whose circumscribed comfort zone may accept or even welcome wicked problems as opportunities to apply their vision to bring about politically rewarding solutions.

---

407 From a 9 August 2010 interview on national security and U.S. strategy, aired by C-SPAN radio, URL: <http://www.cspan.org/Watch/Media/2010/08/09/Terr/A/36779/Gen+Michael+Hayden+Ret+The+Chertoff+Group+Principal.aspx>, accessed 11 August 2010.

At present most tradecraft for sensemaking triangulation remains intuitive, operating in the realm of tacit knowledge. Thus, part of a revolution in intelligence requires that more formal and explicit means of triangulation be developed. It may be that some existing analytic tradecraft, when conscientiously applied, will improve synthesis and interpretation. Another option is to explore and experiment with new tools for conceptualizing rigor in information analysis, synthesis and interpretation.

Rigor in sensemaking can refer to inflexible adherence to a process or, alternatively, to flexibility and adaptation "to highly dynamic environments."[408] As proponents of the latter approach, Daniel Zelik, Emily Patterson, and David Woods recently reframed the idea of rigor into a more manageable concept of "sufficiency."[409] In the applied world of sensemakers, then, an apt question is: "Were sufficient considerations made or precautions taken in the process of making sense of the issue?" Zelik *et alia* observe that this requires a "deliberate process of collecting data, reflecting upon it, and aggregating those findings into knowledge, understanding, and the potential for action."[410] In order to achieve answers to this question Zelik *et alia* developed an eight-element taxonomy of sufficiency and a trinomial measurement of rigor: Each element was calibrated in terms of high, medium or low rigor. In their examination of information products, an overall score could be computed that, in intelligence terms, would communicate to both the practitioner's management and to consumers the rigor of the crafted intelligence product. Their model of the metric is shown in figure 11 and its attributes are reproduced in table 6.

---

408 Daniel J. Zelik, Emily S. Patterson, and David D. Woods, "Understanding Rigor in Information Analysis," in Kathleen Mosier and Ute Fischer, eds., *Proceedings of the Eighth International NDM Conference*, Eighth International Naturalistic Decision-Making Conference, Pacific Grove, CA, June 2007, 1. Cited hereafter as Zelik, and others, "Rigor."

409 Zelik and others, "Rigor," 1. Note that "sufficiency" differs from "satisficing," by definition a low-rigor process where only enough sensemaking is conducted to get to an initial answer. Indeed, satisficing may be considered the epitome of low rigor.

Table 6. Attributes of the Rigor Metric
Hypothesis Exploration describes the extent to which multiple hypotheses were considered in explaining data. In a low-rigor process there is minimal weighing of alternatives. A high-rigor process, in contrast, involves broadening of the hypothesis set beyond an initial framing and incorporating multiple perspectives to identify the best, most probable explanations.
Information Search relates to the depth and breadth of the search process used in collecting data. A low rigor analysis process does not go beyond routine and readily available data sources, whereas a high rigor process attempts to exhaustively explore all data potentially available in the relevant sample space.
Information Validation details the levels at which information sources are corroborated and cross-validated. In a low-rigor process little effort is made to use converging evidence to verify source accuracy, while a high-rigor process includes a systematic approach for verifying information and, when possible, ensures the use of sources closest to the areas of interest.
Stance Analysis is the evaluation of data with the goal of identifying the stance or perspective of the source and placing it into a broader context of understanding. At the low-rigor level an analyst may notice a clear bias in a source, while a high-rigor process involves research into source backgrounds with the intent of gaining a more subtle understanding of how their perspective might influence their stance toward analysis-relevant issues.
Sensitivity Analysis considers the extent to which the analyst considers and understands the assumptions and limitations of their analysis. In a low-rigor process, explanations seem appropriate and valid on a surface level. In a high-rigor process the analyst employs a strategy to consider the strength of explanations if individual supporting sources were to prove invalid.
Specialist Collaboration describes the degree to which an analyst incorporates the perspectives of domain experts into their assessments. In a low-rigor process little effort is made to seek out such expertise, while in a high-rigor process the analyst has talked to, or may be, a leading expert in the key content areas of the analysis.
Information Synthesis refers to how far beyond simply collecting and listing data an analyst went in their process. In the low rigor process an analyst simply compiles the relevant information in a unified form, whereas a high-rigor process has extracted and integrated information with a thorough consideration of diverse interpretations of relevant data.

Table 6. Attributes of the Rigor Metric (Continued)
Explanation Critique is a different form of collaboration that captures how many different perspectives were incorporated in examining the primary hypotheses. In a low-rigor process, there is little use of other analysts to give input on explanation quality. In a high-rigor process peers and experts have examined the chain of reasoning and explicitly identified which inferences are stronger and which are weaker.

Source: Zelik *et alia*, "Rigor," 4.

The tradecraft underlying these attributes assesses the domains of intelligence foraging and intelligence sensemaking (analyzing, synthesizing, and interpreting) as described here. The study by Zelik *et alia* reveals that what might at first glance be considered the application of a low level of rigor really is merely a function of a varying distribution of rigor applied among the attributes. In their study some notable differences appeared in the absolute scores on the rigor scale as different products were scrutinized. However, the more interesting cases involved notable swings in specific attribute scores. Thus, in a test scenario assessing the work of two practitioners (see figure 11), one with a predetermined "high rigor" score and the other with a predetermined "low rigor," the fact that the high-rigor practitioner (Process 2) had a high score for *information search* and a medium score for *information synthesis* whereas the low-rigor practitioner (Process 1) had a medium score for *information search* and a medium score for *information synthesis* is noteworthy.

This distinction suggests a profound insight, namely that information search is perceived as more highly valued than *information synthesis*. In the case above, a definitive judgment about this insight cannot be made, as the other attributes of the two assessments were not identical. Still, it seems clear that at least the participants in the study were still wrestling with a consideration formally discussed by Richards Heuer, Jr. (and many others before and since—including Moore and Hoffman above): How much information is necessary for effective sensemaking?[411] The observations may also reflect the "data-centric" culture of the participants. Finally, it offers a means to counter a tendency or preference among "Google Generation" foragers, as described in Chapter 4, for broad but shallow searches. A next step in examining the metric is to apply it to an assemblage of intelligence assessments. An illustration of how this might work using the case study of the previous chapter appears below.

Team Scores (Each low = 1; medium = 2; high = 3)	**17**	**19**	**23**

Sources: Zelik *et alia*, "Rigor," 4; Author.

The case study in the previous chapter affords an opportunity to demonstrate how this rigor metric functions when applied against the work of real intelligence professionals—or in this case, teams of intelligence professionals. In this example the informed judgment of the author leads to three individual rigor metric diagrams as well as a composite; finally, a table summarizes the results.[412] Applying a scoring metric of 1 point for a Low Score, 2 points for a Medium Score, and 3 points for a High Score yields a range of 8 to 24 possible points. For the reviewers, when no evidence pointed clearly to a low or high score, a default position of medium was presumed.

412 The author is indebted to Russell Swenson who reviewed the assessments (and agreed with the scoring of the author). Numerical scores were assigned at his suggestion. It should be observed that this assessment is not intended to be authoritative. Rather it is provided as an example of how rigor can be assessed.

Rigor and the NIC-Eurasia Group Effort

The NIC-Eurasia Group effort (summarized in figure 12 and column one of table 7) garnered the fewest points of the three groups. **Hypothesis Exploration — Low:** The NIC-Eurasia Group memorandum noted that non-state actors are of interest "because they have international clout, but are often overlooked in geopolitical analysis." The implicit but demanding questions of why and how much non-state actor "power" and "influence" have increased worldwide were not answered, nor was a time frame established. This failure to broaden the hypotheses beyond the initial framing of the issue led to a lack of incorporation of multiple perspectives to identify at least "best," and perhaps most probable answers to these questions. **Information Search — Medium:** Based on the memorandum there was no evidence of a "high rigor" or exhaustive information search. **Information**

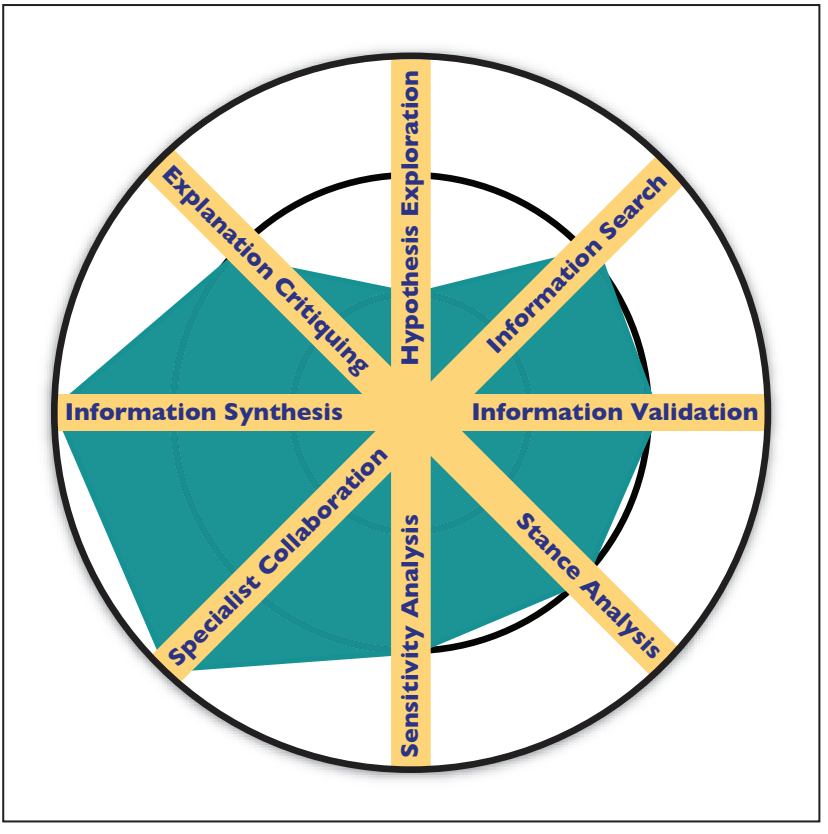

Figure 12. The Rigor of the NIC-Eurasia Group Study of Non-State Actors.
Source: Author, based on Zelik *et alia*, "Rigor."

Validation — Medium: Convergence of evidence was apparent in the NIC-Eurasia Group desktop memorandum. **Stance Analysis — Medium:** This was found to be a process-related metric and the desktop memorandum did not adequately reveal the process undertaken. However, some evidence exists that consideration of the source backgrounds took place. **Sensitivity Analysis — Medium:** While the NIC-Eurasia Group's explanations went beyond the "surface level," no obvious evidence was presented of an explicit strategy to consider the strength and sensitivity of explanations about non-state actors. **Specialist Collaboration — High:** Such a score was expected. Eurasia Group is an organization of experts; this is one of its values to the Community (and others). Leading experts provided their informed opinions about the roles of non-state actors. **Information Synthesis — High:** The NIC-Eurasia Group desktop memorandum presented integrated information with a thorough consideration of the underlying evidence such as the conclusion that "state-owned enterprises" posing as NGOs often are a front for advancing the interests of a modernizing state-government. **Explanation Critique — Medium:** A discussion process presumes the examination and critique of each participant's chains of reasoning. Since discussions were a part of the sensemaking process undertaken by the NIC-Eurasia Group participants, this form of collaboration was present. However, the degree to which this occurred could not be determined from the desktop memorandum, resulting in a score of medium.

Rigor and the Mercyhurst Effort

The work of the Mercyhurst College students earned a score midway between the other two groups. Their **Hypothesis Exploration** was judged to be **High**. Their considerations of the issue clearly went beyond their initial framing of the issue. Similarly, their **Information Search** also scored **High**. A broad range of evidence was employed in making sense of non-state actors in Africa.[413] On the other hand, while the information convergence necessary for the "non-state actor potential spectra" was indicative of high rigor, an informal non-systematic approach resulted in **Information Validation** being assigned a **Medium** score. **Stance Analysis** also was scored as **Medium**. As was the case with the NIC-Eurasia Group effort, this process-related metric could not be further evaluated. With regard to **Sensitivity Analysis**, the Mercyhurst effort was scored as **High:** The participants focused on the non-state actors themselves as well as the means by which they could be assessed. Such a focus leads naturally to a consideration of the

413 This was not unexpected. A finely honed skill of participants in the Mercyhurst College Institute for Intelligence Studies program is that of effective, broad and deep search.

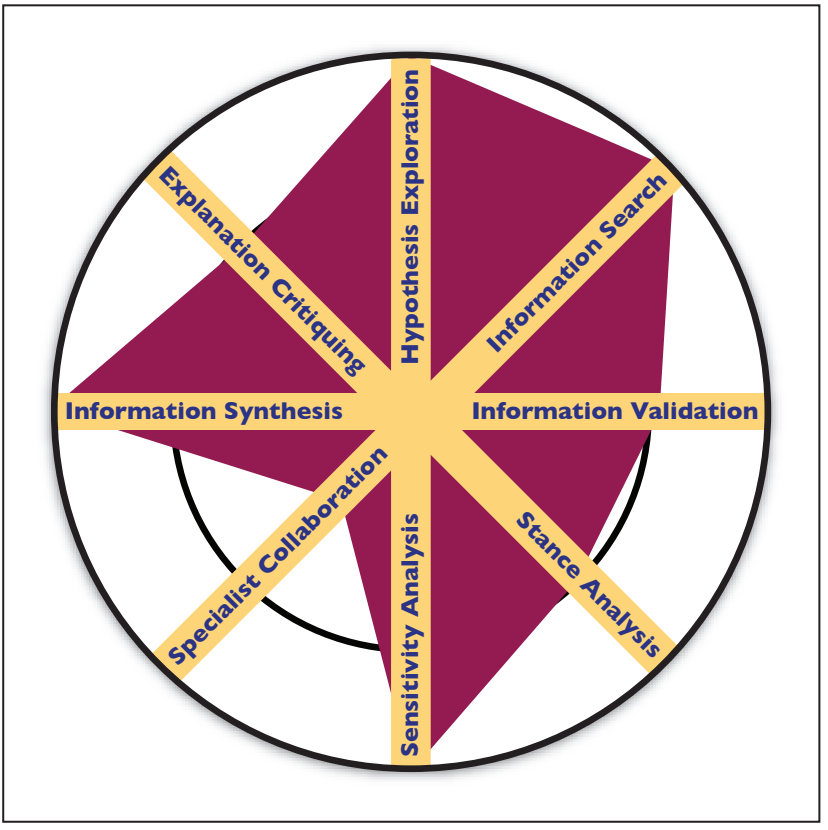

Figure 13. The Rigor of the Mercyhurst College Students' Study of Non-State Actors.
Source: Author, based on Zelik *et alia*, "Rigor."

strengths and weaknesses of explanations. The Mercyhurst students relied on published data. No evidence of consultation with external experts was evident. While this was to be expected given the demographics of a student team, it nevertheless led to a score of **Low** for the **Specialist Collaboration** metric. By contrast, **Information Synthesis** received a **High** score. The consideration of diverse interpretations of the data led the Mercyhurst students to anticipate that Kenya had stability issues well in advance of the breakout of politically related violence. This was unexpected and possibly unanticipated elsewhere. Finally, the **Explanation Critique** metric was scored a **Medium**. The review by the mentoring faculty member and fellow students provided a level of critique that, while valuable, did not meet the standard set by a full peer and expert review of inferences and conclusions, which is necessary for a high score in this category.

Rigor and the LSS Effort

The LSS social science study of non-state actors scored the highest of all three groups, earning a high in each metric save one, **Information Validation**, where they scored a **Medium**. In this case, while converging information was employed to cross-validate source accuracy for the evidence closest to the areas of interest, a systematic approach for doing this was not evident, resulting in the lower score.[414] Overall the LSS effort went well beyond the initial framing of the issue, resulting in a **High** score for **Hypothesis Exploration**. Similarly, their **Information Search** considered every source they could access within their available resources. It was clearly evident that

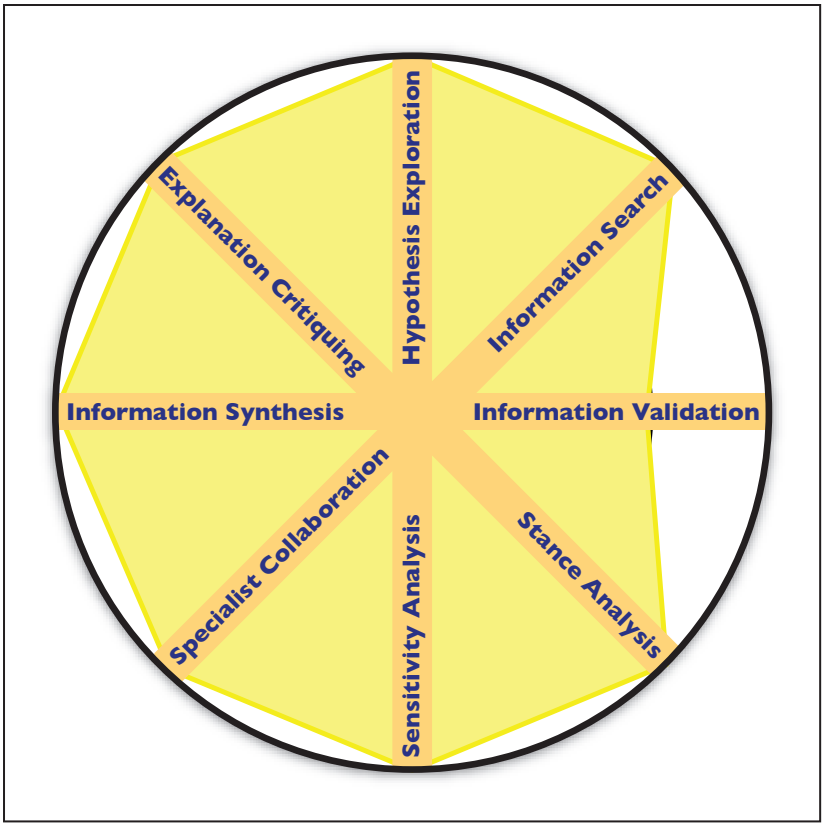

Figure 14. The Rigor of the Least Squares Social Science Study of Non-State Actors.

Source: Author, based on Zelik *et alia*, "Rigor."

414 This determination may be overly stringent, as the LSS Stance Analysis (a related metric) was rated as high.

this group conducted rigorous research into source background, facilitating an understanding of how their respective points of view might influence their stances on the issues of violent non-state actors. The use of a formal model of critical thinking added considerable rigor to both **Hypothesis Exploration** and **Sensitivity Analysis**. Furthermore, their conversations specifically focused on the strength of explanations. The use of multiple points of segmentation also captured the diverse alternatives of this complex (or "wicked") issue. Since the entire team was made up of specialists, their score in **Specialist Collaboration** should come as no surprise. Similarly, the involvement of diverse social scientists as well as the involvement of external peers foreordained that the **Explanation Critique** would be rigorous. All the individuals brought differing perspectives as they identified the strengths and weaknesses of each other's inferences and conclusions. Finally, an explicit multi-methodological approach forced consideration of diverse interpretations of the evidence—a highly rigorous example of **Information Synthesis**.

Observations and Discussion

It is no accident that the traditional means by which assessments of such issues are created, as evidenced by the NIC-Eurasia Group effort, resulted in a relatively weak score, whereas the highly rigorous, critical-thinking based, multimethodological effort by a collaborative team of diverse experts led to a relatively high score (a comparison highlighted by figure 15). It should also be noted that absent the LSS effort, a composite effort by the NIC-Eurasia Group and Mercyhurst teams would have come close to the score attained by the LSS group (21 versus 23 points). Here again, the utility of this metric becomes evident. Teams that complement each others' strengths and mitigate each others' shortcomings can be assigned the same general problem, with the expectation of a more rigorous composite effort and more suitable result. As has been illustrated here, the results of individual efforts and combined efforts can be assessed for their rigor as a guide to the purposeful improvement of sensemaking. Specific feedback can be provided so that efforts can be adjusted.

Another advantage of graphic analysis using Zelik *et alia's* metric is that more information can be clearly conveyed. For example, in examining the composite efforts of all three groups of participants in the non-state actor study, it is evident that Information Validation could have been improved through the use of a more rigorous systematic approach, ensuring that the sources were deemed valid and "closest to the areas of interest."[415] In 2005,

415 Zelik and others, "Rigor," 4.

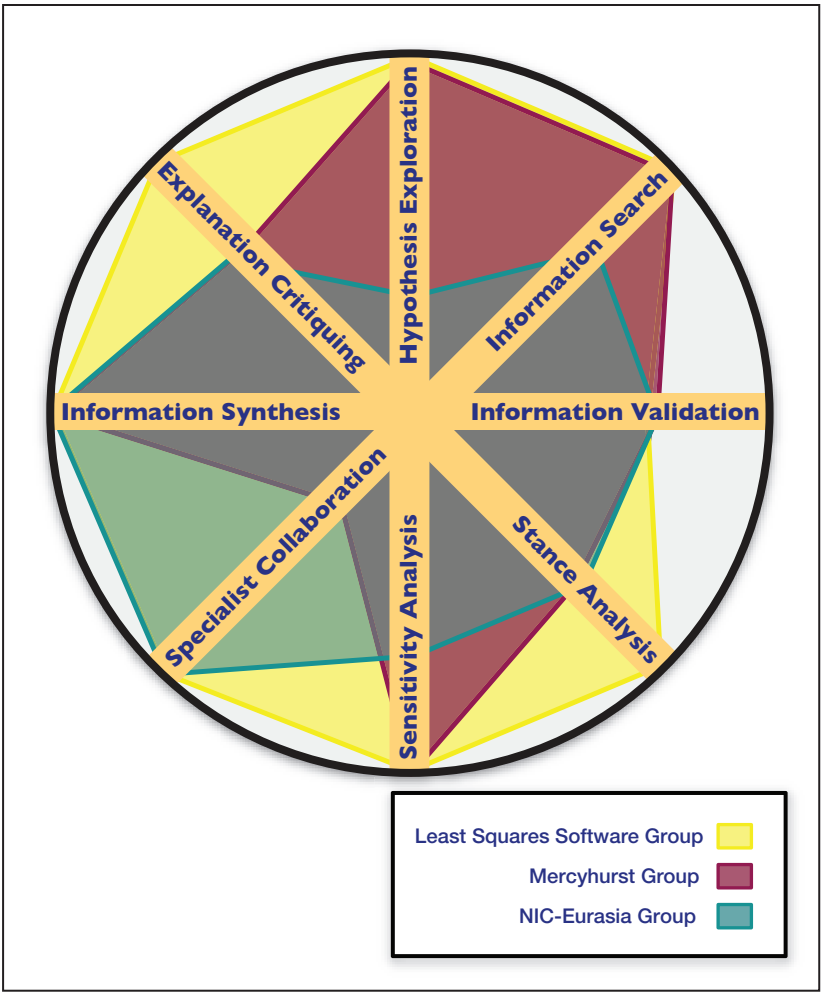

Figure 15. The Composite Rigor of the Three Studies of Non-State Actors.
Source: Author, based on Zelik *et alia*, "Rigor."

an official report on the IC's performance specifically called for improvement in this area.[416]

Despite this call for improvement, there appear to be several reasons why information is often not fully validated in intelligence work. First,

416 The Commission on the Intelligence Capabilities of the United States Regarding Weapons of Mass Destruction (WMD) *Report to the President of the United States* (Washington, DC: Government Printing Office, 31 March 2005), 15, and 371-372. The report recommends that asset validation procedures (a part of information validation) be systematized and standardized.

validation is difficult and the intelligence professional may decide the result is not worth the effort, or that initial conditions *suggest* validity. "Information hubris"—arising when similar information has without negative consequence been presumed or found to be valid, may compound this effort. Wishful thinking and belief in the infallibility of the source are other factors that may contribute to this pathology. Finally, information uncertainty may allow it to resist validation. Unfortunately any or all of these can lead to intelligence errors and failures, suggesting that information validation, despite its inclusion in the rigor metric itself, may require a transcendent application of rigor.

In applying the metric it becomes apparent that some disambiguation is necessary between several of the individual considerations. The differences between high rigor assessments involving Stance Analysis and Sensitivity Analysis at first glance appear to be unusually subtle, suggesting a need for an explanatory critique as part of the standard process assessment. Additionally, because several of the specific metrics are process-related, assessors need to be present to observe the process or otherwise have access to appropriate and sometimes-scarce process-associated materials. Alternately, a formal means for capturing applied (and omitted) sensemaking processes needs to be developed.

In developing the rigor metric, Zelik *et alia* note that it is "grounded largely in the domain of intelligence analysis."[417] Looking at the metric from a generalizing point of view, Zelik *et alia* are interested in whether it can be broadened to other disciplines such "as information search by students working on educational projects, medical diagnosis using automated algorithms for x-ray interpretation, and accident investigation analyses."[418] For those of us within the domain of intelligence, however, that this model "emerged from studies of how experts 'critique' analysis (rather than how experts 'perform' analysis." is a strength.[419] The rigor metric has been *empirically*, if tentatively, shown (according to Daniel Zelik) to "reveal [some of the] "critical attributes to consider in judging analytical rigor" in intelligence sensemaking.[420] In so doing, Zelik and his colleagues also validated the usefulness of the model within the intelligence domain.

---

417 Zelik and others, "Measuring Rigor," 77.

418 Zelik and others, "Measuring Rigor," 77-78. Some of these domains contain applicability to intelligence. Given a tendency for shallow searches by younger people, then a metric for rigor that offers guidance may facilitate the "deep diving" necessary for adequate information foraging.

419 Daniel J. Zelik, email to the author, 15 October 2010. Cited hereafter as Zelik, email, 15 October 2010.

420 Zelik, email, 15 October 2010.

While the rigor metric requires further development, it offers an effective means of assessing the processes underlying intelligence assessments. The rigor metric provides a means of assessing the processes of intelligence sensemaking, allowing managers of intelligence professionals to ascertain whether or not more work is required before the results of the sensemaking are communicated. Additionally, it offers a practical technique to facilitate communication between practitioner and consumer; that is, to promote *sensemaking*. A danger inherent in any process of making sense of an issue exists when the "process is prematurely concluded and is subsequently of inadequate depth relative to the demands of [the] situation."[421] Finally, the metric suggests other sensemaking considerations that, if used, may help reduce inadequacies in the consideration of intelligence issues. This may lead further to an honest reduction in sensemakers' and their customers' uncertainty about issues being examined. In sum, the metric for rigor developed by Zelik and his colleagues is itself an objectification of what they find rigor to be and warrants further study.[422] Zelik, *et alia* note that the metric "represents a current iteration of an ongoing direction of exploration."[423] Such studies, rigorously making sense of rigor, would be yet another example of the model for intelligence sensemaking that has been championed in this book. As Zelik *et alia* conclude, "the concept of analytical rigor in information analysis warrants continued exploration and diverse application as a macrocognitive measure of analytical sensemaking activity."[424] But what does it mean if such a model is adopted, or not adopted? The final chapter examines the implications of either outcome.

CHAPTER 9
In Search of Foresight: Implications, Limitations, and Conclusions

Considering Foresight

We turn in conclusion to a discussion of the purpose of mindful, critical sensemaking for intelligence. The discussion may be best framed by pertinent questions: To what end is intelligence intended? In other words, intelligence professionals and their overseers critically ask "knowledge of what?" and, secondly, "knowledge for whom?" One answer to these questions is embodied in the concept of foresight: Intelligence knowledge advises policymakers and decisionmakers about what phenomena are likely precursors of events of interest before they occur. Such foresight—in light of the discussions in this book—does not entail specific predictions. Rather, it allows us to anticipate a range of alternative event sequences.

Foresight informs policy and decisionmakers about what could happen so that those individuals can improve the quality of their decisions. Done mindfully, its vision shifts and evolves apace with the phenomena about which it makes sense. Done wisely in such a manner as presented here, it augments the vision of leaders, enabling mobilization and discouraging two traits that often handicap visionaries: recklessness and intolerance. Done rigorously, it cannot be accused of failing to be imaginative. This prospective approach contrasts with the current practice and paradigm for intelligence production.

Reprising Anthony Olcott's observations reminds us again that Sherman Kent's vision of national intelligence—his "intellectual genetics"—has predominated in U.S. national intelligence since the late 1940s.[425] That it did so was because it "served the United States extremely well for a long time. However, as happens when environments undergo dramatic change, successful adaptations for one environment can prove to be much less efficacious—perhaps even fatal—in a new environment."[426] In the Kent tradition, as has been noted (and is summarized in figure 16), intelligence knowledge of "analyzed" issues becomes and tends to remain disaggregated into constituent parts—oriented, as Treverton notes, toward solving isolated "puzzles" rather

425 Olcott, "Revisiting the Legacy," 21.

than the more holistic "mysteries" of the intelligence world. On the other hand, we have discussed how Kendall's competing idea, that intelligence knowledge should "paint a picture" (by way of a macrocognitive, holistic approach) for the policy maker as a fellow "insider," is consistent with a model of intelligence where the predominant method and motive of intelligence sensemaking is through aggregation and the articulation of a fact-based "vision" recognizable by national-level policymakers (figure 16). Even in an operational military scenario, where isolated, specific facts are essential to successful employment of mission knowledge, a larger intelligence sense of who the ultimate commanders are and why they are doing what they're doing, remains the essence of useful, foresightful strategic knowledge—also known as national intelligence.

Implications

Creating intelligence as presented here is a mindful process of sensemaking, encompassing the activities of planning, foraging, marshaling, understanding, and communicating. It is critical of itself and the means that are employed in bringing it about. It lies within the largely overlooked Kendallian vision of what national intelligence ought to accomplish. This approach allows a focus on better and worse solutions, and anticipation of likely futures, instead of a more narrow focus on right and wrong answers in an intellectual environment trained on predictive and specific warning. It can make sense of wicked problems.

By contrast, intelligence as it is currently practiced is still somewhat akin to the practice of medicine in the 14th Century. In Medieval medicine, herbs and poultices were applied without (from a modern perspective) an understanding of why they might work. If the patient survived, then the method worked. If not, then from the medieval perspective, God willed it otherwise. Intelligence practitioners find themselves in a similar situation. They often do not know why they do what they do, only that the last time, it "worked"—or that it is an "accepted practice." They do not acknowledge that they have "forgotten" all the times it did not work. Yet, intelligence practitioners who would wear the "professional" label need to know what they are doing and why.[427]

One means set forth for "improving intelligence" is to capture the processes by which sense is made of an issue. It is certainly true that imposing audit trails is a critical step because they encourage process improvement

427 It is pertinent to note that suggesting, "God willed it otherwise," is unacceptable for justifying either an intelligence error or an intelligence failure.

in the light of serious errors, and stimulate repetitive analysis, synthesis, and interpretation for validation in the full course of sensemaking. However, auditing trails remain inadequate when the Community cannot understand from an epistemological point of view what does and does not work and in what situations.

The major intelligence failures of the first years of the present decade, as well as repeated failures over at least six decades, demonstrate what happens when there is a formal failure to synthesize and interpret beyond what is popularly believed or even to recognize that a situation exists that requires new synthesis and interpretation. A popular hypothesis is that tradecraft can minimize the likelihood of such failures of imagination. Yet this hypothesis remains untested except in some anecdotal cases which, given the Type 2, wicked nature of the intelligence issues now often faced by the Community, is inadequate. Indeed, as Grove *et alia* discovered in their psychological meta-study (discussed above), technological approaches (a structuring of sorts) provided accurate solutions less that half the time.[428] Thus, a Community effort to research, test, and evaluate tradecraft remains a need if for no other reason than so the IC can understand what approaches to foresightful sensemaking are likely to be useful and in what circumstances. The above-mentioned failures (and others) show that the typical "analytic" paradigm that remains in place leads to failures of imagination in policy circles as well as in intelligence cloisters.[429] The most recent failures point out that the Community still does not understand how desperately it needs to make sense.

Limitations

It should be noted that a tradecraft of mindful understanding does not guarantee accurate findings. Any of the components of sensemaking can be done poorly yet "correct" answers can be reached. Disaggregating phenomena can be done well yet yield faulty results. Synthesis and interpretation of analyzed phenomena can still lead to faulty conclusions. However, analysis, synthesis and interpretation within the framework of appropriately applied, multimethod tradecraft does guarantee more rigorous sensemaking. As illustrated in the case study presented above (chapter 7), greater rigor can reveal the hidden discrepancies in an intelligence problem. In the example contained in chapter 5, it can be seen that increased rigor may reveal whether the discrepancies comprise self-generated erroneous conclusions or whether one has been manipulated by a deceptive adversary. A rigorous

428 Grove and others, "Meta-Analysis," 25.

429 *The 9/11 Report*, 339. The four failures are discussed in depth in subsequent sections of the commission's report.

multimethodological approach will increase the reliability and validity of the findings. Taken together, the entire process certainly will increase the intelligence practitioner's understanding of the issue, allowing more informed communication of associated knowledge to a decisionmaker. This may lead to increased "accuracy." At best, errors will occur with less frequency, or at least they are more likely to be caught.

Conclusions

As has been noted repeatedly in this book, many 21st-Century intelligence issues are wicked problems: They are ill-defined and poorly understood issues with multiple goals that must be made sense of within severe time constraints; the stakes and risks are high and there exists no tolerance for failure. As a means of increasing situational awareness, merely creating mindfulness about such complex issues falls short. On the other hand, a mindful *sensemaking* approach to situational awareness accomplishes more by enabling the intense, holistic scrutiny of a complex developing scenario, as suggested in the case study in chapter 7. This macrocognitive approach ensures that the knowledge created also evolves.

Schwartz and Randall believe that to be successful against strategic surprise—a goal the IC seeks—organizations must be both imaginative and systematic.[430] This is so, because "[one] cannot foresee strategic surprise without being imaginative, but the results will not be believable without being systematic."[431] If intelligence is to rise above the noise and get the attention of policy and then be acted upon it must be both. A critical, mindful process of sensemaking offers a means for this to occur. As we have seen, it covers the issue broadly, takes into account its complexity, is systematic and rigorous. It offers the best means currently understood for making sense of what is known and knowable.

There is and will always be information of which intelligence professionals are unaware. There is certainly information that does not exist because its precursors have not yet occurred. There also is information that exists but is unavailable to the intelligence sensemaker and their associated decisionmakers. Any of this information can change the conclusions reached in making sense of it. In short, intelligence professionals currently make judgments and will continue to make judgments that, while they appear valid at the time, differ from what ultimately occurs, either because of omission or commission. For evidence of this one need not look further than at the differing

430 Schwartz and Randall, "Ahead of the Curve," 96-100.

431 Schwartz and Randall, "Ahead of the Curve," 97.

judgments contained in the U.S. National Intelligence Council's series of global trends summaries published every five years since 1995.[432] These documents, which look outward 15 years, perhaps are better seen as expressing the issues and concerns of the times in which they are written, suggesting the validity of Taleb's point that to predict the future one must already be in the future.[433]

The spread and use of the sensemaking paradigm, wherein intelligence professionals move from a reductionist, analytic view to formally include the other elements of sensemaking—synthesis and interpretation—increases the value of intelligence findings. Engaging in macrocognitive sensemaking, with its multiple foci of (re)planning for problem detection, use of leverage points in constructing options, and management of both attention and uncertainty, further creates an approach that will improve communication with consumers of intelligence.[434] As Zukav's epigraph at the beginning of this book reminds us, "[nonsense] is nonsense only when we have not yet found that point of view from which it makes sense."[435] Such an inclusive process provides that point—or rather *points*—of view; nonsense is transformed into vital, strategic, and foresightful knowledge facilitating better decisions by leaders.

Some elements of the IC have begun to establish "tradecraft" cells or similar centers focusing on the practice and process of intelligence. Typically, however, they have not transcended the "analysis" paradigm and remain mired in the uncertainty reduction that is characteristic of the practice of the past sixty-plus years. At best, they are not yet able to transform a professional workforce. Pierre Baumard in 1994 anticipated the persistence of this state of affairs: "[Individuals] act on incomplete and variously reliable information. Caught by approaching dead-lines, surrounded by urgency, individuals seek the simplest means to reduce complexity according to the criteria on which they will be *locally* judged."[436] Although some might gain hope from the renewed interest in tradecraft, the fact that the same errors are being repeated by a new generation of intelligence professionals certainly should lead one to doubt that an underlying and necessary paradigm shift has occurred. That is, the change is not occurring because before the "opponents" die off they are

---

436 Baumard, "From Noticing to Making Sense, 31-32. Emphasis in original.

acculturating a new, younger generation.[437] If the community is to change it cannot wait for another generation (or longer), especially if that new generation is hired and acculturated into the inadequate paradigm of the preceding or present generations.[438]

Achieving this paradigm shift therefore requires revolutionary action by a revolutionary workforce. Aggressive, mindful sensemaking is one pathway to this new paradigm, and may require a different mix of skills and abilities than is currently present. It certainly requires greater, authentic diversity. Considering the present community, one is reminded of Kent's quip, "When an intelligence staff has been screened through [too fine a mesh], its members will be as alike as tiles on a bathroom floor—and about as capable of meaningful and original thought."[439] In contrast, making sense of the 21st Century's intelligence challenges requires as much rigorous, "meaningful and original thought" as we can muster. Sensemaking, as it has been developed here, offers us a means of creating that desperately needed thought.

For the Community to remain unchanged is unacceptable: the implications of being wrong are too dire. Developing a validated practice of mindful sensemaking for intelligence, while not a panacea, is a necessary first step in making sense of the nonsense. The results from IARPA's ongoing exploration of sensemaking, if successful, also can be expected to shed light on how this can practically and functionally be accomplished. Both represent a step toward a true professional practice of intelligence that can meaningfully make sense of the national security challenges of the 21st Century.

---

437 Planck observed, "A new scientific truth does not triumph by convincing its opponents and making them see the light, but rather because its opponents eventually die, and a new generation grows up familiar with it." Max Planck, *Scientific Autobiography and Other Papers*, F. Glynor, trans. (New York, NY: Philosophical Library, 1949), 33-34. Cited in Charles Weiss, "Communicating Uncertainty in Intelligence and Other Professions," *International Journal of Intelligence and CounterIntelligence*, vol. 21, no. 1 (Spring 2008), 78-79.

438 While beyond the scope of this book, organizing to bring about a "revolution in intelligence affairs" is another important aspect of focusing intelligence for the century in which it finds itself. William Nolte, writing in *Studies in Intelligence*, explores the environment for reorganization. Yet, Nolte also presages the argument of this volume in noting that "we need to focus less on structure and more on behavior." See William Nolte, "Keeping Pace with the Revolution in Military Affairs," *Studies in Intelligence*, vol. 48, no. 1 (Winter 2004), 1-10.

439 Kent's comment appears in a footnote on page 74 of his *Strategic Intelligence for American World Policy* (1951 and 1966 printings). It is reproduced in Jack Davis' Occasional Paper for the Kent Center at the CIA. Although Kent was reacting to the stringent security policies of the McCarthy era, his remark also applies to all workforce acquisition practices that promote anything but the widest of diversity. See Jack Davis, "Sherman Kent and the Profession of Intelligence Analysis," *The Sherman Kent Center for Intelligence Analysis*, Occasional Papers, vol. 1, no. 5 (November 2002), URL: <https://www.cia.gov/library/kent-center-occasional-papers/vol1no5.htm>, accessed 10 June 2010.

ABOUT THE AUTHOR

David T. Moore is a senior intelligence professional and educator. He teaches critical thinking and structured techniques for intelligence sensemaking and his research focuses on developing multidisciplinary approaches to facilitate intelligence sensemaking. His most recent posting was to the School of Leadership and Professional Development at the National Geospatial-Intelligence Agency. Formerly he served as a technical director at the National Security Agency where he advocated and mentored best practices in intelligence sensemaking. He is an adjunct faculty member of the National Cryptologic School; has taught at Trinity University, Washington, DC; and lectures at the National Defense Intelligence College and the National Defense University. He received a Master of Science of Strategic Intelligence from the National Defense Intelligence College in 2002.

Mr. Moore's publications include:

- "Species of Competencies for Intelligence Analysis," *Defense Intelligence Journal* 11, no. 2 (Summer 2002): 97-119.
- "Species of Competencies for Intelligence Analysis," *American Intelligence Journal* 23 (2005): 29-43 (an expanded version of the original article).
- *Critical Thinking and Intelligence Analysis*, Occasional Paper Number Fourteen; Authorized, Revised Edition (Washington, DC: National Defense Intelligence College, 2006, 2009).
- With coauthor Lisa Krizan:
    - "Intelligence Analysis, Does NSA Have What It Takes?" *Cryptologic Quarterly* 20, nos. 1/2 (Summer/Fall 2001): 1-32.
    - "Core Competencies for Intelligence Analysis at the National Security Agency," in *Bringing Intelligence About: Practitioners Reflect on Best Practices*, Russell Swenson, ed. (2004): 95-131.
- With coauthors Lisa Krizan and Elizabeth J. Moore:
    - "Evaluating Intelligence: A Competency-Based Approach," *International Journal of Intelligence and CounterIntelligence* 18, no. 2 (Summer 2005): 204-220.

- With coauthor William N. Reynolds:
    - "So Many Ways To Lie: The Complexity of Denial and Deception," *Defense Intelligence Journal* 15, no. 2 (Fall 2006): 95-116.
    - "Advancing the Practice: Multi-methodological Analysis for Intelligence", forthcoming.

The author can be contacted via email at *david.t.moore@ugov.gov*.

ABOUT THE CONTRIBUTORS

Robert R. Hoffman, PhD. A world leader in the field of cognitive systems engineering and Human-Centered Computing, he is a Fellow of the Association for Psychological Science and a Fulbright Scholar. Following post-doctoral work at the Center for Research on Human Learning at the University of Minnesota, Dr. Hoffman joined the faculty of the Institute for Advanced Psychological Studies at Adelphi University. Dr. Hoffman has been recognized internationally for his research on cognitive task analysis and the design of macrocognitive work systems.

Elizabeth J. Moore is a senior intelligence professional. She holds a BA in Russian Studies from Randolph-Macon Woman's College, and an MA in International Politics from American University. Ms. Moore began her government career as a Russian linguist in 1982, and has served in a number of language and analysis positions at the Defense, State, and Treasury Departments; at the National Intelligence Council; as a Director of National Intelligence Fellow attached to the National Security Council; and overseas.

William N. Reynolds, PhD. The founder, President and Chief Science Officer of Least Squares Software, he has been a principal researcher and innovator in the field of complexity for more than twenty years. Over the past eight years, he has focused on the role of complex systems in intelligence analysis, especially complexity-based analytic methodologies. In this capacity, Dr. Reynolds has formulated numerous intelligence analysis case studies assessing the impact of technology on efficiency and effectiveness in analytic practice.

Marta S. Weber, PhD. A psychologist who has applied thirty years of clinical and forensic training and experience to the intelligence domain, Dr. Weber pioneered in the development of sophisticated remote profiling and behavioral forecasting techniques. She is an internationally recognized expert in that highly specialized field. She founded and heads Applied Behavioral Sciences, LLC, a boutique consultancy specializing in primary human-source, human-subject research, analysis, strategic consultation and training.

COLOPHON

A colophon records the details of the layout and design of a publication. It acknowledges the craftsmanship and artistic sense required for an attractive graphic representation of ideas. Whereas the acknowledgements record the textual assistance an author receives, a colophon records the equally important technical assistance received.

The text of this book was set in Minion Pro, an Adobe Originals typeface designed by Robert Slimbach. It was inspired by classical old-style typefaces of the late Renaissance, a period of elegant, beautiful, and highly readable type designs. Minion Pro exhibits the aesthetic and functional qualities that make text type highly readable, yet is also suitable for display settings. Tables are presented in Neue Helvetica. Helvetica was developed in 1957 by Max Miedinger with Eduard Hoffmann at the Haas'sche Schriftgiesserei (Haas type foundry) of Münchenstein, Switzerland. Haas set out to design a new sans-serif typeface that would compete well in the Swiss market, and be suitable for a wide variety of signage. After further development, the typeface's name was changed by Haas' German parent company to Helvetica (derived from *Confoederatio Helvetica*, the Latin name for Switzerland), to make it more marketable internationally. This Neue Helvetica features a more structurally unified set of heights and widths.

This publication was written on an iMac and a Macbook Pro using Microsoft Word. Typesetting was done using Adobe Systems InDesign. Illustrations were prepared in Omni Systems Omni Graffle and Adobe Photoshop.

Type fonts, as well as iMac, Macbook Pro, Acrobat, InDesign, Omni Graffle, and Photoshop are registered trademarks of their respective companies.

Desktop composition by Joseph Gallagher.

The cover was designed by Bridgette White.

Published by the National Defense Intelligence College Press, March 2011. Printed at the Defense Intelligence Agency, Washington, DC.

CHAPTER I: Introduction

"We need to help our commanders and staffs escape the gravitational pull of Western military thought."

-- CSA Peter Schoomaker[1]

Why Red Teaming?

The premise of the program at the University of Foreign Military and Cultural Studies (UFMCS) is that people and organizations court failure in predictable ways, that they do so by degrees, almost imperceptibly, and that they do so according to their mindsets, biases, and experience, which are formed in large part by their own culture and context. The sources of these failures are simple, observable, and lamentably, often repeated. They are also preventable, and that is the point of 'red teaming'.

Our methods and education involve more than Socratic discussion and brainstorming. We believe that good decision processes are essential to good outcomes. To that end, our curriculum is rich in divergent processes, red teaming tools, and liberating structures, all aimed at decision support.

We educate people to develop a disposition of curiosity, and help them become aware of biases and behavior that prevent them from real positive change in the ways they seek solutions and engage others.

We borrow techniques, methods, frameworks, concepts, and best practices from several sources and disciplines to create an education, and practical applications, that we find to be the best safeguard against individual and organizational tendencies toward biases, errors in cognition, and groupthink.

Red teaming is diagnostic, preventative, and corrective; yet it is neither predictive or a solution. Our goal is to be better prepared and less surprised in dealing with complexity.

What is Red Teaming?

Red teaming is a function that provides commanders an independent capability to fully explore alternatives in plans, operations, concepts, organizations and capabilities in the context of the operational environment (OE) and from the perspectives of partners, adversaries and others.

A Red Team performs three general types of tasks:

- Support to operations, planning, and decision support
- Critical review and analysis of already-existing plans
- Intelligence support (Threat Emulation)

(UFMCS provides education for the first two tasks; TRADOC's Intelligence School and Center provides education on the third.)

In order for a Red Team to effectively contribute to decision making all of the following elements are required:

- The ability to think critically about the problem. While this may seem obvious, the reality is that critical thinking is a skill set that requires training, education and tools. The Army assimilates people from different backgrounds across the nation. One of the drawbacks of that assimilation is our military tendency to reflect the same biases and perspectives. We pride ourselves in common values—which while ingrained in the Army culture are not universal outside of that culture.
- Thinking critically and challenging the group is an unnatural act for military staffs. Doing so effectively requires tools and methods that enable leaders to see different perspectives.
- Red Teams require top cover to be allowed to challenge the conventional wisdom and the organization's leaders. No matter the quality of the Red Team or the methods they employ, dictatorial or toxic leaders are incompatible with successful red teaming.

- Red teaming is not easy, and not everyone can do it. Red Teamers must be effective written and oral communicators. They must have credibility in the area in which they are providing red teaming insights. They must be able to constructively challenge the plan. This means focusing on what is truly important, able to explain why it is being challenged and offering some alternative ways to think about the problem. Constituting a Red Team with those the organization 'can afford to give up' is a sure recipe for failure.
- There is no given template for a red teaming approach to a problem, no "one size fits all." Red teaming activity must be tailored to specific requirements. Time available is a critical factor, as is expertise with the issue at hand, the makeup of the team, engaged leaders and their predisposition to provide too much input, etc.

A Red Team works best behind the scenes, assisting the commander and staff in a non-critical, helpful manner, without taking credit. (It is hard enough to accept someone criticizing your thinking—it is much tougher if they are obnoxious and loud about it.)

While there is no formula for red teaming, there are some common activities that most Red Teams do most of the time. These include challenging facts and explicit assumptions, looking for implicit (unstated) assumptions, identifying cultural assumptions and developing targeted cultural questions for subject matter experts (SMEs), challenging the problem frame (and proposing alternative frames), identifying cognitive biases and symptoms of underlying groupthink, etc. All of these activities lead to the development of alternative perspectives.

How is Red Teaming Conducted?

Not everyone should practice medicine. Scalpels, drugs, and the procedures in which they are used are not to be trusted to those with a passing familiarity of their application. Everyone should have a basic knowledge of how to maintain their health and wellness (basic elements of diet, exercise, sleep). Red teaming is like medicine. Medicine is diagnostic, preventative, and corrective. It works best when applied in small applications over time. And so it is with red teaming. Everyone needs medicine at one time or another. Not everyone needs the same dose. You want a well-trained Red Team for the same reasons you want a well-trained physician. As with your relation with your physician, monitoring and periodic checkups are preferable to intervention. What does your unit need… intervention, prevention, triage, a second opinion, or a dose of common sense? The applications for red teaming are dependent on the needs of the unit. The following are some important questions to consider when practicing red teaming. Some have definite answers; some answers are dependent on context and the needs of the unit:

- What does a Red Team look like? (Ad hoc, standing team, an individual, or an on-call team)?
- What does it do? (Challenges assumptions, tests hypotheses, explores alternatives, and heightens awareness).
- Who are the best people to do it? (Rank and education are not exclusive discriminators. You want reflective, critical thinking persons with a curious disposition.)
- When is it done? (Continuous, on call, in planning, or when things are going poorly)?
- To whom does the Red Team belong? (Optimally, to the commander, though they may work directly for the Chief of Staff.)
- Where in planning does red teaming belong? (Everywhere.)

How is a UFMCS Education Unique?

Our approach has proven effective in units and organizations from brigades to the Joint Staff. UFMCS' curriculum is designed to improve critical thinking, and proceeds from a premise that before you point out to someone the errors of their thinking, you had better understand your own.

Most of us are disinclined to naturally challenge prevailing thoughts. We challenge students to examine things they hold sacrosanct. We expose them to the ethnocentrism of their own thinking, their overreliance on method, their tendency to default to Western/Aristotelian logic, their lack of appreciation for the frames that subconsciously capture their thinking, their failure to avoid common cognitive biases, and their predisposition to seek consensus while exhibiting classic symptoms of groupthink.

UFMCS' curriculum revolves around some fundamental questions:

- What does it mean to be "self-aware?"
- When I perceive and interpret information, what are those interpretations based upon?
- What do I value and believe? Why? How do these values and beliefs motivate my behavior? How do others' values and beliefs motivate their behaviors *differently*?
- How can cultural anthropology help me think about another culture without resorting to mirror imaging?
- How do I improve my ability to think critically?

UFMCS' curriculum is organized around the following major areas, designed to improve a soldier's ability to think and understand in new and continually evolving environments:

Self-Awareness: Understanding how our values and beliefs affect how we think and decide … and how that differs for others. Major sub-elements:

- Personal reflection, Jungian typology, Personality Dimensions, Thomas-Kilmann conflict mode instruments, etc.
- Watershed event story telling
- Daily Journaling

Groupthink Mitigation & Decision Support: The challenges inherent in hierarchical environments and elite teams—groups which might value maintaining social relationships more than making a tough decision.

- Use of fungible, small group techniques to mitigate groupthink: use of anonymous feedback, liberating structures, etc.
- How to connect critical thinking to operational design, problem framing, assumption validation, assessment tools, and MDMP.

Critical Thinking: Support for planning and decision making - deconstructing arguments, examining analogies, challenging assumptions, and exploring alternatives.

- The role of intuition—System 1 versus System 2 thinking.
- Numerous tools to examine a plan through different lenses—*Premortem Analysis*, *Stakeholder Mapping*.
- Thinking meta-cognitively, and enabling graduates to understand how humans think, and how culture shapes thoughts.

Fostering Cultural Empathy: Developing better questions about culture, in order to facilitate strategic and operational decision making which is informed by cultural empathy.

- Culture examined from the perspective of a cultural anthropologist, versus “dos and don’ts.”

- Conscious examination of the roles of ethnocentrism, versus cultural relativism.
- Culturally-centric case studies.
- Tools to help understand foreign cultural contexts, and to foster empathy.

Our intent is to inculcate behaviors designed to make critical thinking a discipline. The outcome of this process is a student with a bundle of cognitive capabilities—at the heart of which is a better ability to apply one's normal thought processes and their common sense, to the circumstances of a given situation.

Why this Red Teaming Handbook?

The purpose of this Red Teaming Handbook is to provide an aide memoir for UFMCS graduates, and an introduction to the concepts for those unfamiliar with red teaming. This handbook is not a checklist of actions or tasks, but rather serves as a compendium of key ideas and information taught in the UFMCS curriculum to help facilitate practical red teaming. The contents of this handbook are neither doctrine nor the "school solution."

This handbook represents the essence of what students study at UFMCS. It provides an overview in the four major educational areas of the red teaming program as described earlier in this introduction. Each chapter points the user to tools and methods in Chapter VI for use when confronting challenges associated with: Self Awareness and Reflection, Groupthink Mitigation and Decision Making, Critical Thinking, or Fostering Cultural Empathy.

This handbook is a living, UNCLASSIFIED document. We welcome your comments, suggestions, and input. Time and personal preference of different facilitators may result in some of these ideas or tools being new to you despite having attended the program. As you go through this handbook, if you see things you were not exposed to in class, please engage our faculty.

Summary

People and organizations court failure in predictable ways, by degrees, almost imperceptibly, and according to their own culture and context. As a countermeasure, we can fully explore alternatives in that context and from differing perspectives. We call this function *red teaming*.

Red teaming requires challenging the facts, problem frame, and assumptions. This function also seeks to qualify the assumptions, develop targeted cultural questions, and propose alternative perspectives, as well as identify any cognitive biases, groupthink mitigations, etc.

To that end, organizations can utilize individuals taught to execute red teaming, or charter an empowered *Red Team* (standing, ad hoc, or on-call). Either way, red teaming has worked best behind the scene.

UFMCS offers a unique red teaming education. The curricula is designed to challenge one's view of the surrounding world and self. The school creates an experience built upon: self-awareness, cultural awareness, critical thinking, groupthink mitigation, decision support, and practical experiences with red teaming tools.

CHAPTER II: Self-Awareness

Everything that irritates us about others can lead us to an understanding of ourselves. **-- *Carl Jung***[1]

Most of the shadows of life are caused by standing in our own sunshine. **-- *Ralph Waldo Emerson***[2]

The unexamined life isn't worth living. **-- *Socrates***[3]

What is Self-Awareness?

Everyday life is a flurry of activity that demands our attention. From training and deployment schedules, to children and home life responsibilities, we are always on the go. As a result, we have little time for self-awareness and personal development. The process of improving self-awareness via introspection happens when we take a dedicated look inward and examine our own thoughts, feelings, and motives. But, who has the time to do that?

Self-awareness is the capacity for introspection and the ability to recognize oneself as an individual separate from the environment and other individuals.

Why is Self-Awareness Important?

The self-aware person is more enabled as a critical thinker, more aware of personal biases and recognizes his or her own cultural framework. It is with this understanding of self that an expanded world view opens—one that is more empathetic to the differences of other cultures and ways of thinking and thus primed to engage as a Red Teamer.

UFMCS focuses on four areas to develop Self-awareness:

1. Study of Temperament, Personality Dimensions® Instrument and Model, Introversion and Extraversion
2. Study of Interpersonal Communications
3. Introspection Exercise—Who Am I?
4. Daily Journaling Exercise

People are complex and diverse. A self-aware person has dedicated introspective time to acknowledge personality traits, personal values, habits, psychological needs and emotions that drive behaviors.

Personality - An understanding of your personality can help create awareness of strengths and weaknesses, talents, motives, stressors and motivators for decision making and interpersonal communications.

Values - It's important that we each know and focus on our personal values. In doing so, we are more likely to accomplish what we consider most important.

Habits - Our habits are the behaviors that we repeat routinely and often automatically.

Needs - Our needs cause motivation; and when needs aren't satisfied, they can cause frustration, conflict and stress.

Emotions - recognizing your own feelings, what causes them, and how they impact your thoughts and actions is emotional self-awareness.

Who Am I?

The *Who Am I* exercise requires reflection and introspection of your personal family narratives and dynamics, regional culture, religion, educational experiences, and critical watershed moments that shape your worldviews and values—that all put together construct an idea of who you are as an individual. In its whole, the exercise enhances the individual's self-awareness while at the same time creates cohesion and relationship bonding within the participating group.

There are two critical elements to the exercise: private preparation through solo reflection and introspection, and group sharing and storytelling.

1. Individuals first must do the hard work of reflection, of recalling the seminal life events that were critical in shaping their personalities and deeper values. One might

think of these events as crucibles, both difficult and triumphant, that forged the individual's character. In essence, this private preparation is intended to encourage introspection. Such deep reflection takes time, and must be built into the structure of the entire exercise.

What exactly participants choose to share with their classmates in the verbal portion is a different question. It is important during preparation that participants be completely honest with themselves as to how they developed into the person they are today. This preparation can take an hour or longer, and is ideally conducted at least one day prior to the group sharing.

2. In the second step, the group sits together in a private setting, and one by one the individuals hold the floor, sharing aloud their story. Participants should take as long as they want, uninterrupted while providing their story. This enables a degree of rambling which intentionally creates an environment where many people end up sharing more than they originally planned. This open time frame can be very liberating, as for many this is the first opportunity they have ever had to share aloud with others why they are who they are.
3. As such, any interruptions in the form of questions or time limits tend to kill the magic of the moment. To mitigate the abuse of this open ended opportunity to talk, facilitators are encouraged to get their story down under 15 minutes, as this then sets an example that most others will naturally follow. The story should be conducted entirely as narrative—no power point slides or film clips etc.—nothing to distract from the story each person is telling the group, and nothing to hide behind. This activity should be like telling stories around the campfire—but the story we tell is about ourselves.
4. There is no question and answer period following the story so as to avoid any semblance of an 'interrogation', and also to keep the playing field even, (i.e., if the

facilitator were to ask one participant three questions and another only one, it might leave the impression that the first participant‘s story was more interesting, etc.)

5. Every member of the group who is not sharing is asked to practice ‘full-body’ listening by giving their complete and unfettered attention to the person speaking. Receiving this attention while sharing is extremely powerful and the facilitator can both model this and suggest that participants give the kind of attention you yourself would want to receive.
6. Every participant must provide a narrative, but the order of presentation is purely voluntary, an important factor in creating safety. While every participant must share something, precisely how much to reveal about themselves is an individual decision. In this way, the exercise entails individually manageable personal risk.
7. No more than three personal narratives are conducted in a row. If someone goes exceedingly long this may be shortened to two or even simply one. In order for the group to exercise ‘full-body’ listening and remain engaged, the entire group ‘who am I’ must be spaced out over time. Done right, the story is often draining both for the listeners and the presenters. Each hour of stories should be broken up with an hour or more of some other less emotionally investing activity.
8. It is highly recommended that the facilitator models their own story before the participants commence their solo reflection. What the facilitator shares will set the tone for what the participants share. Facilitators are urged to go out on a limb and reveal meaningful events in their life that genuinely shaped them as people. By taking action and modeling this openness first, the facilitator encourages participants to risk being personally vulnerable themselves.
9. From past experience, several participants have initially told the group that they had felt they did not know

everyone well enough to completely share who they are and everything they had learned about themselves in preparing for the exercise. In most cases, they came forward later and decided to redo their story on their own initiative—sharing things they had learned through introspection but needed time to process. This methodology allows people to operate within their comfort zone while simultaneously establishing a group norm that encourages them to both reflect and share.

10. By now, it should be clear that this exercise is definitely NOT a normal biographical recitation. Positions held, size and composition of family, etc. are not important unless they are linked to some watershed event. In an Army context, when someone commanded a company or held some other position of importance is not relevant UNLESS some critical event happened while in that position that has stayed with, and continues to shape their daily outlook. Similarly, while the birth of a child is without question a significant event in anyone's life, it may or may not necessarily change your worldview about things like the nature of personal responsibility, values, etc. Hence participants are ideally sharing events that were personally transformational on a fundamental level.
11. Finally, and most importantly, this all requires a degree of confidentiality among the group. While not confession or protected speech, it is critical that if someone chooses to share personal vulnerabilities (e.g., current struggles at home or difficult events from the past) that this content does not become fodder for gossip. To gain buy-in on this, the facilitator should openly propose confidentiality as a group norm, and foster a brief discussion about what this means. A good rule of thumb is —what happens in 'Who Am I', stays in 'Who Am I'.

Outcomes of Introspection

'Who Am I' is a deceptively simple exercise that works on many personal and emotional levels simultaneously. Several outcomes are enumerated below:

1. Using introspection to better understand how one engages the world, allows participants to view themselves in profound ways at depths rarely encouraged in the Army. Results may be scary for those unlocking doors in their head that may have long been closed, but it universally produces a better self-understanding.
2. When participants share their story, and listen as others share their own, it invariably dawns on them that they are not alone in coping with problems in life such as grief, prejudice, disappointment, relationship issues, etc. This leaves participants feeling significantly more connected with the group and less alone in the world.
3. Practicing active listening is not something we routinely do or reward in leader development. In fact, in some cases people are penalized for not contributing in volume to class discussions. This creates an environment where we reward the loudest who frequently crowd out and undermine efforts at collaboration. This exercise reinforces active listening and more importantly it reinforces listening for a deeper understanding of what they mean. This understanding promotes a connection on an emotional level. This is an exceedingly important skill for leaders to develop. Organizations where leaders and those led are emotionally connected have higher morale, are more committed to the mission, can better discern intent in the absence of explicit orders, and are more adaptable in extreme circumstances.
4. This exercise creates an environment where alternative perspectives can be valued. When a participant hears another tell a personal story about encountering direct prejudice and how that shaped them, they are less likely to think of that participant as simply 'hypersensitive.'

They understand *where* that person is coming from and *why* they see the world as they do—elements foundational to actual communication and education.

5. Finally, this is a tremendous team building vehicle. Upon completion, each member of the group knows all other members in a deeper way, faster than such knowledge normally develops. Often group members express that they now know other participants better than long time neighbors or even some members of their own family.

Journaling Daily

UFMCS requires students to journal daily, reflect on events and information. This layer of personal consciousness is seldom explored in the normal course of a day; paramount to critical thinking habits. Through introspective time with personal thoughts and feelings, this writing process induces the reflection on, and synthesis of, concepts as well as the subsequent application to one's own life experiences.

Journals are not intended to be simple regurgitations of the day's events. Entries should reflect a deeper and more considered review of the day's topics as well as down other paths those considerations lead. The act of journaling often leads the person writing the journal to examine their beliefs, attitudes, and values beyond what was discussed in class.

While students are required to turn in their journals, it is important to remember that the act of keeping a journal is designed to provide a vehicle for reflection for the individual writing them. Entries are not be looked on as graded writing. Bottom-line, they are designed for the writer not the reader.

Prompting questions:

- What have I learned about myself?
- What have I learned about my emotional responses?
- What learning topics or tasks did I respond to most easily/ with most difficulty?
- What do I feel proudest about/ most dissatisfied about regarding my personal growth?

Interpersonal Communication

Interpersonal communication is the face to face exchange between two or more persons that conveys ideas, emotions, and information; what is said and what is received verbally and nonverbally via body language and facial expressions. Personal objectives are one of the many driving forces underlying interpersonal communication.

- Interpersonal communication involves the use of semiotics which includes verbal and non-verbal representations of ideas, emotions, or events.
- Interpersonal communication occurs between people who are themselves developing and changing.
- Ethics, the use of moral principles to guide action, are part of interpersonal communication.
- Interpersonal communication can be strategic.
- Consider how one's communication affects others.
- To achieve their goals, communicators must be competent, meaning both appropriate and effective.

The many benefits of effective interpersonal communication include personal and professional success, more satisfying relationships, and goal achievement.

Strategic Questioning: seeking information to facilitate choices or open a space for new ways of thinking about a problem. It is open and closed questions, not a statement in the form of a question.

When to do it:

- Your professional role demands it
- As part of Critical Thinking
- You are confused about the purpose of the interaction
- You are problem-solving

How to do it:

- Use active listening
- Weigh they are saying against your goals
- Ask clarifying questions and offer paraphrases
- Stay open to new discoveries

Strategic Listening": listening to shape the outcome and help you accomplish your ends; measured later, by whether you gain information or improve the relationship. It considers when to use open and closed questioning, not stating the form of a question.

When to do it:

- Your professional role demands it
- As part of Critical Thinking
- You are confused about the purpose of the interaction
- You are problem-solving

How to do it:

- Use active listening
- Weigh they are saying against your goals
- Ask clarifying questions and offer paraphrases
- Stay open to new discoveries

Active Listening**":** listening to foster social relationships. This is measured at the time by how well you show your interest. It shows respect and involvement. Its absence can show lack of interest and dismissal.

When to do it:

- When the relationship matters
- As part of strategic listening

How to do it:

- Keep your eyes on the other's face
- Show emotional reaction but don't interrupt
- Echo parts of what they are saying

Empathic Listening": listening in support of emotions, demonstrating care and involvement. In the moment it helps the person feel understood and supported. Its absence can show impatience, disinterest, or dismissal.

When to do it:

- When you can be sincere
- When you truly understand or want to understand how your counterpart feels

- When you want to defuse strong emotions

How to do it:

- Show emotional reaction but don't interrupt; murmur
- Use indirect questions to echo parts of what they say
- Keep your eyes on the other's face
- Comment on their emotions

Personality Temperaments

Interpersonal Conflict

An awareness of others' temperaments can be quite helpful when conflict arises. Acknowledging the similarities and differences between the four temperaments allows for bridging strategies to be developed. In other words, courses of action that take into account each temperament's needs, motivators, and skills to form a more mutually beneficial outcome to manage the conflict.

Learning the four temperaments and examining your own personal patterns (dominant to least used) helps to frame your own personal needs, values, inter-personal stressors, and biases. An understanding your own and observing the patterns of others you work and live with allows you to:

- Influence and persuade others in a positive manner.
- Acknowledge your talents and those of others.
- Improve interpersonal communication.
- Identify potential problems early.
- Support and encourage others.
- Narrow gaps and differences.
- Improve team performance.
- Negotiate more effectively.
- Organize efficient teams.
- Increase productivity.
- Elevate morale.

Temperament

Temperament is defined as a pattern of observable personality traits, such as habits of communication, patterns of action, and sets of characteristic attitudes, values, and talents. It also encompasses personal needs, the kinds of contributions that individuals make in the workplace, and the roles they play in society. In essence, the study of temperament describes the 'why' of our behaviors, motivators and sources of stress.

Historically, theorists have identified four unique patterns of individual tendencies, values, and needs. These patterns were not arbitrary collections of characteristics, but sprang from an interaction between basic dimensions of human behavior: our communication and our action, our words and our deeds, or, simply, *what we say* and *what we do*.

Personality Dimensions® is a human relations and communications model rooted in Jungian typology and temperament theory that creates a common language for understanding self and others. The model examines four temperaments with innate psychological needs, values, talents, and behaviors.

Personality Dimensions®	**Core Needs**	**Values**
Inquiring Green	knowledge, competence, mastery, & self-control	scientific inquiry, concepts, theories, & logical consistency
Authentic Blue	finding significance, meaning, & unique identity	harmony, cooperation, ethics, & authentic relationships
Organized Gold	membership, belonging, responsibility and duty	stability, security, procedures, and group preservation
Resourceful Orange	freedom to act in the moment; make an impact, & expediency	variety, adventure, excitement, and performance with skill

Introversion and extraversion were first popularized by Carl Jung. This concept frames a continuum of traits with discernible differences or identifiers for preferences on the extraversion ↔ introversion continuum. Regardless of where one may naturally fall on the continuum, most will develop skills to effectively augment behaviors along the entire continuum to fulfill core needs and motivations.

Those who prefer ***introversion*** will often:

- Do their best thinking, learning, and decision making through quiet reflection and individual contemplation.
- Seek stimulation from within and direct their energies inward in reflection.
- Prefer to inwardly think things through before sharing any of their thoughts.

Those who prefer ***extraversion*** will often:

- Discuss thoughts out loud as a method to process information and make decisions.
- Seek stimulation from external sources and direct their energies outward.
- Prefer brainstorming out loud to get their creative juices flowing.

Linda Berens, *Understanding Yourself and Others*, also addresses the *core self*, the predisposition with which we are born. The *developed self*; the skills and behaviors we learn as we grow and mature; and the *contextual self*, how we prefer to react to a given situation. Berens claims that, given our "core self" and our "developed self", we are able to behave and react in a variety of ways in different situations or contexts. She states that we have the choice of: giving in to our core self, or following our developed self, or selecting an appropriate contextual response.

Summary

Self-Awareness and time introspecting is a fundamental element of the red teaming education. Self-awareness includes acknowledging that each of us come with differing values, behaviors, beliefs, personal stories, motivations and goals. Self-awareness enables the Red Teamer to improve their own: interpersonal communication, critical thinking, empathy for others, and cohesion within the group.

An understanding of individual temperament patterns and *introversion ↔ extraversion* confirms how we see ourselves (what we say and what we do) may be quite different from how others perceive what we say and what we do, and vice versa.

CHAPTER III: Fostering Cultural Empathy

"I don't think we should study things in isolation. I don't think a geographer is going to master anything, or an anthropologist is going to master anything, or a historian is going to master anything. I think it's a broad-based knowledge in all these areas, the ability to dissect a culture or an environment very carefully and know what questions to ask, although you might not be an expert in that culture, and to be able to pull it all together. Again, an intelligence analysis that isn't an order-of-battle, militarily oriented one, but one that pulls these factors together that you need to understand…"I mean, as simple as flora and fauna all the way up to basic geographic differences, environmental differences – cultural, religious and everything else. That becomes your life as a planner, or as the director of operations, and as the key decision maker."

-- General Anthony Zinni, 1998[1]

This chapter is about developing better questions concerning culture, in order to facilitate planning, policy making, and strategic and operational decision making which is informed by cultural empathy and enhanced by red teaming tools and a functional systems approach. Red teaming methods and tools prevent us from accepting easy answers to hard questions about culture and its complexity. The functional systems approach enhances our ability to translate the abstractions and nuances of culture into doctrinal, operational terms. To that end, we emphasize the following in our approach to the red teaming method of cultural examination:

- Conscious examination of the roles of ethnocentrism vice cultural relativism
- Culturally centric case studies
- Tools to foster empathy

"Cultural analysis is intrinsically incomplete. And, worse than that, the more deeply it goes the less complete it is. It is a strange science whose most telling assertions are its most tremulously based, in which to get somewhere with the matter

> *at hand is to intensify the suspicion, both your own and that of others, that you are not quite getting it right. But that, along with plaguing subtle people with obtuse questions, is what being an ethnographer is like."*
>
> ***-- Anthropologist Clifford Geertz, 1973***[2]

Cultural Awareness

In the above passage from *The Interpretation of Cultures,* Clifford Geertz was describing what it is like to be an ethnographer, but he may just as well have been describing a Red Team tasked with cultural analysis. A curious, skeptical disposition, rather than one of certainty befits the Red Teamer. For the Red Teamer, awareness means the discovery that there is no "normal" position in cultural matters.[3]

For the Red Teamer, culture may be best approached with techniques borrowed from the perspective of a cultural anthropologist instead of a prescriptive framework or list of 'dos and don'ts'; in other words, there is value in passively regarding what *is*. However, "Anthropology, or at least interpretive anthropology, is a science whose progress is marked less by a perfection of consensus than by a refinement of debate. What gets better is the precision with which we vex each other."[4] This will not do. What is needed is a systemic approach to culture the outcome of which is designed to enhance military planning.

To observe dispassionately is the role of the ethnographer, but not necessarily the role of the military commander or Red Teamer. Their role is to decide what to "do," based on their observation and analysis.

Cultural awareness is not the same thing as cultural sensitivity. The idea is not to escape or discard our own deeply held values, beliefs, and ideals, or to practice cultural relativism, but to better understand the distinctions and similarities between our own and those held by others (both adversaries and allies) for the purpose of avoiding missteps in planning and policy formulation. Our methods and

outcomes as military planners differ from those of the ethnographer or anthropologist in that our task is not only to observe, but also to plan and act upon our analysis.

With that in mind, keep this caution in mind as you read this chapter and as you begin on any cultural examination: when we analyze another culture we must do so with full consciousness that our vantage point lies outside of it. Moreover, the things we see are the things we most often attempt to manipulate. These things are the superficial edifices of culture. Real wisdom here is to allow for the deep, unalterable foundations of culture, not to reconstruct it in the manner we desire.[5]

Ethnocentrism

One aim of the red teaming cultural methodology is the reduction of blind ethnocentrism. Ethnocentrism, the belief that *one's own culture is inherently superior to other cultures* is a natural tendency of most individuals[6] (Haight, 1990). This is a problem in planning when the planner is so bound by their own culture as to be "blind to the ability to see the world through the eyes of another national or ethnic group."[7] Negative or distorted stereotypes too, are a challenge to complete cultural understanding as well. Stereotypes by themselves are not negative. At issue here is whether they are accurate or distorted. Distorted stereotypes are polarized, simplistic, and self-serving. Race and ethnicity are common characteristics that are historically susceptible to distorted stereotypes.

> *"Stereotyping is a process by which individuals are viewed as members of groups and the information that we have stored in our minds about the group is ascribed to the individual"*
>
> ***-- Behavioral Scientist Taylor H. Cox, 1994***[8]

Often we tend toward oversimplification of cultural complexity in matters of planning. Our natural inclination is to construct simplified models of a complex reality in order to explain things. We develop simplified explanations based upon selected cultural aspects of the OE that facilitate our

planning and desired end states. The tendency is to regard culture as a block, a category with geographic or ethnic boundaries, and not as the people, the individuals that make up what is the human domain. For example, a simple answer to the question “Where is Mexico?” might be one that explains geographical boundaries, as on a political map. A more insightful answer is “It’s where Mexicans are,” or where Mexican food is, where “Mexican” Spanish language is spoken, or wherever Cinco de Mayo is celebrated, by whomever and for whatever reason. Cultures have social and psychological as well as geographical contexts. Culture’s complexity is illustrated by the hundreds or perhaps even thousands of culturally learned identities, affiliations, and roles we each assume at one time or another. “Complexity involves the identification of multiple perspectives within and between individuals.”[9] Multiple and alternative perspectives, better questions, and thinking more “complexly” is the aim of the red teaming approach to culture.

To that end, we adopt the position that the study of culture is “not an experimental science in search of law but an interpretive one in search of meaning.”[10] There are several challenges to forming an interpretive approach to culture, but that is our aim. We seek an explanation that accounts for the occurrence of certain phenomena in culture, in a place, at a certain time, for a certain group, for the purpose of planning, policy formulation, and decision support.

Challenges to interpreting culture

- To choose apperceptive (conscious perception with full awareness) frameworks that are sufficiently rigorous without being reductive.
- What cultural skills should a Red Teamer have?
- How are these skills best introduced in our practice?
- The most important aspects of multicultural awareness may be learned but cannot be taught.[11]

- Good training can create favorable conditions for multicultural awareness to occur and provide the necessary knowledge and skills
- What is "good" training for Red Teams?

> *"It is difficult to know the cultures of others until and unless you have an awareness of your own culturally learned assumptions as they control your life"*
>
> ***-- Psychologists Mary Connerley and Paul Pedersen, 2005***[12]

When seeking to interpret, understand, or analyze a culture, nothing is more essential than to realize the extent to which the interpretation is uniquely our own, with all the inherent and inescapable biases and ethnocentricity that comes with it. While we cannot completely escape our culturally learned ethnocentricity, there are tools, methods, and frameworks we employ to give us greater awareness of it and how it shapes our thinking and decision making.

There are hundreds of definitions of culture. Some are broad, general, and inclusive, while others are specific to the interest of the practitioner (ethnographer, social scientist, psychologist, warfighter, etc.).

Some definitions:

- "Whatever it is one has to know or believe in order to operate in a manner acceptable to its members."[13]
- "The webs of significance designed by men for themselves."[14]
- "The collective programming of the mind that distinguishes the members of one group or category of people from another."[15]
- Operational Culture: Those aspects of culture that influence the outcome of a military operation; conversely, the military actions that influence the culture of an area of operations (AO)."[16]
- "A theory on the way in which a group of people in fact behave."[17]

The key point to remember is *it is all theory until you get there*.

Culture…

- Is learned.
- Is shared.
- Changes over time.
- Is not always rational to outsiders.

There are several frameworks that attempt to capture aspects of culture for the purpose of studying them. These are broad frameworks that lay out major categories of cultural differences.

Differences of the various approaches relate directly to the purpose of the research. Cultural frameworks do not explain everything, but they still explain something, and our attention should be focused on isolating what that something is with regard to military planning.

There is no ideal framework or best way to classify a culture. Moreover, frameworks should not supplant a straightforward explanation. The Red Teamer should understand that classifications and categories often only serve to provide a simplified basis for analysis. Opting for one categorization or framework over another not only determines the kind of questions we may ask, but may obscure other important questions that should be asked. For this reason, the Red Teamer should employ several frameworks or cultural "lenses" (like *4-Ways of Seeing*, p. 76) when conducting cultural analysis.

The Red Teamer views frameworks (including PMESII-PT as diagnostic tools, not by themselves explanations for the way things are.

Some Cultural Frameworks

While PMESII (Political, Military, Economic, Social, Information, Infrastructure) is the most frequently used method of organizing militarily-relevant knowledge about a place it is not the only valid framework nor is it complete in

and of itself. Graduates are encouraged to ask themselves the question 'What is missing in an exclusively PMESII analysis…does it cover the WILL of the people in question, does it address how they view TIME either historically or day to day etc. Frameworks of all kinds are diagnostic tools not explanations for the way things really are in the society.

5. Beliefs & Systems
From Operational Culture for the Warfighter</td></tr>
</table>

In the end, the framework(s) we choose is/are based on what we want to know and what we plan to do. We want to gather not only analysis and facts but explanations that lead to empathy / understanding that contribute to a methodological approach to operational Design, joint and service military decision making processes.

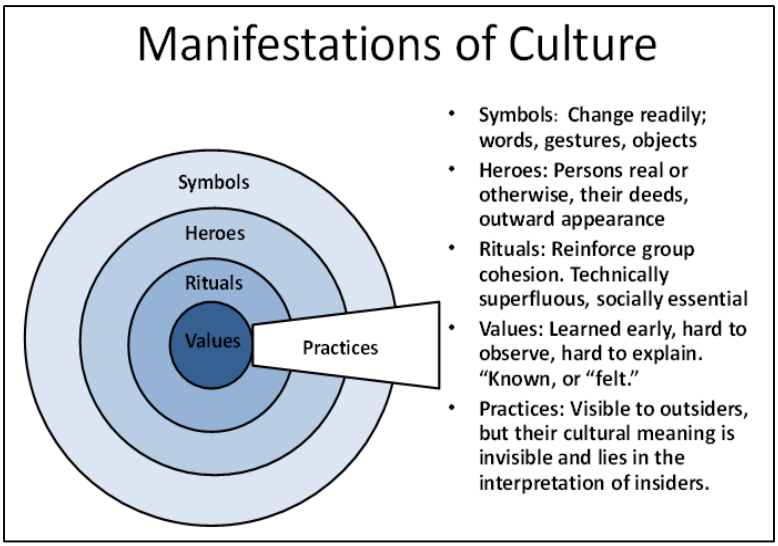
Every Red Teamer should possess a general OE knowledge of:

- Dimensions of Culture
- Aspects of National Culture
- Distinct motivational values born of cultural upbringing and context

Red-teaming instruction at UFMCS focuses on culture at the general level of knowledge. Emphasis is placed on culture because culture was identified as a gap in the understanding of the OE during OIF and OEF, and because culture is historically difficult to understand as its substance and significance is often abstract and not immediately observable.

The UFMCS Culture curriculum includes lessons focused principally on four subjects that are uniformly acknowledged in anthropological studies as foundational to any cultural study: social structure, politics (power and authority), economics, and religion (belief systems). The assumption is that to understand any one part of a culture or society we must look at all the rest of the socio-cultural context. The purpose of separating a society or culture into elemental parts or basic principles is not to isolate these elements, but to determine the nature of the whole.

General knowledge focuses learning about a complex OE on what is important for military planning and decision making. General knowledge is not concrete but an abstraction from experience; generalizations abstracted from multiple specific cases. Generalization simplifies a complex reality; complexity that otherwise overwhelms our ability to understand. An example of a model or framework that serves to simplify and illustrate an otherwise complex cultural reality is Hofstede's "Onion" model of Cultural Manifestations.



This simple, general model (p. 161), when populated, presents the Red Teamer with a cultural "… set of patterns, of and for behavior, prevalent among a group of human beings at a specified time period and which … presents … observable and sharp discontinuities."[18] Models like this one allow the Red Teamer to analyze what is the same, and what is different, the "sharp discontinuities" of the cultural context. It provides general categories and asset of patterns with which to begin a cultural examination of the OE that may be useful in the development of the Environmental frame of the Design process.

Without general categories we easily get lost in the complexity of specific details. At the population level, the human domain is extremely complex and is continuously changing which makes analysis to identify what can be influenced to achieve the desired outcome intractable. There are too many interconnected variables—at some level most all variables are connected—and causal relationships are constantly changing. This fact alone is enough to make planners take an essentialist view of culture, "It's always been that way with these people."

> *"To explain different patterns of culture we have to begin by assuming that human life is not merely random or capricious. Without this assumption, the temptation to give up when confronted with a stubbornly inscrutable custom or institution becomes irresistible" -- **Anthropologist Marvin Harris, 1989**[19]*

Organization of cultural information is more than simple aggregation or populating a rigid systems model with general information. Important nuances of culture may be missed in a simple aggregation and cannot be examined by looking only at institutional design. This is where red teaming tools may be useful in determining which information, general and specific, is contextually important in the design or planning process, and help us to avoid the temptation to "give up," or generalize in a stereotypical fashion.

The complexity of the human domain may be simplified by organizing specific information into general categories important for military operations. These general categories are based on what is important to know. At the highest level of organization for military operations, these general categories are the military operational variables, PMESII-PT. These categories simplify reality and provide a framework to focus collection of Regional Expertise and Culture (REC) - specific information relevant for military analysis.

Systems Thinking: According to CJCSI 3126.01A, *Language, Regional Expertise, and Culture (LREC) Capability Identification, Planning, and Sourcing*, systems thinking is: "Understanding how ...variables in the regional system interact with one another and change over time."[20] At the population level, it is an understanding of the interaction of variables across a population. Given complexity, as mentioned above, "systems thinking" is enabled by the simplification of reality into relevant general categories of variables. The task for the Red Teamer is to render reality as simple as possible, but no simpler, for the purpose of military planning. For this reason, a functional approach to cultural analysis of the OE is suggested as one approach the Red Team may take for the purpose of connecting cultural

analysis to planning and operations. The following Functional Systems Approach to cultural analysis for planning is adapted from the USAFAS Regional Expertise and Culture Instructor Course (Pilot) developed by Dr. Daryl Liskey.

Functional Systems Approach

A *System* is an analytical approach to understand regular interacting relationships (links) and the associated entities (nodes) in an OE (see JP 2 01.3).[21] It is an analytic device for separating from its context a set of phenomenon we want to study. Anthropologist Ronald Cohen describes it this way:

> The system as a whole does something. It can be characterized as having an activity or activities, and its various parts contribute to the fulfillment of these ends. Indeed systems designers are quite clear on this point when they design systems, *since they start with functions* (emphasis added) and then work back to create a set of interrelationships that will, in fact, describe the carrying out of these ends.[22]

How variables are related to produce a specific outcome is the definition of a *function*. The functional system consists of the regular patterns of interacting variables that cause the output. A functional systems approach is useful because it provides a systemic approach to analyzing interactions on what is important to know.

Keep in mind that the functional systems approach is not theory, nor is it doctrine. It is a method that links all aspects of cultural research together (Red Teaming, Design, LREC, PMESII, etc.). It is but one of many methods that may be used to enhance apperception (conscious perception with full awareness). Its intended use is as a bridging device between red teaming analysis and doctrine. The goal of this approach is an accurate description of a culture, leading to an explanation, and ultimately better informed planning and decision making.

The PMESII systems (which the Army identifies as the Operational Variables) purport to identify the *most important outputs or effects* relevant for military operations in a typical country at the campaign level of planning.

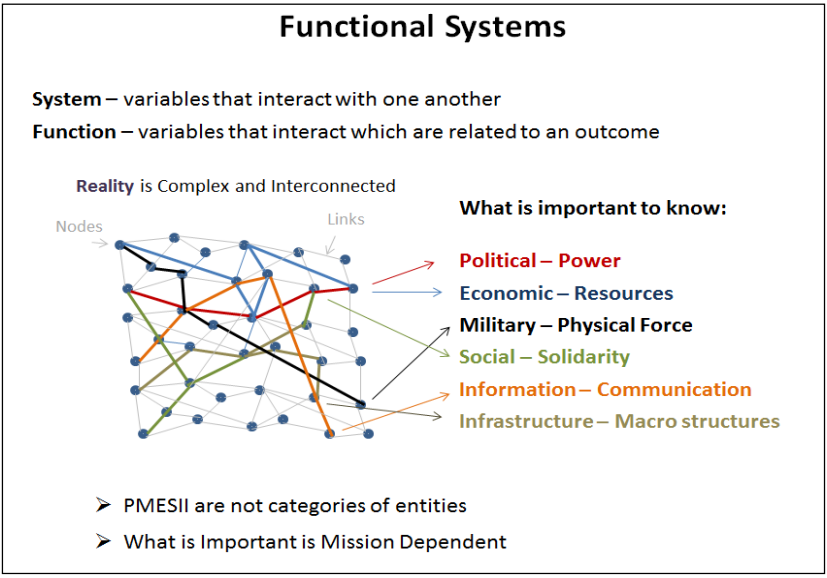
In functional terms, the Operational Variables are:

Political – power: how binding decisions are made

Military – physical force: how physical force is exercised

Economic – resources: how goods and services are produced, distributed, and consumed

Social – solidarity: how people interact in their everyday lives



Infrastructure – physical macro systems: how critical resources and activities move across man-made physical systems

Information – communications: how information is produced, distributed, and consumed

A functional understanding differs from but is consistent with the description of the operational variables in ADRP 5 and other Army and Joint Publications like JP 2-01.3.

At UFMCS, we include **Religion**, or belief systems, as a function.

In general, the PMES variables are important functions of any population, which is well established in the academic literature. A PMESII systems approach can be useful across the levels of war: a village, for example, may be usefully analyzed in terms of a PMESII framework for missions that cross the full range of military operations.

Caveats: In general, a PMESII Operational Variables approach is consistent with a functional systems approach given two ***caveats***:

- ***PMESII are not meant to be stand-alone descriptive bins for categorizing entities (e.g., persons or institutions)***. In other words, it is unnecessary to think of any element of the system as a compartmentalized function which must be sharply separated from its context. A single entity or institution may be important across the PMESII operational variables. For example, a sheik may be an important variable in an analysis of power, force, resources, and solidarity of a tribe. If the sheik is categorized as a social variable but not a political variable, then the analysis of power misses an important variable. In more complex societies, institutions may be structured to perform a single specialized function; for example, a business enterprise is organized to perform an economic function or a government to perform a political function. However, a political analysis of American politics can include military, economic, and social institutions as important variables. If economic institutions are walled off from Political, then the analysis will be partial or biased and unlikely to accurately estimate the effect.

- ***Mission Dependent***: What functions are important in a particular military mission may differ depending on the mission. As noted in JP 2 01.3, *Joint Intelligence Preparation of the OE*, for more-focused military operations, a full analysis of the PMESII variables is not needed. As, in governance operations, analysis of the political system can be the most useful (keeping in mind that PMESII are not descriptive categories) while for military force-on-force operations the analysis of the Military system is likely the most useful.

By now we have established that there are several frameworks, procedures, and models by which to examine culture. Whatever design we decide upon is dependent on the answer to four critical questions (adapted from Keesing, 1970):

1. What will be the shape and design of the cultural description?
2. What is the relation of such a cultural description to the overall goals of the military plan or decision?
3. How is the adequacy of the description to be evaluated?
4. What evidence is there that the descriptions we have sketched will be productive?

The purpose of these questions is to explain culture to what end? What is the connection? And the answers to these questions are critically important in determining the validity of whatever cultural framework, process or model we choose. The answer must be better understanding to inform the planning process.

The human domain is infinitely complex. It pushes back, evolves, and changes rapidly and unpredictably. We currently lack sufficient analytical power to reliably understand functions in the human domain in the same way we can in the biological or engineering domains. Institutions can be *engineered* to perform a function, but the OE outside

institutions, is more complex. Rather, red teaming tools and a functional approach to the human domain generate research questions that focus the purpose for an analysis and what casual relationships are important. Given a certain question, we structure research areas by identifying what is necessary to answer the question based on our general knowledge. To the extent that general knowledge is true, the categories and relationships will be true. It provides our "best initial guess" which is preferable to the alternatives. The Cultural Perceptions Framework (p. 122), Critical Variables (p. 115), and "Onion" model (p. 161) are useful red teaming tools in generating questions and categories that support the functional systems approach and in generating broader understanding (empathy) and alternative perspectives for cultural analysis.

Advantages of a Functional Approach: There are three important advantages of a functional approach.

- ***Focuses Analysis on Outcomes and Effects***: Observing entities alone can tell us little about what is important for outcomes like power (control). A local government official or *sheik* may not be an important variable. In a village, the priest or large land owner may exercise more power. Or, power, more likely, is distributed throughout a functional political system. By understanding the functional system, entities or relationships can be identified that are important for causing an outcome. Systemic functional analysis increases the likelihood of developing course of action (COA) that will achieve a desired effect.
- ***Identifies what is important across specific areas***: A functional approach also enables a REC-general understanding applicable across any area. Understanding key specific functional relationships like decision making, execution, and enforcement enables identification of the specific institutions across specific regions or systems. The specific institutional form can vary greatly: the ultimate decision-making function can

be exercised by Congress in the United States, the Central Committee in the People's Republic of China, or the religious leader in Iran. It may also be shared among different institutions to varying degrees. Understanding of functions provides general knowledge of what is important across specific areas where institutional form can vary widely.

- ***Synchronizes knowledge and analysis across echelons*:** Specific forms of institutions also vary across echelons within an AO. For example, political parties may have a national level organization, linked to regional political groups, which in turn are linked to local informal power holders in a village. A functional analysis enables an understanding of vertical as well as horizontal system relationships related to outcomes despite specific differences in form. This enables an analysis of how one level affects the other as well as enabling the aggregation of information and analysis across echelons.

Cultural Relevance

A few rules of thumb apply to recognize when culture may be more important:

Greater Cultural Differences: Culture is more important when cultures differ from our own. In countries like Afghanistan, these differences can be marked and more important than institutional considerations. In more Westernized cultures, culture differences may be few and institutional differences will matter more.

Unstable Countries: Where institutions are weak or are collapsing, cultural ties are relatively more important and can become a critical source of conflict as well as resilience.

Marked Differences within a Country: The cultures within a country can vary markedly. The culture in rural areas is less Westernized compared to major urban areas and the culture can vary from area to area within a country. Differences in culture can produce strong cultural dynamics

within a country even in highly institutionalized Western countries and these dynamics can be critical for Western countries.

Additionally, culture can be a more critical consideration in population Inform and Influence operations and, at the individual and organizational levels, operating with JIIM partners.

Summary

Anthropology is about observation, collection, and cross-cultural comparisons. Military planning is oriented toward action, and exhibits a bias toward a particular type of action (security, stability, decisive action, etc.) The processes of military planning can have a dramatic effect on the goals of those actions. Red teaming is about apperception, theory construction and testing. These fields frequently overlap, but tend to use different methodologies and techniques. Red teaming methods and tools aim at improving cultural understanding with the goal of enhancing the chances of successful outcomes in military planning. In the case of cultural empathy it is about explanations of the relationships of cultural functions. Red teaming represents a methodology, and the approach affects the method. The order of application reflects a strategy. The aim of the strategy is the support of operational planning in the form of Design and MDMP. The following are some thoughts for the Red Team to keep in mind when conducting cultural analysis:

- The study of culture is not performed in isolation. It is only meaningful when regarded as part of a larger body of thought (e.g., strategy, design, campaign planning).
- Cultural analysis is part of the larger intellectual process of war fighting and peace keeping.
- The tendency to depend on one authority, one theory, or one approach to cultural apperception is extremely dangerous in military planning.

- Red teaming cultural methodology is not a new way of knowing—it is a systematized approach—a synthesis of several works.
- A functional systems approach is useful because it provides a systemic way of analyzing what is important to know about the OE.
- Red teaming methodology does not produce solutions, but insights that inform planning—a logic of inquiry.
- The aim is to avoid spurious correlations and conclusions.
- The goal is to make sense of—or meaning of—what goes on in a particular cultural milieu; for that time, and in that context, for the purpose of planning and policy making.
- The red teaming cultural methodology aims to inventory and understand a people and their motivations at a level of general knowledge for the purpose of resolving or avoiding violence and conflict.
- The goal of general knowledge is not prediction per se, but understanding in order to control and influence the outcomes we desire in military operations.

And finally, some observations on "why we study culture"[23] from Dr. Geoff Demarest:

1. To find people and things. Cultural knowledge helps locate individuals, their wealth and their supporters. 'Locate' means establish their precise whereabouts -- where they will sleep tonight, where their mother is buried, the number of their bank account and the bank routing number, where their motorcycle is sitting, their email address, where and when they play golf…and where they feel safe. For the competitor in a violent struggle this is the first and most compelling reason for cultural knowledge. It is what Sam Spade, the private investigator, knows. The rest is useful, too, but if he knows where you are while you don't know where he is,

you are the prey. To control anonymity, you must know the culture.

2. To communicate good. Cultural knowledge can improve communications with others so as to endear and not offend, to facilitate collaboration and compromise, and to settle disputes peacefully when preferable. This involves language beyond the verbal, and into customs, prejudices, habits, mores, expectations, fears, historical grievances, community pride and the like. All knowledge is grist to the mill. It will be especially productive to identify aspects of the culture related to honor and dishonor.
3. To identify objects of desire, sources and holders of power, grievances, agents (especially 'exclusive' agents), resolution mechanisms, debts, tax relationships, jurisdictions and expectations. In short, to comprehend the territorial geography of conflict and conflict resolution.
4. To set reasonable objectives. Knowing how or if to change the social compact, how long it might reasonably take you to implement such a change, and how long the changes might last. This may include determining the interrelationship between peoples' behaviors and their surrounding environment in order to derive durable improvements in human flourishing and harmony. When good intentions are not built on sufficient knowledge, the reward may be a set of nasty unintended consequences. In a domestic legal setting we demand due diligence of doctors and lawyers -- that they avoid negligent practice. Strategic due diligence presupposes the programmed and resourced study of foreign cultures in order to avoid strategic negligence.
5. To put things in the right places. Whether you want to optimally place a fish pond, police station, camera, or a shooter, it is local cultural knowledge (and usually the kind that cannot be gained via remote sensing) that will guide best.

6. To correctly time actions and activities. Knowing when to act and not act is a much easier standard if we are steeped in local cultural knowledge.
7. To get the joke or make the joke. Jokes work the same mental pathways as military deceptions. For practical purposes, military deceptions are jokes. Irregular armed conflicts are generally clothed in law, economics, propaganda and other aspects of quotidian, civilian life. Not being able to get civilian jokes means being vulnerable to the dangerous military or criminal ones. Just as the insurgent can move from military uniform to civilian attire, so can military thought hide in civilian guise.

CHAPTER IV: Critical Thinking

> *In all affairs it's a healthy thing now and then to hang a question mark on the things you have long taken for granted.*
>
> *Many people would sooner die than think. In fact, they do.*
>
> ***-- Bertrand Russell***[1]

Introduction

Critical thinking is a term that many institutions hold in high regard, that most people have heard about, and that almost nobody practices on a thorough and systematic basis. This section of the Red Team Handbook is designed to acquaint you with many of the fine points associated with critical thinking by doing two things: exploring what critical thinking is, and addressing why critical thinking is necessary.

Critical thinking is hard, deliberative work and it takes an open, inquisitive mind. It is not easy, but it doesn't take a genius either. You can choose to believe whatever you hear and see. But to be a critical thinker, you must learn to ask yourself whether you *must* believe what you hear and see. *Ultimately, critical thinking is about what to believe.*

What Do Critical Thinkers Do?

What exactly is critical thinking? A common approach to answer that question is to consider how the term is defined. Let's look at a few definitions of critical thinking. Drs. Richard Paul and Linda Elder, authors of many critical thinking books and documents, define critical thinking as

> "A process by which the thinker improves the quality of his or her thinking by skillfully taking charge of the structures inherent in thinking and imposing intellectual standards upon them… [It requires] a commitment to overcome our native egocentrism and sociocentrism."[2]

Robert Ennis, also recognized as an expert in critical thinking, defines it differently: "Critical thinking is a process,

the goal of which is to make reasonable decisions about what to believe and what to do."[3]

Are either of those definitions sufficient to explain what critical thinking *is* in full, or what critical thinkers do? Certainly not. Neither enumerate *what* critical thinking is, nor point us in the right direction in terms of *how* to think critically. The challenge of defining critical thinking is that it seems to defy definition—at least a definition that stands alone, fully explaining what it is and how to do it. In fact, several authors who have written about critical thinking do so without attempting to define the term. Among them are Stephen Gerras ("Thinking Critical About Critical Thinking"), Stephen Brookfield (*Developing Critical Thinkers*), Tim Hurson (*Think Better*), and Peter Facione (*Critical Thinking: What It Is and Why It Counts*).

Although the definitions leave us with questions concerning what critical thinking is and how to do it, they do provide insight. By closely reviewing several definitions, we can ferret out ideas that help us better understand the nature of the critical thinking.

Look at the definition by Drs. Paul and Elder above. Several tangible ideas emerge: critical thinking is a *process*, and it deals with the *quality of thinking* by *imposing intellectual standards*. In fact, in other writing these two authors assert that critical thinking *considers points of view*, *the quality of information*, *interpretation and inference*, *assumptions*, and *implications* and *consequences*, and that critical thinkers *think open-mindedly,* and *gather, assess* and *interpret relevant information*.[4]

Additional verbiage from other critical thinking experts, with their key ideas italicized, are as follows:

- Stephen Brookfield (*Developing Critical Thinkers*): Critical thinking consists of *challenging assumptions* and *exploring alternatives*.[5]

- M. Neil Browne and Stuart M. Keeley (*Asking The Right Questions*): "Critical thinking consists of an *awareness* of a set of interrelated critical questions, plus the ability and willingness to ask and answer them at appropriate times" (Italics added.)[6]
- Gary Jason (*Critical Thinking*): "Broadly defined, critical thinking means *developing an ever better worldview* and using it well in all aspects of your life… the essence of critical thinking is *questioning* and *arguing logically*. … the heart of critical thinking is the ability to … infer or reason well… questioning and arguing logically" (Italics added).[7]
- Sylvan Barnet and Hugo Bedau (*Critical Thinking, Reading, and Writing*): "[Critical thinking includes] *searching for hidden assumptions*, noticing various facets, unraveling different strands, and evaluating what is most significant … [critical thinking] implies conscious, deliberate inquiry, and especially it implies *adopting a skeptical state of mind*." "Critical thinkers are…sufficiently *open-minded*… [and] adopt a *skeptical* attitude." "Critical thinking means questioning not only the assumptions of others, but also *questioning your own assumptions*" (Italics added.)[8]

Make a short list of all of the italicized words in the definitions shown thus far. Collectively, these words help illuminate what critical thinking *is*, and what critical thinkers *do*. Here is an initial list of the ideas expressed in italics:

- Critical thinking is:
  - *awareness.*
  - a *process.*
  - *quality of thinking.*
  - *imposing intellectual standards.*
  - *challenging assumptions* and *exploring alternatives.*
  - *searching for hidden assumptions.*

  - *questioning* and *arguing logically.*
  - *developing an ever better worldview.*
- Critical thinkers:
  - *are open-minded.*
  - *adopt a skeptical state of mind.*
  - *gather, assess*, and *interpret relevant information.*
  - *question [their] own assumptions.*
  - *consider points of view*, *the quality of information*, *interpretation and inference*, *assumptions*, and *implications* and *consequences.*

Let's elaborate on a few of the ideas expressed above. First, critical thinking is *awareness*: critical thinkers are aware of their surroundings, what they do know and (more importantly) what they do not know, and how their thinking can often fool them. Because of this, critical thinkers are self-reflective and defer judgment: they do not jump to conclusions, but rather take time to ask questions, ensure they've considered various perspectives, ask themselves what's missing that needs to be considered, and reflect upon how their values and beliefs may be conspiring to fool them.

Critical thinking is also a *process*. Good critical thinkers consider various frameworks when thinking about problems, because frameworks force us to consider alternative perspectives that we wouldn't naturally consider. The latter portion of the Red Team Handbook is filled with frameworks with which we can think critically about various challenges.

Critical thinking includes knowing that for many issues, assumptions prevail. Often these assumptions are hidden, or *implicit*: we make them without realizing that we are doing so. *All* assumptions need to be challenged. When the assumptions are challenged and found to be faulty, we may have better insight into the nature of the problem.

Exploring alternatives is equally important. Otherwise, we take for granted that the first thing that comes to our mind is the way it really is—we fall prey to default-mode thinking, allowing ourselves to be comfortable with the first conclusion we settle upon.

Considering the collective list of extracted ideas from critical thinking experts is a first step toward more fully appreciating what critical thinking is, and how to do it. To add to the list above, think of someone you admire as a critical thinker. What is it that s/he does that you admire? How is it that this person "thinks critically?" What habits of thought does this person exhibit? There is no perfect, all-inclusive list of critical thinking traits. But by constructing such a list, we can better understand the aspects of critical thinking that definitions alone won't provide.

In summary, critical thinking definitions—however eloquently stated—often do not provide complete, self-contained understanding because there is much more to critical thinking than any one definition can provide. Rather than focus on definitions of critical thinking, we invite you to review the list of *Critical Thinking Traits* (p. 112). Review each item on this list. If you aren't doing all of the things noted on the list, perhaps your critical thinking has room for improvement. Make sure to explore those ideas that you don't understand.

This completes the discussion of what critical thinking is, and what critical thinkers do. But is critical thinking a necessity?

Why is Critical Thinking Necessary?

We maintain that critical thinking is indeed vitally necessary. Why? For a number of reasons—among them the fact that we spend most of our waking day on "cognitive autopilot," not consciously thinking about the choices that we make; that each of us perceives and interprets the same information in several different ways; and that there are ingenious attempts on the part of the few to fool the many. This section will briefly examine these reasons.

Most human beings are on "cognitive autopilot" most of the time. Think about it: since you woke up this morning, how much of your daily routine has been just that—a routine? Unless you're a child, and haven't yet learned all of the things necessary to survive and thrive in the modern world, we don't usually give a second thought to many of the things we do during the day. This includes dangerous activities—driving a car on a busy highway; playing ice hockey; working in a noisy, dangerous automotive plant; or crossing a busy street while listening to music on an iPod.

According to Daniel Kahneman, most impressions and thoughts arise in your conscious experience without your knowing how they got there. The mental work that produces impressions, intuitions, and many decisions *goes on in silence in our mind*. As we navigate our lives, we normally allow ourselves to be guided by impressions and feelings, and the confidence we have in our intuitive beliefs and preferences is usually justified.

But not always.[9]

According to Richards Heuer (*The Psychology of Intelligence Analysis*) and Morgan D. Jones (*The Thinker's Toolkit*), we do not approach analysis with empty minds. Our minds are full of biases and assumptions. Unless we are forced to stop and think through a particular challenge, we are able to blot out much of the complexity surrounding us and rely on routines of habit. Usually, this works fine until we treat a truly unique situation as yet another *routine* situation, at which point we are taken by complete surprise. Hopefully we survive and learn. Sometimes we're profoundly embarrassed.

Critical thinking helps us break the bond of unreflective dependence upon our intuition. It is a counter-weight to "cognitive autopilot." Why? For several reasons, among them our reliance upon mental models, patterns and intuition; the effects of "frames"; and our values, beliefs and worldviews.

When we perceive and interpret information, we usually use mental models, patterns, and anomalies: our intuition. Mental models—also referred to as "mindsets"—are tools that we unknowingly create to replicate how we believe the world actually works. They act as *implicit* assumptions—unstated, hidden assumptions we don't consciously make, but which nonetheless exist. We use these mental models to simplify our daily lives. Mental models allow us to cope with reality by providing a ready-made default mechanism: "when I see the following, here's how I interpret it and here's how I act." Most of these mental models, like our values and beliefs, reside in our subconscious, which means that we are not normally cognizant when we are using them. Mental models do make our lives easier; they simplify the environment by bringing to each new experience a pre-established frame of reference. The absence of mental models would require us to figure out every situation as it presents itself, and we would soon be overwhelmed.

When our mental models of the world do not match the reality that we face, we often ignore that reality. Unfortunately, we often try to project our own mental models onto situations, whether or not they actually fit. We tend to perceive what we expect to perceive in the world around us, valuing information that is consistent with our views, and rejecting or overlooking information that is inconsistent with our views. And we perceive in a way that is least likely to disturb what we expect to see—least likely to disturb the mindsets buried in our subconscious.[10]

Related to mental models are sets of patterns that we establish throughout our experiences in life. The longer we live, the more experiences we gather and the more we are able to operate autonomously through the use of these patterns. Sometimes when a particular pattern that we expect doesn't present itself—when we spot an anomaly—we are able to act upon that information too. Many times, however, spotting anomalies is difficult, especially if we are not looking for them in advance.

When we view the world around us in terms of patterns, however, we get into trouble when those patterns don't actually exist. This is a description of a "cognitive bias" called the Narrative Fallacy.

We can also fall into a trap of allowing our minds to jump to conclusions—having been deceived by the faulty use of mental models or patterns—and form a conclusion to a particular problem without first considering alternatives, simply because that's what our mental models or overreliance on patterns tells us is the truth. This is an example of what we call Confirmation Bias, which is another of the *Cognitive Biases* (p. 105). In order to preclude Confirmation Bias, we should not seek to confirm anything. Rather, we should seek to *disconfirm*, or disprove an idea, especially if that idea comes in the form of an assumption. An ideal tool that uses the principle of disconfirming evidence is the *Analysis of Competing Hypotheses* (p. 83).

A concept closely related to mental models is frames, which according to Edward Russo and Paul Schoemaker are "mental structures that simplify and guide our understanding of a complex reality."[11] Frames are hard to recognize, and distort what we see. Most of us don't realize that we have various frames and mental models. We often use frames to consider problems or situations, but fail to realize that we should use several frames instead of just one. Rather, we normally use the first frame that occurs to us. Challenging our frames is a necessity, but we can't challenge our frames if we don't realize that they exist. A useful tool in working with frames is the *Frame Audit,* p. 150).

Our values, beliefs and worldview act as filters to skew our perception and interpretation of information, and they motivate our subsequent behavior. Most of our values and beliefs reside in our subconscious; we know we have them, and when forced to think about them we can generally describe what they are. Values and beliefs are both forms of assumptions about how the world works, and our worldview

could be considered as a compilation of these beliefs and values.

Since each of us (even within the same culture) are apt to have subtle differences in our values, beliefs and worldview, it should be easy to understand that each of us is apt to perceive and interpret information differently from each another. Of course, when we work with people from other cultures, the differences are apt to be much more significant. Critical thinking helps us to think about each others' perspectives.

One way to think critically about issues in which our values, beliefs and worldview may have affected us is to adopt the role of a Devil's Advocate. *Devil's Advocacy* (p. 145) is a process which forces us to think through an issue from a completely different perspective, one which we wouldn't normally consider. *Each of us perceive and interpret information differently—for several reasons.* Among these reasons are the physical limitations of our perceptive processes; our inability to reason properly; our inability to differentiate between causation and correlation; and our difficulty in "thinking complexly" about complex problems.

We are limited in terms of what we can physically perceive. Hence, each of us is apt to see different elements of the same information. When we observe something, we often miss many things. According to Dr. Marcus Raichle, a neurologist at Washington University, each of us has ten *billion* bits of information hitting the backs of our retinas every second—of this, only six *million* bits make it to our optic nerve, and 100,000 bits make it to our visual cortex. Yet only *100* bits of information make it to our conscious brain each second. That is a significant physical filtering of information—from 10^{10} power to 10^{2} power. Even if Dr. Raichle's numbers are a bit off, the effect should be readily apparent. We simply do not have the capability to register and think about everything we can perceive. When several of us look at the same thing, we often notice different aspects of it. Why? Our mental models, the patterns we've

experienced, our frames, our values and beliefs, and our worldview. This is why diversity among groups is important: each of us is apt to be able to think about key aspects and perspectives that others in our group are not, and vice versa.

Our vision is a *construction*. The process of observing includes recreating in our minds—constructing—what we believe we are observing. When we observe, our brains take in information, and relate that information to the surrounding context. Given all of the information that is physically filtered out, we are inclined to fill in the gaps by making assumptions in a way that makes sense to us: we assign meaning to what we perceive, because we are generally uncomfortable with a completely abstract picture devoid of meaning. The more abstract a perception, the more our brains will add meaning to it. (If you don't believe that, assemble a group of people and view the most abstract art you can find. Many will perceive and interpret the art piece in demonstrably different ways, in part because of the physical limitations described above, and in part due to the mental models, patterns, frames, and beliefs and worldview described above.) The completed "picture" that we see is not necessarily the reality in front of us; rather, it is the constructed version of that reality that reflects assumption-based conclusions to which our brains have already jumped. Again—this is why diversity of experience is crucial to groups conducting critical thinking.

Often our reasoning is faulty. We reason in one of a couple of ways—deductively or inductively. Deductive reasoning relies upon drawing a conclusion from two or more premises. So long as the premises are facts—the truth—then our conclusion is certain to be true. Deductive reasoning tends to be faulty, however, when one or more of our premises are not in fact true, but rather are unrealized assumptions that we have overlooked. In order to ensure that we deduce properly, it pays to think critically and ask whether each and every premise upon which we base our conclusion is factual information, and not a *presumed* fact—an assumption.

Inductive reasoning is different. When using inductive reasoning, we infer a conclusion that, at best, is probable (vice certain). The probability of the conclusion's truth varies directly with the degree of likelihood that its premises are true. Inductive reasoning occurs in a number of different ways: reasoning from a sample to a larger population; reasoning from a population to a sample; accepting a conclusion based on what people report observing; inferring "why" something happened; and reasoning from one sample to another, or analogizing (*Determining the Suitability of an Analogy*, p. 143). In all cases, the first requirement of a critical thinker is to realize that he is resorting to inductive reasoning, and as such acknowledge that his inferences and conclusions are at best probabilities. Following that, a critical thinker must ascertain the degree of probability to his conclusion in order to avoid surprise.

In thinking critically about either deductive or inductive reasoning, a valuable tool to consider using is the *5 Why's* (p. 77), which helps us by revealing unsound logic in our thinking.

We fail to differentiate between causation and correlation. Distinguishing between cause and correlation is an important function of critical thinking. Most of us are unaware that the two concepts exist, and tend to fall into a trap of connecting two events in a linear cause-and-effect relationship. We often fail to understand that linear chains of cause-and-effect are rarely the reality. Instead, what we perceive as a cause-and-effect relationship is in fact a correlative one. For example, during an insurgency we might infer that heaps of trash in the city are causing increased levels of violence among the insurgents. Based upon that linear cause-and-effect analysis, removing the trash should eliminate the insurgent violence. Closer examination, however, might dispel that hypothesis. Although both appear to happen with some relatively predictable levels, there is most likely a correlation between the two—that removal of the trash might

help reduce the level of insurgent activity, but not completely eliminate it.

A critical thinker asks himself, therefore, the following question: is there a cause-and-effect relationship at work here, or are the two actions I observe in some correlative relationship? If so, what is the nature of that correlative relationship? Once a critical thinker develops that hypothesis, s/he should test and amend it as necessary, based upon feedback. (Note: an even more troubling question a critical thinker should ask is whether s/he is inferring (or imagining) a relationship that doesn't exist at all. This question is related to the Narrative Fallacy, one of the *Cognitive Biases* (p. 105), as well as to a famous Logic Fallacy entitled *The False Cause* (p. 108).

We fail to appreciate the complexity in systems, and instead resort to "linear" cause-and-effect thinking. Life around us is incredibly complex, yet we tend to think in linear cause-and-effect relationships, according to Dietrich Doerner (*The Logic of Failure*) and Peter Senge (*The Fifth Discipline*). Most of us attempt to act upon a simple, single variable which creates unintended, cascading effects. Instead, we should consciously account for the interrelated variables in a particular scenario by creating and testing a hypothesis of what we believe the complex system consists of. We then should assess the feedback of our actions, amending our initial hypothesis until we have confidently figured out the system with which we're working. Several tools help when working with complexity: *Premortem Analysis* (p. 165), *Shifting the Burden* (p. 184), and *S-W-O-T Analysis* (p. 204).

Finally, we need to think critically because a lot of people are constantly trying to trick us. Beyond all of the reasons cited above for why critical thinking is necessary, there is also the fact that many people are simply trying to fool us. Unfortunately, for the most part they succeed—because most of us don't think critically enough, or recognize many of the tricks that these folks use. Examples of these rhetorical tricks such as Appeal to the Masses, Appeal to Fear, Ad

Hominum, False Dichotomy, and the Slippery Slope, are all *Common Logic Fallacies* (p. 107). Critical thinkers are knowledgeable of these common logic fallacies and use logic to deconstruct arguments based upon them.

For all of the reasons cited above, critical thinking is a necessity. One of the most robust tools for thinking critically about written and oral argumentation is the *Argument Deconstruction* (p. 86).

Summary

That is critical thinking. As you can see, it is pretty involved—deliberative, hard work. To do it properly, you have to know a great deal—about how we perceive and interpret information differently from others, how our thinking can be affected by a number of things like mental models and values and beliefs, and how others are constantly trying to fool us. But with some diligence and hard work, critical thinking can become a valuable habit. We need to practice it thoroughly and systematically at all times.

Remember: critical thinking is about what to believe. We *can* believe most anything.

But *must* we?

The ideal critical thinker is habitually inquisitive, well-informed, trustful of reason, open-minded, flexible, fair-minded in evaluation, honest in facing personal biases, prudent in making judgments, willing to reconsider, clear about issues, orderly in complex matters, diligent in seeking relevant information, reasonable in the selection of criteria, focused in inquiry, and persistent in seeking results which are as precise as the subject and circumstances of inquiry permit.[12]

CHAPTER V: Groupthink Mitigation & Decision Support

The penultimate purpose of red teaming and applying critical thinking techniques is to support the organization in reaching good decisions while avoiding the lure of groupthink. This sounds very simple but as Clausewitz reminded us, "Everything in war is very simple, but the simplest thing is difficult."[1] This section covers identifying groupthink and recommendations for groupthink mitigation, how red teaming fits into the Army Design Model, and the Red Team's role in the MDMP process.

Groupthink

Groupthink is one of a number of terms that we use without truly realizing what it is, why it occurs, and how we can mitigate it. Group norms—and the social pressures to conform to them—are in tension with the need for a staff to consider alternatives during decision-making.[2]

Irving Janis has defined groupthink as: "a mode of thinking that people engage in when they are deeply involved in a cohesive in-group, when the members' strivings for unanimity override their motivation to realistically appraise alternative courses of action." And, "Groupthink refers to a deterioration of mental efficiency, reality testing, and moral judgment that results from in-group pressures."

Janis outlined seven defects in decision-making attributed to groupthink. We list them below for reference. During the conduct of the military decision making process watch for the indicators of these defects and apply red teaming methods and techniques to overcome them.

- Discussion limited to merely two or a few alternative courses of action (often only two)
- No survey of objectives to be fulfilled and the values implicated by the choice

- Failure to reexamine the selected COA from the standpoint of non-obvious risk and drawbacks not considered during the original evaluation
- Neglect COAs initially evaluated as unsatisfactory
- Little or no attempt to gain information from experts on other COAs
- Interest only in information that supports the group decision
- Failure to work out contingency plans to cope with foreseeable setbacks

The Army stresses teamwork, shared understanding and *esprit de corps*. These are admirable traits in the profession of arms. Janis points out however, "The more amiability and esprit de corps among the members of a policy making in-group, the greater is the danger that independent critical thinking will be replaced by groupthink, which is likely to result in irrational and dehumanizing actions directed against out-groups." Officers educated in red teaming, whether or not they are acting as a Red Team or simply a member of a plans team, must ensure groupthink does not take hold.

Symptoms of groupthink are:

- Overestimations of the groups power/invulnerability, and morality
- Closed mindedness and the tendency to rationalize away contrary information
- Pressures toward uniformity of thought within the group
- Self-censorship by individuals in the group, inclination to keep quiet
- The emergence of self-appointed mind-guards to protect group from adverse information
- Stereotyped views of enemy leadership and culture

The consequences of groupthink as stated by Janis are; "whenever a policy making group displays most of the symptoms of groupthink, we can expect to find that the group also displays symptoms of defective decision-making." How can a team avoid the consequences of groupthink?

Groupthink Mitigation

To mitigate groupthink in an organization certain techniques have been developed to try to overcome the symptoms identified by Janis. These techniques are targeted at the organizations as a whole, and situations where groups within that organization are in the decision making process. Janis discusses a number of themes at the organizational level that help mitigate groupthink:

- Senior leaders set the tone for the organization by encouraging decision making groups to air objections and doubts during the decision making process, and discourage members from soft-pedaling disagreements.
- Leaders in the organization should not prejudice the decision-making group with his/her favored course of action. The leader should allow the group to explore impartially a wide range of courses of action without the group feeling the pressure to conform to the leader's views.
- The senior leaders should setup multiple groups to examine the same problem. This allows for differing views and solutions for the leader to consider (see *Team A / Team B*, p. 205)
- Senior leaders should bring in outside expertise to challenge the views being developed by the decision-making group.
- The leaders should assign individuals (if not individuals from the Red Team) to act as "devil's advocate" for solutions and COAs the group is developing.

During the actual decision-making process the following actions can be initiated to mitigate groupthink tendencies in a decision-making group:

- One of the keys to mitigating groupthink is to have all members of the group express their opinion absent pressure from the leader or group to conform. Weighted anonymous feedback techniques give the individual the ability to express his or her opinion in an anonymous fashion without being crushed by group pressure. The leader of the group can have the individuals in the group pre-commit their ideas by writing down their initial answers to the problem being discussed before the meeting occurs. This helps establish the individuals' ideas prior to the group's deliberation, and mitigate the pull towards conformity. Another technique, *5 Will Get You 25* (p. 78), will give each individual a voice in the finding the best COA without the group being dominated by the senior leader or one individual.
- To better facilitate discussion within a group there are a number of techniques which help all members of a group communicate better without being dominated by the senior leader or one dominating individual. Techniques like *1-2-4-Whole Group* (p. 73), *5 Whys* (p. 77), *Circle of Voices* (p. 103), and *Troika Consulting* (p. 209) provide forums for everyone in the group to participate in the discussion concerning the problem.
- To better understand a problem the group faces, the group can use a number of techniques. Techniques like *Shifting the Burden* (p. 184), *Stakeholder Mapping* (p. 186), and *TRIZ* (p. 208) help the group elucidate the problem in a more coherent fashion and provide each individual an opportunity to participate in the discussion and become more aware of the nuances of the problem.
- To help generate a wider range of options/COAs for a problem, the group needs to go through a divergence-convergence thought process. Divergence thinking allows

the group to explore multiple solutions to problems without constraints. A divergence technique like *Brainstorming* (p. 89) allows each group member to offer ideas for a solution to a problem without the idea being judged or "shot down" by the senior or dominating individual in the group. Once the group has identified a number of solutions/COAs, they can begin the convergence process of whittling down and refining viable options by using techniques like *6 Words* (p. 79), *Dot Voting* (p. 148), *My 15%* (p. 160), *Troika Consulting (Ad Agency)* (p. 209). All of these techniques help the group collectively come up with the best COA without being dominated by one individual.

The Operational Environment Laboratory (OEL) at Fort Leavenworth invited a Red Team in for a three-day leader program. The OE lab was being restructured and wanted to use red teaming techniques as a means of identifying and addressing organizational priorities. Much as described above, the Red Team facilitators used weighted anonymous feedback and other tools to identify the single most critical problem the leadership had to address in the near term. The OEL leaders then broke into small groups to work through some solutions. Towards the end of the second day the group appeared to have developed a plan to address its single biggest problem. The OEL Director and all of his lieutenants seemed in agreement.

The Red Team facilitator asked everyone to take out a piece of paper and anonymously provide feedback on the action plan to address the problem. Feedback was a simple: Yes, I think we are on the right track; No, this will not work and the reason why is as follows; or this issue does not affect my section I choose to abstain on judging the merits of the solution.

The facilitator asked the director of the lab to predict, based on the discussion, how many would vote in which manner. The director predicted three of his subordinates would choose to abstain and the remaining six would all vote that the plan was a good one. What actually happened is three did in fact abstain; the remaining six, when allowed anonymity, all said the plan was not executable. In one form or another their major objection to the plan was it lacked any forcing function which would require them to participate in providing the data required to implement the plan. They knew how busy they were and they knew without some hammer they would simply not comply with the very solution they designed. The remaining day of the engagement was spent designing the forcing function that would enable the policy.

Military Decision Making Process

"The *military decision making process* (MDMP) is an iterative planning methodology to understand the situation and mission, develop a course of action, and produce an operation plan or order. The MDMP combines the conceptual and detailed aspects of planning and integrates the activities of the commander, staff, subordinate headquarters, and other partners throughout the planning process. The MDMP helps leaders apply thoroughness, clarity, sound judgment, logic, and professional knowledge to understand situations, develop options to solve problems, and reach decisions. The MDMP results in an improved understanding of the situation and a plan or order that guides the force through preparation and execution."[3]

Army Doctrine Publication [ADP] 5-0, *The Operations Process*, and Army Doctrine Reference Publication [ADRP] 5-0, *The Operations Process*, 26 September 2011, serve as the primary references for the Army's planning and operations system. Red Team members must understand this planning process in order to know *how and when to influence the planning process*. Red Teams supports the wide range of operations across the spectrum of conflict and during all phases of an operation – from shaping to post-conflict stability and support operations.

Chapter VI provides Critical MDMP Questions on p. 109.

Mitigating Groupthink during the MDMP

There is a tendency for organizations, during the Design and the MDMP, to follow formalized procedures which can limit individual participation and lead to groupthink. With the groupthink mitigation recommendations in the paragraphs above, a Red Team can help the organization integrate the full potential of the staff and assist the organization in avoiding groupthink. The following are areas where integration of the mitigating techniques can be integrated in the Design and MDMP processes.

- The Design process, in itself, was developed as a collaborative activity; however personalities can force it down the groupthink path. Within an Operational Planning Team (OPT) the Red Team member can help the team leader overcome groupthink by using groupthink mitigating techniques such as *Team A / Team B Analysis* (p. 205), to help the group look at the problem from multiple perspectives. This will help the OPT Leader maximize all individuals in the group and allow more divergent viewpoints to emerge. Techniques such as *4 Ways of Seeing* (p. 76), *Alternative Future Analysis* (p. 80), *Shifting the Burden* (p. 184), *Stakeholder Mapping* (p. 186), and *TRIZ* (p. 208) can help the group elucidate the problem within steps 1-5 of the Design process, and bring greater participation by all members of the planning team. In smaller organizations, where there are no formalized/separate planning teams (Brigade Combat Teams, Battalions), the XO or Deputy Commander can use the techniques outlined above to avoid the closed-mindedness, self-censorship, and pressure to conform within normally extremely cohesive groups during the design process. Further, individuals in smaller organizations could have a tendency to view problems in a more limited fashion, given the possible commonality of the staff's background. The groupthink mitigating techniques will help the XO/Deputy Commander facilitate the staff in looking at the problem in a broader framework during the design process.
- The MDMP process is one of the most formalized and systematic processes that the U.S. Military uses on a habitual basis. Units have a tendency to conduct the MDMP in a systematic, and in some cases, a lock step approach to produce a decision or an order for execution. This formalized approach to decision-making lends itself to many aspects of groupthink, to include limited COAs, using information that only supports the group's COAs and decisions, lack of outside input from SMEs, self-censorship, mind guards, and ethnocentrism towards the

enemy. The groupthink mitigating techniques helps organizations make the MDMP more dynamic by using the full potential of the personnel in the OPT or staff. During steps 1 and 2 of the MDMP the leader of the OPT or staff can use similar mitigating techniques (*4 Ways Of Seeing* p. 76, *Shifting the Burden* p. 184, *Stakeholder Mapping* p. 186) as in the design process to frame and explore all aspects of the problem more fully. During the COA development the OPT/staff can use the divergence-convergence thought process to develop a broader range of COAs. *Brainstorming* (p. 89) is particularly helpful for expanding the group capability to develop multiple COAs. During the COA war-gaming and COA decision mitigating techniques such as *5 Will Get You 25* (p. 78) and *Dot Voting* (p. 148), can help the OPT/staff narrow and refine the COA options. Once the COA is decided upon by the commander, the OPT/staff can continue to improve and refine the selected COA by using *Troika Consulting (Ad Agency)* (p. 209), again giving the group a collective stake in developing the best possible COA for the organization. All the groupthink mitigating techniques outlined above will help organization execute more comprehensive decision-making, while providing for the fuller use of the greater potential of the OPT/staff as a whole.

Red Teaming During Planning

The commander/chief of staff's guidance, available time, and size of the team will influence the tasks to be completed.

- Red Teams should participate at each phase in the planning process—often without overt intervention and largely remaining in the background.
- Red Teams should avoid briefing in staffing meeting or open forums.
- The Red Team's communication skill and finesse will determine their effectiveness in the planning process.

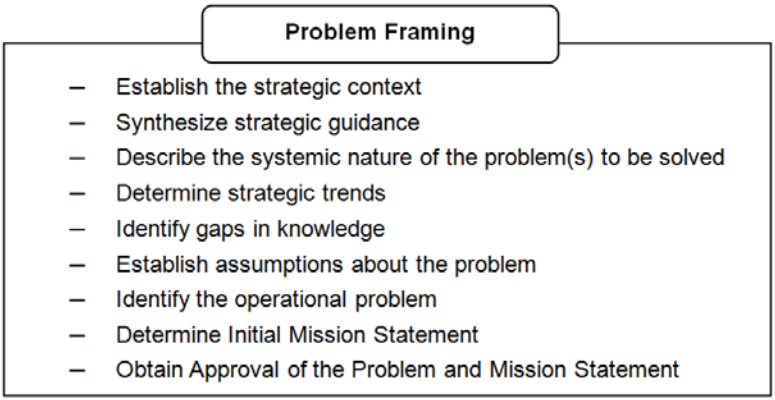
- Identify unseen opportunities, alternatives, gaps and vulnerabilities, and threats to the friendly courses of actions that may generate development of additional branches and sequels not previously considered—determines the Red Team's "value added."
- Timely and tailored Red Team input to the staff and the commander avoids having them move backward in the planning sequence. Early engagement is paramount.
- The echelon, size and expertise of the team, time, and the information available influences the scope of the effort and ability of the Red Team to support the planning process.
- Discuss and consider Red Team inputs at the lowest appropriate level in order to resolve, discount, or incorporate them into the plan.
- Items discounted by the staff but determined as critical to the success of the mission by the Red Team Leader should be elevated–first with the individual staff member, followed by the primary staff member, the Chief of Staff, and ultimately to the Commander (if required).

Red Teaming During Problem Framing

This section contains key ideas and questions to assist Red Teams during problem framing. Below are concepts and several key questions for the Red Team in the design process.[4] Problem framing establishes an initial hypothesis about the character of the friendly, adversarial, and wider environmental factors which define the situation. Problem framing also explores cultural narratives, institutional histories, propensities, and strategic trends in order to postulate a general structure of the factors and their relationships. This hypothesis will be incomplete at first, but will provide a basis from which the commander can visualize the design of his campaign and begin operations to uncover the true nature of the problems. The hypothesis thus defines

the art of the possible, warns what may be unachievable, and anticipates how the situation might evolve.

The art of framing the problem is the art of seeing the essential and relevant among the trivial and irrelevant; penetrating the logic of the broad received mission and its messy contextual situation; and reshaping it into a well-enough structured working hypotheses. It requires commanders to inquire into the nature or character of the factors—friendly, opposing, and the larger environmental—which define the situation into which his command will operate. The figure below refers to the strategic level but the steps are equally applicable to the operational and tactical levels of war.



1. Establish the strategic context. Context establishes the reasons why the problem came to exist, its history, and

how it may develop. Consider and define both the domestic and international context:

- political and/or diplomatic long- and short-term causes of conflict
- domestic influences, including public will, competing demands for resources, and political, economic, legal, and moral constraints
- international interests (reinforcing or conflicting with U.S. interests, including positions of parties neutral to the conflict), international law, positions of inter-governmental organizations, and other competing or distracting international aspects of the situation.

When considering the strategic context, the commander should consider the following questions:

(a) What is the history of the problem? What is its genesis?

(b) Who are the parties interested in the problem

(c) What are the implications of likely outcomes?

(d) What caused the problem to come to the fore?

(e) Why is this emerging problem important to the nation's strategic leaders? Determine how they "see" the problem. For example:

- Are national interests and ideals at stake?
- What are the economic considerations of action?
- Are there treaty obligations that require or block the ability to act?

2. Synthesize strategic guidance: must identify logical boundaries for the problem by establishing its essential relationship to the nation's strategic aims.

- Do the currently tasked strategic aims/objectives vary with previously established policy and objectives? If so, why?

- What policy objectives or statements serve as potential limitations to meeting current strategic guidance?
- Determining the desired strategic ends. What strategic aims define the strategic conditions that constitute success?
- Determining the expected outcomes in terms of time and resources.

3. Describe the systemic nature of the problem. Key components include:
   - Defining the factors, constituents, and relationships, bearing on the problem.
   - Consider the relationships from the points of view of the constituents:
   - Friendly forces, organizations, and entities.
   - Adversaries and those opposed.
   - Neutrals: both with and without interests relative to the problem at hand.
   - Unknowns: those with clear interests and influence but whose intentions are unknown. Consider using *4 Ways Of Seeing* (p. 76) and the *Cultural Perception Framework* (p. 122).
   - Defining the interests and strategies of each constituent, as they understand them, and how they relate—positively and/or negatively—to one another, as well as to those of the U.S. Government.
   - Defining/synthesizing the problem in terms of its constituents' systemic components:
     - How are the constituent parts of the problem related and influenced in terms of capabilities, interests, and intent, from the perspective of culture, politics, social infrastructure, economy, military power, and information?

- What are the power groups and functional components of these systems?
- How do these systems relate to one another? Are there relationships to the constituent's strategic outlook?
- How do these systems sustain themselves?
- Describing the tensions in these relationships and identify opportunities for exploitation, positively or negatively, during the conduct of the campaign.

4. Determine strategic trending. This activity involves describing how the strategic situation might evolve over time. What are the possible "futures" that could unfold based on current understanding? Consider using *Alternative Future Analysis* (p. 80).
5. Identify gaps in knowledge.
6. Establish assumptions about the problem.
7. Identify the operational problem. Based on the tasks above, the commander must identify the critical factors of the problem in order to satisfy strategic aims or objectives. Binding the problem this way requires the commander to distill the essential components from the broad set of factors bearing on the problem to focus the command's efforts to achieve the best effect.
8. Determine initial mission statement.
   - Express the mission in terms of who, what, when, where, and why (purpose).
   - Frame the mission with a clear, concise statement of the essential task(s) and the purpose(s).
9. Obtain approval of the problem and mission statements. The final task in framing the problem requires the commander to obtain approval of the problem statement, the rationale for the development of the problem

statement, and the initial mission statement from his superior.

Conduct mission analysis after you frame the problem and the commander obtained approval of the mission statement. Unlike the traditional mission analysis described in the military decision making process—this mission analysis is just that—an analysis of the mission. This process does not result in a restated mission as the mission has been approved as a result of framing the problem.

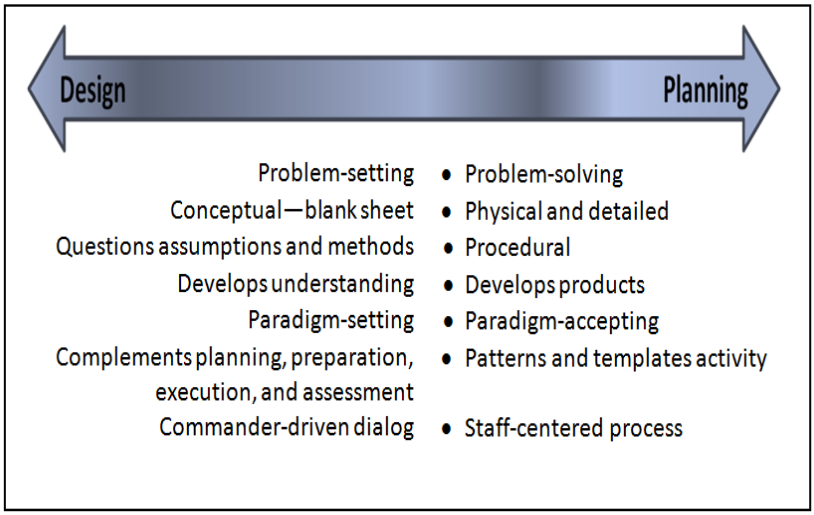
Red Teaming During Operational Design

Design is embedded in Joint and Army doctrine. Army Doctrine Reference Publication, ADRP, 5-0, *The Army in Unified land Operations*, states:

> "The Army design methodology is a methodology for applying critical and creative thinking to understand, visualize, and describe problems and approaches to solving them. The Army design methodology is particularly useful as an aid to conceptual thinking about unfamiliar problems."[5]

When contemplating unfamiliar problems, design aids the commander's visualization of the problem, the initial understanding of the OE, and provides the foundation for the commander's initial intent statement or planning directive.

A key element of design is the collaboration among commanders and their design teams to determine and frame the problem and visualize potential solutions (as illustrated below). A Red Team or the use of red teaming techniques reinforces the effort to frame the correct problem.

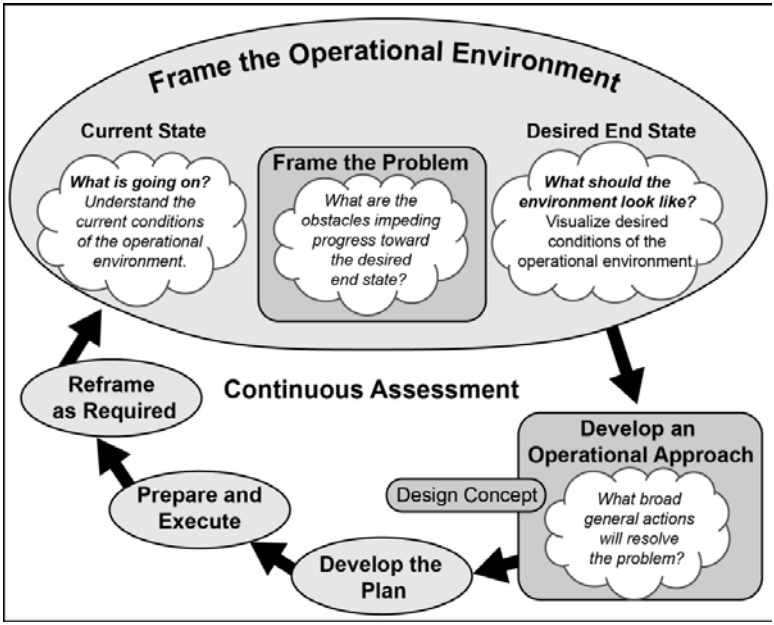


The Red Team's Role

- The Red Team should be represented in the execution of Army Design Methodology (ADM), either as a core

member or by providing critical reviews of the final product of the design.

- Red Teams are an integral part of a critical and creative thinking process about unique situations.
- Red Teams assist the commander and staff to visualize the problem and describe an approach to solve it.
- Red Teams help the design team to capture all perspectives and provide alternative perspectives about the problem.
- Red Teams propose solutions from various perspectives, to include the adversary, partner, and others in the OE.
- Take a breath, step back and to the side, and see what your frame prevents you from seeing.
  Use the divergence-convergence model.



Summary

In the process of decision-making, the group's need to rigorously consider alternatives is at tension with the social pressures to conform to group's norms. Hence, avoiding the lure any 'groupthink' is a penultimate chore in the quest for good decisions. The symptoms of groupthink are observable and groupthink can be mitigated.

To mitigate groupthink, apply the techniques referenced in Chapters V and VI of this handbook, like *Brainstorming*, *Dot Voting*, *My 15%*, and *Troika Consulting (Ad Agency)*. These techniques: eliminate attribution, allow every participants to contribute without the fear of being judged by others, and intercede dynamics [tangential to the process] that might detour the group from its best productivity.

A Red Team or the use of red teaming techniques reinforces the effort to reaching a good decision. The Red Team can have a role in: problem framing, operational design methodology, the MDMP, etc. Moreover, there are rules of thumb for planning sessions.

CHAPTER VI: Red Teaming TTP

(Tactics, Techniques and Procedures)

1-2-4-Whole Group

This process is a good way to get a rich conversation and more ideas by using small groups. It involves the principle of pre-commitment, critical thinking, and the clear expression of thought.

Method

One: Individual reflection and pre-commitment. Give participants a short amount of time to reflect on a question or issue. You may use a common issue or have each person choose their own issue. Have them write down their thought or position on the issue. To write is to think again. By writing the participants are pre-committing to their ideas without external influence. Encourage the participants to use the framework of State, Elaborate, Exemplify, and if possible, Illustrate (SEEI). For example, "Here's what I think, here is what I mean by that, let me give an example, and here is a graphic illustration (or analogy)." If you can complete all these steps, you have thought through a problem completely.

Twos: Have the participants find another person and share their ideas. Record any new thoughts or insights.

Small Groups: Invite each of the pairs to join up with another pair to briefly share their issues and any insights gained. Then share observations of the quality of each pair's examination of their issues. How were the issues framed? What was missing from the explanation? Were there biases detected?

Whole Group: Invite everyone back into the whole group. Ask an open question like "What insights emerged from your conversations? What did you learn? How has your understanding/view of the issue changed?" Lastly, ask "What's your 15% of the problem?"

Example

“Most people have about 15-percent control over their work situations. The other 85 percent rests in the broader context, shaped by the general structures, systems, events and culture in which they operate. The challenge rests in finding ways of creating transformational change incrementally: By encouraging people to mobilize small but significant "15-percent initiatives" that can snowball in their effects. When guided by a sense of shared vision, the process can tap into the self-organizing capacities of everyone involved.”

- Gareth Morgan, The Globe and Mail[1]

It doesn’t matter if you’re a General or an enlisted soldier, a senior executive or a member of the team. You still have only your 15 percent. Where do you have freedom to act? What’s in your 15%?

This conversation works very well using the Troika process. Grow from small groups (1 on 1) into larger groups and exchange group representatives. This is a great way to get into a rich conversation with small groups. The steps are:

1. Prepare: Position an issue or problem into one straightforward question.
2. Reflect individually: Give participants two minutes of silence to reflect on the question. They may close their eyes, jot a few notes, etc.
3. Share in pairs: Ask participants to stand, find a partner, and share both ideas in 10 minutes. They may pick the nearest person or move around to mix.
4. Gab in groups: Ask each pair to partner with other pairs in groups of 4-6 for 10 minutes. Suggest that they begin with each sharing items of interest from the previous round and then move to converse as a group.
5. Harvest in whole: Ask everyone back to a ‘whole group’ for 10 minutes. Open with, “What insights emerged from your conversation?” or “How has your understanding/ view of the issue changed?”

1 on 1, 2 on 2, Exchange Emissaries

In this method members of the team are asked to think about ways to address the problem before the group.

1. They first spend time thinking and writing down their ideas.
2. Next, the members form into pairs and exchange ideas. Two groups of two each form a group of four and exchange the ideas each group developed both individually and as a group of two.
3. Each group of four selects a spokesperson for the group. After each group has had sufficient time to explore their options to address the problem, they send their spokesperson to another group of four that addressed the same problem and in turn welcome the spokesperson from the other group to their group.
4. Each spokesperson (emissary) provides the group they have joined a description of the ideas developed by the group they are representing. After they are finished, the group they have joined tries to add to or improve the ideas brought to them by the emissary. After this exchange, the emissary returns to his/her group.
5. Upon return, the emissary shares the feedback from the group visited. In turn, the emissary's group informs him/her of their exchange with the other group's emissary.
6. This concludes with a group out brief of the issue.

4 Ways of Seeing

Examining the situation using the Four Ways of Seeing may show the challenges you face:

1. How you view yourself, your unit, the mission, etc.
2. How the adversary (or indigenous people) views himself; his cause, unit mission, etc.
3. How you view the adversary (or indigenous people)
4. How the adversary (or people) views you
5. Identify disconnects between steps 1 & 4, 2 & 3. These are critical points that analysis and planning must address

Thorough research should be conducted to complete the analysis of these perceptions. It is more complex than the simple model implies, for several reasons:

How X Sees Itself	***How X Sees Y***
How Y Sees Itself	***How Y Sees X***

- Seldom, if ever, will there be only two actors in the system under study.
- All the actors' perceptions and inter-relationships within the system must be considered in order to provide context for the analysis.
- How each actor perceives and defines the OE, legitimate targets and acceptable weapons must also be considered.
- It must be realized that all actors hold values, beliefs, and perceptions that they view as right and rational.
- Perceptions of the external audience(s) to whom we and our adversaries are playing cannot be discounted.

5 Whys

The 5 Whys is a question-asking technique used to explore the cause-and-effect relationships underlying a particular problem. The technique is used to determine the root cause of a defect or problem symptom. However, the process can be used to go deeper to explore questions related to purpose rather than problems.

Method: Pick an issue or pose a question and ask participants to think about it for at least a minute. Pair up or form a small group and choose one person to state their thoughts on the issue. Each participant gets a turn in this role of explaining their thoughts and position on an issue of their choice.

The role of the others in the group is at first to be active listeners. Let the speaker complete their thoughts; do not interrupt for clarification or any other purpose. Once the speaker is done, ask “why?” at least five times, e.g., “Why is that important? Why should my staff section care about that? Why should resources be applied against that effort now?”

You don’t need to stop at 5 whys, several “what” and “who” questions should arise as a result, like “what should do we do now? What are the implications of what is suggested? Who else needs to know?”

It is important to begin with “why” questions. The answers to “why” questions get at causal links behind events and problem symptoms. “What” questions tend toward simple data collection, and are subject to confirmation biases.

5 Will Get You 25

This is a method to tap into the wisdom of the crowd. This is not recommended to make a decision. It is a way to get feedback you might not otherwise get from your staff. *5 Will Get You 25* and *Dot Voting* are two methods of weighted anonymous feedback.

Method

Distribute file cards to everyone. Pose a question: (i.e., *What is the single greatest obstacle to implementation of plan/concept/policy X?*)

Ask the participants to think about it and write their best idea as clearly and in as few words as possible on the card –- a bullet, not an explanation.

When everyone has completed their card, invite the participants to stand up, mill around, and pass the card to someone new. Repeat the process until told to stop, and then each participant reads the card they hold. On the back, rate the idea from 1 to 5; 5 is brilliant, 1, not so much.

Once you grade the card, repeat the process. No one should grade their own card. Emphasize the participants must read the reply without turning the card over and viewing previous scores so they are not influenced.

Repeat the process five times, in five rounds. By round five, each card should have five ratings on the back of the card. Add them up.

Ask “Does anyone have a card with a score of 25…24…23…until you get a “yes.” Ask that person to read the card aloud and record the reply on a piece of butcher paper. Continue with the countdown until you get at least the top five replies.

6 Empathetic Questions

Questions [and difficulty] when looking empathetically from another's perspective:

1. It is difficult to appreciate another's problems.
   What are the "other's" problems?
2. It is difficult to feel another's pain.
   What is the nature of the "other's" pain?
3. It is difficult to understand another's ambitions.
   What are the "other's" ambitions?
4. It is difficult to internalize another's experience.
   What is the "other's" experience?
5. It is difficult to understand how our own actions appear to others.
   How do our own actions appear to "others?"
6. It is difficult to feel how threatened another may feel.
   Why does the other feel threatened?[2]

6 Words

Help people get to the core of an idea by writing a short phrase summarizing their thinking into a set number of words.

This idea is based on a complete short story written by Hemingway "For sale, baby shoes – never worn."

These 6 words communicate a huge degree of information and emotional content. This is an exercise in creating pithy bumper stickers that communicate in a visceral way and are memorable.

Alternative Futures Analysis

Systematically explores multiple ways a situation can develop when there is high complexity and uncertainty.

When to Use

This approach is most useful when a situation is viewed as too complex or the outcomes as too uncertain to trust a single outcome assessment. First, the Red Team must recognize that there is high uncertainty surrounding the topic in question. Second, they, and often their customers, recognize that they need to consider a wide range of factors that might bear on the question. And third, they are prepared to explore a range of outcomes and are not wedded to any preconceived result. Depending on how elaborate the futures project, the effort can amount to considerable investment in time, analytic resources, and money.

A team can spend several hours or days organizing, brainstorming, and developing multiple futures; alternatively, a larger-scale effort can require preparing a multi-day workshop that brings together participants (including outside experts). Such an undertaking often demands the special skills of trained scenario-development facilitators and conferencing facilities.

This technique is a sharp contrast to contrarian techniques, which try to challenge the high confidence and relative certitude about an event or trend. Instead, multiple futures development is a divergent thinking technique that tries to use the complexity and uncertainty of a situation to describe multiple outcomes or futures that should be considered, rather than to predict one outcome.

Value Added

This approach is useful in highly ambiguous situations, when analysts confront not only a lot of “known unknowns” but also “unknown unknowns.” What this means is that the Red Team recognizes that there are factors, forces, and dynamics among key actors that are difficult to identify

without the use of some structured technique that can model how they would interact or behave. Given the time and resources involved, scenario analysis is best reserved for situations that could potentially pose grave threats or otherwise have significant consequences.

Past experience has shown that involving policymakers in the alternative futures exercise is the most effective way to communicate the results of this exploration of alternative outcomes and sensitize them to key uncertainties. Most participants find the process of developing such scenarios as useful as any finished product that attempts to capture the results of the exercise. Policymakers and Red Teams can benefit from this technique in several ways:

- It provides an effective means of weighing multiple unknown or unknowable factors and presenting a set of plausible outcomes.
- It can help to bind a problem by identifying plausible combinations of uncertain factors.
- It provides a broader analytic framework for calculating the costs, risks, and opportunities presented to policymakers by different outcomes.
- It helps anticipate otherwise surprising developments by challenging assumptions and considering possible *wild cards* or discontinuous events.
- It generates indicators to monitor for signs that a particular future is becoming more or less likely, so that policies can be reassessed.

The Method

The most common method used in both the public and private sectors involves the following steps:

- Develop the “focal issue” by systematically interviewing experts and officials who are examining the general topic.

- Convene a group of experts (both internal and external) to brainstorm about the forces and factors that could affect the focal issue.
- Select by consensus the two most critical and uncertain forces and convert these into axes or continua with the most relevant endpoints assigned.
- Establish the most relevant endpoints for each factor; (e.g., if economic growth were the most critical, uncertain force, the endpoints could be “fast” and “slow” or “transformative” and “stabilizing” depending on the type of issue addressed.)
- Form a futures matrix by crossing the two chosen axes. The four resulting quadrants provide the basis for characterizing alternative future worlds.
- Generate colorful stories that describe these futures and how they could plausibly come about. Signposts or indicators can then be developed.

Participants can then consider how current decisions or strategies would fare in each of the four worlds and identify alternative policies that might work better either across all the futures or in specific ones. By anticipating alternative outcomes, policymakers have a better chance of either devising strategies flexible enough to accommodate multiple outcomes or of being prepared and agile in the face of change.

Analysis of Competing Hypotheses (ACH)

Identification of alternative explanations (hypotheses) and evaluation of all evidence that will disconfirm rather than confirm hypotheses.

When to Use

This is an effective technique when there is a large amount of data to absorb and evaluate. While a single analyst can use ACH, it is most effective with a small team that can challenge each other's evaluation of the evidence. Developing a matrix of hypotheses and loading already collected information into the matrix can be accomplished in a day or less. If the data must be reassembled, the initial phases of the ACH process may require additional time.

ACH is particularly appropriate for controversial issues when analysts want to develop a clear record that shows what theories they have considered and how they arrived at their judgments. Developing the ACH matrix allows other analysts (or even policymakers) to review their analysis and identify areas of agreement and disagreement. Evidence can also be examined more systematically, and analysts have found that this makes the technique ideal for considering the possibility of deception and denial.

Value Added

ACH helps analysts overcome three common mistakes that can lead to inaccurate forecasts:

- Red Teams can be susceptible to being unduly influenced by a first impression, based on incomplete data, an existing analytic line, or a single explanation that seems to fit well enough.
- Groups seldom generate a full set of explanations or hypotheses at the outset of a project.
- Groups often rely on evidence to support their preferred hypothesis, but which also is consistent with other explanations.

In essence, ACH helps Red Teams to avoid picking the first solution that seems satisfactory instead of going through all the possibilities to arrive at the very best solution.

The Method

Explicitly identify all the reasonable alternative hypotheses, then array the evidence against each hypothesis—rather than evaluating the plausibility of each hypothesis one at a time. To create a level playing field, the process must:

- Ensure that all the information and argumentation is evaluated and given equal treatment or weight when considering each hypothesis.
- Prevent individuals from premature closure on a particular explanation or hypothesis.
- Protect the individual against innate tendencies to ignore or discount
- Protect information that does not fit comfortably with the preferred explanation at the time.

To accomplish this, the process should follow these steps:

- Brainstorm among analysts with different perspectives to identify all possible hypotheses.
- List all significant evidence and arguments relevant to all the hypotheses.
- Prepare a matrix with hypotheses across the top and each piece of evidence on the side. Determine whether each piece of evidence is consistent, inconsistent, or not applicable to each hypothesis.
- Refine the matrix and reconsider the hypotheses—in some cases, individuals will need to add new hypotheses and re-examine the information available.
- Focus on disproving hypotheses rather than proving one. Tally the pieces of evidence that are

inconsistent and consistent with each hypothesis to see which explanations are the weakest and strongest.

- Analyze how sensitive the ACH results are to a few critical items of evidence; should those pieces prove to be wrong, misleading, or subject to deception, how would it impact an explanation's validity?
- Ask what evidence is not being seen but would be expected for a given hypothesis to be true. Is denial and deception a possibility?
- Report all the conclusions, including the weaker hypotheses that should still be monitored as new information becomes available.
- Establish the relative likelihood for the hypotheses and report all the conclusions, including the weaker hypotheses that should still be monitored as new information becomes available.
- Identify and monitor indicators that would be both consistent and inconsistent with the full set of hypotheses. In the latter case, explore what could account for inconsistent data.

Argument Deconstruction

When to use

Use the argument deconstruction framework when posed with an oral or written argument that requires critical thinking.

Value added

Deconstructing arguments without a framework can lead to insufficient challenging of opinions, value conflicts, statistics, alternative causes and conclusions, and the implications of accepting the argument posed. Critical thinking emphasizes the need to be thorough and systematic, which the argument deconstruction framework facilitates.

The Method

- What is the argument?
  - Argument =
    Issue (or premise, or thesis) + Reasons + Conclusion
  - Premise: a proposition supporting or helping to support a conclusion; a proposition antecedently supposed or proved; something previously stated or assumed as the basis of further argument; a condition; a supposition.
  - Thesis: a proposition stated or put forward for consideration, esp. one to be discussed and proved or to be maintained against objections; an affirmation, or distinction from a supposition or hypothesis
    - ✓ Is the right problem defined?
    - ✓ Is there any use of vague or ambiguous words?
    - ✓ What is the author's point of view?
- Are there any value conflicts?
- Are there any *prescriptive* assumptions? (Statement by author of the way things *should* be, is it a good assumption?)

- Are there any *descriptive* assumptions? (Statement by author of the way things *are*—is it a good assumption?)
- Are there any fallacies in reasoning?
- Does the author use any heuristics (a simplifying strategy, or "rule of thumb") to lay out his information/make his case? (The devil is in the details…)
- How good is the evidence? Does the author use or rely on
    - ✓ Intuition?
    - ✓ Personal experience?
    - ✓ Testimonials?
    - ✓ Appeal to authorities?
    - ✓ Personal observation?
    - ✓ Research studies?
    - ✓ Analogies? (Is the analogy apt?)
- Is there a rival cause? Are there other plausible hypotheses (than the author suggested) which might explain what happened? What are they? Some other way to explain the evidence (reasons) and conclusion?
- Are statistics used?
    - o Are they deceptive?
    - o Use numbers without percentages?
    - o Use percentages without numbers?
- Is there any significant information which is omitted? (Where is the dog that *isn't* barking?)
- Is there any other reasonable conclusion you can draw from the evidence?
- What are the implications of *accepting* the argument?

BATNA

“What is your BATNA – your Best Alternative To a Negotiated Agreement? That is the standard by which any proposed agreement should be measured. That is the only standard that can protect you both from accepting terms that are too unfavorable and from rejecting terms it would be in your best interest to accept.

Your BATNA not only is a better measure but also has the advantage of being flexible enough to permit the explorations of imaginative solutions. Instead of ruling out any solution that does not meet your bottom line, you can compare a proposal with your BATNA to see whether it satisfies your interests.[3]

Develop your BATNA. Vigorous exploration of what you will do if you do not reach agreement can greatly strengthen your hand. Attractive alternatives are not just sitting there waiting for you; you usually have to develop them. Generating possible BATNAs requires three distinct operations: (1) inventing a list of actions you might conceivably take if no agreement is reached; (2) improving some of the more promising ideas and converting them into practical alternatives; and (3) selecting, tentatively, the one alternative that seems best.[4]

Consider the other side’s BATNA. You should also think about the alternatives to a negotiated agreement available to the other side. The more you can learn of their alternatives, the better prepared you are for the negotiation. Knowing their alternatives, you can realistically estimate what you can expect from the negotiation.

Having a good BATNA can help you negotiate on the merits. You can convert such resources as you have into effective negotiating power by developing and improving your BATNA. Apply knowledge, time, money, people, connections, and wits into devising the best solution for you independent of the other side’s assent. The more easily and

happily you can walk away from a negotiation, the greater your capacity to affect its outcome.[5]

Developing your BATNA thus not only enables you to determine what is a minimally acceptable agreement, it will probably raise that minimum. Developing your BATNA is perhaps the most effective course of action you can take in dealing with a seemingly more powerful negotiator."[6]

Brainstorming

Brainstorming is an unconstrained group process designed to generate new ideas and concepts.

When to Use

A technique for stimulating new thinking and it can be applied to virtually all of the other structured analytic techniques as an aid to thinking. Typically, Red Teams will brainstorm when they begin a project to help generate a range of hypotheses about their issue.

Brainstorming, almost by definition, involves a group meeting to discuss a common challenge; a modest investment of time at the beginning or critical points of a project can take advantage of their different perspectives to help structure a problem. This group process allows others to build on an initial idea suggested by a member of the brainstorming session.

Value Added

This technique can maximize creativity in the thinking process, force Red teams to step outside their normal mind-sets, and suspend their typical "good judgment" about the practicality of ideas or approaches. More generally, brainstorming allows organizations to see a wider range of factors that might bear on the topic than they would otherwise consider. Brainstorming gives permission to think more radically or "outside the box."

In particular, it can spark new ideas, ensure a comprehensive look at a problem or issues, raise unknowns, and prevent premature consensus around a single hypothesis.

The Method

Paradoxically, brainstorming should be a very structured process to be most productive. An unconstrained, informal discussion might produce some interesting ideas, but usually a more systematic process is the most effective way to break down mind-sets and produce new insights. In particular, the process involves a divergent thinking phase to generate and collect new ideas and insights, followed by a convergent phase in which ideas are grouped and organized around key concepts. Some of the simple rules to be followed include:

- Never censor an idea no matter how unconventional they might sound.
- Rather find out what prompted the thought, as it might contain the seeds of an important connection between the topic and an unstated assumption.
- Give yourself enough time to do brainstorming correctly. It usually takes one hour to set the “rules” of the game, get the group comfortable, and exhaust the conventional wisdom on the topic. Only then will the truly creative ideas begin to emerge.
- Involve at least one “outsider” in the process—that is, someone who does not share the same educational background, culture, technical knowledge or mindset as the core group but has some familiarity with the topic.

A two-phase, twelve-step, structured process is often used to get the most out of the brainstorming sessions

Divergent Thinking Phase:

- Typically, 10-12 people work best.
- Pose the problem in terms of a "focal question." Display it in one sentence on a large easel or whiteboard.
- Ask the group to write down responses (as many as they can think of) to the question.
- Go sequentially around the room, with each individual giving one idea at a time. Write down the ideas up on the whiteboard. No judgments concerning the ideas are voiced at this time. Continue going around the room until each individual's ideas are exhausted.
- The individuals conducting the brainstorming exercise then will group similar ideas together, forming similar ideas into categories.

Convergent Thinking Phase:

- The individuals conducting the brainstorming exercise then will group similar ideas together, forming similar ideas into categories
- The group can then check/discuss each idea for feasibility as a solution to the problem.
- Assess what the group has accomplished in terms of new ideas or concepts identified or new areas that need more work or further brainstorming.
- The brainstorming group can then use other techniques, such as Dot-voting, to further narrow the field of ideas.

Challenges to Effective Planning

1. Background: Working in groups, especially in the planning process, is fraught with challenges. From an individual perspective, intuitive reasoning often fails under conditions of uncertainty, time pressures and cognitive bias. From an organizational perspective, group structure and conformity can also lead to suboptimal judgments and decision making. This section describes some of the variables and common challenges found in the planning process and what can be done to prevent, mitigate them and improve planning performance.

    a. In addition to exploring alternatives in plans, operations and concepts, Red Teams help commanders and staffs identify and understand flawed organizational processes that contribute to potential errors in planning and decision making.

    b. From an organizational perspective, Red Teams not only provide mitigation and prevention tools but also contribute to improved performance through the use of liberating structures and structured analytical tools. These tools and methods are group combat multipliers that should augment conventional methods such as staff planning meetings and presentations.

2. Factors affecting the planning process: A number of factors can contribute to planning errors, poor decisions and outcomes to include:

    a. Group cohesion and the pull toward conformity: A cohesive staff is a force multiplier but cohesion can exert pressure for group conformity which can lead to the phenomena of groupthink (see Introduction). Excessive conformity stifles professional dissent because hierarchy and relationships are more valued than critical analysis and decision outcomes. If group activity is structured to mitigate hierarchy and conformity, then members are likely to provide feedback and insights that expose invalid

assumptions, ill-conceived plans or flawed courses of action. Red Teamers are trained to interact with the staff to enable structured discussion that balances cohesion with groupthink mitigation. Simultaneously, Red Teams must support the dynamics of staff interaction and avoid 'paralysis by analysis.'

b. Strong directive leadership: Strong leaders under time pressure may direct a course of action thereby limiting options for staff consideration. Doctrine cautions leaders to avoid directing a course of action early in planning process that prevents the staff in identifying other appropriate alternative courses of action.

c. Cognitive biases and heuristics: Research conducted over the past three decades indicate that people are prone to systemic errors in judgment and decision making in predictable ways.[7] These errors are associated with heuristics and biases of our cognitive processes in the context of judgment and decision making. Cognitive biases result in suboptimal actions and beliefs and are generally related with intuitive thinking.[8] Manifestations of these biases in intuitive thinking, are found in heuristics formally defined as, "…a simple procedure that helps find adequate, though often imperfect answers to difficult questions."[9] In high risk, uncertain and complex environments, these imperfections are costly and warrant prevention and mitigation.

d. Relationship and task conflict: Conflict between group members is bound to occur due to difference in leadership styles, personalities, interests and personal agendas. However, not all conflict is bad. Research indicates that "moderate amounts of task conflict (i.e. differences of opinion about the task and how it should be completed) are necessary and valuable for group decision making processes in preventing groupthink. However, relationship conflict in which personal

differences are attacked can distract the group from its purpose and objectives.[10] (see Chapter II)

e. Time constraints and lack of preparation: No matter how cohesive the group, inadequate planning time, inexperience in the operational environment, lead to poor situational understanding and development of flawed plans. Poor preparation and organization for planning further encumber the commander and staff in producing useful and timely plans and orders.

f. Organization for planning: Factors such as a poorly designed physical space and a lack (or excess) of planning standing operating procedures can stifle productive discussion, increase staff friction and hamper effective staff coordination. Poor Information management (e.g., inaccurate or incomplete displays of visualization and dissemination of information) can contribute to a lack of shared situational understanding and degrade staff interactivity.

3. Planning challenges: Many of the variables above manifest themselves in dysfunctional group behaviors that lead to poor planning and decision making outcomes. Red Teams assist the commander and staff in identifying and mitigating these challenges. If left undetected dysfunctional group behaviors may result in bad decisions, lost opportunities, and increased vulnerabilities for the unit. These challenges include:

   a. Complacency: In planning, this often takes the disguise of “we’ve always done it this way” mentality. In a complex environment, the dilemma is to adapt based on prior experience of what works in one situation to another situation. The challenge is understand when continuity and change are decisive and when to discard principles, tactics and strategies that governed past success. As Major Tim Karcher notes in *Understanding the Victory Disease*, the attitude among some staffs could be:

(1) "Why change what has worked in the past?" The greatest danger when using established patterns lies in the enemy's reaction. Setting a pattern is fine as long as the enemy follows with his own patterns and reacts in a predictable fashion. A considerable danger occurs, though, when the enemy deviates from his normal reaction, placing the friendly force at a significant disadvantage and causing the supposed recipe for success to turn into a recipe for failure." [11]

(2) Situations in the OE often change after completion of deliberate planning (e.g., MDMP) but the unit continues executing its' original plan. This behavior is often characterized as "fighting the plan and not the enemy." The staff may adhere to inadequate plans and orders due to the investment in time, pride in ownership, and time. New evidence disconfirming assumptions and tactics may emerge in the interim where new strategies and tactics provide more appropriate solutions to the mission. Red Teams should assist commanders, staff and planning teams in questioning strategies, tactics and plans that claim to be the only solution to a problem when the situation indicates otherwise.

(3) The Red Team's challenge is to help the staff think about "what's next" or "what could potentially occur" – balancing realism with imagination. Red Team tools designed to mitigate complacency are *Alternative Futures Analysis* (p. 80), *Analysis of Competing Hypotheses* (p. 83), and *Shifting the Burden* (p. 184).

b. Mirror Imaging: Richards J. Heuer, who spent 45 years in the CIA working in collection operations, counterintelligence, intelligence analysis, and personnel security, views mirror imaging as "…filling gaps in the analyst's own knowledge by assuming that

the other side is likely to act in a certain way because that is how [your country or organization] would act under similar circumstances."[12] Mirror imaging occurs when you apply your attitudes about trends, capabilities, beliefs, culture onto another. Many American policy makers and analysts fell into this trap during the planning for Operation Iraqi Freedom (OIF). As noted in the report on the miscalculation of Iraqi WMD capabilities, it noted:

(1) "Analysis of Iraq's weapons programs took little account of Iraq's political and social context. While such a consideration would probably not have changed the Community's judgments about Iraq's WMD, the failure even to consider whether Saddam Hussein had elected to abandon his banned weapons programs precluded that possibility.

(2) It seems unlikely to us that weapons experts used to combing reports for tidbits on technical programs would ever have asked: "Is Saddam bluffing?" or "Could he have decided to suspend his weapons programs until sanctions are lifted?" But an analyst steeped in Iraq's politics and culture at least might have asked those questions, and, of course, those turn out to be the questions that could have led the Intelligence Community closer to the truth."

(3) The culture and objectives of others nations and other transnational groups differ from ours. Our assumptions, assessments, and estimates of adversary courses of action need to account for these differences.

(4) While working to avoid mirror imaging American intentions, motivations, thought processes, and capabilities to the enemy. It is just as important

not to apply mirror imaging to partners and others within the operational environment.

(5) Using *4 Ways of Seeing* (p. 76) and *Stakeholder Mapping* (p. 186) are ways to mitigate and prevent mirror imaging.

c. Ethnocentrism: Unlike mirror imaging, this error recognizes the existence of adversary and partner cultural differences but perceives these differences with contempt, disdain and in many cases out of context. Ethnocentrism is "…using the practices of your own 'people' as a yardstick to measure how well the customs of other, different peoples measure up."[13] A common tendency of most individuals is to view one's culture and customs as inherently superior to others. This can lead to a condescending attitude toward other cultures that breeds arrogance. Contempt and arrogance contribute to overconfidence by underestimating the capabilities and motivations of others. One historical example:

(1) "At the tactical level, the 7th Cavalry displayed remarkable overconfidence, clearly demonstrated by how Custer viewed his Indian adversary. During the 1868 Battle of the Washita, when a subordinate speculated they might find more Indians than they could handle, Custer reportedly said, "There are not enough Indians in the country to whip the Seventh Cavalry."[14] Custer's conceit seems to have trickled down to his subordinates, causing them to also believe in their indestructibility."[15]

(2) The challenge for the commander and staff is to understand the culture of the adversary, as well as our partners and others. Then staffs must apply this understanding to the assumptions made and the assessments created.

(3) See Chapter III for a discussion of interpreting, understanding and analyzing cultures and mitigating the effects of ethnocentrism.

d. Mindsets / Patterns of Expectation: Perception is not a passive process that allows us to objectively view the world 'as it is'. Richards J. Heuer notes that, "…experiments have been conducted to show the extraordinary extent to which the information obtained by an observer depends upon the observer's own assumptions and preconceptions." The human brain is designed to 'fill in the blanks' based upon our individual, cultural and social experience. Heuer states, "We tend to perceive what we expect to perceive." In other words, our mission; organizational climate; culture; self-interest; assumptions; prejudices; doctrine; and attitudes influence our thinking. A mindset is a "summation or consolidation of all of our biases about a particular subject."[16]

(1) As individuals receive new information and data, they perceive them in existing images governed by these factors. Continually asking, "What does this mean?" and, "How else can I perceive it?" can offer critical insights.

(2) The challenge is to understand when changes in the operational environment negate the usefulness of past patterns and trends for projecting future developments. Military history contains numerous examples of countries refuting past trends to field new dominating technology or concepts (e.g., development of carrier aviation and the concept of Blitzkrieg to defeat French stationary defenses).

(3) David C. Gompert and Richard L. Kugler note a classic case study of this failure to perceive change. They analyzed Lee's decision to order (on July 3, 1863, the 3rd day of the Battle of

Gettysburg), a frontal assault across a mile of open field against the strong center of the defending Union forces. The authors argue that Lee depended too much on his experience from previous battles such as at Chancellorsville. That when pressed, Union forces would collapse. Lee ignored the fact that the Union forces learned lessons from these battles. Lee underestimated their training and commanders. He ignored the latest information that a significant Union force was entrenched with significant reserves available.

(4) Another challenge of 'patterns of expectation' is when planners believe that "the future will be a linear continuation of the present."[17] This 'planning pitfall' is likely when planners believe their plan can dictate the future. A method for combating this tendency is to use the Premortem technique (p. 165)

e. Oversimplifying or Failure to Think and Decide 'Complexly': In problem solving simulations, cognitive researcher and author, Dietrich Doerner observed that "People court failure in predictable ways" based upon habits of thought that "set failure in motion from the beginning" [18] and an inability to think and decide more 'complexly.' Doerner contends that

- Failure develops gradually according to its own logic.
- When we fail to solve a problem, it is often due to several small mistakes. Small mistakes add up.
- Complicated situations elicit habits of thought that may not measure up to the demands of the system that is generating the problem.
- Apprehensions of failure encourage methods of decision making that may exacerbate the problem

(1) Doerner observed that 'bad' participants:

(a) Acted without prior analysis of the situation.

(b) Failed to anticipate side effects and long term repercussions.
(c) Assumed that the absence of immediately obvious negative effects meant that correct measures had been taken.
(d) Let over involvement in *projects* blind them to emerging needs and changes in the situation.
(e) Were prone to cynical reactions

(2) Good participants:

(a) Made more decisions per task and goal.
(b) Considered of not just the primary goal of any given measure but also its potential effects on other sectors of the system.
(c) Acted more 'complexly' – their decisions took different aspects of the entire system into account, not just one aspect.
(d) Recognized early where [the situation's] real problems lay and attacked them first.
(e) Tested their hypotheses - asked more 'why' than 'what' questions.
(f) Dug deeper in their analysis.
(g) Were interested in causal links behind events and the causal network.
(h) Did not lapse into 'ad hoc-ism.'
(i) Focused on right fields of endeavor and continued to focus on those fields over time.
(j) Were self-critical/ reflective and structured in thinking.

(3) The challenge for any staff is accounting for the myriad variables in a complex problem without oversimplifying the situation. This is even more difficult when planning under time constraints and when a staff lacks organization and integration, (e.g., staff elements and planning teams that "working in their own functional perspective and lanes").

(4) Red Teams can help staffs think more ‘complexly’ by employing Red teaming tools such as *1-2-4-Whole Group* (p. 73), *Shifting the Burden* (p. 184), and *Troika Consulting* (p. 209). Specifically, *Shifting the Burden* fosters close examination of underlying problem(s) and perspective(s) rather than dealing with symptoms manifesting themselves throughout a system.

f. Flawed (historical) or False Analogies: Webster defines analogy as “a form of logical inference, or an instance of it, based on the assumption that if two things are known to be alike in some respects, then they must be alike in other respects.” As one author noted, “When confronted with a novel challenge, the human mind reasons by analogy. We then become prone to reading the world in ways that reaffirm the choice we have made.”[19]

(1) When used successfully, analogies help make sense of a new situation, reduce complexity, and aid in the dialogue with others. However, analogies should be used with caution. Secretary of Defense Robert Gates, quoted American historian Gordon Wood that, “History does not teach lots of little lessons. Insofar as it teaches any lessons, it teaches one big one: that nothing ever works out quite the way its managers intended or expected.”[20]

(2) Decision makers often use history and historical analogies. In Richard Neustadt and Ernest R. May‘s, *Thinking in Time: The Uses of History for Decision Maker*, the authors highlight the challenge and potential errors of using history and historical analogy in decision making without understanding the details and context of events and the differences between the current and past situations (Determining the suitability of an Analogy, p143).

g. Hubris and Overconfidence. Flawed planning takes place when staffs are overconfident in their ability to predict the future, anticipating the actions of adversaries or the consequence of the effects of operations and tactical actions. Some scholars such as Nicholas Taleb contend that it is impractical to predict the future or understand the complexity of the situation. Taleb argues that the only real solution is to have planning systems in place that can react quickly to changes and events.[21]

(1) Overconfidence also stems from faulty reasoning in terms of "attaching high probabilities to low-frequency events" or base rate neglect.[22] Political scientist Philip Tetlock notes that political analysts often base probabilities on "…case-specific hunches about causality that make some scenarios more "imaginable" than others."[23] Tetlock follows that "A plausible story of how a government might suddenly collapse counts for far more than how often similar outcomes have occurred in the past."[24]

(2) The connection between faulty intuition and confidence in improbable but plausible arguments is emphasized in Taleb's notion of the "narrative fallacy." Taleb believes that people are "[vulnerable] to over interpretation and predilection for compact stories over raw truths. It severely distorts our mental representation of the world; it is particularly acute when it comes to the rare event."[25]

Summary: Effective planning in unique, novel, and uncertain situations is difficult. Red Teams help the commander, staff, and planning teams when their reasoning is flawed or when organizational processes impede sound planning. This chapter offers ways to prevent and mitigate challenges in planning and decision making processes. Red Teams must balance *intellectual distance* to observe and highlight potential errors in reasoning against being embedded in the organization as a contributor to the planning process.

Circle of Voices

Circle of Voices is a simple facilitation practice designed to equalize participation and teach students that listening, appreciating, and synthesizing are just as crucial to good discussion as is making brilliant original contributions.

Participants form small groups of five to six seated in a circle. They are given a minute or so in silence to think about what they have to say about an assigned topic. The discussion opens with one person having a period of uninterrupted “airtime” of no more than one minute. During this time the speaker may say whatever they wish about the topic at hand. While the person is speaking no interruptions are allowed. People take their turn to speak by going around the circle in order. This eliminates the stress of other participants having to decide when or whether to jump in, or for the speaker to worry about interruption before they can finish their thoughts.

After the initial *circle of voices* is complete, discussion opens for anyone to speak. The only restriction on this period of discussion is that participants are only allowed to discuss other person’s ideas that have already been expressed. Participants may not expand on their own ideas, only about their reaction to something already said. This prevents a tendency toward *grandstanding*.

Facilitation principles:

- Pre-commitment
- Everyone speaks once before anyone speaks twice.
- Active listening.
- Respectful engagement.

Circular Response

This is a great way to facilitate discussion participation, promote continuity of conversation, and to give people some experience in the effort required for respectful listening.

Participants form groups of six to eight, seated in a circle. They are given a minute or so in silence to think about their response to a discussion topic or question. The conversation begins with one person having a period of uninterrupted “airtime” of no more than one minute. During this time the speaker may say whatever they wish about the topic at hand. While the person is speaking no interruptions are allowed.

After the minute is up, first speaker yields the floor to the person on their left, and that person speaks for a minute. The second speaker is not free, however, to say anything they want. They must incorporate into their remarks some reference to the preceding speaker’s message, and then use this as a springboard for their own comments. This does not have to be an agreement; it may be an expression of dissent from the previous opinion.

After a minute, the second speaker stops talking, and the person on their left becomes the third discussant, following the same ground rules. Following this pattern the discussion moves around the circle. Once everyone has had the opportunity to speak, the floor is opened for unconstrained conversation.

The interesting thing about this facilitation technique is that the last person has no advantage over the second speaker. This is due to the last speaker not having the luxury of mentally rehearsing the perfect contribution because they have no idea what the person immediately before them is going to say until they speak.

Facilitation principles:

- Pre-commitment
- Everyone speaks once before anyone speaks twice.
- Active listening.
- Respectful engagement

Cognitive Biases

Cognitive biases are unconscious beliefs that condition, govern and compel our behavior. Examples include the following:

- Anchoring: Oftentimes, humans are unable to compute an item's true value. Instead, they resort to an overreliance upon an initial "anchor" value provided by someone else, and thereafter bias all subsequent value decisions relative to that initial "anchor."
- Status Quo Bias: Many humans find the status quo comfortable, and avoid changing it.
- Confirmation Bias: A trap that humans often fall into — we tend to look for evidence that supports the conclusion we've made prematurely, not realizing that evidence can often support *several* hypotheses. "No matter what we humans think about, we tend to pay more attention to stuff that fits in with our beliefs than stuff that might challenge them…"[26] In the process, inclined to "see what we expect to see," we actively dismiss evidence that contradicts our conclusion. It is this phenomenon that lends importance to the active search for *disconfirming* evidence: evidence that would disprove the conclusion we've formed.
- Sunk-Cost Bias (aka "Loss Aversion"): A bias in which humans increasingly persist in deciding and acting illogically, based upon decisions they made *previously*. This occurs despite the fact that the *present* context dictates deciding otherwise. Sunk-cost bias occurs because it relieves one of the necessity to admit that preceding decisions might have been made in error. It also may avoid incurring a permanent loss, at least in the short term. It is a *failure to cut bait*, to use a fishing metaphor.

- Framing Trap: The way we frame an issue affects the way we perceive it, and hence, affects a solution's potential options.
- Halo Effect: We tend to select that which we see as more attractive, regardless of actual capabilities or qualities. The opposite of the halo effect is the Pitchfork Effect: we tend to disregard (or put at the bottom of a list) that which we find *unappealing*.
- Narrative Fallacy: The human compulsion to turn a series of connected or disconnected facts into story or pattern; *inventing reality*. This is a human tendency to construe meaning in a completely random situation, where no meaning actually exists.[27]
- Self-Fulfilling Prophecy Bias: A term coined by Robert Merton in 1948. "The self-fulfilling prophecy is, in the beginning, a *false* definition of the situation evoking a new behavior which makes the originally false conception come *true*… the prophet will cite the actual course of events as proof that he was right from the beginning…"[28]

Common Logic Fallacies

Appeal to Emotions, or to Fear. The use of emotionally charged language to distract readers and listeners from relevant reasons and evidence.

Appeal to Popularity, or to the Masses. Occurs when an assertion is made that if something is good for everyone else, it must be good for you too. Marketing and advertisements usually make this claim.

Glittering Generality. The use of vague, emotionally appealing virtue words that dispose us to approve something without closely examining the reasons.

Appeal to Questionable Authority. Occurs when the authority we use to support the premises is actually the wrong authority for the issue at hand. It's akin to "hiding behind" someone/something famous, in the hopes that that alone will sell the argument.

Slippery Slope. Occurs when the conclusion of an argument rests upon an alleged chain reaction and there isn't sufficient reason to conclude that the chain reaction will actually take place.

Red Herring. Occurs when the author diverts the reader's attention with distracting information that is flashy, eye-catching, and generally not relevant to the topic at hand.

Straw man. Stacking the deck by distorting an opponent's point of view so that it is easy to attack; thus we attack a point of view that is weak, irrelevant, or does not truly exist.

False Dichotomy. Occurs when someone presents a complex situation in black and white terms (i.e., they only present two alternatives where many exist). The logic fault here is that there is much more to the argument than the watered-down version presented. Rather than allow watered-down arguments, critical thinkers must think divergently to determine the best possible set of options.

Ad Hominem. Occurs when someone tries to attack a person, and not a position or argument.

Begging the Question. An argument in which the conclusion is sneaked into the premises. “Accept this as true: the premise from which it comes is true!” A fallacy of deductive reasoning.

Hasty Generalization Fallacy. A person drawing a conclusion about a large group based on experiences with only a few members of the group. A fallacy of inductive reasoning.

Faulty or Weak Analogy. Occurs when an author uses an analogy to communicate a concept, but the analogy used is not strong enough to support the conclusion being drawn.

Causal Oversimplification. Explaining an event by relying on causal factors that are insufficient to account for the event, or by overemphasizing the role of one or more of these factors.

Neglect of a Common Cause. Failure to recognize that two events may be related because of the effects of a common third factor.

Post Hoc Ergo Propter Hoc. Occurs when someone argues that because two events occurred, and one followed the other closely in time, then the first event caused the second. It’s an appeal to believe a cause-and-effect relationship that does not actually exist.

Confusion of Cause and Effect. Confusing the cause with the effect of an event or failing to recognize that the two events may be influencing each other.

The False Cause. The presumption that a real or perceived relationship between things means that one is the cause of the other.

Explaining by Naming. Falsely assuming that because you have provided a name for some event or behavior, that you have also adequately explained the event.

Critical MDMP Questions

We discussed the *MDMP* and *Mitigating Groupthink During the MDMP* in Chapter V, p62. This is a consolidated list of considerations from those discussions. Upon receipt of a mission, a planning directive, or commander's guidance, the Red Team Leader must determine the following, often in collaboration with the Commander/Chief of Staff:

- When should the Red Team engage in the planning process? (Most Red Teams will primarily work with Plans.)
- How should the Red Team engage? What are the expected deliverables or outcomes? Are their reporting requirements to the Commander or Chief of Staff?
- What linkage should the Red Team have within the staff? For example, does the chief of staff expect the Red Team to observe or participate in the war gaming process? Does he expect the Red Team to develop alternatives on their own for presentation to the Commander?
- What information does the Red Team need and is it available inside or external to the unit? Are their restrictions on the dissemination of information? What reach-back capability does the team require?
- What is the relationship between other specialized groups on the staff (e.g., Commander's Initiative Group)?

Red Teams face a number of challenges to "provide commanders an independent capability to fully explore alternatives to plans, operations, concepts, organizations, and capabilities in the context of the OE and from the perspectives of our partners, adversaries, and others."

Challenge 1: Remaining *independent* but *accountable*. While independent of the staff as a special staff element, Red Teams rely on the primary and other coordinating staffs to provide them information and must work with

staff members to resolve issues, insights, and observations.

Challenge 2: Inherent tension with the staff. There are inherent tensions with the staff who may view the Red Team's efforts with suspicion. The Commander must endorse the Red Team's effort. Conversely, the Red Team must carefully weigh which items require elevation to the Commander. The Red Team is not a "shadow staff" nor does it replace any of the inherent functions performed by the staff. Success can be judged by quality of the Red Team inputs which provides insights, perspectives, identification of vulnerabilities and unseen opportunities, as well as the team's effort to foster dialogue and communication among staffs.

Challenge 3: "Groupthink versus Pros from Dover." While the Red Team is an independent staff entity, it lives and works within the unit. The team must balance its abilities to be part of the team—cooperatively working to accomplish the mission, while remaining immune to "groupthink." Conversely, the team cannot be aloof or viewed as the "Pros from Dover."

Challenge 4: Cookie-cutter TTP approach. While the deliberate planning system describes a linear thinking process (e.g., Mission Analysis consists of 17 steps), no single red teaming TTP can fit all problems. For example, a red teaming approach to planning consideration for a humanitarian operation will differ from that of planning an offensive operation against a conventional force.

Critical Review Steps

A critical review is an intellectual exercise using various investigative and analytical techniques. The process described here is only a start point for Red Team leaders to formulate their own plan and serves only as baseline to spur thought on how the Red Team will approach a specific critical review.

While the process described here appears as a linear process, in reality many of the steps may overlap. Except for the first and last step, the other steps should be conducted simultaneously or amended based on time, resources, and the initiating authority's guidance.

By definition, a critical review assumes the existence of a concept plan or other document in need of review. If the initiating authority is dissatisfied with the existing courses and desires the Red Team to examine a problem to determine alternative solutions, the Red Team should use the Problem Solving Method rather than the Critical Review.

1. Identification of the Requirement – Receipt of Mission
2. Critical Review Mission Analysis
3. Restatement of the Requirement or Red Team Task to the Initiating Authority
4. Key Issue/Problem Identification and Assessment
5. Initial Research – Formulate Data Collection Plan
6. Conduct Research
7. Determine Critical Review Criteria
8. Contrast and Comparison - Key Questions + Alternative Perspectives
9. Finalize the preliminary assessment and initial report
10. Crosswalk the initial report with requirement
11. Complete report and briefings

Critical Thinking Traits

[Note—this is by no means an "all-inclusive list!"]

Critical thinking is:

- Awareness.
- a process.
- quality of thinking.
- imposing intellectual standards.
- challenging assumptions and exploring alternatives.
- searching for hidden assumptions.
- questioning and arguing logically.
- developing an ever better worldview.
- meta-cognition—thinking about the process of thinking.

Critical thinkers…

- are *active* listeners.
- adopt a skeptical state of mind.
- are open-minded–they never shout down an idea, and they reconsider and revise views where honest reflection suggests that change is warranted.
- abhor absolutes–they realize there is often more than one way.
- think contextually–they gather, assess and interpret *relevant* information, and disregard irrelevant information.
- are dialectical thinkers–they can handle contradictions and opposing ideas.
- identify and question their own assumptions.
- consider points of view, the quality of information, interpretation and inference, assumptions, and implications and consequences.
- are "reflectively skeptical."
- regard problems as exciting, not a hassle.
- understand the constraining role of personal world views.

- demonstrate the intellectual courage required to challenge conventional wisdom.
- search for what s/he doesn't know, rather than being complacent with what s/he does know.
- ask "Why?" "How Do?" "So What," and "What *should* we be doing?"
- are exceedingly curious and inquisitive; driven to determine a more refined version of a given perception.
- are detached emotionally—"reason prevails."
- are disinclined to board the Bus to Abilene—"intellectually independent."
- seek to understand the opinions of others.
- detect attempts to turn concepts into actual entities.
- frame a problem in several ways to consider alternative perspectives.
- evaluate the consequences of various alternatives.
- understand how framing can be used by others to mislead, in order to bias the reader/listener.
- attempt to identify the interconnected variables of a complex situation, and the variables' interrelationships/relative strength of those interrelationships.
- generate hypotheses for given situations, and then test those hypotheses.
- seek disconfirming evidence.
- discern inferences drawn, and looks for faulty inferences.
- distinguish between *causation* and *correlation.*
- recognize the bias in hindsight analysis.
- understand the effects of memory on decision making.
- know of/recognize cognitive biases present in decision making.

- know of/recognize the effects of social conformity/social psychology (including groupthink) present in group decision making.
- discriminate between inductive and deductive reasoning.
- use metaphors and analogies appropriately.
- produce and uses graphics to enhance comprehension.
- judge the credibility of an information source.
- identify premises and conclusions.
- challenge explicit assumptions.
- actively look for implicit assumptions, and challenge them.
- challenge "facts": not all facts are created equal.
- recognize and defend against inappropriate use of emotional/loaded language.
- identify/recognize underlying theories and/or philosophies inherent in an argument.
- detect misuse/abuse of word definitions.
- understand, recognize and avoid common logic fallacies.
- remember to ask "What's missing from the argument?"
- check for adequate sampling size and possible bias in sampling when a generalization is made.
- review statistics used in arguments, and challenge them.
- ask "Are there rival causes that we have overlooked?"
- ask "What are the implications of accepting this argument as-is?"

Finally:

- are systematic and thorough in applying precepts of critical thinking to various situations.
- *defer judgment* to avoid jumping to conclusions or believing false claims.

Critical Variables (CVs)

1. The *Physical Environment* defines the physical circumstances and conditions that surround and influence air, land, sea, and space operations. The defining factors are terrain, weather, topography, hydrology, and environmental conditions. The physical environment has always been a key factor in military operations. History demonstrated that forces able to take advantage of the physical environment have a much higher probability of success. Our opponents understand that less complex and open environments favor the U.S. This is due to our standoff technology, precision guided munitions (PGM), and sophisticated surveillance and reconnaissance capabilities. For this reason, adversaries will seek to use complex terrain, unfavorable weather, and less trafficked sea lanes when confronting U.S. forces.
2. *Nature and Stability of Critical Actors* refers to the internal cohesiveness of actors. It evaluates the population, economic infrastructures, political processes and authority, military forces, goals, and agendas. It also refers to an actor's strength or weakness. It is important to determine where the real strength of the organization lies. It may be in the political leadership, the military, the police, or some other element of the population. Understanding this variable allows US forces to better visualize the nature of the military campaign and the true aims of a threat's campaign. An entity that must commit significant resources to maintain internal control may represent less of a conventional threat and more of a stability and support threat.
3. *Sociological Demographics* concern the characteristics of a human population or part of it. Demographics measure the size, growth, density, and distribution of populations. Demographics also measure statistics regarding birth, marriage, disease, and death. Demographics are a significant factor contributing to likelihood of conflict.

Perceived inequities among sectors of a population can breed envy and resentment. This often results in conflict. Overpopulation and an uneducated, unemployed "youth bulge" can aggravate economic, ethnic, religious, and other rivalries.

4. *Culture* is a system of shared beliefs, values, customs, behaviors, and artifacts that the members of society use to cope with their world and with one another. Understanding a culture requires examining multiple elements, including its core values, history, myths, traditions, and other factors. A culture can change over time. Cultures transmit their shared values and beliefs from generation to generation through learning and social interaction. Finally, a culture in and of itself does not cause a conflict. The friction that comes from the interaction between two different cultures creates the potential for conflict.
5. Nation-states or non-state actors often enter into *Regional and Global Relationships* that can be local, regional, or global. These relationships include political, economic, military, or cultural mergers and partnerships. Membership or allegiance to such a relationship can determine an actor's actions. This can be in terms of support, motivation, and alliance construct. When actors create alliances, they can add to their collective capability and broaden the scale of operations and actions. Regional and global relationships of opponents or allies shape the scale, intensity, and perseverance of antagonists in military operations. In the age of globalization, regional activities will undoubtedly draw global interest and potential involvement. Effects created in one part of the world at the operational or tactical level could have global, cascading outcomes at the strategic level.
6. Existing *Military Capabilities* are the most critical variable for military operations, political aspirations, resolve, and will. It was once easy to define military capabilities.

However, this variable is rapidly becoming one of the most complex. A commander must be able to visualize all military capabilities of the threat. Red Teams must emphasize that our enemies can be flexible and adaptive. They could have the knowledge and ability to use a combination of conventional and unconventional capabilities. The commander must have information on conventional and unconventional capabilities, his ability to use modern technology, and his economic and political ability to affect the mission. Capabilities include equipment, manpower, training levels, resource constraints, and leadership issues. Niche technologies will be increasingly the norm for the near-term. Hybridization, rapid technological advancement, and asymmetric concepts generate constantly changing requirements and needs. In addition, paramilitary organizations, Special Forces, or enhanced police organizations take on greater significance as their capabilities and roles expand.

7. *Information* involves civil and military access, use, manipulation, distribution, and reliance on information technology systems by an entity. Information technology is the systems or mechanisms for preserving or transmitting information. Various actors seek to use perception management to control how the public sees things. The threat will exploit U.S. mistakes. They will also use propaganda to sway the local population to support their cause. Media and other information means can make combat operations visible to the world. The media can influence U.S. political decision making, internal opinion, or the sensitivities of coalition members. The expansion of information technology will greatly assist commanders. Complicated networks provide a vast web of communications capabilities. Redundant communications systems allow for the constant flow of information. Developing countries may have little in the way of communications infrastructure. Information may flow by less sophisticated means—couriers, graffiti,

rumors, gossiping, and local print media. Understanding existing communication infrastructure is important because it ultimately controls the flow of information to the population and the threat.

8. *Technology* reflects the equipment and technological sophistication that an entity could bring to the OE. Technology includes what nations or actors can develop, produce, or import. Global access to technological advances is slowly eroding the U.S.'s advantage. Understanding this variable can determine whether the threat has the technological ability to achieve equality or overmatch in selected areas. The presence of sophisticated technology can indicate where opponents expect to achieve the greatest advantage or perceive the greatest threat.

9. The U.S. military could find a variety of *External Organizations* in a conflict or failed state. These include non-government organizations (NGOs), international humanitarian organizations, multinational corporations, transnational organizations, and other civilian organizations. The organizations can have stated and hidden interests that assist or hinder U.S. mission accomplishment. Each organizational or individual participant pursues its interests in concert or competition with other entities. These actors may have economic, political, religious, cultural, or private motivations that differ from their public organizational mission statements. Defining these variables should inform the commander of the impact external organizations have on mission accomplishment.

10. *National Will and Will of Critical Actor* encompasses a unification of values, morals, and effort between the population, the leadership or government, and the military. Through this unity, all parties are willing to sacrifice individually for the achievement of the unified goal. The interaction of military actions and political judgments, conditioned by national will, further defines

and limits the achievable objectives of a conflict. This determines the duration and conditions of termination of a conflict. The willingness of the people to support threat military, paramilitary, terrorists, or insurgencies can be a significant characteristic of the battlefield. It will influence the type and intensity of resistance the people will pose to U.S. military operations. Most countries view the U.S. national will as a U.S. strategic center of gravity.[29] The degree to which one group can attack its opponent's will and still preserve its own represents its ability to set the conditions for achieving favorable conflict resolution. In a world of transparent military operations, attack on (and defense of) national will has tactical, operational, and strategic implications. A perceived attack on a group's cultural identity will usually serve to bolster its will to fight. This potentially increases both the intensity and duration of a conflict.

11. *Time* is a critical factor and a tool to manipulate tactical, operational, and strategic advantages. It drives the conduct of operations and campaigns. Time is one of the most significant planning factors driving decision-making. How much time is available and how long events might take will affect every aspect of military planning. This includes force package development, force flow rate, quality of intelligence preparation of the AO, need for forward-deployed forces and logistics, etc. Planners need to consider time in the context of the culture that the force is operating. Every culture views time differently. An opponent's view of time might be radically different from ours. This different view of time causes disjointedness in operational tempo.

12. The *Economic* variable establishes the boundaries between the "haves" and the "have-nots." This gap of economic differences among nation-states and other actors can cause conflict. Differences may be significant among nation-states, organizations, or groups regarding how they produce, distribute, and consume goods and

services. Control and access to natural or strategic resources can cause conflict. The ability to affect another actor through economic, vice military means, may become the key to regional hegemonic status or dominance. Economic deprivation is also a major cause of conflict. One actor may have economic superiority over another for many reasons, including access to natural resources or power.

Economic power and the ability to mobilize it represent a nation or actor's ability to rapidly procure, mobilize, and conduct sustained operations. It also reveals external relationships that could result in political or military assistance. For example, potential adversaries understand that the U.S. economy is a center of gravity that is very sensitive to perturbation. American economics and the power that flows from it will be inviting targets. Any disruption of the flow of oil products would have a significant negative impact on our economy. Many of our economic institutions may appear vulnerable to cyber-attack. Economic superiority rather than military superiority may be the key to power or dominance within a region. Analysis identifies those elements of economic power that may be a significant characteristic of the battlefield. In a globalized economy, the threat may leverage its economic power in a manner that affects friendly operations.

13. *Religion* is a variable that affects each of the preceding variables. Religion in itself "is a world view in which people personify cosmic forces and devise ways to deal with them that resemble the ways they deal with powerful human beings in their society. Religion provides man with a way to deal with uncertainty that they otherwise cannot control.[30] Religion is interwoven with a nation's culture. It can be a cornerstone that affects every aspect of culture. It also provides the individual a more worldly connection to other co-religionist outside the boundaries of a particular state. Our understanding of the religion

practiced in a state that U.S. forces operate is crucial to our success. This understanding will shape the way the Army should conduct operations (i.e., belief system of our opponent, key sites, organization of society, interpersonal relationships between our forces and the population).

What Critical Variables inform PMESII+PT		
Politics • Culture • Religion • Nature & Stability of State • Regional & Global Relationships • Sociological Demographics • External Organizations	**Military** • Culture • Religion • Military Capabilities • Nature & Stability of State • Regional & Global Relationships • Technology • National Will	**Economics** • Culture • Religion • External Organizations • Technology • Nature & Stability of State • National Will
Social • Culture • Religion • Sociological Demographics • Technology • External Organizations • Nature & Stability of State • National Will	**Information** • Culture • Religion • External Organizations • Information • National Will	**Infrastructure** • Sociological Demographics • Technology • Regional & global Relationships • Culture • Religion • Nature & Stability of State • Technology
Physical Environment • Culture • Religion • Regional & global Relationships • Physical Environment		**Time** • Time • Culture • Religion • National Will

Critical Variables are relevant to PMESII+PT and METT-TC.

Cultural Perception Framework

When to use

The Cultural Perception Framework is used to assist Red Team members in apperceiving another culture. It complements the 9-Step Cultural Methodology by posing questions of much greater detail. In order to avoid mirror-imaging, its steps lead red teamers through a process of discovering another culture based on its underlying tendencies, habits, values and beliefs. It provides red teams an ability to consider the *kinds* of questions that must be asked of Subject Matter Experts, in order to provide alternative perspectives about that culture.

Value added

Thorough use of the Cultural Perception Framework will ensure an enhanced understanding of a particular culture, by forcing the Red Team members to consider aspects of that culture they might not otherwise have discerned.

The Method

Step 1 – Establish a baseline of understanding by using the 4-Ways of Seeing

- How X views itself
- How Y views itself
- How X views Y
- How Y views X

Step 2 – What does the physical environment offer to the culture? (Water, Land, Food, Climate, Fuel/Power, Natural Resources)

Water

- What is the symbolic significance of water?
- Are there cultural rules about water's use?

- What is the relationship between water use and ritual?
- Who customarily exercises specific functions with respect to water? What are these functions?
- Who, in the culture, has customarily controlled access to water, and how have they used that for power, influence, etc.?
- What roles are expected of U.S. military personnel with respect to water use and provision?

Land

- Has the geography facilitated security, or invite invasion by another culture? How has the security outlook of the people evolved with respect to its geography?
- Who owns the land? Is access open to everyone, or restricted? What are the local conventions of private, communal, and state ownership/use of land? How is the ownership of land related to the power structure of the region?
- Is there sufficient land for agricultural use? Does this land allow for completely feeding the population? Does it provide for agricultural export?
- What land in the area is/is not appropriate for certain groups of people to use? Why?
- Who, locally, has legitimate ability to determine outsiders' access to land?
- Are there symbolic meanings for certain sub-districts in the region, and do groups within the area view this symbolism similarly, or differently? Why?
- What is the relationship between the political national/regional boundaries, and how people living in the nation/region view those boundaries, in terms of politics, economics, genealogy, and security?

- What are the geographic area's principles of division, and is there a relationship between these dividing lines and access to both tangible and symbolic resources?
- Are there particular land formations that are visually striking, with local significance?

Food

- What are the local staples, and what is the required labor to grow, prepare, and serve them?
- What foods are served by whom, to indicate the status of server or guest?
- How do U.S. Military operations or logistics impact the ability of local people to obtain essential foodstuffs?
- What foods have which kinds of ritual significance?
- What are the time- or calendar-related roles of various foods?
- Which foods are strategic commodities, inasmuch as controlling access to them influences one's coercive or political power?
- What, in local terms, is considered food sufficiency, food scarcity, and the proper role of external forces in providing food?
- What kinds of locally-accepted foods are considered strange, dangerous, or not even food (by the U.S. Military)? What foods raise concerns about health or sanitation?

Climate and Seasons

- How does the climate influence local attitudes to—and capabilities for—work, business, and combat?
- What, in local terms, passes for good weather, bad weather, etc?

Fuel and Power

- What are the locally-found, or locally-produced sources of power and fuel?
- What is the relationship between local elites and access to/provision of fuel and power?
- How does the larger government authority provide, or control, access to power?
- What do local people expect of outside forces in terms of power/fuel provision and protection?
- How does the population deal with shortages of power and fuel, and how do U.S. Military operations impact them?

Natural Resources

- What natural resources can be found inside the recognized borders of the nation/region?
- Are these natural resources accessible? Are they nearing depletion? Who controls access to these natural resources?
- Which natural resources are required by the culture, but not available internal to their borders? Where are these locally unavailable resources procured? Who is in the controlling seat for procuring them, and who provides them? What sources of power emanate from this relationship?

Step 3 – How is the economy structured? How do the people make use of what the physical environment offers? (Formal, Informal, As a Means of Exchange, Effect on Social Structure)

The Formal Economy

- What comprises the formal economy?
- On what commodities/services does the formal economy focus?

- What categories of people work in the formal economy?
- How will U.S. Military operations impact the formal economy, and people in it?

The Informal Economy

- How big is the informal economy, as compared to the formal economy? If it is large—why?
- What categories of people work in the informal economy?
- On what commodities/services does the informal economy focus?
- What is the relationship between the informal economy, on the one hand, and unregulated movement of people, crime, and violence, on the other?
- How does the formal economy rely upon the informal economy? Does this cause abuse to the area's population?
- What economic opportunities exist for the population?
- What are formal/informal economic actors' expectations of the state or over-arching political-military authority, with respect to involvement in or disregard for economic activity?
- What is considered an "illegal" good or service in the area, and on what basis? Is what would be termed in the West as "bribery" and "corruption" endemic? If so, what do locals consider corrupt?
- What goods/services are legal, but culturally frowned upon? Who deals in these goods/services?
- What percent of the formal and informal economy is under "foreign" control?
- How will U.S. Military expenditure in the local informal economy, or employment of local informal economic

actors, influence the socio-economic balance of power in the area?

Economy as a Network of Exchange

- How are important physical resources (food, clothing, shelter, cars etc.) obtained by local peoples?
- How do people gain access to critical services such as medical care, transportation, or education?
- Would a specific operational plan improve or block access to critical goods and services?
- What is the degree of (in)equity in the distribution of goods and services among the population?
- Who seems to control the distribution of goods and services, and how? Would a planned operation change this distribution pattern?
- Along with or instead of money, what do local peoples rely on to obtain and exchange goods in the region?
- If money is not the primary economic system, can the U.S. Military effectively use the local method of economic exchange?

Economy as a Way of Structuring Social Relationships

- What are the main economic systems in place in the region (pastoralism, agriculture, industrial production—all three may be present simultaneously)?
- What are the economic rhythms of the community (migration seasons, planting and harvesting, market day, work hours)?
- What are the important features of the environment that determine the economy of the area?
- Who has/controls most of the wealth? What percent of the population lives in poverty, as locally defined?

- How is wealth distributed? Does wealth seem to be concentrated in the hands of certain individuals or groups? On what basis? What power is conferred from such a concentration?
- Does the economy rely on general, balanced, or negative reciprocity?
- Do the elites own wealth, or do they possess power that generates wealth?
- How do local economic structures reflect the relationship of the group to the larger political and state system?

Step 4 – How is the social organization structured? How do the people organize, given the gifts of their physical environment, and their economic choices? (Age, Gender, Kinship, Class, Ethnicity)

Age

- What are the population's demographics? What do they suggest?
- At what age is someone considered a child or adult?
- What specific ceremonies mark the transition to adulthood? Which new social privileges are granted to men and women when they pass these manhood or womanhood rituals?
- What are locally accepted or expected economic roles for what U.S. society considers children?
- How should the U.S. Military prepare to respond to children that act as soldiers in militaries or insurgencies, or participate in violent activities against U.S. forces?
- What special status or roles are accorded to the elderly?

- Is there an age grading system that stratifies people according to their age and stage in the life cycle? And if so, what rights, roles, and duties do people have at each stage?

Gender

- What are the common child rearing practices, and how do they differ by gender and class?
- What are the roles assigned to men? What are the roles assigned to women?
- What work, activities, and spaces are assigned predominantly to men and women?
- Who undertakes which tasks and where?
- How must operational plans change to account for different work, roles, and spaces assigned to men and women?
- What roles do women play in local militaries and insurgencies? Do they engage in armed combat?
- If women are not visibly observable, what roles and tasks do they undertake “behind the scenes?”
- How can operational plans and assignment of manpower include gender to maximize effectiveness of the unit?

Kinship and Tribal Membership

- Does some form of “tribe”- or “clan”-related social structure exist, and play a role in society? To what degree?
- From which side of the family does descent originate? Is the society a matriarchal or patriarchal one? Do members of a family identify with the father’s side/relatives, the mother’s side/relatives, or both?
- What is the nature of marriage in society: who decides, what are the power relationships internal to, and

external to the married couple? Does the society practice monogamy or polygamy?

- To what degree does the society believe in collective unity, vice individualism? What degree of egalitarianism is prevalent in society?
- What are the reasons underlying social unity? What is it that holds the society together? What provides "meaning" to this society?
- Does the society rely upon "fictive" kinship? What is the essence of this fiction—which segments of society does it uphold, and which segments does it suppress?
- Does the society rely upon extended family units, or nuclear families? Why?
- How are land, water, or access to certain goods and resources concentrated in the hands of specific kin groups or tribes?
- How will our operations in the region support certain kin groups and enhance their power; or conversely undermine these groups?
- What are the possible outcomes of an operation that will challenge the power or control of resources by certain kin groups in the region (war, insurgency, increased stability, greater/lesser access to important goods and services)?
- How does a U.S. Military's choice of local points of contact interact with or disturb local kin relationships, thus influencing the degree of success of U.S. Military initiatives?

Class

- Does class play a role in society? To what degree?
- How is class defined in the area: on the basis of wealth, education, region of origin, inheritance, or other factors?

- Is status acquired through birth, or achieved through action?
- What are the privileges (economic, political, social, and religious) of members of the upper class?
- What are the key institutions in the social structure, and how did the leaders of those institutions acquire their roles?
- How is access to essential resources for survival (food, shelter, clothing, water) determined by class?
- How does the concentration of wealth (through corruption, graft, or legitimate means) in the hands of an elite upper class relate to resource or power access?
- If creating a plan to support lower class groups, will funds and resources have to pass through the hands of the upper class first (and consequently disappear)?
- What is the reality of upward mobility in the area's class system, and what do local people consider to be their potential for in-system upward mobility?
- How will U.S. Military measures that influence different groups' social mobility be viewed by those groups, or by other, competing groups?

Ethnicity

- Does ethnicity play a role in society? To what degree?
- What is the relationship between particular ethnic groups and control of professions or positions of power?
- How do groups that are barred from these positions of power challenge the system (breeding grounds for insurgents, theft and bribery, civil war)?

- What are local assumptions about U.S. and western biases and partisanship with respect to ethnic group struggles?
- How will a US Military alliance or dealings with a particular ethnic group affect those in power? What are possible reactions of those groups that are ignored?
- In this area, what kinds of processes have historically activated which ethnic identities and feelings of group membership?

Step 5 – What defines the political structure? Who makes the decisions concerning power distribution and resource usage? (leadership, conflicts over power)

Leadership

- What types of leaders does the society support? Charismatic? Violent? Legally elected?
- Who are the central players in the leadership? What are their histories, and what are their ideologies and beliefs? What networks do they belong to?
- Do the members of the leadership "live for politics," or make a living "off of politics?" What are their motives in doing so?
- How is decision-making organized, and who makes decisions?
- What particular social and political ideologies are prevalent? What narratives is the leadership using?
- What are the principles and processes governing policy deliberations and decision-making?
- Whom do leaders have to consult; to whom must they answer?

- How is leadership obtained and passed on (by election, inheritance, demonstration of skill, and membership in a certain age or social group, by force)?
- Who are the official formal leaders and what symbols indicate their status?
- To whom do people turn to actually get something done?
- What is the relationship between the formal and informal leader?
- Which institutions wield power? Particular social structures (tribes, clans, etc.)? Religious entities? Labor unions? Political parties? Courts? Criminal organizations?

Conflicts over Power

- What motivates the society? This may be political in nature, as well as economic, or even based on desires for social change. What tensions are inherent in the society?
- How does the society handle the inequity of power? Do members of society revile others who exert power upon them? Or are members of society inclined to accept this inequitable power structure submissively? Are members who accept inequitable power relationships submissively inclined to "wait until told what to do?" In other words, are they overly dependent on what the boss says—as opposed to a society in which the people feel inclined toward a high degree of interdependence, and use initiative?
- To what degree are the members of society comfortable with uncertainty (exhibited in low stress and low anxiety—what is different is curious)? To what degree do they attempt to avoid uncertainty (exhibited in high stress and high anxiety—what is different is dangerous)?

- Is this a society that relies on harsh power, or rule of law?
- What are the most important cultural characteristics that determine one's position and power in the community (age, class, gender, tribal identity, ethnicity, religion)?
- What is the degree of polarization in the region with respect to religious/ethnic/tribal identities?
- What is the amount of flexibility and interaction between religious/ethnic/tribal groups?
- Which groups hold power, and to what degree of concentration?
- Which groups are excluded, and along which axes?
- What is their degree of consciousness of exclusion?
- What is the nature of the bureaucracy? Is it efficient, and easy for the society to navigate? Or do the members of the bureaucracy exact tribute from society as a way of conducting business, or exercising power? To what degree is it necessary to find someone who can deal with this inefficient bureaucracy (someone who has "wasta") quickly?
- What is the role of patronage, and what characterizes a "patron?"
- Are politics used for religious purposes, or is religion used for political purposes?
- How do state bureaucracies relate to other elements of the social structure?
- Do these groups' leaders think it is possible to challenge the system?
- How do marginalized and losing groups gain access to valued goods, resources, and opportunities (black market, theft, raids, and insurgency)?

- How will allying with one group affect U.S. Military relationships with the other groups?

Step 6 – What are the belief systems? (History, Folklore, Rituals, Norms, Imagined Memory, Icons, Symbols and Communication, Taboos, and Religion)

History, Imagined Memory, Folklore

- What are the critical narratives of the cultural history? What are the pivotal historical stories that all people in the community share?
- What do people believe about themselves, and where they came from? What are the stories taught in school?
- How do the people learn in school? Via rote memory? Socratic dialogue? Other? Are they taught to challenge authority and conventional wisdom, or follow the party line?
- What are the daily sayings and folktales that everyone refers to in common conversation?
- How are these (remembered histories, folktales, and sayings) used to emphasize or teach important values and ideals?
- How do different groups in the area give different significance to the same historical stories?
- How does the society perceive current and past events?
- What are the key myths associated with social control?
- Does this society defer to ethnocentric beliefs, or does it display cultural relativity in its views of outsiders?
- Are there any myths explaining the essence of the "nation?" To what degree do the people identify with a "national" myth? How does this national myth conflict

with other social structure bases—ethnicity conflicts, tribal conflicts, etc.?

- Are there any significant emotional events in the life of the people? How recent/how far back in time are these events? To what degree has myth embraced these events, and what are the myths? Which leadership groups within the area support these myths to their own ends?
- Has the area been historically invaded or isolated? What is the significance of this?
- How are these histories, folktales, and sayings used to support propaganda for or against U.S. Military and U.S. activities in the region?
- How has the society accommodated cultural change in the past? Is it a society that relies upon pluralism? Syncretism? Or Assimilation?

Icons

- Who are the local heroes? What important qualities do these heroes embody?
- Who are the local villains? Why are they villainous (what makes them evil)?
- Are the heroes or villains compared to the U.S. Military or Americans?
- What do the comparisons illustrate about local attitudes towards the U.S. and the military?

Symbols and Communication

- What physical symbols (clothing, headdress, insignia, and scarification) indicate membership or status in the ethnic, religious, and social groups of the region?
- What physical and written symbols (graffiti, fences, signs, and spiritual markers) are important to be able to

recognize in order to navigate and understand what is happening in the region?

- What is the nature of routine greetings and farewells? What do they mean?
- What are the hand signals and predominant body language actions that members of the population use? What do they mean?
- How do the people communicate? Word of mouth? Gossip and rumor? In written form? Via television? Via texting and cell phone? Via Internet?
- What are the society's proverbs? For those which translate only with difficulty—what do they mean?
- What words or phrases are essential for basic communication with local people?
- What non-verbal behaviors may be misinterpreted by local people? Which non-verbal behaviors are important to understand in meetings and negotiations?

Rituals

- What are the rites of passage? Rites of enhancement?
- What behaviors and actions are important in the ritual or ceremony, and what does this reveal about cultural ideals and values?
- Who participates in the ritual, and what roles do the participants play?
- What does presence of participants, or the nature of their participation, say about their membership and status in the group?
- What does the public performance of the ritual communicate to outsiders?
- How is this performance potentially a politically charged statement about the group's status and rights within the larger society?

- What activities, not related to the ritual or ceremony itself, occur at ceremonial gatherings, due to the social status of the participants?

Norms, Mores, and Taboos

- What does the society value? Are its values predicated on dualism (e.g., absolutes, “evil versus good”), or on relativism (right versus wrong depends upon context)?
- How does society sanction its members? Does it allow for criticism and alienation?
- What is the role of emotional outburst—is it restrained? Accepted? Gender specific?
- To what degree do the members of society value human life? For what reasons would people in the society kill someone else? Why—as a measure on behalf of the state? To restore personal or family honor? To appropriate vengeance?
- What underlying allegiances or codes of honor could influence the success of an operation?
- What activities in the area are considered serious violations of social mores and could carry serious punishments, including death?
- What food and behavioral taboos exist in the region?
- What norms should the U.S. Military observe, even if they are foreign to the area?
- What beliefs or assumptions exist locally about American practices as regards local norms, mores, and taboos?
- What might the local people think (or have been propagandized to think) that the U.S. Military is likely to disregard in terms of local norms, mores, and taboos?

Religious Beliefs

- What are the predominant religions in the area?

- What are the key religious narratives? What do they signify, and whom do they support?
- Are the practiced religions focused on the social welfare of the people, in the hereafter, or both?
- What are the actual (versus theoretical/textual) religious practices in the specific area where the U.S. Military operates? Are these religions affected by local culture?
- How do local practices of a religion the U.S. Military has encountered elsewhere differ from what the U.S. Military thinks the religion is "supposed" to look like?
- Who is the actual leader of the local religious community?
- How do religious leaders relate to the educated elite vs. popular groups, etc?
- What is the basis of authority for a "religious" leader in the area: book learning, lineage, charisma, etc.?
- What power and role, if any, does the formal religious system play in local peoples' daily lives?
- What conflicts or disagreements exist between the formal religious system and the local religious practices of the area?
- How prominent is "religion" as an explanatory factor for people in current events, and in reference to history, or historical trajectories?
- What is "the way the world is supposed to be" according to locally-held religious beliefs, and how does the U.S. Military presence impact that?

Religious Membership

- How do people define and express their religious membership in the region?
- What roles and status do the various religious groups or sects hold in the larger society?

- What is the meaning of geography for religious groups in the area?
- What effects would a planned U.S. Military operation in the region have upon the power, status, and access to critical resources of the various religious groups or sects?
- How will the U.S. Military operations influence indigenous peoples' views of U.S. Military or U.S. biases towards different religious groups of the social structure?

Step 7 –

A. Conduct an analysis, based on the results of all information acquired. What particular deductions can you come to, based on the aggregate of the collected information?

B. Synthesize the results. Given the particular reason/motive for conducting the analysis, what is the "so what?" How does the information provide insight as to how another culture might react to U.S. Military presence? In what ways does the information illuminate "how they might think" about various issues?

Deception Detection

Systematic use of checklists to determine when deception actually may be present and how to avoid being deceived.

When to Use

In reality, analysts too seldom check for the possibility of deception, even when there is a well-known history of its use. The search for clues that deception is being conducted is often time consuming and requires extensive fact checking and hypothesis testing. Nonetheless, it can be critical in cases where the stakes are high. Analysts should be concerned about the use of deception when the deceiver would have a lot to gain through his efforts and has strong capabilities to deny or manipulate U.S. intelligence collection assets.

Value Added

Deception Detection can add rigor to analysis and reinforce the effectiveness of other analytic techniques covered in this primer. There may be times when analysts will place too much confidence in the effectiveness of other techniques covered in this primer, if they have not considered the possibility that deception may be present as well. For example, a well-developed set of indicators might actively mislead analysts, if they were partly developed from information purposely designed or fabricated by an adversary to mislead its opponents. While most analysts know they cannot assume every piece of collected intelligence is valid, few know how to adapt their daily work habits to adjust for the possibility of deception. Posing the hypothesis of deception places a considerable cognitive burden on analysts. Once accepting this possibility, it places in question all the evidence and makes it difficult to draw any inferences from the evidence with high confidence. A checklist of questions to detect possible deception can prevent the analyst from becoming paralyzed.

The Method

Analysts should routinely consider that their information base is susceptible to deception. If there is any possibility that deception could be present, a small group of analysts should assess key reporting based on four sets of criteria:

- Does a foreign actor have the motive, opportunity, and means (MOM) to deceive?
- Would this potential deception be consistent with past opposition practices (POP)?
- Do we have cause for concern regarding the manipulability of sources (MOSES)
- What can be learned from the evaluation of evidence (EVE)?

In addition to using this deception detection technique, analysts can also employ the technique of analysis of competing hypotheses (ACH). In this case, analysts would explicitly pose deception as one of the multiple explanations for the presence or absence of information. In the counterintelligence field, the use of ACH as well as Deception Detection techniques has proven very useful.

Determining the Suitability of an Analogy

An analogy is a comparison, used to improve our ability to comprehend one situation by comparing it to a previous situation about which we know something. It is a form of inductive reasoning, in which we proceed from one general premise to another. Like all inductive thinking, however, there is no certainty whether the analogical conclusion is warranted—at best the conclusion could be probable.

The manner to determine an analogy's suitability is to compare the ways in which both situations are *similar* to each other, and the ways in which both situations are *dissimilar*. For example, given the analogy "Going into Iraq will be our next Vietnam," the person making the statement presumes that one will be like the other. In some ways, perhaps it might. In others, however, there may be significant differences.

As such—given the analogy stated above, first determine the criteria around which you make the "similar/dissimilar" assessment. List the broadest and most expansive set of criteria you can possibly think of; the assessment of an analogy's suitability rests in large measure on the number of different criteria you can possibly site. Just a few of the criteria for our scenario could be as follows:

- Nature of the enemy
- Nature of the environment in which we will operate
- Nature of the regional allies or antagonists which may help/hinder either side
- Size and composition of enemy forces we will fight against
- Size and composition of our own enemy forces
- Whether or not the population will tend to rally around one side or the other
- Duration of the conflict
- Professional state of the enemy forces
- Professional state of the U.S. forces

Next, carefully consider our situation in Vietnam for each criterion. Make a list.

Thereafter, carefully consider our situation in Iraq for each criterion. Make a list.

Now compare the two lists, criteria-by-criteria. Are those two lists more similar or dissimilar? If they are mostly similar, perhaps you have a *strong* analogy/inductive argument. However, if they are mostly dissimilar, you have a *weak* analogy/inductive argument, and whomever uttered the statement most likely didn't think through the ramifications of his/her remarks. Instead, they were likely focused on a narrow subset of the criteria you have considered, in a way that frames their conclusion.

Devil's Advocacy

Challenging a single, strongly held view or consensus by building the best possible case for an alternative explanation.

When to Use

Devil's Advocacy is used to consider whether stated beliefs or assertions have been formed prematurely, without first considering alternative perspectives. It is a technique designed to help expose *implicit* assumptions and faulty reasoning.

The logic behind Devil's Advocacy stems from the cognitive challenges of decision making discussed by Richards Heuer (*The Psychology of Intelligence Analysis*) and Morgan D. Jones (*The Thinkers Toolkit*):

- We commonly solve problems by first forming a conclusion, and *then* using available evidence to support it. "[We tend to] favor a particular outcome or solution early on in the analytic process...long before we can objectively analyze the evidence and reach a conclusion." (This is the cognitive bias known as confirmation bias.)
- We tend to perceive what we *expect* to perceive
- We tend to value information that is *consistent* with our views, and reject or overlook information *that is not*
- We can easily become wedded to a pre-existing plan, person's reputation, etc., which precludes us from continuing to think critically about that plan, person, etc.

Value Added

Devil's Advocacy helps red teamers expose faulty reasoning, especially when the beliefs or assertions in question are the result of "conclusions jumped to." The tool will help establish additional evidence which should have originally been considered; it helps illuminate evidence which was either intentionally or unintentionally disregarded or ignored.

The Method

Conducting Devil's Advocacy is fairly straightforward: for a stated belief or assertion, *prove its opposite*. Do this by 1) considering the same evidence, some of which may have been disregarded or ignored, and by 2) finding new and disconfirming evidence originally unavailable.

Example. Given a stated position: "The U.S. Federal Government should *not directly* fund private schools"

- State and prove the position in its opposite form: "The U.S. Government *should* directly fund private schools, because…"
    - Enumerate reasons why this should be so. Consider all evidence originally available, especially that which was disregarded or ignored. Oftentimes, evidence can support several hypotheses, based upon its interpretation.
    - *Actively search* for new evidence which proves this opposite assertion.
- Disprove the *original* belief or assertion:
    - Reasons in the "stated position" which are *faulty*
    - Reasons in the "stated position" which were *ignored/overlooked*
    - Reasons *which are missing* from the "stated position"
    - Consider any implicit assumptions upon which the "stated position" rests

Divergence - Convergence

Think - Write - Share - This is the single most important idea to enable critical thinking. Before tackling any issue, we should think independently and reflectively first, then write down our thought–which helps us to shape and refine them, and finally share them in a disciplined fashion. Divergence-convergence is a form of ‘think-write-share’ – method:

- Everyone writes down as many ideas as they can about the problem or issue – they do not self-censor.
    - Facilitator goes around the room taking only one idea from each member of the group. Everyone speaks once before anyone speaks twice. Ideas are collected without commentary or criticism. If someone else offers something on your list, then scratch it out and offer something not yet raised.
- This goes on until all lists are exhausted.
- Once everyone’s list is exhausted and captured on the board, the group, aided by the facilitator, bins the ideas into a set of unique and distinguishable approaches so ideas bleed over on each other to the minimum extent possible. This sets the table for ‘dot voting’.

Dot Voting

Frequently, planning teams must prioritize their efforts as there is simply not enough time to address all legitimate issues. Dot voting is a method designed to anonymously collect the groups' perspective about the most urgent issues needing to be addressed. *Dot Voting* and *5 Will Get You 25* are two methods of weighted anonymous feedback.

- Identify the largest possible universe of issues using divergent thinking and collect them in a macro list
- Group the input in the broadest possible way so that no two topics remaining on the list overlap with each other (i.e., each topic is distinguishable from each other)
- Number the remaining distinguishable issues (for the sake of this illustration let's assume there are 12 different and legitimate issues worthy of the groups energy and attention)
- Each member writes a list of the numbers 1-12 in a column on a 3x5 card
- Each member then 'dot votes' 7 times (place a dot next to the number of the topic that s/he wants to vote for. All 7 votes can be given to a single topic, 7 topics one vote each, or divided 3 and 4, 1 and 6, 2 and 5, etc.
- Collect the 5x8 cards and total the number of votes for each idea or issue

The value of this approach is as follows:

- forces each person to prioritize by having a little more than 50% votes of the total number of issues (7 of 12) but also gives them the opportunity to vote for more than one compelling issue
- gives some indication of the weight of each idea with respect to each other (a group score of 40 is significantly higher than a group score of 20 even though 20 may be the second highest score). This can

be used to develop what the weighted/ priority factors for a COA should be

Note - for this to work properly it is absolutely critical that ideas don't compete against each other during dot voting so creating distinguishable issues is a key part of the process.

Fishbowl

“Fishbowl” is a liberating structure aimed at developing active reflection, listening, and fresh perspectives.

Create a circle of chairs in the center of a larger circle. Five-six is a good number. If you have a very large group, there may be multiple outer circles.

Invite a small group of people that have direct experience with the challenge into the small circle of chairs at the center. Ask this group to talk about the challenge together, sharing stories of their direct experience and insights as they might do if they were sitting in a coffee shop or at dinner together. They talk to each other, NOT the audience.

Invite the audience to ask questions and share their insights about the conversation while those in the center circle just listen. Gather all the questions. You might want to use file cards or have someone capture all the questions on chart paper.

Then invite the group to dialogue with each other between the two circles.

Some good questions for the debrief:

- What did you hear that surprised you?
- How has your perspective on the issue changed?
- What questions are still open for you?

Frame Audit

Use the Frame Audit to help uncover less than successful frames and faulty logic, as well as potentially reframe an issue in more helpful ways. Given a situation and frame, do the following:

- Ask yourself: what matters most to whomever uses this frame? What do they tend to talk about the most? Why?
- Also ask: given the frame we are using, how do others tend to see/frame the same issue? What is it they consider that we don't consider?
- For the frame you are using, consider further:
    - What issue(s) does the frame address most? Why?
    - What boundaries do we put on the question? (Boundaries are what we include within the frame, versus what we leave out.)
    - What yardsticks (how we measure the question) and reference points (key measurement benchmarks) do we use to measure success?
    - What metaphors do we use in thinking about this issue? Why?
    - Why do we think about this question this way? What training or experience frames the way we view the world?
    - What does the frame emphasize? Minimize? Why?
    - Do other people in our profession think about this question differently? How? Why? Are their frames successful?
- Finally, ask whether your frame is effective:
    - Does the frame prompt you to ask the right questions most of the time?

- Have you tested or challenged the frame, or have others tried to do so?
- Is your frame decisive in the sense of helping you resolve tough issues?
- Is your frame easily communicated to and understood by others?
- Do key stakeholders accept your frame as a guide to joint action?
- Does your frame achieve sufficient simplicity without being too simple?
- Is your frame adaptive and up-to-date with respect to changing times?
- Does your frame generate solutions that achieve desired results?
- What are some notable failures of the frame? Where has it led you astray?
- What are some of the deeper assumptions which underlie your frame?
- What are some of the origins of the assumptions in your past experience?[31]

High-Impact/ Low-Probability Analysis

Highlights a seemingly unlikely event that would have major policy consequences if it happened.

When to Use

A contrarian technique that sensitizes analysts to the potential impact of seemingly low probability events that would have major repercussions on U.S. interests. Using this technique is advisable when policymakers are convinced that an event is unlikely but have not given much thought to the consequences of its occurrence. In essence, this can be a warning that the intelligence and policy communities must be alert to an unexpected but not impossible event.

Value Added

Mapping out the course of an unlikely, yet plausible, event can uncover hidden relationships between key factors and assumptions; it also can alert analysts to oversights in the mainstream analytic line. In addition, an examination of the "unthinkable" allows analysts to develop signposts that may provide early warning of a shift in the situation. By periodically reviewing these indicators a Red Team is more likely to counter any prevailing mind-set that such a development is highly unlikely.

The Method

If there is a strongly held view that an event is unlikely, then postulating precisely the opposite should not be difficult.

- Define the high-impact outcome clearly. This process is what will justify examining what most analysts believe to be a very unlikely development.
- Devise one or more plausible explanations for or "pathways" to the low probability outcome. This should be as precise as possible, as it can help identify possible indicators for later monitoring.
- Insert possible triggers or changes in momentum if appropriate. These can be natural disasters, sudden

health problems of key leaders, or new economic or political shocks that might have occurred historically or in other parts of the world.

- Brainstorm with individuals having a broad set of experiences to aid the development of plausible but unpredictable triggers of sudden change.
- Identify for each pathway a set of indicators or “observables” that would help you anticipate that events were beginning to play out this way.
- Identify factors that would deflect a bad outcome or encourage a positive outcome.

Indicators or Signposts of Change

Periodically review a list of observable events or trends to track events, monitor targets, spot emerging trends, and warn of unanticipated change.

When to Use

An analyst or team can create an indicators or signposts list of observable events that one would expect to see if a postulated situation is developing; (e.g., economic reform, military modernization, political instability, or democratization). Constructing the list might require only a few hours or as much as several days to identify the critical variables associated with the targeted issue. The technique can be used whenever a Red Team needs to track an event over time to monitor and evaluate changes. In those instances, a Red Team would be watching for mounting evidence to support a particular hypothesis, low probability event, or scenario.

When there are sharply divided views on an issue, an indicators or signposts list can also “depersonalize” the argument by shifting analytic attention to a more objective set of criteria. Using an indicators list can clarify substantive disagreements, once all sides agree on the set of objective criteria used to measure the topic under study.

Value Added

By providing an objective baseline for tracking events or targets, indicators instill rigor into the analytic process and enhance the credibility of analytic judgments. An indicators list included in a finished product also allows the policymaker to track developments and builds a more concrete case for the analytic judgments. By laying out a list of critical variables, analysts also will be generating hypotheses regarding why they expect to see the presence of such factors. In so doing, the Red Team can make the analytic line much more transparent and available for scrutiny by others.

The Method

Whether used alone, or in combination with other structured analysis, the process is the same:

- Identify a set of competing hypotheses or scenarios
- Create separate lists of potential activities, statements, or events expected for each hypothesis or scenario
- Regularly review and update the indicators lists to see which are changing
- Identify the most likely or most correct hypotheses or scenarios, based on the number of changed indicators that are observed

Developing two lists of indicators for each hypothesis or scenario may prove useful to distinguish between indicators that a development is or is not emerging. This is particularly useful in a “What If?” Analysis, when it is important to make a case that a certain event is unlikely to happen. Checklist of questions to detect possible deception can prevent the analyst from becoming paralyzed.

Key Assumption Check

List and review the key working assumptions on which fundamental judgments rest.

When to Use

Most useful at the beginning of an analytic project. An individual analyst or a team can spend an hour or two articulating and reviewing the key assumptions. Rechecking assumptions also can be valuable at any time prior to finalizing judgments, to ensure that the assessment does not rest on flawed premises. Identifying hidden assumptions can be one of the most difficult challenges an analyst faces, as they are ideas held—often unconsciously—to be true and, therefore, are seldom examined and almost never challenged.

Value Added

Explicitly identifying working assumptions during an analytic project helps:

- Explain the logic of the analytic argument and expose faulty logic.
- Understand the key factors that shape an issue.
- Stimulate thinking about an issue.
- Uncover hidden relationships and links between key factors.
- Identify developments that would cause you to abandon an assumption.
- Prepare analysts for changed circumstances that could surprise them.

The Method

Consider how their analysis depends on the validity of certain premises, which they do not routinely question or believe to be in doubt. A four step process will help analysts:

1. Review what the current analytic line on this issue appears to be; write it down for all to see.
2. Articulate all the premises, both stated and unstated in finished intelligence, which are accepted as true for this analytic line to be valid.
3. Challenge each assumption, asking why it "must" be true and whether it remains valid under all conditions.
4. Refine the list of key assumptions to contain only those that "must be true" to sustain your analytic line; consider under what conditions or in the face of what information these assumptions might not hold.

Questions to Ask During this Process Include:

- How much confidence exists that this assumption is correct?
- What explains the degree of confidence in the assumption?
- What circumstances or information might undermine this assumption?
- Is a key assumption more likely a key uncertainty or key factor?
- Could the assumption have been true in the past but less so now?
- If the assumption proves to be wrong, would it significantly alter the analytic line? How?
- Has this process identified new factors that need further analysis?

Liberating Structures

A liberating structure (LS) is any approach/technique/effort that liberates good ideas from group constraints. Liberating structures intercede factors [tangential to the process, i.e., group dynamics] that otherwise detour the group from their best productivity. Liberating structures release a group in deliberation [i.e. problem-solving or decision-making] from constraints unrelated to the problem itself.

Useful techniques are detailed throughout this chapter and at http://www.liberatingstructures.com.

Liberating structures can:

- Buy time.
- Suspend rank.
- Afford anonymous input.
- Vocalize opportunity costs.
- Enjoy life, suspend stressors.
- Lead a person out of logical habits.
- Take people out of their comfort-zone.
- Test prevalent wisdom as though it were wrong.
- Summons diversity; contributions with differing expertise, backgrounds, perspectives, etc.
- Invites dichotomy; from those closest to the problem to farthest from the bias or a view on the other side.

Mitigating Groupthink

- The leader should refrain from stating up front any preferences or expectations.
- Establish an *expectation of conflict* in deliberation—but focused on the issues, not between personalities. Conflict can foster creativity and learning.
- Prior to beginning, have all individual "pre-commit" by writing down their initial answers to the issue being discussed—this helps establish ideas prior to deliberation and mitigate a pull toward conformity. Demand several options from each member.
- Each member of a decision-making group should have the *responsibility* to air objections and doubts, and be reinforced by the leader's acceptance of criticism from the group at large.
- *Leverage anonymity of ideas and responses* where possible.
- The group should consciously construct alternative perspectives of the situation. Alternative perspectives force the group to form options in the case they occur.
- The group should set up several independent sub-groups to work on the same issues. *Seek diversity in assembling these groups*.
- The group should assign individuals to act as a devil's advocate vis-à-vis options, policies, etc., that the group is assembling.
- The group's individuals should seek outside expertise and input on the question(s) at hand.
- The group should bring in expertise to challenge the views being developed by the group itself.
- Once the group has reached a conclusion on the best option, a "second chance" meeting should be held at which

every member restates any and all reservations he/she may have concerning the chosen option.

My 15%

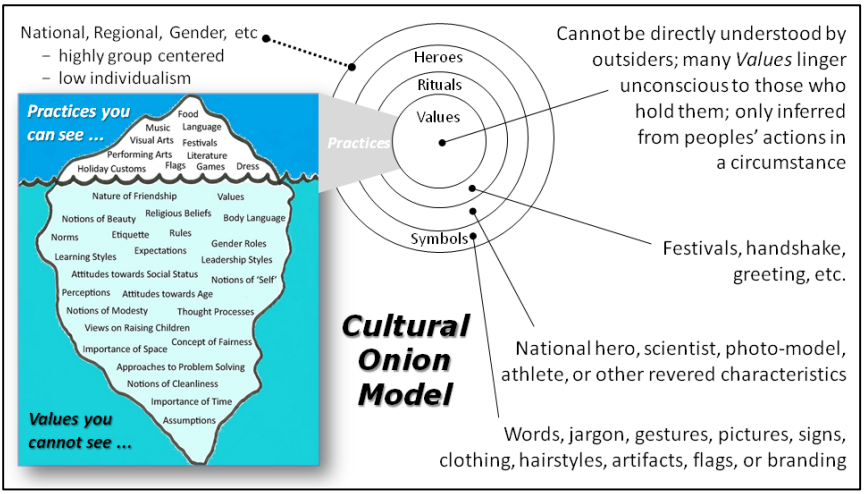
Most people have about 15 percent control over their work situations. The other 85 percent rests in the broader context, shaped by the general structures, systems, events and culture in which they operate. The challenge rests in finding ways of creating transformational change incrementally: By encouraging people to mobilize small but significant "15 percent initiatives" that can snowball in their effects. When guided by a sense of shared vision, the process can tap into the self-organizing capacities of everyone involved.

It doesn’t matter if you’re a General Officer or an enlisted soldier, a Senior Executive or a member of the team. You still have only your 15 percent.

Where do you have freedom to act? What’s in your 15%?

Onion Model

Hofstede's "Onion" Model: Manifestations of Culture at Different Levels of Depth (p. 30). In Hofstede's model we find *Values* at the core, wrapped by *Rituals*, *Heroes*, and *Symbols.* Each layer is influenced by the core and subsumed under the term *Practices*. As with most red teaming tools, the "onion model" should be used to prompt better questions, create a more comprehensive perspective, and expose ignorance. Notionally, it is possible to learn about, train on, or emulate each layer through concentrated practice; but not the core. Core values are learned culture, and deeply contextual. This is what Connerley and Pederson meant when they said "Culture may be learned, but it cannot be taught."[32]



When to Use

Like *4-Ways of Seeing*, use this tool early in any cultural review. Many people belong to several different groups at the same time, unavoidably carrying within them layers of mental programming that corresponds to different levels of culture. Refer to Chapter III for additional insight.

Value Added

This model helps to surface manifestations, similarities, and differences among or within the culture of a country, region, or group.

The Method

Interview and observe subjects. Postulate values and layers within the group(s). Populate the layers. Compare and contrast against the other selected groups, as needed.

For example:

- a *National* level according to one's country (or countries for those who migrated during their lifetime)
- a *Regional* and/or *Ethnic* and/or *Religious* and/or *Linguistic Affiliation* level; most nations are composed of culturally differing groups: regions, ethnicities, religions, and language
- a *Gender* level, according to whether a person was born as a girl or as a boy
- a *Generation* level, according to whether a person is a grandparent, parent, or child
- a *Social Class* level, according to opportunities linked with educational, occupational, or social standings
- an *Organizational* or *Corporate* level, according to how employees are/were socialized in their workplace

Outside-In Thinking

Used to identify the full range of basic forces, factors, and trends that would indirectly shape an issue.

When to Use

At the conceptualization of an analytic project, when the goal is to identify all the critical, external factors that could influence how a particular situation will develop. It would work well for a group of analysts responsible for a range of functional and/or regional issues. When assembling a large database that must identify a number of information categories or database fields, this technique can aid in visualizing the entire set of categories that might be needed in a research effort. Often analysts realize only too late that some additional information categories will be needed and then must go back and review all previous files and recode the data. With a modest amount of effort, “Outside-in Thinking” can reduce the risk of missing important variables early in the analytic process.

Value Added

Most analysts spend their time concentrating on familiar factors within their field or analytic issue. That is, they think from the “inside”—namely, what they control—out to the broader world. Conversely, “thinking from the outside-in” begins by considering the external changes that might, over time, profoundly affect the analysts’ own field or issue. This technique encourages analysts to get away from their immediate analytic tasks (the so-called “inbox”) and think about their issues in a wider conceptual and contextual framework. By recasting the problem in much broader and fundamental terms, analysts are more likely to uncover additional factors, an important dynamic, or a relevant alternative hypothesis.

The Method

Develop a generic description of the problem or the phenomenon under study. Then:

- List all the key forces (social, technological, economic, environmental, and political) that could have an impact on the topic, but over which one can exert little influence (e.g., globalization, social stress, the Internet, or the global economy).
- Focus next on key factors over which an actor or policymaker can exert some influence. In the business world this might be the market size, customers, the competition, suppliers or partners; in the government domain it might include the policy actions or the behavior of allies or adversaries.
- Assess how each of these forces could affect the analytic problem.
- Determine whether these forces actually do have an impact on the particular issue based on the available evidence.

Premortem Analysis

This is a method for helping decision makers anticipate problems. The purpose of a Premortem is to find key vulnerabilities in a plan. In contrast to risk analysis, the Premortem begins with the assumption that the plan *has failed*. The pull of groupthink, consensus, and a false sense of security is punctured, and is replaced by an active search aimed at preventing trouble later on. The premise for the Premortem exercise is that people may feel too confident once they have arrived at a plan. Premortem analysis empowers the participants to question the premise of a proposed course of action, its assumptions, and tasks. It breaks ownership of a course of action through a divergent process that encourages objectivity and skepticism.

Dr. Gary Klein developed the concept of the Premortem analysis.[33] This is a powerful red teaming tool as it is 1] simple to use, 2] simple to understand, 3] and when used during the decision-making process will empower the red team and members of the larger plans team to question the premise of a proposed course of action, assumptions, or specified tasks.

When to Use

The ideal time to use a Premortem analysis is just before the war gaming step in the decision making process, either the war game that analyzes proposed COAs or the war game that refines the selected COA into the concept of the operation.

Value Added

The use of a Premortem analysis will break the ownership of a particular course of action by a thorough, if rapid, session of answering the question, what would cause this course of action to fail if it is the basis for the operations plan?

The Method

Premortem analysis is an application of mental simulation. The premise for Premortem analysis is that people may feel too confident once they have arrived at a plan, especially if they are not highly experienced. The Premortem analysis requires one person to act as the scribe and must be limited in duration to no more than 30 minutes, ideally 20.

Step 1 Preparation. All members should be familiar with the base plan, at a minimum.

Step 2 Imagine a fiasco. Imagine that the plan failed. Ask, why did this happen? What could have caused this? Specifically, what are the *reasons*?

Step 3 Generate the reasons for failure. Participants individually spend several minutes writing down all the possible reasons for failure. It is important to do this individually first, so that the insights and experience of each participant are brought to bear.

Step 4 Consolidate the lists. Go around the room in round-robin fashion and solicit input from the participants, one at a time. Record the ideas on a whiteboard or poster paper. Continue until all ideas are exhausted. This is a divergent process in which four rules must be followed:

Rule 1: The more ideas, the better

Rule 2: Build one idea upon another. In other words, if someone else's idea prompts a new one from you, write it down.

Rule 3: Wacky ideas are okay. This rule bothers most people. Conventional wisdom dictates that "new" ideas must be sensible, reasonable, constructive, and practical. Wacky, silly, and foolish are subjective modifiers that people tend to apply to any idea that does not conform narrowly to a risk-free standard of sensible, reasonable,

constructive, or practical. Although wacky ideas may seem foolish, they can generate serious thought.

Rule 4: Don't evaluate ideas, neither yours nor someone else's. This includes body language, eye rolls, nods or groans. This rule liberates people from their self-imposed restraints in generating ideas, and eliminates fear of criticism and ridicule.

Step 5 Revisit the plan. Based on the list of concerns, revisit the plan and determine what to mitigate. Determine "ownership" and develop concepts for modifications to the plan.

Step 6 Keep and periodically review the list. This helps keep the possibility of different types of failure fresh in everyone's mind as the plan develops or is implemented.[34]

Problem Restatement

When to use

Problem Restatement is a process ideally conducted during the early stages of the problem solving process (Defining the Problem). Too often, humans uncritically accept a problem statement as given, without critically reflecting on whether the problem has been adequately framed. This happens because we are usually too eager to jump in and solve the problem as stated —believing that "the authorities know what they want"—rather than first considering various ways the problem could be framed. Several examples of poorly framed problems include those that:

- Are too *vague or broad* in definition
- Are too *narrow* in definition
- Contain inherent assumptions
- Contain a presumed solution

Since the manner in which we frame a problem directly affects its solution, poor problem framing leads to solutions which don't solve the real problem at hand.

Value added

Problem Restatement tool allows red teamers a way to ensure that the commander and staff have adequately considered how to best frame their problems, before solving those problems.

The Method

Problem Restatement consists of conducting several tasks related to the "proposed problem statement" in a *divergent* thinking mode, before settling on the best frame of the problem. Do each of the following; any or all of these may lead to alternative perspective in improving the framing of the problem:

- Paraphrase the problem statement—restate it using different words without losing the original meaning.

"Trying to say the same thing with different words puts a slightly different spin on the meaning, which triggers new perspectives and informative insights."

- Turn the problem on its head—by stating it in an opposite manner. (This is similar to Devil's Advocacy: stating the given problem in the opposite manner. This provides a different perspective in which to consider the problem.)
- Broaden the focus—restate the problem in a larger context. This may reveal a narrowly-defined problem statement.
- Redirect the focus—boldly, consciously change the focus of the problem. If the original focus concerned boosting sales, consider framing the problem instead in terms of cutting costs. This task involves looking for unexamined variables affecting the problem frame.
- Ask "Why?" Formulate a "why" to the initial question, then answer it, then do it again, etc. Conducting this task may reveal insights obscured in the original framing of the problem statement, as well as murky, unclear thinking.

Quality of Information Check

Evaluate completeness and soundness of available information sources.

When to Use

Weighing the validity of sources is a key feature of any critical thinking. Moreover, establishing how much confidence one puts in analytic judgments should ultimately rest on how accurate and reliable the information base is. Hence, checking the quality of information used in intelligence analysis is an ongoing, continuous process. Having multiple sources on an issue is not a substitute for having good information that has been thoroughly examined. Analysts should perform periodic checks of the information base for their analytic judgments. Otherwise, important analytic judgments can become anchored to weak information, and any “caveats” attached to those judgments in the past can be forgotten or ignored over time.

Value Added

A thorough review of information sources provides analysts with an accurate assessment of “what we know” and “what we do not know.” It is also an opportunity to confirm that sources have been cited accurately. In the case of HUMINT, this will require extensive review of the sources’ background information and access as well as his or her motivation for providing the information. Similarly, reviewing technical sourcing can sometimes reveal inadvertent errors in processing, translation, or interpretation that otherwise might have gone unnoticed. In addition, a quality of information check can be valuable to both collectors and policymakers:

- It can help to detect possible deception and denial strategies by an adversary.
- It can identify key intelligence gaps and new requirements for collectors.
- It can assist policymakers in understanding how much confidence analysts are placing on analytic judgments.

The Method

An analyst or a team might begin a quality of information check by developing a database in which information is stored according to source type and date, with additional notations indicating strengths or weaknesses in those sources. Ideally, analysts would have retrieval and search capability on the database, so that periodic reviews are less labor intensive and result in a more complete review of all sources used in past analysis. For the information review to be fully effective, analysts will need as much background information on sources as is feasible. Knowing the circumstances in which reporting was obtained is often critical to understanding its validity. With the data in hand, analysts can then:

- Review systematically all sources for accuracy.
- Identify information sources that appear most critical or compelling.
- Check for sufficient and strong corroboration of critical reporting.
- Reexamine previously dismissed information in light of new facts or circumstances that cast it in a different light.
- Ensure that any recalled reporting is identified and properly flagged for other analysts; analysis based on recalled reporting should also be reviewed to determine if the reporting was essential to the judgments made.
- Consider whether ambiguous information has been interpreted and caveated properly.
- Indicate a level of confidence that analysts can place in sources, which are likely to figure in future analytic assessments.

Red Team Analysis

Models the behavior of an individual or group by trying to replicate how an adversary would think about an issue; UFMCS also refers to this method as the *Initiatives Group*.

When to Use

Frequently, analysts face the challenge of forecasting how a foreign leader or decision-making group may behave when it is clear that there is a risk of falling into a "mirror-image" problem. That is, analysts can sometimes impute to a foreign actor the same motives, values, or understanding of an issue that they hold. Traditional analysis sometimes assumes that foreign leaders or groups will behave "rationally" and act as the analysts would if faced with the same threats or opportunities. History has shown that foreign leaders often respond differently to events because of different cultural, organizational, or personal experiences. Red teaming analysis tries to consciously place analysts in the same cultural, organizational, and personal setting ("putting them in their shoes") in which the target individual or group operates. Whereas analysts normally work from the position of the "blue" (friendly forces), a "red" team of analysts attempts to work in the environment of the hostile forces.

Value Added

Like Devil's Advocacy and Team A/Team B techniques, red teaming analysis is aimed at freeing the analyst from the prison of a well-developed mind-set; in this case, the analyst's own sense of rationality, cultural norms, and personal values. Whereas analysts usually operate as "observers" of a foreign adversary, the red teaming technique transforms the analyst into an "actor" operating within the adversary's culture and political milieu. This form of "role playing" is useful when trying to replicate the mind-set of authoritarian leaders, terrorist cells, or other non-Western groups that operate under very different codes of behavior or motivations. Often this technique can introduce new or different stimuli that might not have been factored

into traditional analysis—such as the target's familial ties or the international political, economic, and military pressures felt by the individual. For example, Red Team participants might ask themselves: "What would my peers, family, or tribe expect me to do? Alternatively, a Red Team analyst might pose the question to his colleagues: "How do we perceive the external threats and opportunities?" Finally, the red teaming technique can factor into its analysis the way in which personal power and status might influence a target's behavior.

The Method

Build a team of experts with in-depth knowledge of the operating environment, the target's personality, and the style of thinking used. The team should be populated not just with those who understand the language, but also with people, who might have experienced the culture, share the ethnic background, or have worked in a similar operational environment. Once established and separated from traditional analysis, the team members should:

- Put themselves in the adversary's circumstances and react to foreign stimuli as the target would.
- Develop a set of "first-person" questions that the adversary would ask, such as: "How would I perceive incoming information; what would be my personal concerns; or to whom would I look for an opinion?"
- Draft a set of policy papers in which the leader or group makes specific decisions, proposes recommendations, or lays out courses of actions. The more these papers reflect the cultural and personal norms of the target, the more they can offer a different perspective on the analytic problem.

Red teaming analysis is not easy to conduct. It requires significant time to develop a team of qualified experts who can think like the adversary. The team has to distance itself from the normal analysis and work as though living in the

target's world. Without a sophisticated understanding of the culture, operational environment, and personal histories of the foreign group, analysts will not be able to behave or think like the enemy. Analysts can never truly escape their own experiences and mindsets, but this technique can at least prevent them from falling into "mirror-imaging" unconsciously.

The most novel feature of red teaming analysis is its presentation.

- The analysis is often in a "first person" format—that is, drafted as memos to or from a leader or group.
- Red teaming analysis avoids the use of caveats or qualifications and assumes that the recipient understands that the paper is aimed more at provoking thought or challenging the conventional understanding of how an adversary thinks.
- Such papers are rarely coordinated among other experts and do not purport to represent the consensus view on an issue.

Red teaming papers do not plot out all possible courses of action but seek to give a prediction based on the target's special personal, organizational, or cultural experiences.

Red Teaming – Assessment Questions

- Are the proposed measurements of effectiveness clearly linked to the strategy, mission, or end state?
- Does the measurement have a clear start point (baseline) in which to measure progress?
- Does the measurement system incorporate higher headquarters metrics? Are the unit's tasks developed to local conditions?
- What is the level of coalition or interagency agreement to the assessment measures? If no agreement, what are the implications?
- Who has primary responsibility for assessment? Has the task (who, what, when, where) been established?
- Has key assessment measures been included in the unit's CCIR?
- Do the metrics reflect a cultural sensitivity, whereby important things are measured? From the civilian population perspective, does the U.S. MOE matter (e.g., Maslow Theory - electricity vice elections)? What are the expectations of the people in terms of patience for process?
- From the enemy's perspective, what are their measures of effectiveness? Does our MOE's measure what is important to him?

Red Teaming – Assumption Questions

When to Use

An individual analyst or a team can spend an hour or two articulating and reviewing the key assumptions. Rechecking assumptions also can be valuable at any time prior to finalizing judgments, to ensure that the assessment does not rest on flawed premises. Identifying hidden assumptions can be one of the most difficult challenges an analyst faces, as they are ideas held—often unconsciously—to be true and, therefore, are seldom examined and almost never challenged.

Value Added

Explicitly identifying working assumptions during an analytic project helps:

- Explain the logic of the analytic argument and expose faulty logic
- Understand the key factors that shape an issue.
- Stimulate thinking about an issue
- Uncover hidden relationships and links between key factors
- Identify developments that would cause you to abandon an assumption
- Prepare analysts for changed circumstances that could surprise them

The Method

Consider how their analysis depends on the validity of certain premises, which they do not routinely question or believe to be in doubt. A four step process will help analysts:

- Review what the current analytic line on this issue appears to be; write it down for all to see.

- Articulate all the premises, both stated and unstated in finished intelligence, which are accepted as true for this analytic line to be valid.
- Challenge each assumption, asking why it “must” be true and whether it remains valid under all conditions.
- Refine the list of key assumptions to contain only those that “must be true” to sustain your analytic line; consider under what conditions or in the face of what information these assumptions might not hold.

The List

- Does the assumption meet the standards for an assumption; fact or opinion?
- Is the assumption based on preconception, bias, or historical analogy; are they relevant and/or accurate?
- Is the assumption logical, given what is known about the enemy (equipment, doctrine, and TTP), weather, and terrain; does the assumption reflect reality found in the OE?
- Does the staff use a defined procedure throughout the planning and preparation (and potentially portions of the execution phase) that continually examines whether assumptions are valid?
- Is the assumption appropriate to the level of planning?
- Are there assumptions made implicitly during planning but not stated or assumptions made by the staff but not included in the plan?
- How is the staff addressing assumptions included in higher headquarters plans?
- How many assumptions are acceptable?

Red Teaming – Key Questions

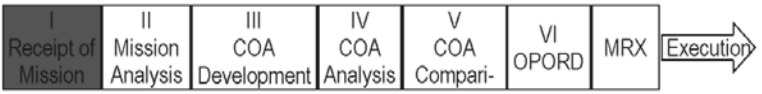
Red Teams continually and constructively challenge the staff's thinking processes during planning and operations:

Question	**Result in**
• What if….?	• Alternative analysis
• What are the objectives of….?	• Consideration of enemy, partner, and others on the battlefield
• What about….?	• Identification of gaps, seams, vulnerabilities
• What are we missing?	• Identification of gaps, seams, vulnerabilities
• What happens next?	• Identification of branches and sequels
• What should we assess?	• Identification of measures of effectiveness
• How can we assess…?	• Description of the assessment
• How do we know success?	• Description of a desired end-state
• What worked and why?	• Enables a learning organization
• What didn't work and why?	• Avoid patterns of operation

Red Teaming – MDMP Actions

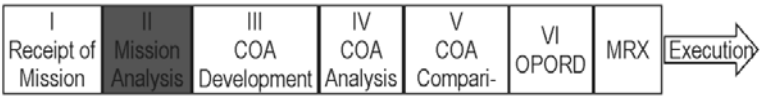
The military decision making process (MDMP) combines the conceptual and detailed aspects of planning and integrates the activities of the players throughout the planning process. The MDMP begins with *Receipt of the Mission* and ends with *Execution*. Staff actions are outlined in doctrine and the following are recommendations for the Red Team.

Receipt of the Mission



1. Based on the mission brief, construct a simple matrix using the *S-W-O-T* (p. 204) formula identified in the briefing which are found in the operational environment from the US, adversary, and other perspectives. From this matrix, what are glaring omissions/gaps in the briefings/products provided?
2. What are the timelines associated with the plan?
3. Did the mission brief provide sufficient details to support the planning for all phases of the operation?
4. Were higher headquarters assumptions identified?

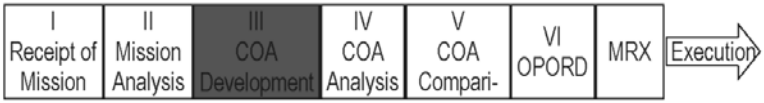
Mission Analysis



5. Assist the staff in the identification of specified, implied, and essential tasks.
6. Identify higher headquarters assumptions and challenge assumptions used by the staff.
7. Attend mission analysis brief.
8. Identify the enemy and US/coalition centers of gravity from their perspectives.

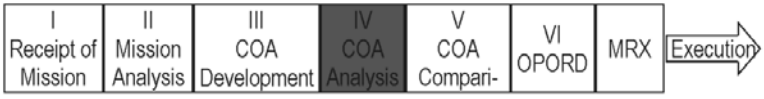
9. Identify potential end state definitions for adversaries, coalition, and other major stakeholders.
10. Continue OE/cultural analysis for use in COA Development.
11. Red Teaming Tools/Questions include:
    - Was the U.S./coalition end states clearly stated? Are there differences between the partners? Did we identify the enemy end state?
    - Does the information about the OE provide sufficient detail and linkages among the variables?
    - Has the higher headquarters provided any "assessment" measures that would affect formulation of the unit's assessment system

COA Development



- Is there sufficient focus and identification of requirement for all phases of the operations (e.g., stability and support)
- Does the COA account for all variables found in the OE (e.g., PMESII-PT)?
- Are the assessment tasks sufficiently identified?
- Continually examine assumptions for validity. Is there a plan to confirm/deny them? What consequences or branches are required? Did we consider key assumptions as potential CCIR? ISR Implications?
- Conduct a *Premortem Analysis* (p. 165) of the COAs.

COA Analysis



- Assist staff by serving as the unbiased "umpire" for the war game to arbitrate disputes.
- Help staff determine if adequate measures are in place to measure success and how/who will provide input to the measurement.
- Monitor the war game to help insure accuracy, for:
  - Realistic friendly and enemy capabilities.
  - Appropriate actions and results.
- Review the war game procedures and questions.
- Does the war game account for the involvement, reaction, or counteraction by significant stakeholders? (*4 Ways of Seeing* p. 76, *Stakeholder Mapping* p. 186)

(DOD) Wargaming is a conscious attempt to visualize the flow of an operation, given own strengths and weaknesses and dispositions, enemy assets and possible COAs. It attempts to foresee the action, reaction, and counteraction dynamics of an operation. This process highlights tasks that appear to be particularly important to the operation and provides a degree of familiarity with operational-level possibilities that might otherwise be difficult to achieve. **(JP 5-00.2)**

War games succeed or fail due for a variety of reasons. Red Teams can help the staff review the following with them:

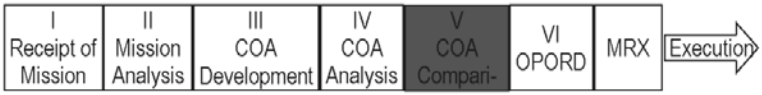
12. What are the standing operating procedures for the war game?
13. Who's in charge? XO or Chief of Staff according to doctrine – Is this reality?
14. What is the role of the G5/G3 Planner – who has ownership of the plan?
15. Who's the umpire? Who decides and arbitrates disputes?
16. Is there sufficient time available for war gaming?

Does the war game account for the most difficult phase or aspect of the planned operation? (e.g., for a conventional fight – river crossing/passage of lines are considered among the most difficult).

Who fights the enemy? G2? Is there significant seniority/expertise of the enemy team?

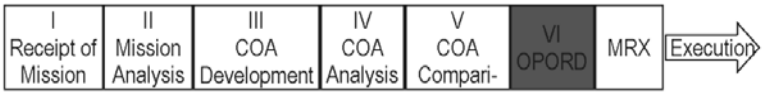
- Is the enemy's "aim and concept" placed within a larger context to see the "big picture"?
- Is the range of alternatives available broad enough for consideration (e.g., prevent deployment of US forces)?
- Are enemy capabilities wished away through the application of joint capabilities (e.g., airpower)
- Does the enemy fight realistically? What doctrine/TTP?
- What is the cultural mindset and how does it influence the ECOA?
- Based on lessons from the war games, which intelligence estimates require changes?
- What assumptions are used? What unstated assumptions are used?
- What procedures or "plays" are used based on SOP? TTP from experience? How is the OE for the current operation different from previous experience?
- Who role plays the others on the battlefield? Civilian factions, militias, NGOs, corporations?
- Who role plays the coalition or interagency partners?

<u>COA Comparison</u>



- Monitor development of COA comparison and subsequent briefings to ensure the COA accounts for critical items to include:
    - the OE variables
    - assumptions
    - perspectives of coalition partners and others

OPLAN/OPORD Production & Briefing



17. If directed, conduct order's crosswalk to identify gaps, disconnects, or vulnerabilities to the plan based on critical review of the prepared order and staff annexes and appendices.
18. Review the assessment plan to insure adequacy and it reflects the cultural implications associated with assessing progress.
19. Review timelines for release of the order/plan for a review whether sufficient planning time is available for subordinate units.

Key Points

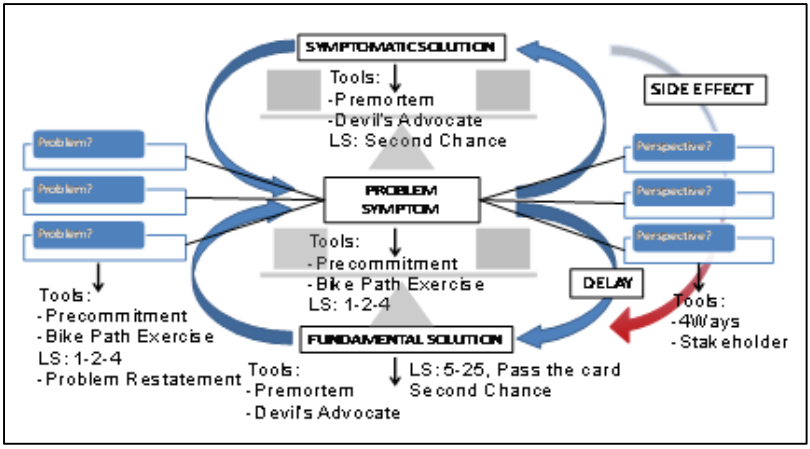
- Red Teams do not normally produce a separate staff product for inclusion in the order or plan.
- The best measure of Red Teams value is the staff producing a better staff product and identification of alternatives to the Commander.
- Red Teams depend on the Commander's or Chief of Staff's guidance, the negotiations/communication skills of the Red Team, and the culture of the unit.

Shifting the Burden

The “Shifting the Burden” model structure as Peter Senge calls it is composed of two balancing (stabilizing) processes. Both balancing loops try to correct the same problem symptom, but one addresses symptoms while the other addresses the underlying problem(s). Efforts directed only at symptomatic solutions which appear beneficial at first only serve to exacerbate the problem over time, often with debilitating side effects.

While Senge addresses the underlying problem indirectly in “Understanding and Using the Model” on page 105 of *The Fifth Discipline*, (revised 2006 edition), the problem is not part of the model, only the problem symptom. He talks about a problem again in “How to Create Your Own Shifting the Burden Model” on page 111, but does not address how to determine what the problem is or how it is perceived.

Senge’s approach is symptom/solution centric. The addition of problem and perspective elements to the structure along with Red Team tools and Liberating Structures to diagnose them, make Senge’s structure a richer framework for Red Teamers to develop alternative perspectives and options. To start with identifying the problem symptom as Senge suggests is a good place to begin, but rather than proceeding from there to identifying the fundamental solution (convergent thought process), this model recommends a close examination of the underlying problem(s) and perspective(s) before moving on to the solution(s). Sometimes restating a problem shows there is more than one problem. Several tool recommendations are included in the illustration on the next page.



Operating Assumption is an alternate term for Perspective. JJ O'Boyle explains operating assumptions and cultural logic in *The Culture of Decision Making*; http://www.winstonbrill.com/bril001/html/article_index/articles/251-300/article251_body.html.

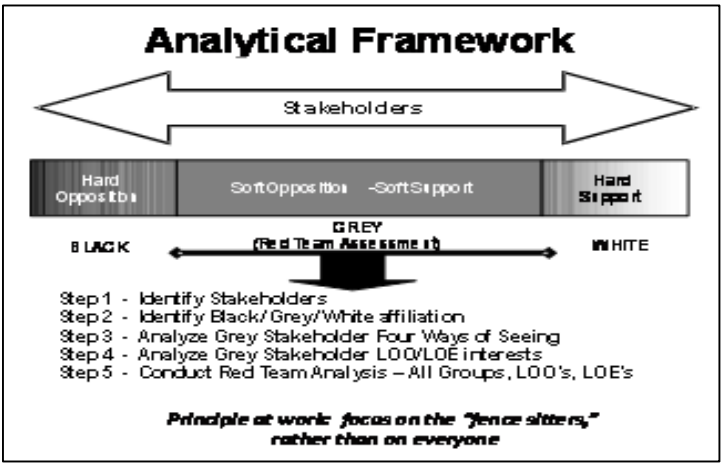
Stakeholder Mapping

When to Use

Stakeholder Mapping is a diagnostic tool for use in analysis, influence, negotiation, and decision support. It should be used when the Red Team needs to demonstrate the breadth of effects a planned operation can have within an operating area. Using intelligence and information available, the Red Team can develop a perspective on operations that will enhance the appreciation of the staff on potential unintended consequences of operations. The Red Team can also suggest methods of improving the impact of an operation on groups that are "on the fence" regarding their support for US/coalition/host nation operations.

Value Added

Stakeholder Mapping's greatest value is in the campaign design phase of decision making, specifically in framing the problem. In developing the commander's appreciation for the mission and operating area that precedes mission analysis Stakeholder Mapping provides understanding and viewing the operational environment from a systemic perspective. The analysis that occurs in the Stakeholder Mapping provides commander and planners insights into how the stakeholders view operations in the battle space.

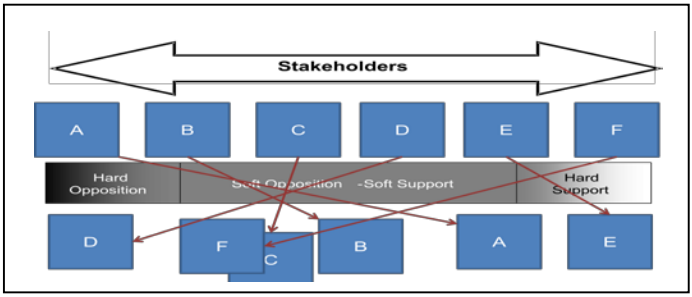


The Method

Step 1: Identify Stakeholders. They can be:

- Internal or external
- Individual, organization, or entity
- Strategic, Operational, or Tactical
- Senior or subordinate, or horizontal levels

Step 2: Identify Stakeholder Black/White/Grey Affiliation



Step 3: Analyze Grey Stakeholder *4-Ways of Seeing*

Conduct thorough research to complete the analysis of these perceptions as it is more complex than the simple model implies, for several reasons:

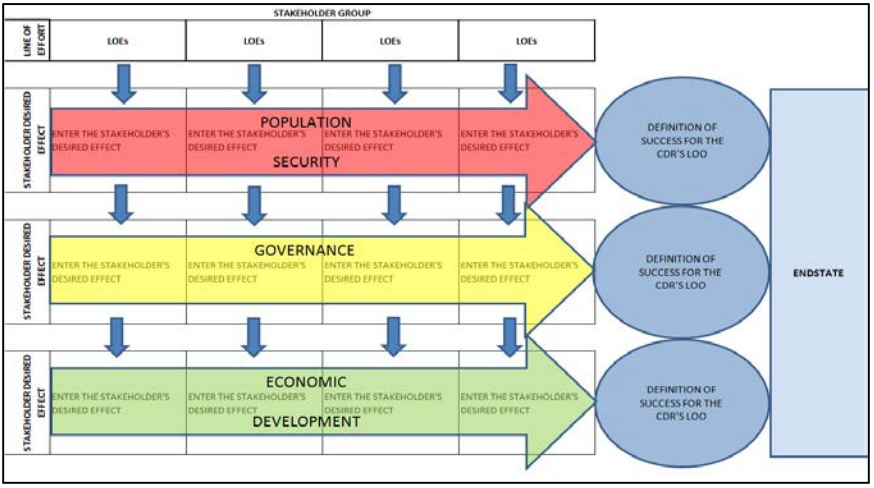
- Seldom, if ever, will there be only two actors in the system under study.
- All the actors' perceptions and inter-relationships within the system must be considered in order to provide context for the analysis.
- How each actor perceives and defines the organizational or Operational Environment, strategic goals, and plans must be considered.
- It must be realized that actors and organizations may hold perceptions, both accurate and inaccurate.

- Perceptions of the external audience(s) to whom we and our allies are playing cannot be discounted.

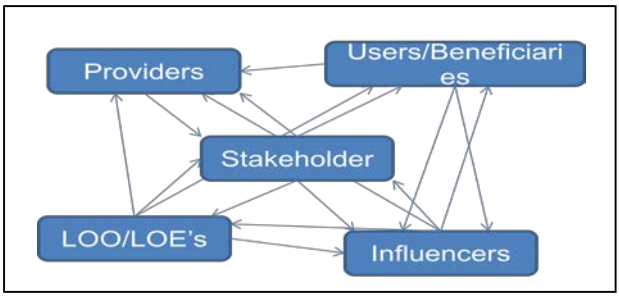
	A	B	C	D	E	F
A	A-A	B-A	C-A	D-A	E-A	F-A
B	A-B	B-B	C-B	D-B	E-B	F-B
C	A-C	B-C	C-C	D-C	E-C	F-C
D	A-D	B-D	C-D	D-D	E-D	F-D
E	A-E	B-E	C-E	D-E	E-E	F-E
F	A-F	B-F	C-F	D-F	E-F	F-F

Step 4: Analyze Stakeholders Lines of Effort (LOE) Interests.

- After a thorough assessment of the Stakeholder, the Red Team defines the Stakeholder's LOEs. Begin with the "fence sitters."
- Determine what the Stakeholder's Desired effect is within each LOE.
- Next, the Stakeholder's desired effect in the Lines of Effort (LOE) is assessed within the Commander's LOOs.



Step 5: Red Team Analysis: Organizational Mind Mapping. There is no one way to conduct Red Team analysis. Mind Mapping may be useful in organizational analysis: after identification of stakeholders, categorization is required. This is done by using a whiteboard or flip chart.

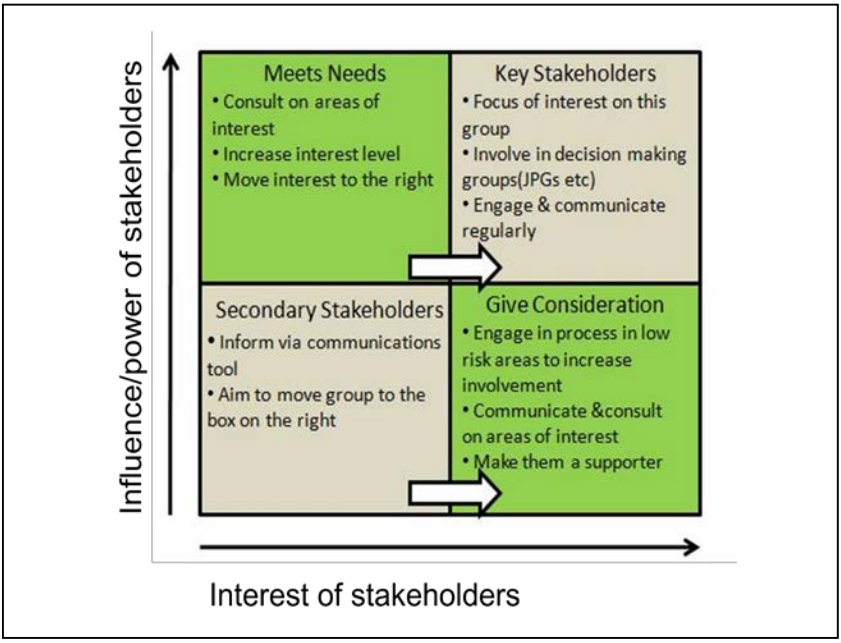


The arrows are representative of potential links between stakeholders, e.g., command relationships, habitual collaboration, common interests, etc.

Step 6: Another method for Analysis

- Once stakeholder interests have been mapped, they must be prioritized. A common approach is to map the interest and influence of each stakeholder group based on a chart like this one:

- Once the stakeholders have been mapped, focus of effort can be placed on the highest priority groups while providing sufficient information to keep the less influential groups happy.



Strategies for Structured Analysis

These structured analytic techniques can be used in a variety of ways when analysts begin a new assessment. Some can be used equally effectively at multiple points in the process and can promote an analyst's ability to keep an open mind, to consider multiple—including highly unlikely—hypotheses, to challenge conventional wisdom, and to assess the impact of important information gaps or deception on analytic judgments and confidence levels. The Timeline for Using Analytic Techniques provides some thoughts on when to use one or more of them during the course of an analyst's research and writing.

Starting Out

At the beginning of an analytic project, analysts are always wise to consider brainstorming and assumptions checks to ensure that important factors are not being missed or taken for granted. Similarly, outside-in-thinking can sometimes put an analytic project into a broader international context, in which factors outside the lead analyst's area of responsibility might impact on his or her analytic judgments. For instance, economic assumptions about the price of oil might be key to a regional political analyst's understanding the prospects for political stability in an oil-exporting country or an underdeveloped country entirely dependent on expensive energy imports. A High Impact/Low Probability assessment can also sensitize analysts early on to the significance of dramatic events that might affect their analytic lines.

Some techniques like Indicators and Signposts or Analysis of Competing Hypotheses (ACH) can be useful throughout a project and revisited periodically as new information is absorbed and analyzed. ACH, in particular, is a good tool to use throughout a project to prevent premature closure and to highlight evidence that is most "discriminating" in making an analytic argument. Alternative Futures analysis is similarly useful at the beginning of a project, but can amount to the structure for the entire project.

Hypothesis Testing

As an analytic project takes shape, and hypotheses are being formed about the key intelligence question, it can be appropriate to use one or another contrarian technique to challenge the conventional analytic line that is being developed. If the assessment contains strong judgments about an adversary's behavior, then challenging this view with a "Red Team" effort might be a good corrective to too much of a rational actor approach. In addition, a review of intelligence gaps at this juncture can also help give the analysts a better degree of confidence in the information base and judgments reached in the assessment.

A Final Check

As the assessment is being finalized, it can still be useful to review key assumptions as a sanity check on the underlying logic of the analysis. A brainstorming session also may be helpful to ensure that no plausible hypothesis has been dismissed or left unaddressed. If a firm consensus has formed around an analytic line and has not been seriously questioned in some time, then a Devil's Advocacy exercise could be useful. Analysts might also use a final review to decide if they have identified a list of key indicators for future developments. This can be an important guide to include in the assessment as a way to track future developments and monitor whether the analytic judgments reached are being realized or in need of revision.

String of Pearls

The Army Directed Studies Office developed the Task Concept Analysis technique, often called the “string of pearls” as a technique to link a rigorous analysis of assumptions with consideration of unintended consequences. This is a time consuming analysis best suited to a structured planning process. Use of the tool provides a way to visualize the cumulative effects that result from “wishful thinking” and failure to consider the many possible outcomes in a friendly plan or order. This analysis will show if the plan is vulnerable to faulty assumptions; dependencies that may not remain in place when the plan is executed; or the effects of unmitigated, unintended consequences (cascade or 2nd & 3rd order effects).

Identifying critical vulnerabilities in the plan allows planners to reinforce or mitigate these critical vulnerabilities. At a minimum, it informs the commander that there is a risk associated with a particular area in the plan. There are an infinite number of unintended consequences for any action. This technique will help identify those that are most likely to occur and most likely to generate results which may need to be mitigated by branch and sequel planning.

This analysis of the plan can stand alone or be used in a comparison with an emulative analysis of an enemy plan in order to see where differing strategies match up. The staff may identify an enemy strategy that is “unanswered” by a friendly course of action.

When to Use

String of Pearls is a time consuming process. It is best used when the Red team is asked to do an independent assessment of an existing plan. Red Teams can also use the method in a focused manner for analyzing and challenging assumptions associated with a plan, as well as showing the cumulative effect of failed assumptions on the entire plan.

Value Added

The methodology is a rigorous process of analyzing the plan:

- help prevent "assuming away the problem"
- identify weaknesses in a plan
- force consideration of unintended consequences
- highlight the need for focused branch &/or sequel plans

The Method

There are four basic steps to conducting a concept analysis.

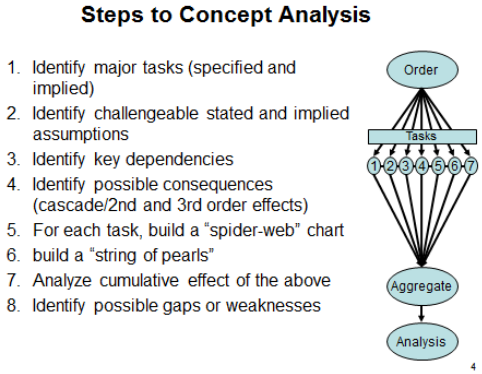
Step one is to identify all the major tasks.

Step two is to identify three elements of each major task:

- Identify challengeable stated and implied assumptions
- Identify key dependencies in each task
- Identify the potential unintended consequences (cascade and 2nd & 3rd order effects) for each task

Step three is to depict how the combined assumptions, key dependencies, and possible unintended consequences for each task accumulate across the entire plan.

Step four is to analyze how the cumulative effect [depicted above] might indicate any gaps or weaknesses in the plan.



The key to this *concept analysis* is the graphics rendered in *PowerPoint*, e.g., the source of the phrase *String of Pearls*. It is this representation which allows the decision maker to

"see" and understand the cumulative effects which are often hidden when considered separately.

Assumptions & Dependencies

Appropriate assumptions have two characteristics:

- They are valid, that is, they are likely to be true, and
- They are necessary, that is, they are essential to continuing the problem solving process.

The staff is most concerned about the validity of each assumption. If planners are considering assumptions that are valid but not necessary, they are creating extra work for themselves. If they are creating a roadblock in the planning process for themselves by identifying an assumption that is not necessary but can't be shown to be valid, that is a concern and should be pointed out. It is important to distinguish between assumptions and dependencies.

- Assumptions replace unknown facts in order to enable continued planning.
- If an assumption is invalid, the task associated with it may fail or may be at risk of failure.
- A dependency is a critical condition or precursor action necessary for successful execution of the task.
- Another task can be a dependency.

Let's talk about the difference between an assumption and a dependency. By re-wording a dependency, you can turn it into an assumption but that defeats the purpose of this analysis. For example, you could say either that execution of a task is dependent on fuel being available or that a planning assumption is that fuel will be available.

The difference is temporal, (i.e. whether or not you actually know the answer "at the time" of the analysis). An assumption is a fact that you don't know, but must "assume" in order to continue planning a specific course of action. If the staff assumes fuel will be available, then the staff can plan a road movement or helicopter assault.

A dependency is necessary to execute the task successfully and is a fact at the time of planning. For example the staff may know that fuel is available for a planned helicopter assault and plans accordingly, but if the fuel is destroyed or diverted to other uses, then the task cannot be executed.

Remember, a task can also be a dependency. Relationships between tasks can create dependency; the start or end date of the 2nd task (successor) is constrained by the start or end date of the 1st (predecessor). Differentiate the assumption from the dependency by asking, "Where is it listed during mission analysis, under 'facts' or 'assumptions'?"

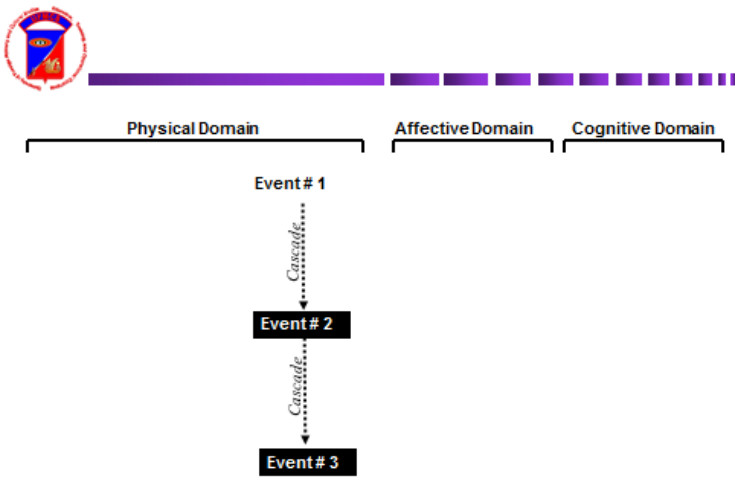
Unintended Consequences

An understanding of unintended consequences must begin with a discussion of an adaptation of Bloom's Taxonomy.[35] Bloom postulated that learning occurs in three Domains and for our purposes, so do effects. So, what are domains?

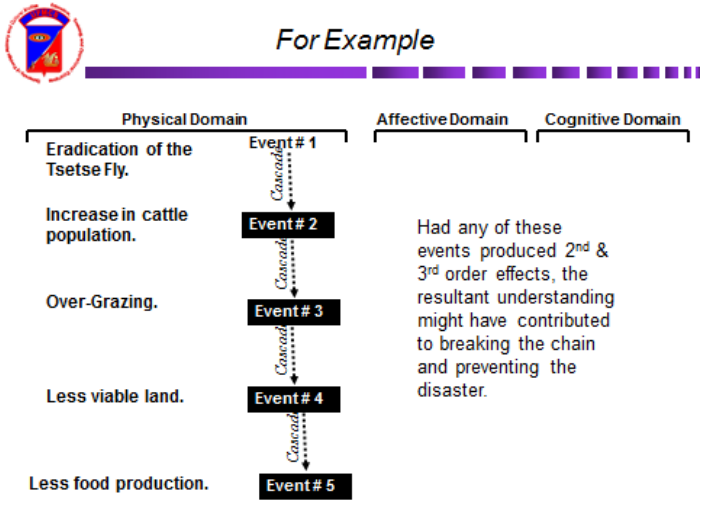
Domains are a particular sphere of influence, concern, or activity.[36] Bloom offers three domains. The cognitive domain reflects *knowledge*. In this domain, the mind completes levels of understanding a concept; building to next higher *level of understanding*. The affective domain reflects *emotion*: attitude, awareness, and integration; one feels *levels of feeling* about recognizing and synthesizing the information. The psychomotor [physical] domain reflects the *body*; one connects mind to body events in a way that generates particular *muscle memory for an action*.

Events or actions are sometimes called 1st order effects as they actually *occur* in the physical domain. 2nd order effects represent how individuals *feel* about the event; emotions in the affective domain. 3rd order effects represent *thoughts* about the event; thinking in the cognitive domain.

On the other hand, cascading effects follow a chain of actual causality (*If-then* or *Cause-in-fact*) as they occur exclusively in the physical domain. Cascade effects are mechanical, as one event *precipitates* the next.



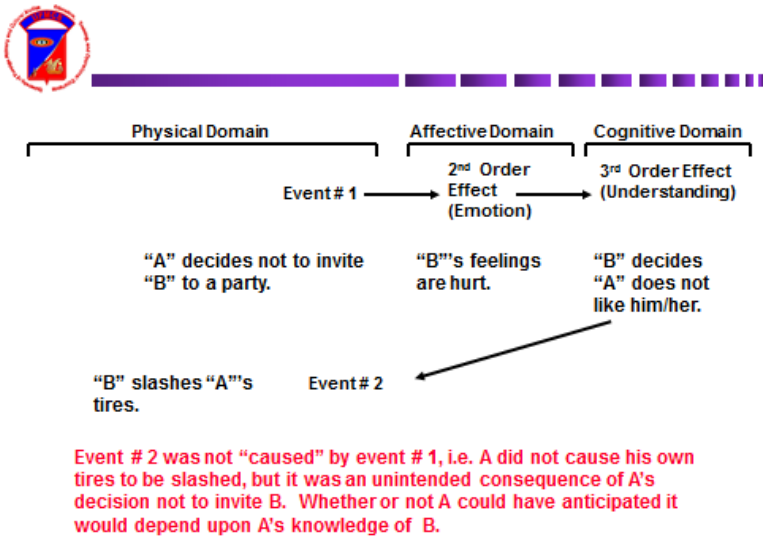
Consider the unintended disaster in southern Africa which resulted from a project to combat hunger in the Okavango delta.[37] A simple plan to repress the Tsetse Fly and increase cattle production resulted in over-grazing which after several years turned originally habitable land into barren desert, ultimately resulting in more starvation than in the beginning.



Theoretically, in this scenario, one could call *starvation* a "6th Order Effect", however such an analysis renders the terms meaningless since an infinite number of events could result.

Contrast this against the causality associated with 2nd & 3rd order effects and its concept of "free will" (remember the distinction between *complicated* and *complex*). 2nd & 3rd order effects result in what is commonly called *but for* causation. For example, in the scenario, individual "A" decides not to invite individual "B" to a party. B decides A dislike him and gets angry, slashing the tires on A's car.

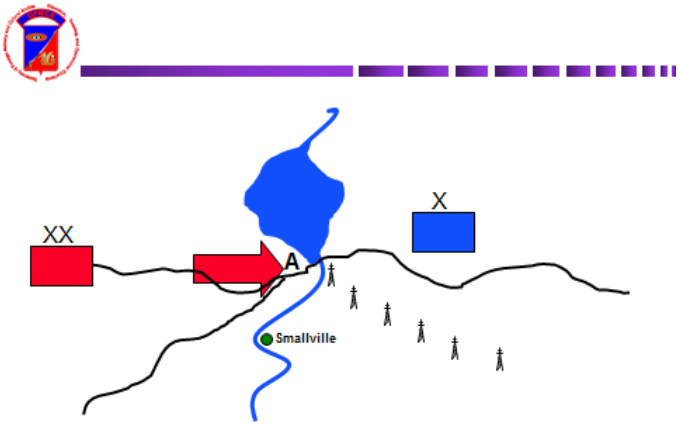
We could say that *but for* A's decision, his tires would not have been damaged, but one should not accuse A of *causing* the damage to his own tires.



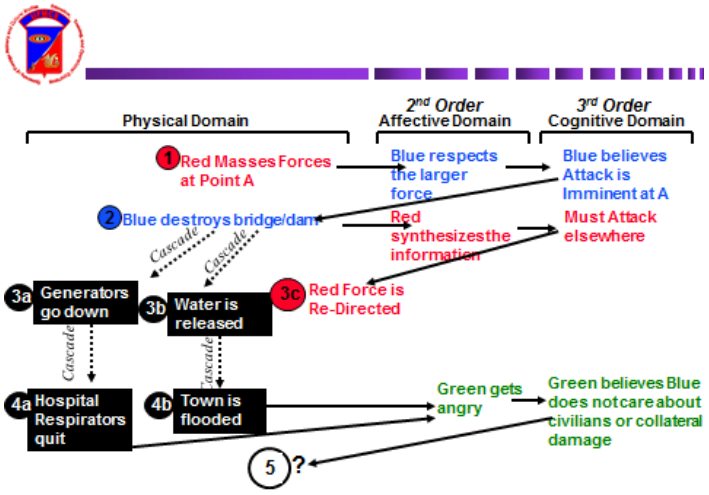
Events subsequent to 2nd & 3rd order effects which precede them are often "*unintended*" consequences of the first event or decision, but they are not caused by the original event. 3rd order effects do NOT produce 4th order effects, they merely introduce the element of choice into the equation. They become the catalyst for the new event.

2nd & 3rd Order Effects are a "term of art", used to focus the planner's attention on the OE (especially Culture) and the way in which it affects how people (friendly, enemy, or others) may "feel" and "think" about the results of the plan.

Considering unintended consequences, both cascade and 2nd & 3rd order effects, will minimize the likelihood that one or the other will be overlooked in the analysis. For example:



In image, a smaller Blue Force, observes a larger Red Force massing at Point "A". The movement occurs in the physical domain, but Blue's thoughts (i.e. is attack imminent, is this a feint or ruse?) influence Blue's action. For example, if Blue decides an attack is imminent and decides to destroy the Bridge/Dam in order to prevent Red from crossing, the unintended consequences might be illustrated like this:



To identify *cascade effects* requires a knowledge of physics, a *hard science* question. To identify 2nd & 3rd order effects and predict their consequences requires an understanding of culture, history, and sociology among other social, or "soft" sciences. The Red Teamer must be adept at both of these skills or enlist the aid of "ad hoc" members to do so. Ask:

- Will the plan you are contemplating produce a cascade of other events and if so, what could they be?
- What message or "information" is being conveyed by the plan and to whom is it being conveyed? (See also Stakeholder Analysis).
- How will it be "interpreted" by your adversary, friends, partners or others?

Build the "String of Pearls"

This image is key to understanding (or demonstrating) the final analysis. Group the tasks by objective, phases, layers, or any other way the planners related them. At the end, the grouping will surface tasks that need a closer look and show the cumulative effect on each objective, phase, or layer. To build the graphic, take the following steps:

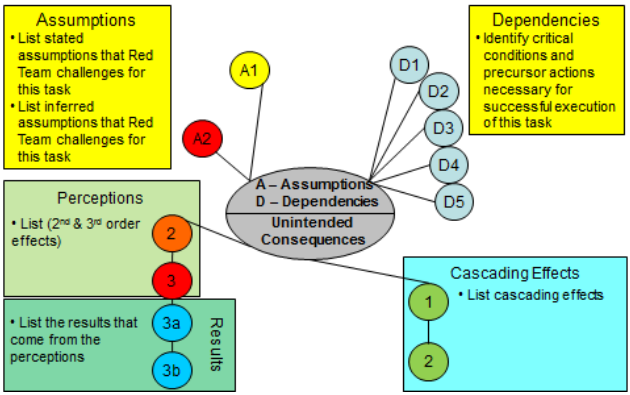
Examine the assumptions (specified & implied) in the plan.

- Determine whether they are valid.
- Associate each assumption that you do not consider valid with a specific task or tasks that you have previously identified.
- For each task, determine whether a dependency should be implied as necessary in order for that task to be executed.
- Decide whether these are "risky" dependencies.
- List these assumptions & dependencies for inclusion in the spider chart you will build for each task.
- Characterize each based upon whether it places the plan at "risk" or if invalid will cause the plan to "fail".

Consider the potential for unintended consequences associated with each task.

- Determine if there are likely to be cascading effects.
- Consider what message is being sent to each of the major stakeholders and how they may feel about it.
- Determine the spectrum of beliefs that may be engendered by the message (i.e. their perceptions).
- Consider what actions they may take as a result.

Build a "Spider-Chart" For Each Task



Next, build a spread sheet to help determine how frequently each assumption, dependency, or unintended consequence appears, i.e. how many other tasks may not be completed as a result of a particular assumption or action. The more tasks that may not get completed, the greater risk of failure.

Build a Spreadsheet

- Spreadsheet lists assumptions, dependencies, and consequences (effects) for each task.
- Fill in the spreadsheet with the same information which you compile for the spider charts as you complete them. This will help you identify the frequency with which they occur throughout the plan or order.
- Use exactly the same language for similar ideas
  - Example: "The enemy changes tactics" is similar to "The enemy adjusts his tactics" but will be counted as two separate ideas by excel
- This spreadsheet will help count the frequency of events

	A	B	C	D	E
1	**Task**	**Assumption**	**Dependencies**	**CONSEQUENCE**	**CONSEQUENCE**
2	Displace Command Post	Trucks available (ground movement)	Jump CP is operational	Fuel will be consumed	Fuel depot will need to be replenished
3		Helicopters available (air movement)			

19

From the spreadsheet or a manual count:

- Count how many times each assumption occurs throughout the entire plan or order.
- Count how many times each dependency occurs throughout the entire plan or order.
- Count how many times each unintended consequence occurs throughout the entire plan or order.

A thorough analysis of the data will reveal that some events occur repeatedly across multiple tasks—this should be of concern to the commander.

For Example:

If the same dependency is necessary for 15 of 20 tasks, it is significant for this analysis. If the same unintended consequence might occur as a result of only 7 of 20 tasks, it may not be significant for this analysis.

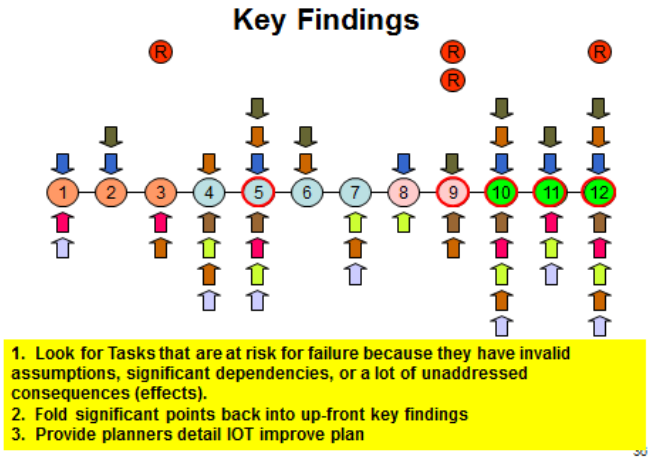
Now Build The PowerPoint Images.

The aggregate effect of the identification of possibly invalid assumptions, dependencies, and unintended consequences for each task can be viewed in a graphic representation. This representation indicates which tasks are most sensitive to other events and helps planners determine and prioritize which tasks should be revisited or what branch plans should be written to mitigate unintended consequences.

- Step 1: Draw “failure” and “risk” assumptions over the tasks on the “string of pearls”
- Step 2: Draw dependencies over the tasks on the “string of pearls”
- Step 3: Draw 2nd & 3rd order effects under the tasks on the “string of pearls”
- Step 4: Draw cascade effects under the tasks on the “string of pearls”.
- Step 5: Combine all elements in one slide, except for “at risk” assumptions

Analysis/Key Findings

- Note which tasks are most sensitive to the aggregate effect of the different elements you have identified
- Recommend that planners revisit these tasks or write branch plans to mitigate the consequences of the attempted or successful execution of the tasks
- In the chart below tasks 5 and 9-12 were identified as especially sensitive tasks given the number of dependencies and unintended consequences. Each staff group should then provide its analysis and guidance back to the plans staff section (G5/S5) for its final efforts in writing the operations plan. The steps of this process, much like the steps of the decision making process, can be adapted to the time available.



LIMITATIONS

Remember, the different elements that are identified are not weighted. For example:

- An unintended consequence might be *igniting a civil war*. This is more important than another identified unintended consequence like *running out of fuel*.
- However, both effects would get one arrow in this analysis; identify in both the analysis and the brief.

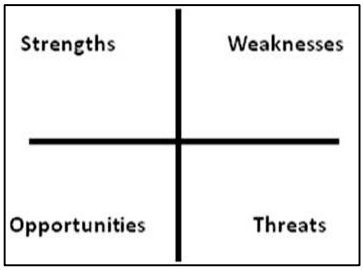
S-W-O-T Analysis

When to use

SWOT (Strengths, Weaknesses, Opportunities and Threats) is a red teaming framework designed to view a situation from four different perspectives. While SWOT can be used at any time, it is especially beneficial when used early in the red team's analysis of a problem, in conjunction with the 4 Ways of Seeing. Doing so helps the red team step away from its personal and cultural biases early-on, in order to attain alternative perspective. Combining S-W-O-T Analysis with 4-Ways of Seeing can become a powerful process to help stimulate the red team's effort.

Value added

SWOT is a framework that adds value by essentially forcing the red team to think through the various perspectives of a given situation.



The Method

Red teams using SWOT should establish a four-quadrant diagram, and label each quadrant as "Strengths," "Weaknesses," "Opportunities," and "Threats."

Thereafter, the team brainstorms to identify entries for each of the four quadrants, based upon the situation being red teamed. For example a red team could conduct a SWOT analysis on the potential implications of actively affecting the economic situation in a given region. When using SWOT in a situation of various actors (e.g., Division red team recognizing and dealing with various political leaders within its area, or a theater-strategic red team considering the interaction between the various entitles within the theater), conducting multiple SWOT analyses (one for each actor that views the other actors) would help the red team "see" the situation in a more holistic light. Finally, when SWOT used in conjunction with the 4 Ways of Seeing, some consideration should be given to which of the two tools is used first, and which follows.

Team A / Team B Analysis

Use of separate analytic teams that contrast two (or more) strongly held views or competing hypotheses.

When to Use

If there are at least two competing views within a Red Team or perhaps competing opinions within the policymaking community on a key issue, then Team A/Team B analysis can be the appropriate technique to use. Developing a full-blown Team A/Team B exercise requires a significant commitment of time and resources, so it is worthwhile considering if the issue merits this kind of attention. A longstanding policy issue, a critical decision that has far-reaching implications or a dispute within a community that has obstructed effective cross-agency cooperation would be grounds for using Team A/Team B. If those circumstances exist, then the Red team will need to review all of the data to develop alternative papers/briefing that can capture the essential differences between the two viewpoints.

Value Added

For the policymaker, this technique helps to surface and explain important analytic differences within the expert community. Often senior officials can learn more by weighing well-argued conflicting views than from reading an assessment that masks substantive differences or drives analysis to the lowest common denominator. By making the key assumptions and information used for each argument more transparent, a policymaker can judge the merits of each case, pose questions, and reach an independent judgment on which argument is the strongest. Moreover, highlighting alternative views puts individuals on notice that they need to be searching for new information that can confirm or disconfirm a range of hypotheses.

If opposing positions are well established, it can be useful to place individuals on teams that will advocate positions they normally do not support; forcing Red Teamers to argue “the other side” can surface an awareness to their own mind-set.

The Method

Analysis Phase: A Team A/Team B exercise can be conducted on an important issue to:

- Identify the two (or more) competing hypotheses or points of view.
- Form teams or designate individuals to develop the best case that can be made for each hypothesis.
- Review all pertinent information that supports their respective positions.
- Identify missing information that would buttress their hypotheses.
- Structure each argument with an explicit presentation of key assumptions, key pieces of evidence, and careful articulation of the logic behind the argument.

Debate Phase: An oral presentation of the alternative arguments and rebuttals in parallel fashion can then be organized for the benefit of other analysts:

- Set aside time for an oral presentation of the alternative team findings; this can be an informal brainstorming session or a more formal “debate.”
- Have an independent “jury of peers” listen to the oral presentation and be prepared to question the teams regarding their assumptions, evidence, or logic.
- Allow each team to present their case, challenge the other team’s arguments, and rebut the opponent’s critique of its case.
- Let the jury consider the strength of each presentation and recommend possible next steps for further research and collection efforts.

Telling Stories

The most conservative estimates of linguists and anthropologists put the evolution of oral language a minimum of 175,000 years prior to the development of written languages. As a consequence humans are wired to learn things through the use of storytelling.

When remembering or telling a personal story humans are more connected to the information being described. There is a difference in the quality of discussions and learning when stories are personal. An illustration follows:

Recently the author was asked to facilitate a discussion of desirable leadership qualities with a group of Majors at CGSC. Rather than ask them to regurgitate a list of established desirable qualities of leaders they were asked to remember the best leaders they had ever worked for and write down the qualities that made them such good leaders. The group then collected a comprehensive list, the number of qualities collected was staggering (group of 11 in 5 minutes of this exercise named 80 independent leadership qualities) and very personal. While well accepted qualities such as ‘setting the example’, treating others with respect, etc., were on the list so were much less noted qualities such as ‘being respectful of their subordinates time’, ‘a sense of humor’, ‘empathy,’ etc.

Telling stories is a powerful way to generate conversation and have people learn and remember.

TRIZ

TRIZ is "a problem-solving, analysis and forecasting tool derived from the study of patterns of invention. It was developed by the Soviet inventor and science fiction author Genrich Altshuller and his colleagues in the 1940s. In English it is typically translated as “the Theory of Inventive Problem Solving.” It is sometimes used in Six Sigma processes, in project management and risk management systems, and in organizational innovation initiatives. The full TRIZ process includes many problem-solving strategies. For our purposes we’re only going to use one piece of the TRIZ approach.

Ponder a difficult and complex problem you need to solve by walking through.

Describe the key elements of the desired result, and be specific.

Design a complete system that makes it impossible to achieve that result.

Then ask:

- What policies, practices, and ways of operating could eliminate any possibility of any requisite events occurring?
- What does this system have in common with the current state of affairs?

What will eliminate similarities between the current system and the new design?

Troika Consulting (Ad Agency)

This is a great process to help participants get started thinking about applications and action planning.

Invite participants to find two partners and sit down in a group of three (or four, but no more than four). Suggest that one member of the group be a time keeper to keep the group on track and to ensure everyone gets equal time. Give everyone time to reflect individually on a gnarly question. It may be very useful for them to take some notes.

Think about a challenge you are facing in your staff section.

- What's the question you most need to answer in order to move forward?
  How can you get that question answered?
- What's the biggest obstacle to making the changes you want to make?
  What must be done to move beyond that obstacle?

In each round of 10 minutes, one participant will share their challenge and ideas for next steps.

The role of the partners is first to ask questions to help them hone and improve their ideas.

Next, the partners engage with each other and, finally, with the participant about how they might handle the challenge and what possibilities might contribute to moving forward.

Switch roles so that each member of the Troika has a turn. After each member of the Troika has had their turn, the group can spend some time in conversation about insights and patterns they noticed across the three rounds.

This is a method to tap into the wisdom of the crowd. This is not recommended to make a decision. It is a way to get feedback you might not otherwise get from your staff.

Validating Assumptions

How many times have we encountered situations in which completely plausible premises, based on solid expertise, have been used to construct a logically valid forecast—with virtually unanimous agreement—that turned out to be dead wrong? In how many of these instances have we determined, with hindsight, that the problem was not in the logic but in the fact that one of the premises—however plausible it seemed at the time—was incorrect?

In how many of these instances have we been forced to admit that the erroneous premise was not empirically based but rather a conclusion developed from its own model (sometimes called an assumption)?

And in how many cases was it determined after the fact that information had been available which should have provided a basis for questioning one or more premises, and that a change of the relevant premise(s) would have changed the analytic model and pointed to a different outcome?[38]

-- Douglas MacEachin
Former CIA Deputy Director of Intelligence

No plan of operations extends with certainty beyond the first encounter with the enemy's main strength.[39]

-- Helmuth von Moltke
Chief of the Prussian General Staff, 1857-1887

1. <u>What is an assumption?</u> An assumption is an implicit or explicit belief about a past, current or future situation, issue or state of affairs. Planning and problem solving rely on assumptions because commanders, staffs and planning teams often lack relevant information about a situation and habitually rely on their beliefs to interpret a situation. Assumptions also help simplify and interpret factors related to 'what ought to be done' or 'how the world works'. From a cognitive perspective, humans are persistently on "cognitive autopilot" enabling us to accomplish routine tasks efficiently but unreflectively (without costly mental effort) (See Chapter III). Hence, it is often the case that assumptions are overlooked or

accepted uncritically, even when matters are complex and entail high risk under conditions of uncertainty.

a. Assumptions are often hidden from view. In solving or managing problems we often act based upon intuition and if questioned, rationalize our actions after the fact. If there is a degree of risk associated with taking action it is prudent to understand the assumptions underlying that decision. In matters involving high risk, it is essential to understand assumptions behind that decision. The latter is important in anticipating the consequences of those actions.

b. Assumptions can also constrain us as we attempt to deal with an issue. If we critically assess assumptions we might be able to gain additional insight and generate options that would not otherwise be apparent. Identifying and assessing assumptions, when working in groups, is also useful in preventing misunderstanding, aligning interests and reducing conflict within the group.[40]

2. Assumptions and Red Teaming: Red teaming tools and techniques provide a critical capability for checking, challenging and validating assumptions in planning, problems solving and decision making. Specifically, Red Teams assist Commanders, staffs and planning teams in checking, challenging and validating assumptions by:

   a. Helping the staff identify invalid and unneeded assumptions.

   b. Identifying needed assumptions to further the planning process.

   c. Identifying when the staff has defaulted to an unstated assumption – during design, mission analysis and course of action development and analysis.

   d. Offering alternatives and insights to assumptions about the operational environment, adversaries and other actors in the operational environment.

e. Identifying when the staff needs to develop a branch plan in case a key assumption proves invalid.

3. Assumptions in military planning: Joint Publication (JP) 5-0, *Joint Operation Planning* defines an assumption as "…a supposition about the current situation or future course of events, assumed to be true in the absence of facts…[or] a presupposition on the future course of events, either or both assumed to be true in the absence of positive proof, necessary to enable the commander in the process of planning to complete an estimate of the situation and make a decision on the course of action."[41],[42]

   a. Commanders, staffs and planning teams employ assumptions to "…address gaps in knowledge critical for the planning process to continue."[43]

   b. Commanders and staffs and planning teams "…must either validate the assumptions (turn them into facts) or invalidate the assumptions (alter the plan accordingly) as quickly as possible." Rules of thumb are "…never assume away adversary capabilities or assume that unrealistic friendly capabilities would be available."[44]

4. Assumptions in the context of oral and written statements and arguments: Authors M. Neil Browne and Stuart M. Keeley define an assumption as "…an unstated belief that supports…explicit reasoning."[45] The authors emphasize the importance of identifying implicit assumptions because, "hidden or unstated beliefs may be at least as significant in understanding [an] argument."[46] (See assumptions in arguments)

   a. Browne and Keeley further define assumptions into two categories: value and descriptive assumptions.

      (1) A value assumption "is an implicit preference for one value over another in a particular context."[47]

These are prescriptive in nature and imply how the world 'ought to be.'

(2) A descriptive assumption "is an unstated belief about how the world was, is, or will become."[48]

b. Browne and Keeley believe that questioning assumptions not only benefits individual reasoning but contributes to the quality of group reasoning and decision outcomes. Underlying this is their observation that assumptions are often, "hidden or unstated; taken for granted; influential in determining the conclusion; and potentially deceptive."[49]

5. Sources of Assumptions:

a. Mental models, mindsets, values, beliefs and world views: These are ideas that help us frame and interpret how the world works. These are similar to heuristics which help us navigate and engage our environment. As guiding patterns, these are valuable from an efficiency perspective but often hinder us when the environment changes or when the world does not conform to our expected pattern (See Chapter III).

b. For military operations, assumptions often relate to:

(1) Policy and strategic aims that direct the use of military action.
(2) Narratives describing the nature of the operation.
(3) Characteristics of the OE — the composite of the conditions, circumstances, and influences that affect the employment of capabilities and bear on the decisions of the commander.
(4) Descriptions of adversary capabilities and will, critical links, key nodes, high value targets (HVTs) and centers of gravity (COG).
(5) Adversary probable intentions and likely courses of action (COA).[50]
(6) Weather.

(7) Specific terrain considerations that significantly affect the feasibility of the course of action.
(8) Deployment time, assets, availability, and access to airfields and ports.
(9) Risk.
(10) Date and level of mobilization for reserve and National Guard forces.
(11) Cultural implications (e.g., how the population views US/coalition involvement).
(12) Post conflict conditions.

c. For problem solving, assumptions often deal with resources, support, and relationships.

d. In concept development, specifically in the force development arena, assumptions often address conditions anticipated to be prevalent in the future, 5 to 15 years.[51]

6. Checking, Challenging and Validating Assumptions: Commanders, staffs and planning teams should question whether their assumptions are valid throughout planning and the operations process. Assumptions must be continually reviewed to ensure validity.[52]

a. Challenging assumptions helps identify stakeholder perspectives and their implications to the planning process.

b. JP 2-0, Joint Intelligence states, “Red teams assist joint operation planning by validating assumptions about the adversary, participating in the war-gaming of friendly and adversary COAs, and providing a check on the natural tendency of friendly forces to “mirror image” the adversary (i.e., to ascribe to an adversary the same motives, intent, and procedures that guide friendly forces).”[53]

c. In conceptual planning or Army Design Methodology (ADM), planning teams develop assumptions in the lack of factual evidence as they frame an OE and

problems. Planning teams record their assumption and challenge them while planning.

d. A structured analytical technique for identifying assumptions is listing and reviewing key working assumptions on which fundamental judgments rest, *Red Teaming – Assumption Questions* (p. 176).

(1) Broad assumptions without an understanding of their sub-level components may lead to faulty assumptions.

(2) For example, given sufficient preparation, load, and travel time, a staff can only assume a Brigade Combat Team (BCT) will be available to a theater commander in 30 days. Airfields and ports must have favorable weather unfettered by the enemy. The staff should continually question whether their assumptions are valid using the variables found in the OE or a similar construct.

(3) Past operations illustrate the challenges inherent to any operation when planning assumptions prove false. It appears that most senior civilian and military leaders failed to review the historical records of military occupations and of Middle Eastern or Iraqi history, and also failed to listen and evaluate outside views about potential weaknesses with their planning assumptions. Even the most senior staffs can fall into this trap, noted in ON POINT II:

"In the case of OIF, the postwar situation in Iraq was severely out of line with the suppositions made at nearly every level before the war. The V Corps commander, Lieutenant General Wallace, asserted that the assumptions made by planners about the Iraqi infrastructure and society after the conflict were particularly damaging to the PH IV plan:

I believe the things that we assumed would be in place on the ground that make Phase IV operations extraordinarily easy if they are there or extraordinarily hard if they are not had most to do with Iraqi institutions and infrastructure. We made the

assumption that some of those institutions and some of that infrastructure would be in place upon our arrival, regardless of the presence of the regime or not. The criticality of those assumptions was such that when the regime ceased to exist or ceased to dominate the areas in which we were operating, then all of those institutions and all of that infrastructure ceased to operate at the same time.

Wallace succinctly concluded, "We had the wrong assumptions and therefore we had the wrong plan to put into play."
-- ON POINT II[54]

Another example, assumed access by a friendly nation to ports and airfield to support closure into a region – requires continual checks to insure the assumption isn't wishful thinking but is grounded in reality. Throughout the lengthy planning effort for Operation Allied Force in 1998-99, allied leaders and planners widely adhered to a significant assumption. When the order arrived to execute the operation – on the very eve of hostilities – that assumption continued to prevail. But as the days of the aerospace campaign stretched into weeks and then months, the allies recognized their assumption for the fallacy it was – namely, that President Slobodan Milosevic of Yugoslavia would capitulate after a "modest set of punitive air strikes…"
-- COL Malone, USAF
OPERATION ALLIED FORCE[55]

(4) Are the assumptions logical, realistic, and considered likely to be true?
(5) Are there too many assumptions? How many assumptions are acceptable? There is no rule that defines the correct number of assumptions but an excessive amount of assumptions may correlate with higher risk and an increased probability of a faulty plan. General (ret) Anthony Zinni USMC offers, "I would always challenge assumptions very vigorously as the commander in chief (CINC). We have too many (assumptions). Many are pointless and some assume away problems."[56]

(6) Are there branches and sequels to execute if one or more key assumptions prove false?
(7) Why must this assumption “be true”?
(8) How much confidence exist that this assumption is true?
(9) What is the explanation for the degree of confidence for this assumption to be true?
(10) Could the assumption have been true in the past but less so now?
(11) If the assumption proves to be wrong, would it alter the line of thinking?
(12) Has checking assumptions identified new factors that need future analysis?
(13) What circumstance or information might underline this assumption?

e. Planning team and planning process considerations in challenging assumptions: A system must be in place that enables continual examination of the accuracy of the assumptions. Planners must also establish branch plans in case key assumptions prove invalid. The planning team works on these questions as a group, assigns a sub-team to work on these questions, or solicits support from the unit’s red team to help with challenging assumptions.

(1) Is there a procedure that is used throughout the planning and preparation (and potentially portions of the execution phase) that continually examines whether assumptions are valid? A technique is to establish validation points throughout the planning process to insure:
(a) Assumptions remain valid
(b) Assumptions proven as facts are deleted
(c) Assumptions proven invalid are discarded - requiring re-examination of the feasibility of the plan or development of branches.
(2) Is the assumption appropriate to the level of planning?

(3) Are there assumptions made implicitly during planning but not stated or assumptions made by the staff but not included in the plan? Unstated assumptions (explicit or implicit) can fault a plan from the beginning and do a disservice to the commander and the planning process.

(4) How are assumptions in higher headquarters plans addressed? Joint planning doctrine states, "For planning purposes, subordinate commanders can treat assumptions made by higher headquarters as true in the absence of proof to the contrary. However, they should challenge those assumptions if they appear unrealistic."[57]

(5) In deliberate planning there likely assumptions that cannot be verified until a crisis develops. In Crisis Action Planning (CAP), "…assumptions should be replaced with facts as soon as possible."[58]

(a) The staff accomplishes this by identifying the information needed to convert assumptions to facts and submitting an information request to an appropriate agency as an information requirement.

(b) If the commander needs the information to make a key decision, the information requirement can be designated a commander's critical information requirement (CCIR). Although there may be exceptions, the staff should strive to resolve all assumptions before issuing the Operations Order (OPORD).

f. Argument Deconstruction: For evaluating assumptions in statements and oral arguments, we can employ critical questioning to expose hidden assumptions. For example questions see Challenging Assumptions below. Authors M. Neil Browne and Stuart M. Keeley refer to critical thinking as:

(1) Awareness of a set of interrelated critical questions;
(2) Ability to ask and answer critical questions at appropriate times; and the
(3) Desire to actively use the critical questions.[59]

g. 5 Whys is important to begin with “why” questions. The answers to “why” questions get at causal links behind events and problem symptoms. “What” questions tend toward simple data collection, and are subject to confirmation biases. The 5 Whys is a question-asking technique used to explore the cause-and-effect relationships underlying a particular problem. The technique is used to determine the root cause of a defect or problem symptom. However, the process can be used to go deeper to explore questions related to purpose rather than problems.

h. Four Ways of Seeing is a flexible tool; a technique available to planning teams to develop and compare how other actors within an OE view a situation or problem. The planning team can compare the friendly force with an enemy force or other actors or compare multiple actors with each other.

(1) To develop a richer understanding of an OE and problems, it is helpful for the planning team to examine the situation from the perspectives of other actors within the OE in order to appreciate their respective assumptions. For example:
(2) How does an enemy view the causes of conflict?
(3) What are the goals of the enemy force within an area?
(4) How does the enemy force perceive the goals of coalition forces in the area.

i. Premortem is another means of identifying and challenging assumptions is to apply the Premortem Analysis to a plan or COA. Premortem Analysis is a form of mental simulation in which you imagine an

outcome that results in failure. The premise for the Premortem exercise is that people may feel too confident once they have arrived at a plan. Premortem analysis empowers the participants to question the premises of a plan or proposed course of action, its assumptions, and tasks. The pull of groupthink, consensus, and a false sense of security is punctured, and is replaced by an active search aimed at preventing trouble later on. It breaks ownership of a plan or COA through a divergent process that encourages objectivity and skepticism.

j. Frame Analysis Audit: The frame audit is useful for uncovering built in biases and blind spots in mental models, beliefs or worldviews.[60]

7. Intelligence and Assumptions: Intelligence analysts often have to fill in gaps in knowledge with assumptions about adversary will, capabilities, probable intentions and visualization of the OE (e.g., PMESII-PT). The intelligence estimate supporting the operation should clearly identify these assumptions. The intelligence staff should identify and tap into any ongoing or existing information collection activities or joint intelligence, surveillance, and reconnaissance (ISR) collection that may offer relevant information to fill gaps.[61] The challenges for the intelligence professional are threefold:

   a. Avoid confusing assumptions as facts.

   b. Keep assumptions to a minimum, challenge them continually, and assumptions must reflect the culture, doctrine, TTP, and realistic adversary capabilities.

   c. The Information Collection or intelligence, surveillance, and reconnaissance (ISR) plan must reflect the requirements to confirm or deny these assumptions using available ISR assets.[62]

8. Key Points:

   a. An assumption is an implicit or explicit belief about a past, current or future situation, issue or state of affairs. Assumptions help simplify and interpret factors related to ‘what ought to be done’ or ‘how the world works’

   b. It is often the case that assumptions are overlooked or accepted uncritically, even when matters are complex and high risk under conditions of uncertainty.

   c. Assumptions are often hidden or unstated; taken for granted; influential in determining the conclusion; and potentially deceptive.

   d. Assumptions must be continually reviewed to ensure validity. Commanders, staffs and planning teams should question whether their assumptions are valid throughout planning and the operations process.

   e. In joint planning, a valid assumption has three characteristics: logical, realistic, and essential for the planning to continue.

   f. An excessive amount of assumptions may correlate with higher risk and an increased probability of a faulty plan.

   g. The use of assumptions requires the staff and planning teams to develop branches and sequels if the assumptions prove invalid.

   h. Often an unstated assumption may be more dangerous than stated assumptions proven wrong.

What if? Analysis

Assumes that an event has occurred with potential (negative or positive) impact and explains how it might come about.

When to Use

A technique for challenging a strong mindset that an event will not happen or that a confidently made forecast may not be entirely justified. It is similar to a High- Impact/Low-Probability analysis, but it does not dwell on the consequences of the event as much as it accepts the significance and moves directly to explaining how it might come about.

Value Added

By shifting the focus from whether an event could occur to how it may happen, analysts allow themselves to suspend judgment about the likelihood of the event and focus more on what developments—even unlikely ones—might enable such an outcome. An individual or team might employ this technique and repeat the exercise whenever a critical analytic judgment is made.

Using this technique is particularly important when a judgment rests on limited information or unproven assumptions. Moreover, it can free analysts from arguing about the probability of an event to considering its consequences and developing some indicators or signposts for its possible emergence. It will help analysts address the impact of an event, the factors that could cause—or alter—it, and likely signposts that an event is imminent.

A *What If? Analysis* can complement a difficult judgment reached and provide the policymaker a thoughtful caution to accepting the conventional wisdom without considering the costs and risks of being wrong. This can help decision makers consider ways to hedge their bets, even if they accept the analytic judgment that an event remains unlikely.

The Method

What If? Analysis must begin by stating clearly the conventional analytic line and then stepping back to consider what alternative outcomes are too important to dismiss, even if unlikely. Brainstorming (p. 223) over a few days or weeks can develop one or more plausible scenarios by which the unlikely event occurs:

- Assume the event has happened.
- Select some triggering events that permitted the scenario to unfold to help make the "what if" more plausible; for example, analysts might postulate the death of a leader, a natural disaster, or some economic event that would start a chain of other events.
- Develop a chain of argumentation based as much on logic as evidence to explain how this outcome could have come about.
- "Think backwards" from the event in concrete ways– that is, specifying what must actually occur at each stage of the scenario is often very useful.
- Identify one or more plausible pathways or scenarios to the unlikely event; very often more than one will appear possible.
- Generate a list of indicators or "observables" for each scenario that would help to detect the beginnings of the event.
- Consider the scope of the positive and negative consequences of each scenario and their relative impacts.
- Monitor the indicators developed on a periodic basis.

Why Assess?

"Nothing is more wasteful than doing with great efficiency, that which is totally unnecessary!"[63]

Assessment is a process that measures progress toward accomplishing a task, creating an effect, or achieving an objective.

Assessment Considerations:

- Effective assessment systems focus on the end state and objectives.
- Measures of effectiveness are usually more important than measures of performance.
- Assessment's applicability transcends the spectrum of conflict and all phases of an operation.
- Effective assessment planning is not an afterthought, but built up front in planning.
- Assessment processes and metrics should be nested with the higher headquarters but designed and tailored to assess the specific objective of the unit.
- A good assessment system enables commanders to make timely shifts in resources to reinforce efforts.
- Assessment measures can be either quantitative or qualitative.
- Objectives, effects, and measures of effectiveness are interrelated.
- Assign responsibility for assessment.
- Understand other stakeholder's interests in an assessment system (coalition, interagency, enemy).

Assessment measures must be:

- Relevant: Assessment measures should directly relate to the envisioned operational end-state, objective, or mission. The less precise an end state the more difficult it is to define assessment measures.
- Appropriate: Should reflect the OE; be realistic and appropriate for the echelon.

- Measurable: Assessment measures can be qualitative or quantitative. To be measurable, a baseline must be established which accurately states the current situation in order to determine progress. Objective, quantitative criteria (metrics) are less subjective to error than qualitative or subjective criteria (metrics).
- Timely: Good assessment systems provide commanders timely feedback. Timeliness not only determines success or failure of efforts, but it also helps to reprioritize and reallocate resources as needed. Good assessment systems should be reasonable in the time required to input and use the system.
- Numerically Reasonable: Keep measures to a minimum to maintain focus on the most important and to enable recognition of success or failure to reallocate resources.
- Resourced: For any effective assessment system, planners must establish:
  - Who will observe?
  - When will we observe
  - How often will we observe?
- Nested (when appropriate) with Higher Headquarters Assessment Measures.
- Systemically (and graphically when appropriate) Displayed and Reviewed.
- Account for the "culture and expectations" found in the OE.

It should be emphasized that both MOE and MOP must be "measurable." If you can't Measure it, it can't be an MOE or an MOP. This means it must be stated in terms of "numbers." It should also be emphasized that while MOE are usually more important, if we don't look at MOP and we are not achieving the desired effect, we won't know if it's because we aren't doing the right thing or if it's because we're not doing things right. MOP must be looked at to rule out execution if the tasks aren't achieving the desired effect.

Measures of Performance (MOP)

- Criteria used to evaluate accomplishment of our actions.
- Should answer “Are we doing things right?”
- The criterion to assess friendly actions that is tied to measuring task accomplishment?
- Sometimes called a Measure of “EFFORT”

Example

Desired Effect: Reduction in popular support to criminal elements

Task: Influence populace to report crime &criminals

MOP: Number of face-to-face engagements with local leaders

Number of advertisements for tip-line numbers

Common Measures of Performance (MOP)

- Quantity
- Cost
- Schedule
- Productivity

Measures of Effectiveness (MOE)

- The criteria used to evaluate how actions have affected (changed) system behavior or capabilities.
- Should answer “Are we doing the right thing?”

Example

Desired Effect: Reduction in popular support to criminal elements

Task: Influence populace to report crime &criminals

MOE: Number of valid citizen reports of criminal elements

Number of valid citizen reports of criminal activities

Available at http://www.defense.gov/news/newsarticle.aspx?id=51250 (Accessed 29 August 2014). In his speech to the Oxford Analytica in Blenheim Place, England, Secretary of Defense Gates juxtaposed lessons of miscalculations, nationalism and hubris which led to WW I and the Munich 'appeasement.' He concluded "For much of the past century, Western psychology, rhetoric and policy-making on matters of war and peace has been framed by, and often lurched between, these two poles – between excessive pressures to take military action and excessive restraint, between a too eager embrace of the use of military force and an extreme aversion to it." Thus he concludes that the "lessons of history" may be over learned.

I. Introduction

The following guide was developed from the curriculum for the "Introduction to Crime Analysis Mapping and Problem Solving" training course conducted by members of the Police Foundation's Crime Mapping Laboratory in 2001 and funded by the Office of Community Oriented Policing Services (COPS). The purpose of this document is to convert the information presented in the training into a succinct and readable report that makes it available to a larger audience than was reached through the training sessions. It is not intended to be a comprehensive document on crime analysis, crime mapping, and problem solving, but rather a "starter" guidebook for someone just entering the field or a reference manual for current crime analysts or other law enforcement analysts. The format of the document follows the format of the training slides loosely, but it is not necessary to read them together. This document stands on its own. For further reading on crime analysis and mapping, see other relevant documents written by the Police Foundation at www.policefoundation.org or www.cops.usdoj.gov.

II. Introduction to Crime Analysis

As an introduction to crime analysis, this section provides the definition of crime analysis as a general concept as well as definitions of five types of crime analysis. These definitions are used in the Police Foundation's "Introduction to Crime Analysis Mapping and Problem Solving" course and have been created to synthesize current concepts and ideas in the field of crime analysis. These definitions are meant to enhance the understanding of crime analysis and to help create commonly understood terminology. The latter part of this section includes a hierarchical model by which all five types of crime analysis are related to one another.

Definition of Crime Analysis

> *The qualitative and quantitative study of crime and law enforcement information in combination with socio-demographic and spatial factors to apprehend criminals, prevent crime, reduce disorder, and evaluate organizational procedures.*

Qualitative and quantitative. Crime analysis uses both qualitative and quantitative data and analytical techniques. Qualitative data and analytical techniques refer to non-numerical data as well as the examination and interpretation of observations for the purpose of discovering underlying meanings and patterns of relationships. This is most typical of field research, content analysis, and historical research. Quantitative data are data primarily in numerical or categorical format. Quantitative analysis consists of manipulations of observations for the purpose of describing and explaining the phenomena that those observations reflect and is primarily statistical. Crime analysis employs both types of data and techniques depending on the analytical and practical need. For example, crime data can be used in various ways, both quantitatively and qualitatively. The information such as date, time, location, and type of crime is quantitative in that statistics can be used to analyze these variables. On the other hand, narratives of crime reports are considered qualitative data in that a large number of narratives are nearly impossible to analyze statistically and are primarily examined to determine general themes and patterns.

Study. Study is a systematic way of looking at crime and law enforcement information. That is, crime analysis is not examining information haphazardly but rather is applying formal analytical and statistical techniques as well as research methodology to law enforcement information according to the rules of social science.

Crime. In a law enforcement agency, the central focus is crime, both those reported to the police and those that are not. Thus, the central type of data analyzed is crime and the information surrounding it, such as arrests, offenders, victims, property, and evidence.

Law enforcement information. In addition to crime, law enforcement agencies address many other issues and thus collect many other types of data. Examples of law enforcement data that are often available for crime analysts are calls for service (e.g., noise complaints, burglary alarms, suspicious activity), traffic information (e.g., accidents and citations), citizens' perceptions (e.g., fear of crime, crime prevention behavior, satisfaction with the police), victimization, probation records, and parole information.

In combination with… This phrase refers to identifying patterns and studying relationships of crime and law enforcement data with other types of information, such as those listed below.

Socio-demographic. This type of information refers to characteristics of individuals and groups such as sex, race, income, age, and education. On an individual (micro) level, socio-demographic information is used in law enforcement to search for and identify crime suspects. On a macro level, socio-demographic information is used to determine the characteristics of groups and how they relate to crime. For example, the information may be used to answer the questions, "Where can we find the suspect who is a white male, 30-35 years of age with brown hair and brown eyes?" or "Can demographic characteristics explain why one neighborhood has a higher rate of crime than another?"

Spatial. The location where crimes or activities occur and the relationship of those places to one another and to other information is an important factor in the analysis of crime. It is not only important where a crime takes place but also the characteristics of those places and the environment in which the crime occurs. Thus, examination of spatial data such as streets networks, parcel information, orthophotographs, school locations, business and residential zoning, among others, is imperative for effective crime analysis.

The last four key points describe the four goals of crime analysis.

Apprehending criminals. The main function of crime analysis is to support law enforcement endeavors. One of the primary goals of law enforcement is the apprehension of criminals; consequently, one of the primary goals of crime analysis is to assist in the apprehension of criminals. For example, a detective may have a robbery incident in which the suspect has a snake tattoo on his left arm. The crime analysts may assist by searching a database of field incident cards to identify

individuals with such a tattoo. Also, a crime analyst may conduct a time of day/day of week analysis of burglary incidents that would assist officers in surveillance of an area to catch offenders.

Prevent crime. Another primary goal of law enforcement is to prevent crime through methods other than apprehension. This goal lends itself particularly well to assistance from crime analysis. For example, members of the police department are conducting a crime prevention campaign about residential burglary and would like to target their resources in the areas that need it the most. Crime analysis can assist in planning community education and patrol response tailored to the problem by providing spatial analysis of residential burglary, analysis of how, when, and where the burglaries occurred, and analysis of what items were stolen. This information could be used to develop crime prevention suggestions such as closing and locking a garage door.

Reduce disorder. Many criminologists contend that social disorder can lead to crime; that is, blight and other indicators of social decay left unchecked can attract crime and accelerate further decay. Thus, reducing disorder is a law enforcement objective and, by extension, one for crime analysis as well. Crime analysis can assist with these efforts by providing research and analysis of disorder indicators such as traffic accidents, noise complaints, or trespass warnings that can assist officers in addressing these issues before they become more serious problems.

Evaluate organizational procedures. The fourth goal of crime analysis is assisting with the evaluation of organizational procedures. Several examples include resource allocation, the assessment of crime prevention programs, realigning geographic boundaries, forecasting staffing needs, and developing performance measures for the police department.

Types of Crime Analysis

The following are five types of analysis that fall under the umbrella of crime analysis. As you will see, each contains characteristics of crime analysis in general, but each is specific in the type of data and analysis used as well as in its purpose.

Intelligence Analysis

> *The study of "organized" criminal activity, whether or not it is reported to law enforcement, to assist investigative personnel in linking people, events, and property.*

The purpose of intelligence analysis is to assist sworn personnel in the identification of networks and apprehension of individuals to subsequently prevent criminal

activity. A related goal is to link information together, prioritize information, identify relationships, and identify areas for further investigation by putting the analysis in a framework that is easy to understand. Much of the information analyzed in the field of intelligence analysis is not reported to the police by citizens but is gathered by law enforcement. Examples of data collection methods include surveillance, informants, and participant observation. In addition, the type of information is not limited to criminal information but can include telephone conversations, travel information, financial/tax information, and family and business relationships. Intelligence analysis has traditionally focused more or less on organized criminal activity, which includes drugs and prostitution syndicates. The data analyzed are plentiful and primarily qualitative, and thus are usually analyzed through qualitative methods. In light of the events of September 11, 2001, intelligence analysis has most recently begun to focus on terrorist activity at the local level as well.

Criminal Investigative Analysis

> *The study of serial criminals, victims, and/or crime scenes as well as physical, socio-demographic, psychological, and geographic characteristics to develop patterns that will assist in linking together and solving current serial criminal activity.*

This type of analysis has also been called "profiling," which is the process of constructing a "profile" of an unknown offender based on the nature of the crime, the facts of the case, and the characteristics of the victim. As with intelligence analysis, this type of analysis focuses primarily on qualitative data surrounding serious serial crimes such as murder and rape. Data are collected and analyzed on an individual level for those persons primarily or peripherally involved with the incidents. The spatial nature of the incidents and related locations such as the body dump sites or the encounter sites is also considered. The primary purpose of criminal investigative analysis is to develop patterns of serial crimes crossing city, state, and even national boundaries by linking behavior and evidence within and among incidents in order to catch the offender and/or clear cases. This is a very specific type of crime analysis that is primarily done on the federal law enforcement level since these types of crime occur infrequently and cross jurisdictional boundaries.

Tactical Crime Analysis

> *The study of recent criminal incidents and potential criminal activity by examining characteristics such as how, when, and where the activity has occurred to assist in problem solving by developing patterns and trends, identifying investigative leads/suspects, and clearing cases.*

Tactical crime analysis focuses on information from recent crimes reported to the police. "Recent" can refer to the last few months or longer periods of time for specific ongoing problems. Tactical crime analysis also focuses on specific information about each crime such as method of entry, point of entry, suspects actions, type of victim, type of weapon used, as well as the date, time, location, and type of location. Field information such as suspicious activity calls for service, criminal trespass warnings, and persons with scars, marks, or tattoos collected by officers is also considered in the analysis. Although quantitative analysis is often conducted once a pattern has been identified, qualitative analysis, (i.e., critical thinking and content analysis) is used to identify patterns and trends initially. Three purposes of tactical crime analysis are 1) linking cases together and identifying the notable characteristics of the patterns and trends, 2) identifying potential suspects of a crime or crime pattern, and 3) clearing cases. The focus of tactical crime analysis is examining data daily in order to identify patterns, trends, and investigative leads for recent criminal and potential criminal activity. Once a crime pattern, suspect, or investigative lead is identified, the information is compiled and disseminated to patrol officers and detectives.

Strategic Crime Analysis

> *The study of crime and law enforcement information integrated with socio-demographic and spatial factors to determine long term "patterns" of activity, to assist in problem solving, as well as to research and evaluate responses and procedures.*

Strategic crime analysis consists primarily of quantitative analysis of aggregate data. Monthly, quarterly, and/or yearly compilations of criminal and non-criminal information such as crime, calls for service, and traffic information are analyzed in aggregate form. That is, general categories such as date, time, location, and type of incident are analyzed instead of qualitative data such as narrative descriptions of incidents. Variables including race, class, sex, income, population, location, and location type are examined along with law enforcement information in the analysis process. The two primary purposes of strategic crime analysis are 1) to assist in the identification and analysis of long-term problems such as drug activity or auto theft and 2) to conduct studies to investigate or evaluate relevant responses and procedures. Both of these purposes correspond very well to the problem solving process (see

Section IV for a discussion of crime analysis and problem solving specifically). These types of studies include evaluation of crime prevention programs, in depth examination of a particular crime problem, and implementation of a survey of citizens' perceptions of crime and the police. They incorporate pre- and post-measurement as well as both impact and process evaluation methodology. Procedures examined include such activities as deployment and staffing, redistricting of beats or precincts, data entry and integrity, and the reporting process. In sum, strategic crime analysis uses statistical techniques and research methods to investigate long-term problems and evaluate organizational procedures. Analysts who primarily conduct strategic crime analysis are also called problem or research analysts.

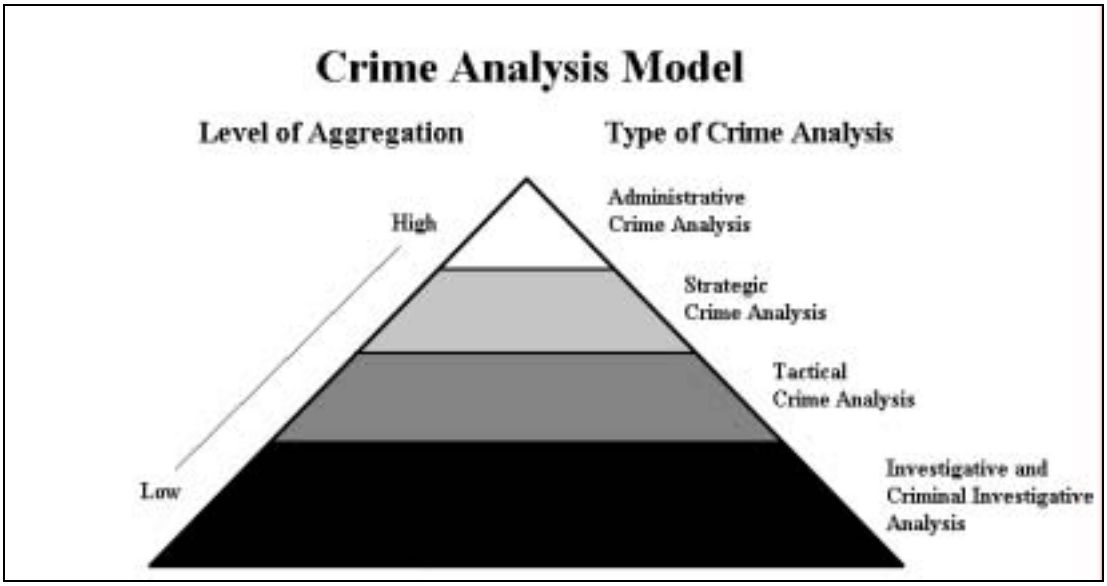
Administrative Crime Analysis

> *The presentation of interesting findings of crime research and analysis based on legal, political, and practical concerns to inform audiences within law enforcement administration, city government/council, and citizens*.

Administrative crime analysis is different from the previous types of analysis in that it refers to presentation of findings rather than to statistical analysis or research. The decision of what and how to present information is the primary focus of administrative crime analysis. Often, the type of information that is presented represents the "tip of the iceberg" of all the work and analysis that has previously been done, for example, an executive summary of a report. The purpose and the audience of the information determine "what" is presented along with legal (e.g., privacy and confidentiality), political (e.g., union issues, election concerns), and practical concerns (e.g., complexity of the information presented). The primary purpose of administrative crime analysis is to inform audiences. These audiences may vary from one situation to the next, which is why the type and quantity of information should vary as well. Audiences can be police executives, city council, media, citizens, and neighborhood groups or a combination. An excellent example of administrative crime analysis is the use of the Internet to provide information to the general public. Audiences of a police Internet site include citizens, police personnel, businesses, victims, criminals, and media—essentially everyone; therefore, the type of information published should be appropriate for an array of diverse customers. The information provided should be simple, clear, and concise and should not disclose sensitive information. One rule of thumb would be to only publish information that one would be comfortable seeing on the evening news.

Crime Analysis Model

The following figure displays how all of these types of crime analysis relate to one another in terms of the level of aggregation of the information. That is, types with low levels of aggregation focus on individual cases and used qualitative data and analysis techniques and those with high levels of aggregation focus on a limited scope of larger amounts of data and information. At the top of the figure, criminal investigative analysis and intelligence analysis utilize the least aggregated and most qualitative data. The data consist of information about informal networks of criminals and their non-criminal acquaintances and relatives as well as where individuals live, work, and "play." The focus here is on the specifics of criminals, the nature of their crimes, their relationships, and their lives in general.



Tactical crime analysis utilizes only crimes and activity reported to the police so the data are more aggregate and somewhat less abundant than those used for criminal investigative and intelligence analysis. Tactical crime analysis is primarily qualitative in nature but depending on the data, quantitative techniques can be used to describe characteristics of a given pattern such as the most common time the crimes occur (time series) or where the crimes are located in relationship to one another.

Strategic crime analysis utilizes large amounts of data that are even more aggregated than tactical and investigative data. For example, information used in tactical crime analysis is primarily made up of crime incidents but includes such information as date, time, location, methods of the crime, and detailed description of the crime. Strategic crime analysis focuses only on those variables that can be easily quantified, such as date, time, location, type of location, type of crime, and priority. Thus, the

type of analysis is more quantitative and the large amount of data calls for statistical operations instead of reading and examining each case individually.

Finally, administrative crime analysis in this figure is literally the "tip" of the triangle in level of aggregation. The focus is presenting the most aggregate or summary information to a variety of audiences.

Overall, these types of analysis fall under the general definition of crime analysis in that each one contains some of the key components of crime analysis. For the purposes of the rest of this report, we will focus on examples of the last three types of analysis, tactical, strategic, and administrative, as they are the types of analysis that are most likely to be conducted on a regular basis by a crime analyst in an average law enforcement agency.

III. Introduction to Crime Analysis Mapping

Historical Overview

The following chart is a brief outline of the history of crime mapping (taken from Weisburd and McEwen, 1997; and Harries, 1999). Mapping itself has a long history, but crime mapping specifically can be traced back to the early 1800s when social theorists began to create maps to illustrate their theories and research about crime. In relation to crime and policing, maps initially were used to examine issues like poverty or demographic characteristics and crime. One of the first police departments to use mapping was New York City in the 1900s. The maps consisted of simple wall maps in which "push pins" were used to indicate crimes that had occurred. During the 1920s and 1930s, sociologists at the University of Chicago used mapping to examine crime and delinquency, specifically juvenile delinquency and related social characteristics. In the 1960s and 1970s, the first computer-generated maps of crime were created. (See Weisburd and McEwen, 1997 for more information).

Early 1800s:	Social Theorists: Single symbol point and graduated area maps
1900s:	New York City Police Department and others: Single symbol point maps, "pin maps"
1920s-30s:	Urban sociologists at the University of Chicago: Graduated area maps of crime and delinquency
1960s-70s:	First computer generated maps of crime
1980s:	Desktop computers available for mapping, but with limited quality; Environmental Criminology theory
1990s:	Desktop GIS and integration with law enforcement systems and data; government funding, etc.

In the 1980s, more advanced technology and desktop computers became available, and more widely used. However, the quality of computerized mapping at that time was limited because of slow processing speeds and poor printing quality. At the same time, environmental criminology theory began to emerge, and academics began to examine the spatial characteristics of crime as well as how location characteristics

might contribute to criminal activity at particular locations over others. In the 1990s, desktop geographic information systems (GIS) became widely available, and in the late 1990s, they began to be generally used by law enforcement agencies and criminologists.

Most recently in the late 1990s, Federal programs such as the Crime Mapping Research Center (National Institute of Justice) and the Crime Mapping and Analysis Program (National Institute of Justice, National Law Enforcement and Corrections Technology Center) were established. As part of its $1 billion Making Officer Redeployment Effective (MORE) program, from fiscal years1995-1998 and in fiscal year 2001, the COPS Office provided funds to law enforcement agencies to acquire crime mapping software and hardware. As with all MORE funded technology, the purpose of this software and hardware was to enhance community policing activities through timesavings and increased officer effectiveness. Since 1995, the Police Foundation's Crime Mapping Laboratory has been funded by COPS to assist police agencies in incorporating crime mapping into their practices. In addition, universities and colleges have begun to offer undergraduate and graduate courses in crime analysis and crime mapping.

Types of Mapping

Manual Pin Mapping

Wall maps have long been a simple and useful way to depict crime incidents or hot spots. Many police departments still have large maps tacked to the wall of the briefing room with the most recent crimes represented by pins. Although useful, manual wall maps, offer limited utility because they are difficult to keep updated, keep accurate, make easy to read, and can only display a limited amount of data. For example, although different colored pins could be used to represent different types of crime, date and time of incidents, the nature of incidents, and other information cannot be displayed easily. In order to update a manual wall map, for example, the pins must be removed each month. Unless a photo or some other mechanism is used to record the previous month's map, the information illustrated on the map is lost. Thus, comparison is difficult, if not impossible, from one month to the next. Finally, the maps become unreadable when they display large amounts of data because of the numerous pins and/or holes.

Computer Mapping

The following is an example of a computer map. It has been taken from MapQuest©, an Internet mapping program, where an address is entered and a map of the surrounding area appears with a pin to locate the address.

Even though it is possible to zoom in and out of this type of map, the geographic features (e.g., locations, streets, parks) are static and cosmetic only. In essence, a computer map is similar to a wall map, in that the computer is used to place a point at a specific location just as a person would put a pin on a wall map. Thus, computer maps have limitations similar to wall maps. For instance, when using MapQuest© to map an address, clicking on a point will not provide information behind that point, such as the specific address. While visually appealing and easy to use, computer mapping does not allow any more effective analysis than manual pin mapping.

Geographic Information System (GIS)

> *A geographic information system (GIS) is a set of computer-based tools that allow a person to modify, visualize, query, and analyze geographic and tabular data.*

A GIS is a powerful software tool that allows the user to create anything from a simple point map to a three-dimensional visualization of spatial or temporal data. A GIS is different from manual pin maps and computer maps in that it allows the analyst to view data behind the geographic features, combine various features, manipulate the data and maps, and perform statistical functions. There are many different types of GIS programs, which include desktop packages (e.g., ArcView®, MapInfo®, GeoMedia®, Atlas GIS®, Maptitude®) as well as professional software (e.g., ArcInfo® and Intergraph®).

Crime Analysis Mapping

"Crime mapping" is a term that has been used for the past few years to refer to research analysis using GIS in a law enforcement setting. In this report, the term crime analysis mapping is used to describe this process because using a GIS to analyze crime is not just the act of placing incidents on a map but also of analysis. Consequently, "crime analysis mapping" is:

> *The process of using a geographic information system in combination with crime analysis techniques to focus on the spatial context of criminal and other law enforcement activity.*

GIS Components

The following is a description of the major components of a GIS, which include data representation, data features, visualization, scale, and querying.

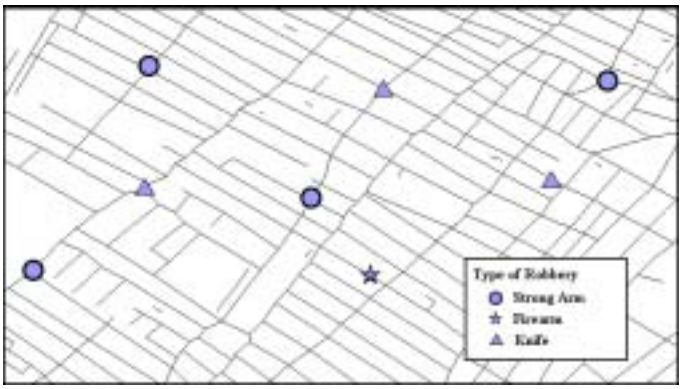
Data representation

Real world data are represented by one of four features in a GIS. They include point, line, polygon, and image features.

Point feature

> *A point feature is a discrete location that is usually depicted by a symbol or label.*

A point feature in the geographic information system is analogous to a pin placed on a paper wall map. Different symbols are used to depict the location of crimes, motor vehicle accidents, traffic signs, buildings, beat stations, and cell phone towers. The following map shows a robbery point map.



Line feature

A line feature is a geographic feature that can be represented by a line or set of lines.

The following map shows how different types of geographic features such as railways, streets, and rivers can be represented by a line in a GIS. Additional examples are streams, streets, power lines, bus routes, student pathways, and lines depicting the distance from a stolen to a recovered vehicle.

Polygon feature

A polygon feature is a multisided figure represented by a closed set of lines.

In the following map, the largest blue polygon represents the city boundary, the green are census tracks, and the black are census block groups. Other examples of polygon features used in law enforcement would be patrol areas, beats, neighborhoods, or jurisdictions. Polygon features can represent areas as large as continents and as small as buildings.

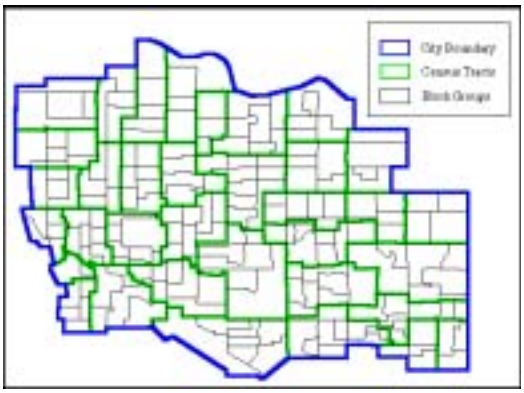


Image feature

> *An image feature is a vertical photo taken from a satellite or a plane that is digitized and placed within the geographic information system coordinate system so that there are -x and -y coordinates associated with it.*

The following image is an example of an aerial photograph. Note that details of the streets, buildings, and environmental features such as landscaping are visible.

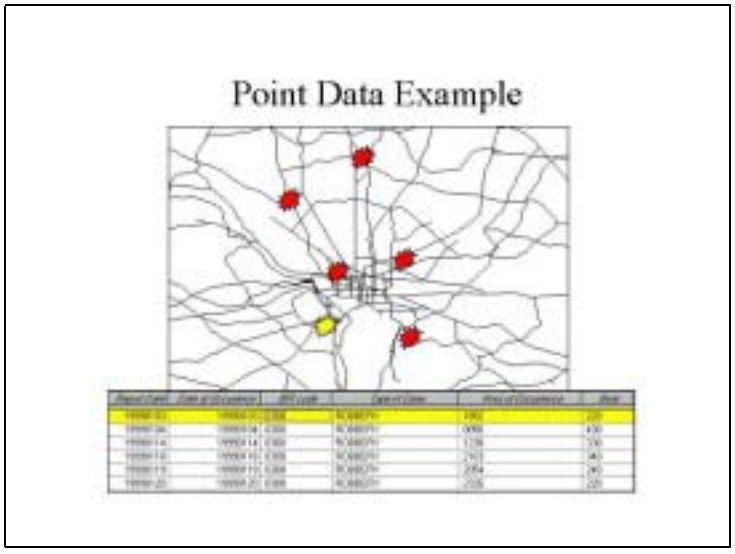
There is a distinction between aerial photography (just the image) and digital orthophotography (the image combined with geometric qualities of the map). Because orthophotographs are located within the geographic information system, they can be viewed with other layers such as street or parcel information. The following image depicts a digital orthophotograph with the corresponding street network and parcel boundaries.

Data of geographic features

Each type of feature has "attributes" or a table of data that describe it. All the attributes for three of the four types of features (point, line, and polygon) are stored in a GIS as a data table (Note that a digital orthophotograph has an –x and –y coordinate but does not have an associated data table worthy of analysis). The ability to view, query, relate, and manipulate data behind these features is the true power of a GIS. A manual pin map and a computer map depict points, lines, and polygons but do not have data associated with the features and are not easily manipulated. In a GIS, simply clicking on a point, line, or polygon can produce the data table associated with that particular feature.

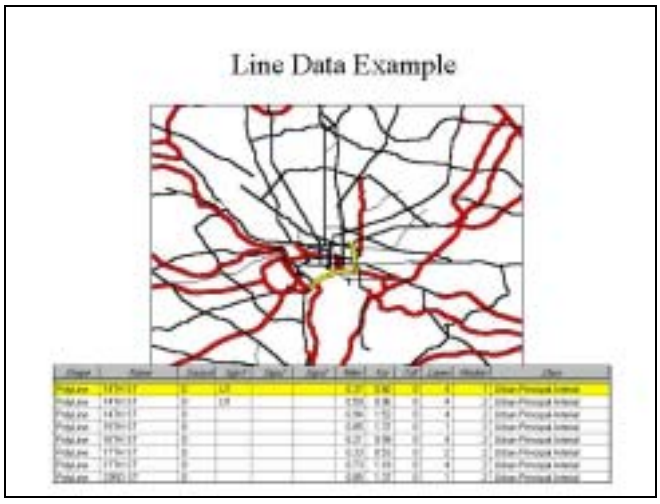
Point data

The following is an example of point data taken from a GIS. The highlighted point has a corresponding data table, which describes the features. For instance, the yellow point is a robbery that occurred at 6:52 pm on January 1st, 1999. In this case, each line of data describes a different point on the map and each variable describes something about that point.



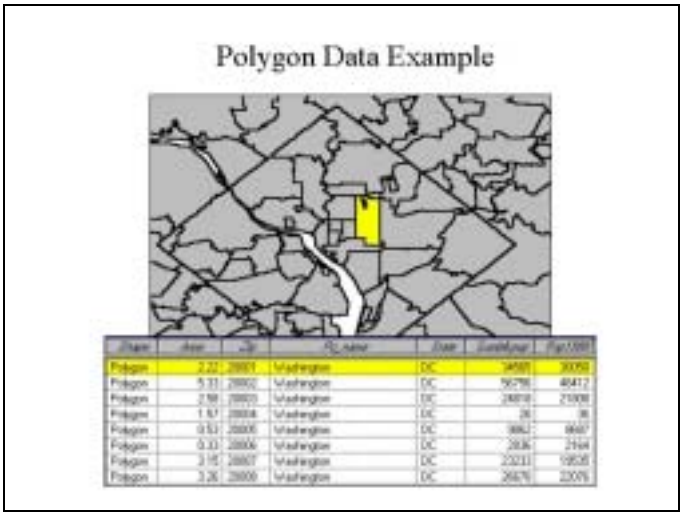
Line data

The following is an example of line data. The table describes the street segments (e.g., the miles, the length of that street segment, and the name of the street). The yellow street segment corresponds to the case highlighted in yellow in the data table. The GIS knows which line corresponds to each case in the table.

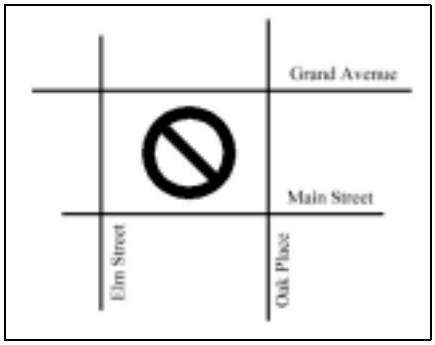


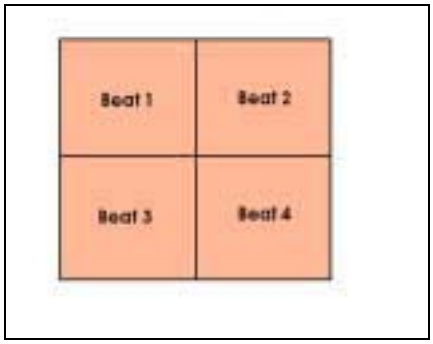
Polygon data

The following image displays the data describing polygons, which are zip codes. The yellow polygon is zip code 20001 in Washington DC with an area of 2.22 square miles and a population of 30,050 in 1990 as is seen in the data table.



Note that the lines themselves only make up the borders of the polygons, rather than being distinct lines with associated data. For example, the image, below left, depicts four intersecting line features that create a square. Each line has associated data; however, the area within the square or polygon that they have formed has no meaning. The image, below right, depicts similar lines; however, these lines are the borders for four separate beats and thus, the lines do not have meaning by themselves, only in relation to the other lines and in the fact that they create a shape.





GIS toolbox

The primary advantage of a GIS is its functionality that allows geographic data to be manipulated. The following are some components that enable data to be manipulated.

Connectivity

> *Connectivity refers to streets and other linear features that are represented by segments that connect at intersections.*

As noted above, data are associated with each line feature. However, each segment connects at an intersection, and connectivity is the ability of the GIS to recognize that the two line segments come together to form an intersection.

Thus, connectivity allows intersections such as Shiawassee and Pine or Chestnut and Ottawa to be located on the map, which is particularly important in law enforcement data since accident information (reports and calls for service) usually list an intersection as the location of an accident.

Contiguity

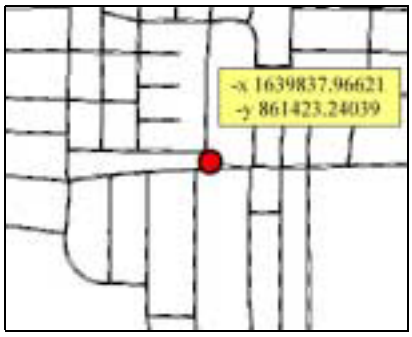
> *Contiguity refers to adjacent areas that are represented by adjacent polygons.*

The following map shows how a GIS includes adjacent polygons representing parcels and buildings. The ability of the GIS to recognize adjacent polygons allows for querying, selection of polygons within others, and visualization of complex land units.

Geometry

> *Geometry refers to the fact that all features in the geographic information system have at least one set of –x and –y coordinates.*

In the example depicted below, the point on the map has a distinct –x and –y coordinate which is listed in the yellow box.



Although these numbers may not make sense at first glance, they are an integral part of the GIS reference system, as every feature in a GIS has at least one –x and –y coordinate. For a point, the –x and –y feature is the center of the point. For a line segment or a polygon, the –x and –y coordinate is at the center of that particular line segment or polygon. Having an –x and –y coordinate for map features, especially points, is important because the location is more precise and there is no need for geocoding (see the explanation of geocoding later in the report).

Visual display/mapping

Thematic approach

> *In a geographic information system, the data are separated by type of feature into what are called "layers" or "themes" as well as by type of data.*

For example, point data of crime and calls for service would not be contained in the same layer or theme because these data come from two different sources. This is a thematic approach to organizing data. This component allows the data to be analyzed and visualized separately or together. Thus, when more than one layer is viewed in the GIS, they are stacked, similar to a stack of pancakes. In the following figure, each layer represents a different type of feature (point, line, polygon, or image) and a different type of data (shopping centers, bus routes, roads, and census tracts).

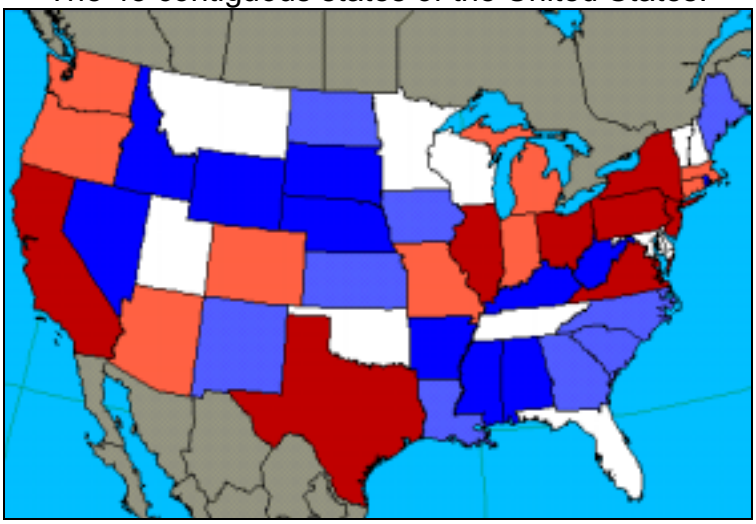
In a GIS, how the layers are stacked is important since some layers are opaque and hide others. For example, orthophotographs are opaque and if placed on top will cover any layers underneath.

Scale

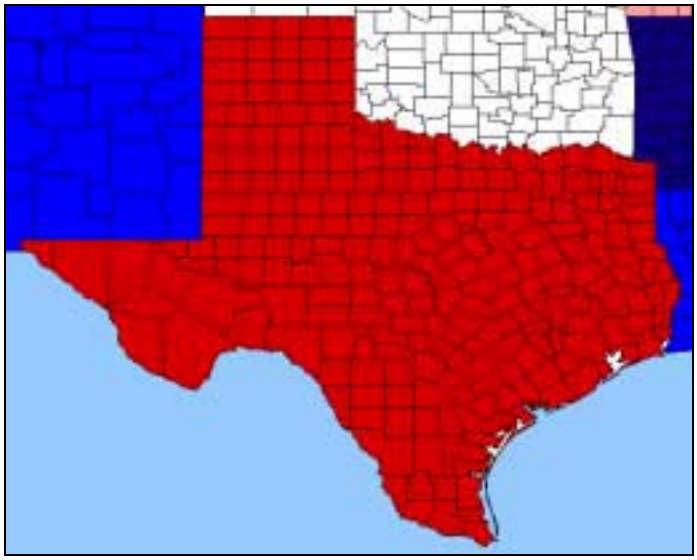
Scale is the relationship between the dimensions of the map and the dimensions of the Earth.

Usually, the scale depends on the purpose of the analysis or map. The following are examples of maps at various scales.

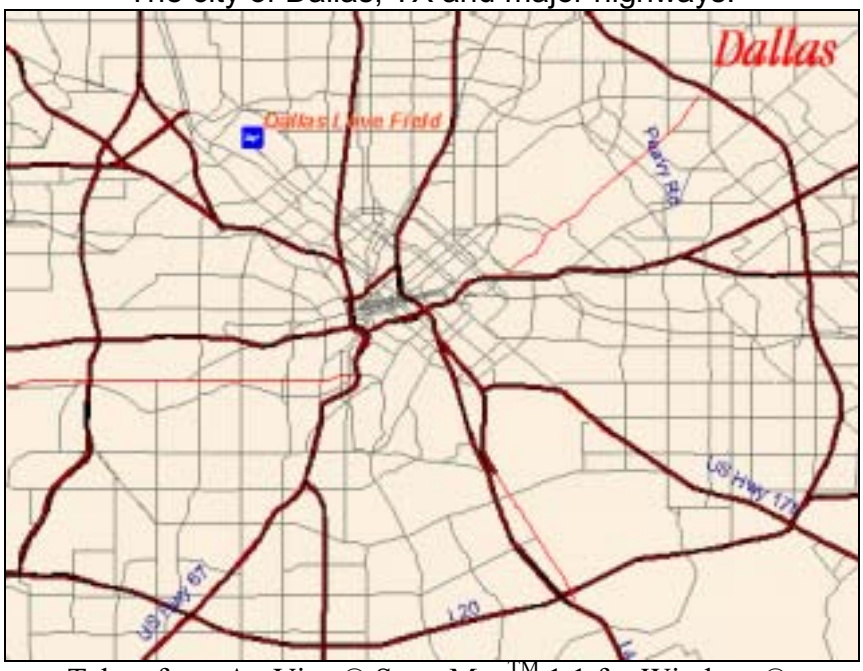
The 48 contiguous states of the United States.



The state of Texas and counties within it.

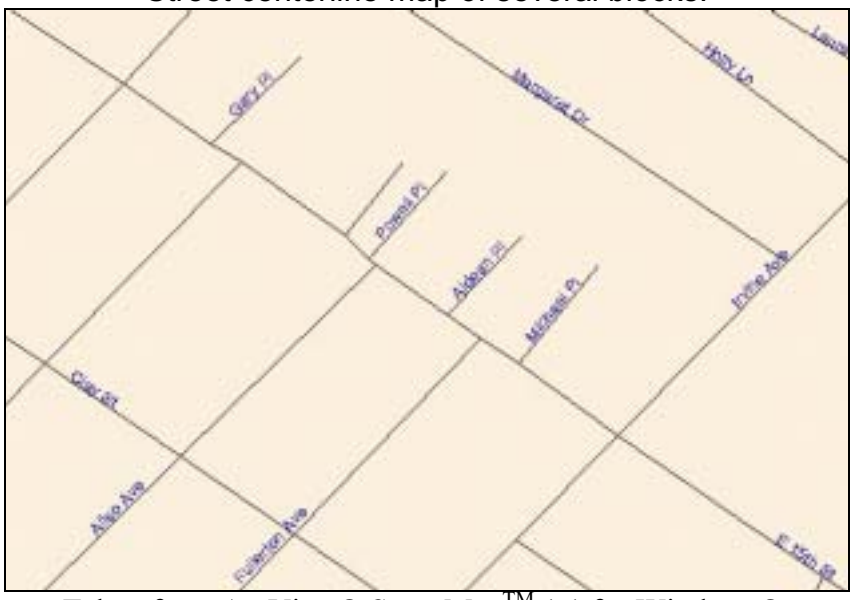


The city of Dallas, TX and major highways.



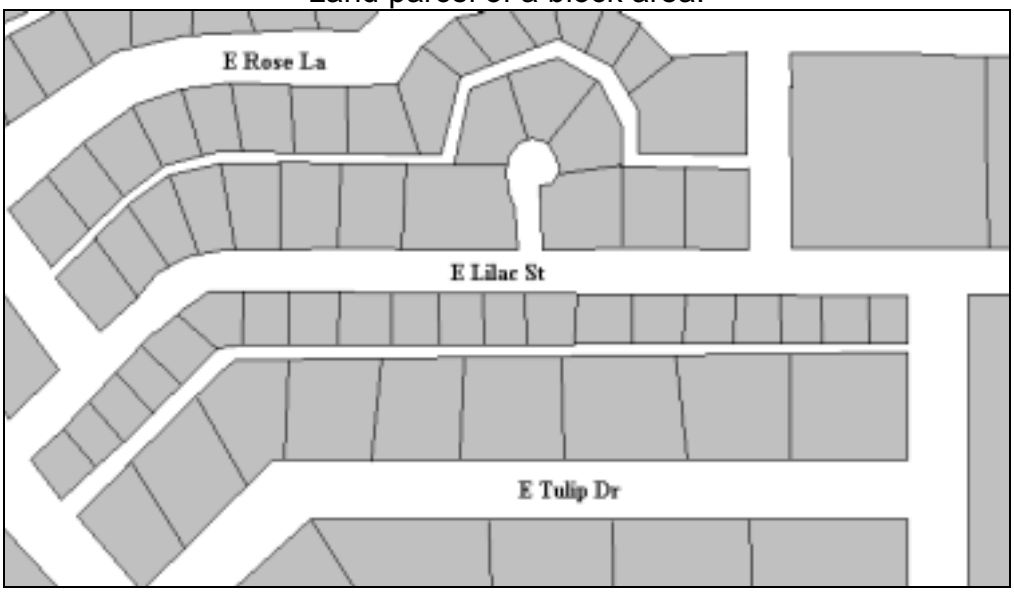
Taken from ArcView® StreetMap™ 1.1 for Windows®.

Street centerline map of several blocks.



Taken from ArcView® StreetMap™ 1.1 for Windows®.

Land parcel of a block area.



Parcel map with buildings.

Orthophotograph of a neighborhood.

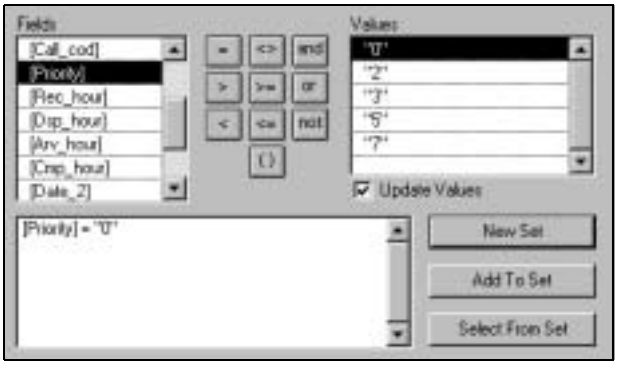
The appropriate scale depends on both the purpose of the map and the type of data that are displayed. For example, it would be impossible to view orthophotographs like the one above for the entire United States at one time. The GIS allows the user to set the scale at which orthophotographs are viewed (e.g., ½ mile or 1 mile). That way, the orthophotographs only become activated when the map is at that scale.

Querying GIS data

Geographic information systems contain the ability to query or select data in various ways.

Tabular queries

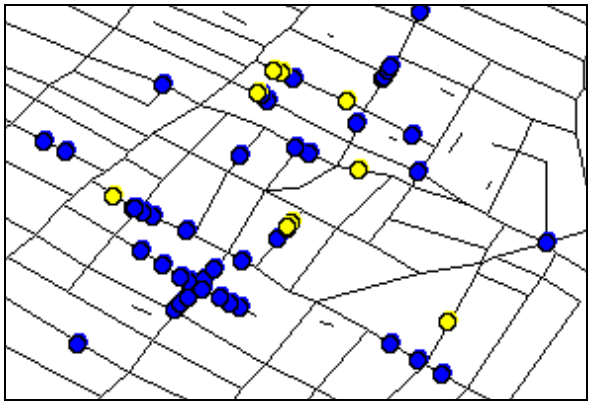
In a GIS software program, query expressions can be created to select features both in the data and on the map. For instance, one can construct a query to select emergency calls for service (priority 0) from tabular calls for service data.



After running this query, the priority 0 calls are selected (highlighted yellow) in the table.

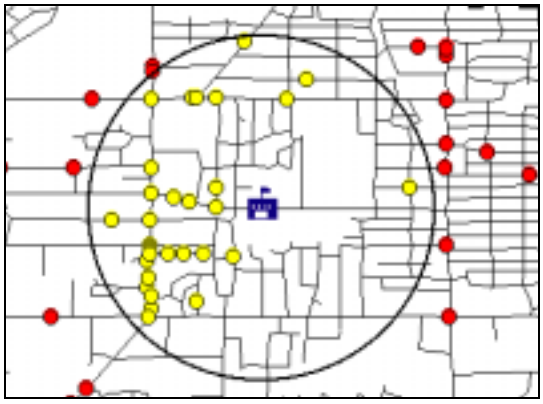
Event_no	Str_name	Str_apt	Date	District	Grid	Call_code	Priority
00203108	9 HECKMAN DR		960628	S	1133	G1300	0
00231068	9 SHERMAN AVE		960720	N	4402	G1300	0
00239616	253 STEGMAN ST		960727	S	1127	G1300	5
00203160	238 CARBON ST		960628	E	3523	G1300	0
00240989	348 WOODWARD ST		960728		3528	G1300	5
00247027	127 RANDOLPH AVE		960802	S	1614	G13	7

Additionally, the priority 0 calls are selected (highlighted yellow) on the map.

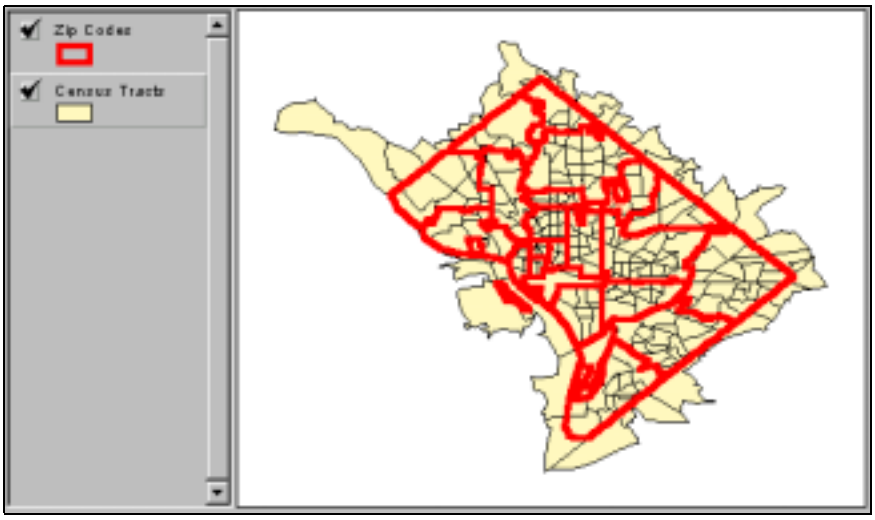


Spatial queries

Spatial queries enable map features to be queried based on their location on the map or their location relative to other features. A very simple example is drawing a one-mile buffer around a school to select the crimes that have occurred within a mile of the school.



In addition, one can select a feature of a map based on its relationship to another feature. The following is an example of selecting zip codes (in yellow) that border any census tract in Washington D.C.



IV. Introduction to Problem Solving

The following is a brief discussion of problem solving. The source of the problem solving and SARA definitions as well as the location of extensive literature on problem solving is the Office of Community Oriented Policing Services (COPS) Web site at www.usdoj.gov/cops/cp_resources/pubs_prod/s5.htm.

Definition of Problem Solving

> *A methodical process for reducing the impact of crime and disorder problems in a community. The problem solving approach is an integral component of the philosophy of community policing*.

SARA Approach to Problem Solving

The SARA approach to problem solving is described as scanning (S), analysis (A), response (R), and assessment (A). That is, once a problem is identified and its characteristics are analyzed, a response is developed and deployed to combat the problem, and after a determined time period, the response is evaluated. The following is a brief discussion of each aspect of the SARA process.

Scanning

> *Scanning is the first step to problem solving and is the identification of a cluster of similar, related, or recurring incidents through a preliminary review of information, and the selection of this crime/disorder problem among competing priorities for future examination.*

One example of using crime analysis information to scan for crime problems is comparison of crime on a monthly basis. Comparison of specific areas over time may indicate a problem area or type of crime. Another example is examining housebreaks over a six-month period to identify small patterns of activity, which could represent a larger housebreak problem.

Analysis

> *Analysis is the use of several sources of information to determine why a problem is occurring, who is responsible, who is affected, where the problem is located, when it occurs, and what form the problem takes.*

Often, individuals think they already know the nature and cause of problems identified in the scanning phase; thus, they do not conduct intensive analysis of the

problem. However, analysis of the problem from several perspectives with several types of data often yields information not previously known. For example, while discussing the auto theft problem, detectives in a jurisdiction in the Southwest US insisted that the auto theft problem centered on cars being taken to Mexico. Yet, when the data were analyzed, it was discovered that nearly 85% of the vehicles were being recovered in or near the jurisdiction. The detectives did not have a good sense of the problem because they only saw a select few of the auto theft and recovery reports.

Response

> *Response is the execution of a tailored set of actions that address the most important findings of the analysis phase.*

A recent report by Mike Scott, entitled *Problem-Oriented Policing: Reflections on the First 20 Years*, offers an evaluation of the last twenty years of problem solving and problem oriented policing and found that police departments are getting very good at responding creatively to the types of problems that they identify (Scott, 2000). Police departments are now working with communities and developing partnerships on a regular basis. Some examples of responses that have been used are working with city engineers to redesign a park that had a high number of assaults, vandalism, and drug dealing incidents (Mankato, MN); convening an advisory board composed of law enforcement, residents, business owners, and charities to address traffic and safety concerns at day-laborer gathering points (Glendale, CA); and establishing a juvenile diversion program whereby police bring together adolescent taggers and the owners of the property they deface to agree on terms for restitution and community service (Santa Ana, CA) (Sampson and Scott, 2000).

Assessment

> *Assessment is the measurement of the impact(s) of the responses on the targeted crime/disorder problem using information collected from multiple sources, both before and after the responses have been implemented.*

For law enforcement agencies, assessment is probably the most challenging part of the SARA process, not only because measures of effectiveness are often difficult to determine and capture, but also because assessment takes time and effort to complete at a time when the problem solving process is winding down. For example, measuring a response such as a crime prevention education campaign is difficult because there may be substantial lag time between intervention and measurable effects of the response.

Crime Analysis and Problem Solving

Crime analysis and mapping play a major role in all phases of the problem solving process. It is important to measure the problem accurately during the scanning, analysis and the assessment phases. Analysts can also assist in the response phase of the SARA process by informing the effective allocation of resources by determining the times when, and areas where the offenses are most frequently or disproportionately occurring. The role of crime analysis in problem solving lies in the fact that members of a law enforcement agency have different experiences and understandings of a problem, and it is necessary for the crime analyst to either support or refute these assumptions by providing a comprehensive analysis of a problem and an evaluation of process and response impact.

V. Data and Geocoding

Types of Data

Data collection and dissemination is a cyclical and on-going process. The term "database" can refer to anything from entire records management systems to simple spreadsheets containing a few variables and a handful of cases. Databases are vital for conducting crime analysis and mapping. It is essential to identify the actual and potential data sources within an agency that can be used for analysis. Below is a description of two distinct categories in which law enforcement information falls.

Tabular Data

> *A list of records contained in a table that, along with information about the record, contain addresses or some other type of geographic variable.*

The unit of analysis in tabular data can be anything that is not inherently geographic. Law enforcement examples of tabular data include crime, calls for service, accidents, field information, sex offender information, and arrests.

Geographic Data

> *Data that are inherently geographic; that is, they describe geographic features.*

The unit of analysis in geographic data is a geographic feature. Examples of quantitative geographic data sources include streets, districts, jurisdictions, census tracks, and bus stop/route data. Law enforcement examples of qualitative geographic data include neighborhood boundaries and pathways children take to and from school. Even though all geographic data have associated attributes (tabular data), the tabular data do not make much sense outside of a GIS. The following table contains the attributes of a geographic street file. Variables such as the length of the street in feet, prefix, street name, suffix, and number of lanes describe each street segment on the map.

Length	Pre	Name	Type	Lanes
373.68484	E	THIRTIETH	ST	2
65.24045	E	FOURTH	ST	2
430.24857	E	THIRD	ST	3
134.70268	E	SECOND	ST	2
309.69322	E	FIFTH	ST	3
234.76184	E	FIRST	ST	4
202.07308	E	TWENTY-EIGHTH	ST	4
240.78427	E	TWELFTH	ST	2
376.39829	E	TWENTY-SEVENTH	ST	2

General Data Integrity Issues

There are various data integrity issues associated with tabular and geographic law enforcement data. This section is not meant to serve as a comprehensive description of the data integrity issues in law enforcement but instead gives a general overview of the major issues.

Data Entry

In a law enforcement setting, oftentimes the individuals, officers, dispatchers and records clerks, who are conducting data entry, do not realize that others are using the data they produce. This lack of awareness can lead to carelessness and result in unreliable data. Data entry errors can be improved by technology (address cleaning software), proper training, and making individuals aware of the uses and importance of the data.

Timeliness

A primary concern in crime analysis, especially in tactical crime analysis, is that data obtained are current and available in a timely manner. Unfortunately, because of human error and technological difficulties, this is not always possible. One method to remedy this problem is to stress the need for and the value of current data for crime analysis. This need should be communicated throughout the department in order to come up with solutions for improving data timeliness.

Data Validity

Validity refers to whether data accurately reflect the concept that they are intended to measure. Although true validity is difficult to measure, law enforcement data, like any other data, are prone to validity issues. For example, many police departments use calls for service information as a proxy for crime. This is problematic, because not all calls that are originally dispatched as a crime are in fact crimes. The best example is a robbery call for service, since there is a common confusion about the difference between a robbery and a burglary. A citizen who has been burglarized may call 911 to report, “they’ve been robbed” when in fact they were not. If the dispatcher enters what the citizen reports and the title of the call is not changed when the actual crime is determined (a common problem), the call for service would not accurately represent the crime that occurred. Even if the call title and crime match, using calls as a proxy for crime is problematic as the date and time variable would indicate when the call was received by the police department, not when the crime actually occurred. Analysis of these variables would yield invalid results in that they would indicate when the citizen called the police and not when the crime actually occurred.

Reliability

Reliability refers to the whether data are measured the same in repeated observations. An example of a reliability issue related to law enforcement data is when there is a policy or law change (e.g., mandatory arrest for domestic violence offenses). Frequently, there will be a sharp increase or decrease that indicates that the data no longer represent the same phenomenon and thus, the numbers are not reliable. Obviously, reliability issues can significantly affect crime analysis results.

Data Transfer Process

The data transfer process can affect data quality and integrity in that data can be inadvertently or unavoidably lost or reformatted. An issue associated with the data transfer process is data compatibility. Police departments are notorious for having data in many different formats, and converting and combining these data is often a time-consuming and frustrating process.

Data Confidentiality/Privacy

Crime analysts are managers of law enforcement data; therefore, crime analysts are responsible for protecting the information and individuals represented within the data. Normally, the data used and created in crime analysis adheres to a jurisdiction's policies on privacy and confidentiality. New situations of providing information have surfaced which require additional and more detailed policies such as the invention of the Internet and the use of mapping. Thus, police departments should include specific crime analysis concerns into their data-protection plan.

On a related issue, the crime analysis unit, itself, should have a written data and analysis request policy that addresses common issues surrounding requests for crime analysis information. A policy, supported by the agency's administration, can provide guidelines for requesting information and expectations of what will and will not be provided. A recent document published by the National Institute of Justice provides a discussion and suggestions specifically for mapping and data confidentiality, see www.ojp.usdoj.gov/cmrc/pubs/welcome.html to download or order a copy of the publication entitled, *Privacy and the Information Age* (Wartell and McEwen, 2001).

Data Management

Metadata

Metadata refers to the data that describes the analyst's work.

Metadata are the data that describe data. Every police department has its own set of procedures that outlines how crime analysis is conducted. Frequently, these procedures are kept only in the analysts' memories, and it is important to have them written down for a variety of reasons. They include consistent data handling and cleaning procedures, guidelines for sharing work with others, keeping track of products and files created, and reducing duplication of effort. These written procedures are also invaluable training tools for new analysts. Some examples of categories of metadata include:

- Location of data files (e.g., on network, mainframe, personal computer)
- Source of the data (e.g., Records Management System, Investigation Bureau)
- Data cleaning procedures
- Geocoding procedures
- Report and map formats
- Methodology for regular reports and studies (e.g., monthly crime report, annual staffing analysis)

Geocoding

The following discussion of geocoding is taken directly from another document produced by the Police Foundation's Crime Mapping Laboratory as a part of the work conducted for COPS. The report is entitled, *Geocoding in Law Enforcement* (2000) and can be found on both the Police Foundation (www.policefoundation.org) and COPS (www.cops.usdoj.gov) Web sites.

Introduction

Geocoding is the process of bringing tabular and geographic data together based on a common geographic unit of analysis. A geographic unit of analysis refers to a spatial characteristic within the data that is necessary to locate it on a map such as address, zip code, beat, or grid. Tabular data are contained in a table and are a list of records that, along with information about the record, contain addresses or some other type of geographic variable. Examples of law enforcement tabular data are calls for service, crime, accidents, citations, sex offenders, and arrests. Along with information about nature of the incident (e.g., type of call or crime, date, time), these data contain the

location of the incident (e.g., address, grid, and/or beat), which will allow it to be geocoded. Geographic data are data that can be displayed on a map such as streets, census tracts, parcels, and buildings. Examples of geographic data specific to law enforcement are police districts, beats, or grid boundaries.

The purpose of geocoding is to assign tabular data to a location on the earth's surface to visualize the spatial characteristics of the data. It is analogous to placing a pin on a map in the appropriate location. Unlike the paper map, when geocoding in a geographic information system, data associated with the pin, or data point, are available. In order to geocode either electronically or manually, there must be a common geographic unit of analysis. In law enforcement, address is primarily used as the geographic unit of analysis to which tabular data are geocoded. However, other types of geographic units are also used such as parcels, zip codes, census tracts, census blocks, or beats. In the case of geocoding, geographic data used for geocoding are called "reference data" since the geographic data are used to reference the tabular data.

The following is a discussion of the geocoding process, regardless of the geographic information system (GIS) software used, and some common problems faced when geocoding law enforcement data.

The geocoding process

In general, there are five basic steps in the geocoding process. They are:

1. Prepare the geographic and tabular files for geocoding.
2. Specify the geocoding parameters.
3. Geocode.
4. Review results.
5. If necessary, respecify parameters and geocode again.

Step 1: Prepare the geographic and tabular files for geocoding

The first step is preparing the tabular and geographic files, which is the most important and can be the most time consuming of the five steps.

Tabular data. Tabular data used in law enforcement primarily consist of calls for service, crime, arrests, and accident data. Other types of tabular law enforcement data can include field information, sex registrant information, or intelligence information. In the past, much of this information was not captured electronically. However, currently, many departments either already have in place or plan to acquire an automated computer aided dispatch (CAD) system and a records management system (RMS) which have the capacity to store digital information as well as standardized

tables of addresses and location names. The most important aspects of these systems as they relate to geocoding are that they reduce the need for manual data entry and provide clear and consistent rules in order to ensure that data are reliable and valid. Because individuals are the data entry mechanism, there is still the possibility of human error and inconsistencies, which is why training should coincide with the technology.

Geographic data. A variety of geographic data types may be used as a reference layer, though street files such as the Census Bureau's TIGER/Line ® files are the most commonly used. Street files are often called centerline files in that they depict the center of the streets by line segments. Details of curbs, alleys, or cul de sacs are not depicted in centerline files. In this context, street files are geographic databases containing records that describe interconnected street segments. More specifically, each street is broken down into sections with address ranges associated with them. These sections usually span between cross streets. The following map is an example of a street centerline file and the darkened line is one street segment. The table below is the data describing the streets.

Street	Fromleft	Toleft	Fromright	Toright
YORK ST	473	479	478	480
YALE AVE	83	173	84	174
YALE AVE	1	81	2	82
WRIGHT AVE	1	91	2	96
WOODWARD ST	283	395	304	380

Street centerline databases generally have fields that describe the physical address along each street segment in the layer. Conventionally, addresses are recorded as

'from' and 'to' ranges for both the left and right sides of each street segment. In the above example, the centerline street segment of Yale Ave that is thicker than the others is represented by the address ranges of 83 to 173 on one side of the street and 84 to 174 on the other side, as highlighted in the table.

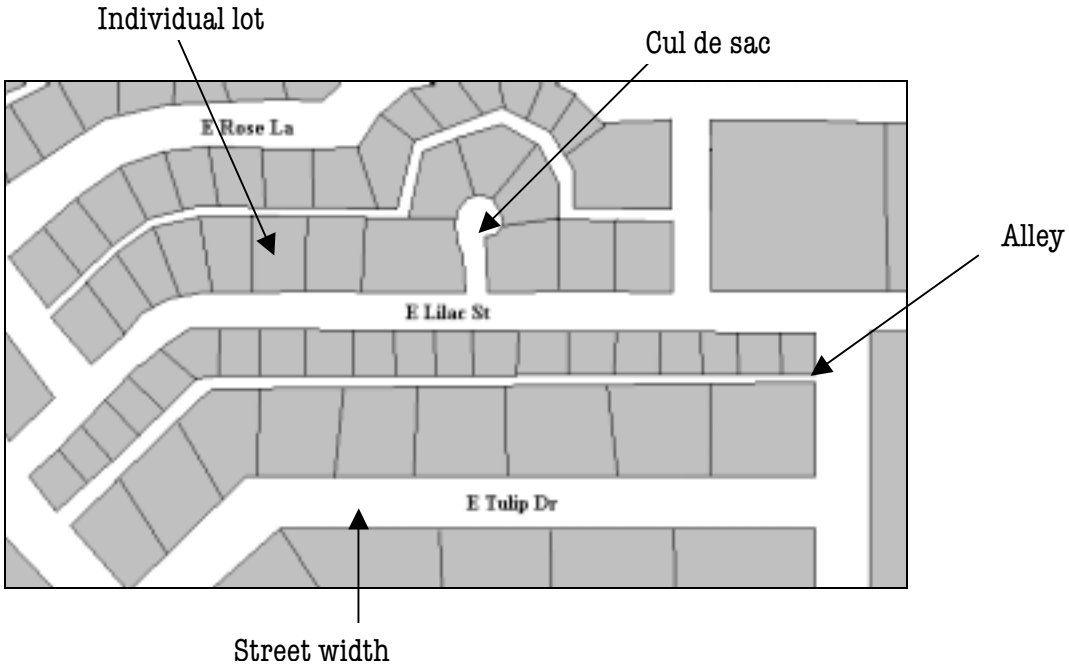
In addition to address ranges, street segments can be depicted by several variables such as street name, type, prefix, and suffix, as noted earlier. Street centerline databases vary in how the addresses are described. In the previous example, address is depicted with a variable called "street" along with the address ranges. The following are tables with highlighted examples of two additional ways in which addresses are found in a geographic database. The prefix and suffix fields are used to store information such as quadrant. The first table highlights a street segment with the prefix W for West Northern Ave. The second table highlights a street segment with the suffix NW for Chesterfield Place Northwest. Type refers to the type of roadway (e.g., street, road, lane, and drive). The highlighted examples in the following tables show Ave for Northern Avenue and Pl for Chesterfield Place.

Shape	L_Lastd	L_Lastd	R_Lastd	R_Lastd	Prefix	Name	Type	Suffix
PolyLine	4901	5099	4900	5098	W	Vista	Ave	
PolyLine	5051	5099	5050	5098	W	Kaler	Cir	
PolyLine	5947	5999	6000	6098	W	Northern	Ave	
PolyLine	5401	5499	5400	5498	W	Orangewood	Ave	
PolyLine	5301	5399	5300	5398	W	Orangewood	Ave	
PolyLine	7451	7301	7452	7300	N	51st	Ave	
PolyLine	7499	7453	7498	7454	N	51st	Ave	
PolyLine	7515	7501	7516	7500	N	51st	Ave	
PolyLine	7605	7517	7604	7518	N	51st	Ave	
PolyLine	7647	7607	7648	7606	N	51st	Ave	

Shape	L_Lastd	L_Lastd	R_Lastd	R_Lastd	Prefix	Name	Type	Suffix
PolyLine	2799	2701	2798	2700		Albemarle	St	NW
PolyLine	3099	2901	3098	2950		Audubon	Ter	NW
PolyLine	2699	2601	2698	2600		Tilden	Pl	NW
PolyLine	2899	2801	2898	2800		Chesterfield	Pl	NW
PolyLine	2899	2801	2898	2800		Allendale	Pl	NW
PolyLine	4201	4249	4200	4298		Lenore	Ln	NW
PolyLine	4799	4601	4798	4600		Broad Branch	Rd	NW
PolyLine	4499	4423	4498	4400		Broad Branch	Rd	NW
PolyLine	4421	4401	0	0		Broad Branch	Rd	NW
PolyLine	4599	4583	4598	4546		Broad Branch	Rd	NW

Because the Census Bureau's mission to count and profile the nation's people and institutions does not require a high level of positional accuracy in its geographic products, its TIGER/Line ® files and centerline maps are designed to show only the relative position of geographic elements.

As previously mentioned, another common layer used as a reference for geocoding is the parcel file. A parcel file is a polygon layer used to keep track of lots, subdivisions, and ownership information primarily for planning and tax purposes. The following is an example of how a parcel map looks in a GIS. Note that it is more specific than a centerline map in that alleys, cul de sacs, lot size, and street widths are discernable.



Parcel files provide a good base layer to examine relationships between land use, zoning, demographic data, and economic data as all of this information is contained in parcel files. Also, parcel reference layers can be very helpful in mapping law enforcement information because they can help to indicate the exact location of an incident (e.g., corner lot), and provide ownership information, which may prove valuable as in the case of rental property.

While parcel files have the ability to be highly accurate, like street files, accuracy is largely dependent on how often and how well the files are maintained. Because of the nature of real estate and other planning mechanisms, keeping parcel files updated and accurate can be a full-time job for several technicians depending on the area.

Successful geocoding depends not only on the quality of the geographic reference layer, but also the tabular data to be mapped. For any crime mapping application to be effective, basic reporting procedures need to be uniform and consistent. While most high-end geocoding software packages incorporate complicated algorithms

making them somewhat forgiving, a well established reporting procedure is often the best way to ensure a high rate of accuracy.

Step 2: Specify geocoding parameters

Step two consists of specifying the parameters of both the reference data and the tabular data to determine how the geographic units from each source will be matched successfully.

Selection of which reference layer would be most effectively used for geocoding must consider the needs of the individual end user. Considerations of accuracy, cost of product, maintenance costs, utility, current reporting procedures, and compatibility with other existing reference layers must be dealt with on a case-by-case basis. In the case of law enforcement, most information is geocoded to the street reference layer. However, sometimes it is necessary to be more specific, in which case a parcel reference layer may be used. For example, one might use the street centerline file to pin map residential burglaries in an entire city since the exact location of the burglary would not be as important as getting a general idea of where the incidents are occurring throughout the city. On the other hand, one might use a parcel file to pin map residential burglaries in a one or two block area to determine exactly which houses were targeted and whether they were along alleys, wooded areas, or on the end of the block.

Parameters set to determine how tabular and geographic data are matched are set within the GIS software and may include spelling sensitivity of the match, address style (e.g., whether to match on address only or address and zip code, or whether to accept partial match scores). A match score denotes the number of address records from the tabular file that were located in the reference layer. Another parameter is offset distance, which is placing a data point a predetermined distance away from the original geocoded location. This may be done to place points on one side of the street segment or another to make the map more readable and/or realistic.

These parameters are choices within the GIS software that will affect the geocode match rate. These preferences should be set and modified only after an examination of the tabular data. One should be completely familiar with the data in order to set these preferences. For example, if the spelling sensitivity parameter is lowered in a city that has two streets named Mill and Miller, inaccurate geocoding may result.

Step 3: Geocode

Once the parameters are set, geocoding is just a push of a button that starts the geocoding process. Often, software packages use a fairly simple method to accomplish the actual placement of the tabular data in relation to the reference layer. The common approach is to place the address point along the street within the range of the street number. For example, this first table highlights one call for service at the address "292 Princeton Ave."

Shape	Bg	Str_name	Str_apt	Date	District	Grid	Call_cod	Priority
Point	37001	292 PRINCETON AVE		960622	S	1112	G1300	5
Point	21002	24 VIRGINIA AVE	F-BSMT	960813	S	1620	G1300	5
Point	09022	133 MARTIN LUTHER KING DR		960801	S	1603	G1300	0
Point	25002	227 MARTIN LUTHER KING DR		960604		1625	G1300	5

The following table depicts the data for the street reference layer, and highlighted is the street segment in which "292 Princeton Ave" falls.

Shape	Street	FromLeft	ToLeft	FromRight	ToRight
PolyLine	PRINCETON AVE	289	315	290	316
PolyLine	E 53RD ST	33	85	34	66
PolyLine	ADLER ST	1	41	2	42
PolyLine	ALBERT PL	1	29	2	30
PolyLine	ARLINGTON AVE	23	71	24	70
PolyLine	ARLINGTON AVE	73	101	72	100

When an incident is geocoded, the point is placed relative to a proportioned length derived from the ratio of the difference between the maximum and minimum address values and the physical length of the line segment.

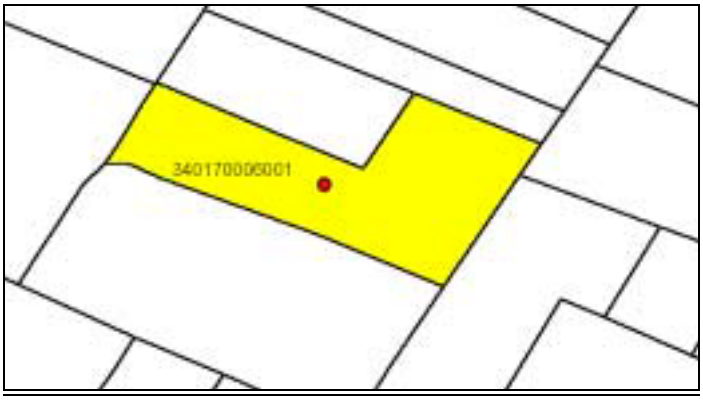
For example, a segment may represent a street with an address range of 101 to 151 for the left side. An address of 125 would be placed approximately halfway down the line on the left side. Although this method usually misses exact real world coordinates, it is often sufficient given the detail of the street file and necessary resolution of the final map. In this example, "292 Princeton Ave" is located near the beginning of the street segment.

As noted earlier, geocoding by street centerline may not be adequate to depict the exact location of an incident. In the case of mapping a few blocks of residential burglaries, one may want to geocode by parcel address. In some cases, such as recording traffic citations along routes that may not have readily discernable addresses, intersection address data can be recorded for later geocoding using street files. Intersection geocoding is often more accurate than street geocoding since there is no mathematical algorithm to define the physical location of the point generated; instead, the point is placed at the center of the intersection of the appropriate line segments. However, even using intersection data to geocode is not completely accurate since, in reality, most incidents occurring at an intersection address do not occur exactly in the middle of where the two streets intersect.

A similar geocoding strategy uses polygons as opposed to previously discussed street centerline files. This method is the same as geocoding specific address data in that a value from the tabular data must match that of a geographic reference layer. For example, calls for service data often have a grid, beat, or district field in addition to an address field. In this case, the incident data has a census block number field.

When geocoding polygons, the grid, beat, or district value is geocoded to the center of the polygon that represents the grid, beat, or district layer. In this example, the census block group layer matches that from the incident data.

Once the incident is geocoded, the point is placed in the exact middle of the polygon, as are all the points geocoded to that polygon.



This type of geocoding is often used to create graduated color thematic maps by aggregating the data by polygon since data geocoded by polygon can no longer be located by address. However, many people geocode by address first and aggregate the data by polygon after the fact to avoid losing address data. Other types of geographic polygon data that can be used as reference layers for geocoding are zip codes, census blocks, census tracts, county, state, and country. Geocoding data at the polygon level is particularly useful when a dataset is very large or when address information is not as reliable as information such as grid or beat information.

Step 4: Review results

Step four, reviewing results, is a matter of determining whether the geocoding process was successful and how successful it was. Most GIS software will have geocoding outcome statistics that indicate how many of the cases were successfully geocoded, how many are a partial match, and how many were not geocoded at all. Obviously, the ideal successful geocoding rate is 100%. Depending on the number of cases and the purpose of the analysis, a rate of 95% can also be acceptable. The important factor in accepting a geocoding rate less than 100% is understanding why some of the incidents are not geocoded. In some cases, missing data or data outside the mappable jurisdiction make up the incidents that are not geocoded. However, many times, there are other reasons that can and should be corrected.

In the case of a street centerline layer, geocoding problems are generally manifested in the form of missing or incorrect address ranges or missing street segments. Street layers often lack address ranges for streets because of recent construction of new roads or errors in the original creation process of the reference layer. The quality of these layers will depend both on those maintaining the layers and the growth rate of the jurisdiction. For example, in a small town that has not added new streets in fifty

years, the street reference layer would be easy to maintain, not only because nothing is being added but also because the town has relatively few streets to maintain. On the other hand, in a large city that is growing rapidly, the street layer would be much more difficult to maintain.

Because street files are generally manually updated, they are also prone to data entry errors. The combination of these problems can be difficult to solve. Many agencies produce and maintain their own street centerline files or rely on their city or town's engineering department to maintain them, and others have opted to purchase street centerline files that have been corrected and are bundled with contracts for regular updates. However, for layers particular to the police department, such as police district boundaries or beat boundaries, someone at the police department will most likely be tasked to maintain these. Fortunately, these layers are typically composed of many less geographic components than a street reference file. In any case, interagency cooperation can prove invaluable as a means for resolving geocoding problems.

Even if the geographic reference layers are complete, there may still be problems with the tabular data used by law enforcement agencies, which stem primarily from having incorrect information or inaccurate data entry. Address errors in calls for service, crime, or accident data are often the source of much of the woes of geocoding in law enforcement and can be categorized into five common types: incorrect street numbers, street name errors, direction errors, incorrect intersections (in the case of intersection geocoding), and discrepancy errors.

- Street number errors can be the result of entry mistakes and are frequently identified as range errors; the address identified is either less than or greater than the address range of the corresponding records in the source file.

- Street name errors can occur for a variety of reasons and are a result of the address record not matching the street name in the source database. These errors are among the most common, with reasons including misspellings, abbreviations, inconsistent street types, or lack of compliance with city addressing standards.

- Direction errors occur when the direction code of the address record does not match the direction code in the source database, either because they are incorrect or missing.

- Unmatched intersections can result from inaccurate intersection addresses or incorrect format. For instance, the intersection of Main Street and Center Avenue is referred to as "Main St & Center Av" and will not be recognized by many GIS software packages if entered as "Main St/Center Av" or "Center Av & Main St."

- Other errors can occur because there is a discrepancy between the common name of a location and the official address. For example, a police agency may have in its computer aided dispatch system a street called "Route 123," but the official name in the street centerline file may be "US HWY 123;" thus, they will not match.

Step 5: If necessary, respecify parameters and geocode again.

Step five is only necessary when there is not a 100% geocoding rate, which seems to happen most of the time with law enforcement data. Once the data have been geocoded and problems have been determined by the geocoding process, there are a few solutions. Some may choose to take care of the problems by changing the preferences (e.g., lowering the spelling sensitivity). However, as noted earlier, this should be done cautiously and with full knowledge of the tabular and geographic datasets, as changing preferences such as spelling sensitivity can lead to incorrect address geocoding.

Another solution is developing alias tables, which allow for multiple names for a single entity. For example, a location such as a park or a mall may be referred to in a computer aided dispatch system as "Central Park" or "Centertown Mall" instead of by address to make them easy for dispatchers to enter. An alias table would replace the common name with the appropriate address in the GIS system so it can be located on the map. However, even though alias tables are helpful, it is still recommended that data be cleaned in the original database to reduce confusion and facilitate consistency in data. Data are not only used for mapping purposes, so cleaning the data only in the GIS would not solve data integrity issues when the data are used elsewhere.

The best way to correct data is to fix it at the source; in other words, bring the errors to the attention of those administering the computer aided dispatch system, to those maintaining the street centerline file, to the officers writing the reports, or to the clerks entering the data. However, this may not always be a realistic or a fast enough solution. In small projects or where a large number of cases share the same few mistakes, manual correction may be possible. Large datasets can often be corrected more efficiently when imported into a database or spreadsheet program which has a "search and replace" utility. In addition, specialized software programs,

referred to as “scrubbers” can be useful for large projects and in instances where data are regularly imported.

Conclusion

These five steps outline the general process of geocoding law enforcement data. Because the types of data, problems, and solutions are common among law enforcement agencies, there is much to learn and share with one another. This overview has not detailed the specific methodology of geocoding in a particular GIS software program since the software used varies from agency to agency. For a specific outline of how to geocode in particular GIS software applications, see the text manual or electronic help files accompanying the software.

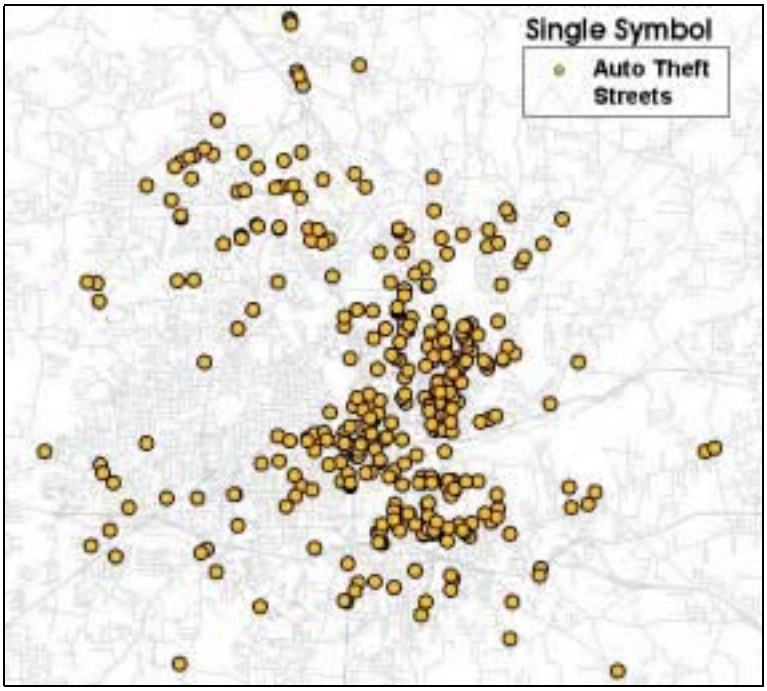
VI. Spatial Analysis Techniques

This section describes and illustrates basic types of mapping that are most commonly used and data classifications that are available in a GIS. This section is meant to serve as a guide and reference for these types of mapping rather than as a "how to" guide for creating crime analysis maps (please note that all of the data used here are fictional, and the maps do not have labels, scales, and North arrows that would be included in a map for presentation, as they are meant to illustrate a point and not represent a map for distribution. For elements of a map and final formatting, see section VII). For assistance in developing thoughtful, appropriate crime analysis maps, see the *Manual of Map Production* (2000) at www.policefoundation.org or www.cops.usdoj.gov produced by the Police Foundation's Crime Mapping Laboratory as a part of the work conducted for COPS.

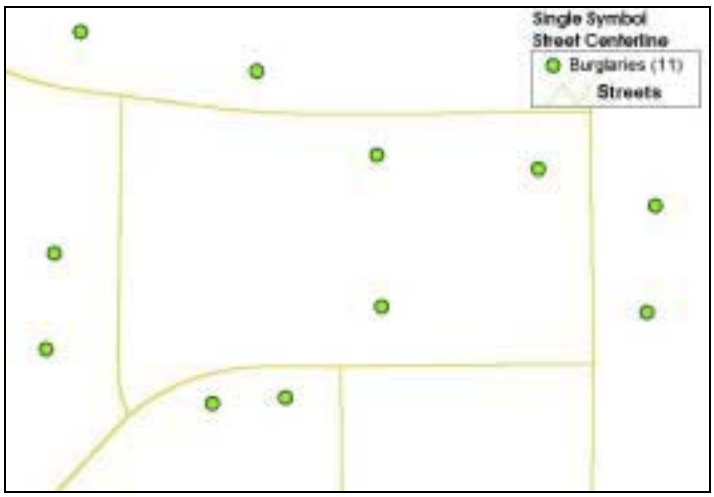
Single Symbol Mapping

Single symbol mapping refers to the use of individual symbols to represent point, line, and polygon features.

The utility of single symbol maps is that they allow for a detailed analysis of small amounts of data. This following is an example of an inadequate single symbol map. This map has too much data for this scale, which is why this method is primarily used for small amounts of data.

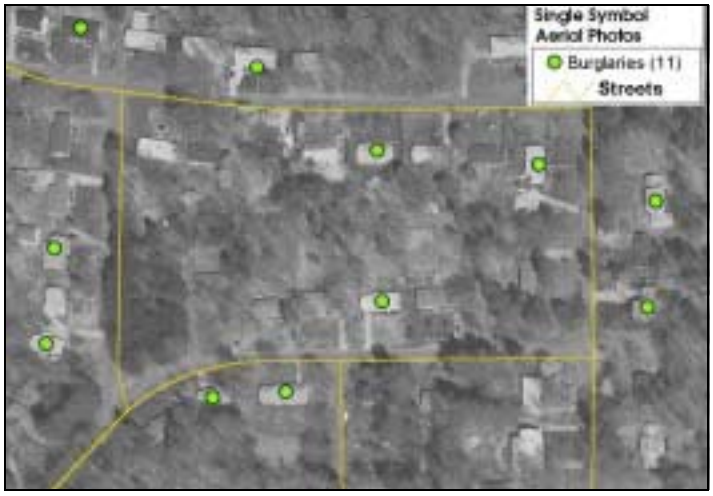


A drawback of single symbol mapping is that if two incidents have the same address, they are placed exactly on top of one another and cannot be differentiated by looking at the map. The following map is a better example of single symbol mapping that uses an appropriate scale. However, to avoid confusion since the points may still be placed on top of one another, one should list the number of incidents in the legend, as is done here or place a number (2) next to a location with more than one incident.

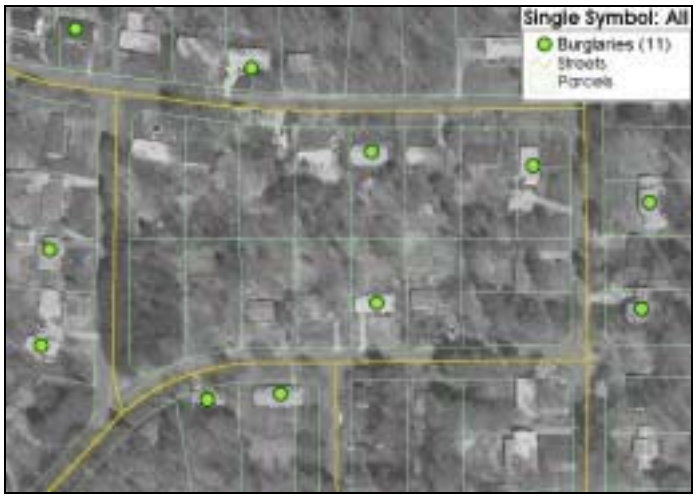


Because single symbol maps are more useful for small amounts of data, they are particularly useful for tactical crime analysis and mapping crime patterns. In addition, they allow a more detailed look at the geography surrounding the incidents. For example, the following map illustrates the same burglary incidents as above with the land parcels drawn that show the number of houses on each block and which were burglarized.

The next map depicts the same data as well as centerline streets with the digitized orthophotograph of the neighborhood that shows the actual houses and surroundings of the burglary locations.



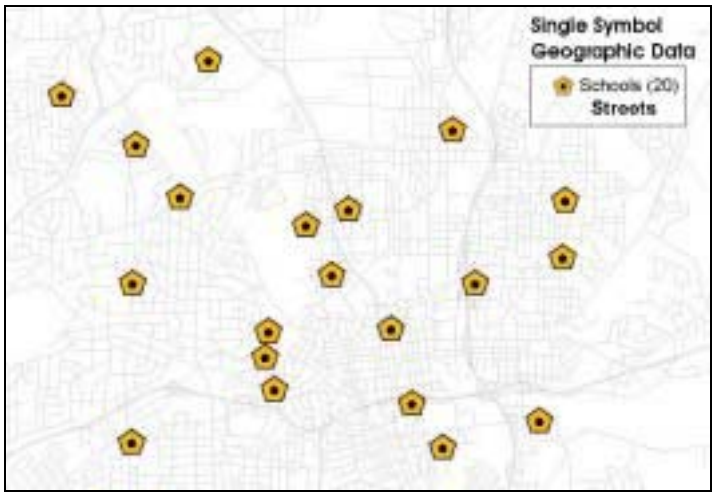
Finally, this map depicts the parcels, orthophotographs, street centerlines, and burglary incident data together. This map could assist in determining additional characteristics of the burglary pattern by examining neighborhood characteristics such as proximity to alleyways or shrubbery, and in responding to the problem by determining potential surveillance locations.



These maps could be used for a neighborhood analysis of accidents or burglary and provide a good example of the use of descriptive geographic data. The key to using a single symbol map effectively is for the analyst to be aware of the number of

incidents on the map and be sure they are all represented and their scale is appropriate.

Single symbol mapping is also helpful in representing geographic data such as schools or churches in that it is known that they are discrete addresses and the risk of two points on top of one another is low. The following is an example of schools in a single symbol map. The user should be aware of the readability of the map in order to determine what is "too much" data.



Graduated Mapping

> *Graduated mapping consists of aggregating data into groupings that are displayed on the map.*

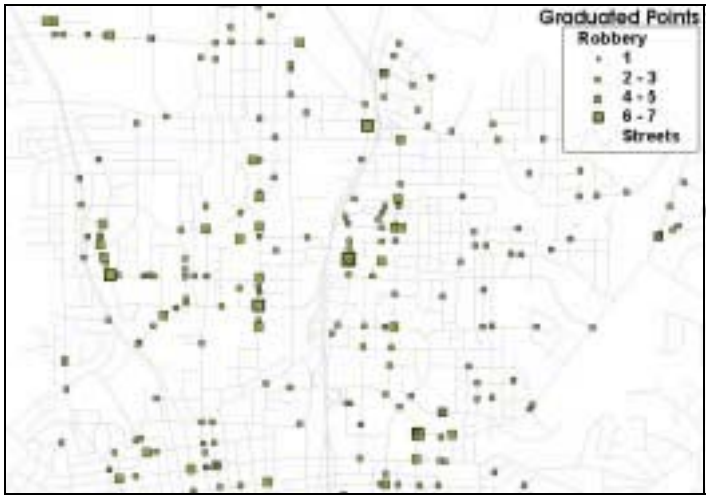
These groupings can be graduated by size or by color and can be classified statistically in various ways. This next section describes the size and color graduations as well as the classifications that are available in most GIS software packages.

Graduation By Size

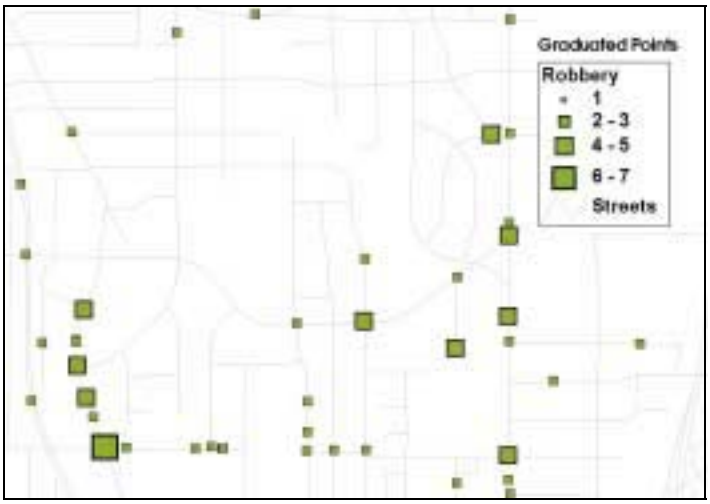
> *Graduated size mapping is the process by which data are summarized so that symbols (point or line features) are altered in size to reflect the frequencies in the data.*

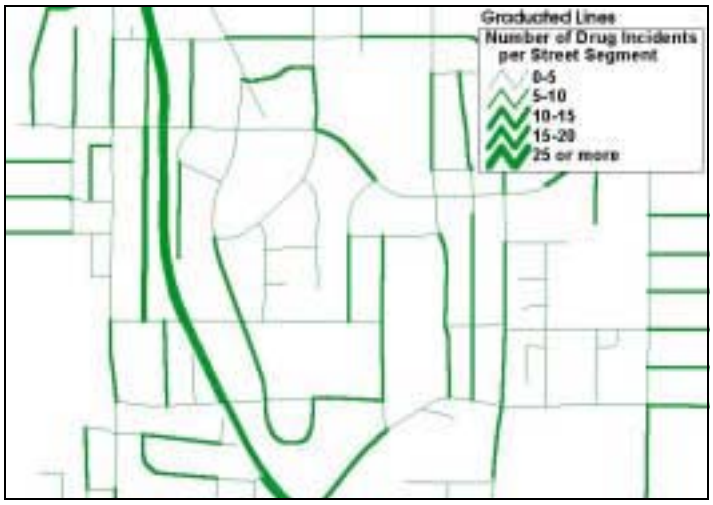
In other words, in this type of map, more than one incident at a given point or line is represented with a larger symbol or a thicker line. One drawback is that oftentimes, the size of the symbol or line is difficult to distinguish and the actual value associated with that symbol is not clearly displayed. In addition, similar to single symbol

mapping, this type of map is most helpful with smaller amounts of data, since too many incidents make the map unclear and difficult to read. The following map is an example where size is difficult to determine and points are overlapping.



This type of map is more useful when mapping law enforcement tabular data when the scale is smaller, see below and at the top of the next page.

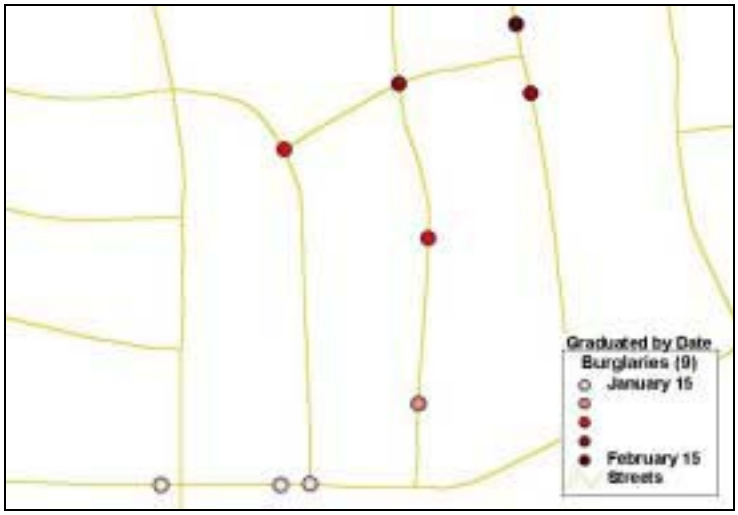




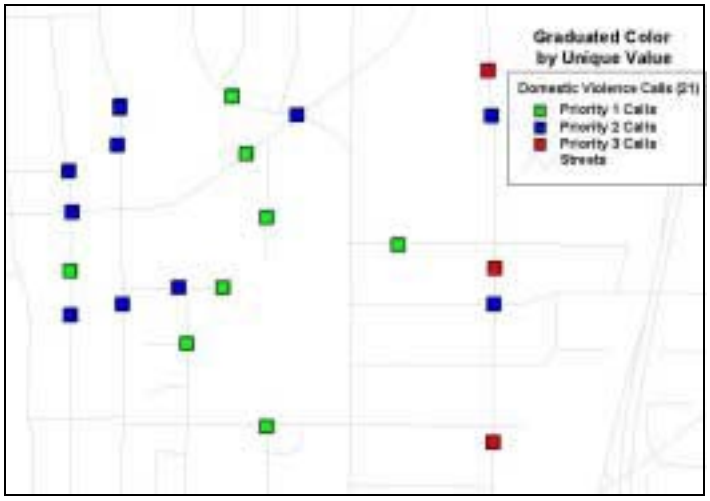
Graduation By Color

In graduated color mapping, symbols (point, line, or polygon features) are altered in color to reflect a particular value of the feature.

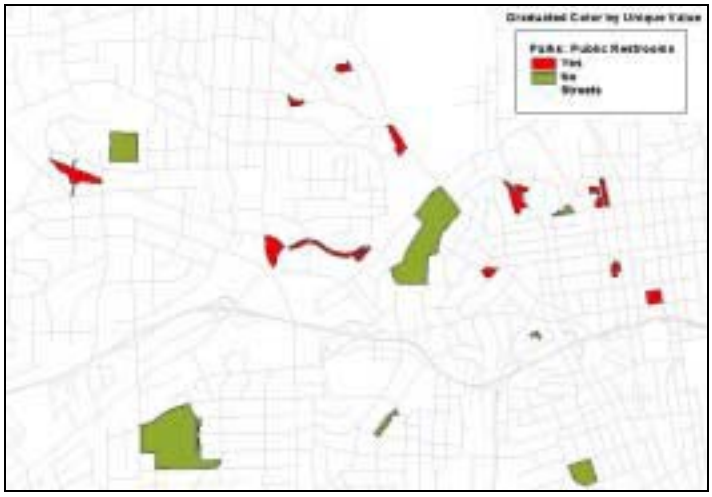
Features can be graduated by any variable. Law enforcement variables include shading by date/time, by priority, by crime type, by number of crimes at a location or in an area, or by crime rate of an area. The next map contains points that are shaded by their date of occurrence and shows the progression from older to the most recent incidents, which are in dark red However, each location must only represent one incident since it would be impossible to shade one point with data from two incidents. As with single symbol mapping, this map is most helpful when examining a small number of cases within crime patterns.



Points can also be shaded by a categorical variable. Each category or unique value is a different color. In the example, the priority of each domestic violence call is a different color.



This method can also be used for line and polygon features. The next map is an example of parks shaded by whether or not they contain public bathroom facilities, which could impact the type of criminal activity in that park.



Classification Methods

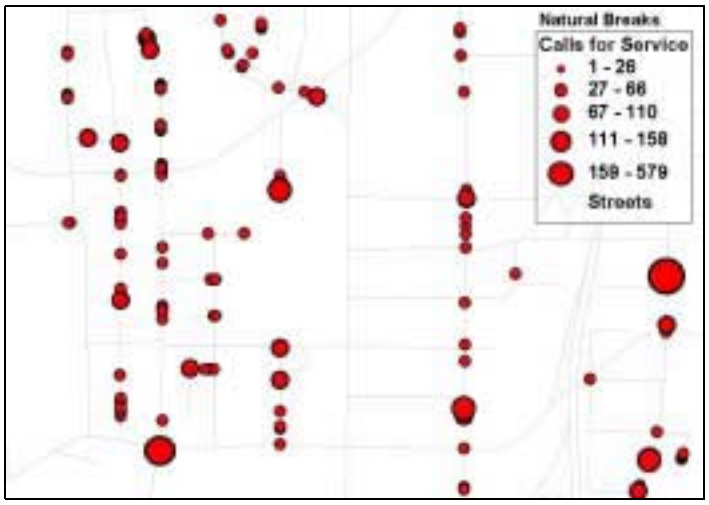
There are several different statistical methods for classifying numeric data in a GIS when creating both graduated size and graduated color maps. The same data are used in the respective point and polygon illustrations to show how different classification methods result in very different maps. Note that in each of the classifications, the user can also change the number of categories, which can also result in different maps of the same data.

Natural breaks

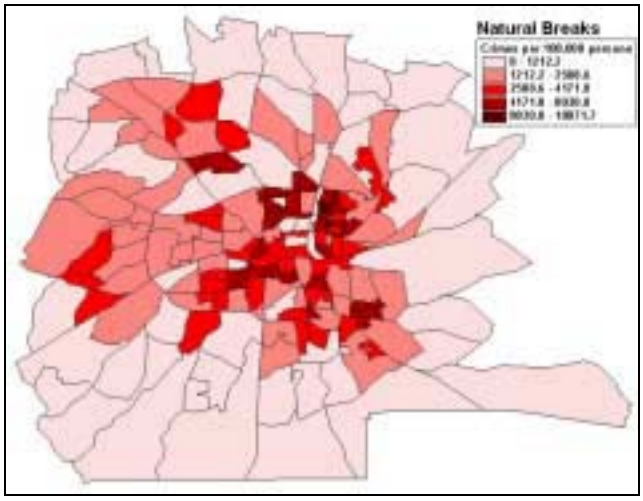
> *This is the default classification in most GIS programs and identifies the natural break points within the data using a statistical formula.*

The software program examines the selected data and their distribution, identifies natural break points, and creates the categories based on the best fit to the data. With each data set, the natural breaks classification would result in different ranges of categories; thus, the classification is "data dependent."

The following is an example of points graduated by size. Note in the legend that the categories do not make much sense, in that they are not evenly distributed or have equal number of values in each. This is because the ranges are determined by the GIS and the nature of the data distribution.



The following is an example of polygons graduated by color.

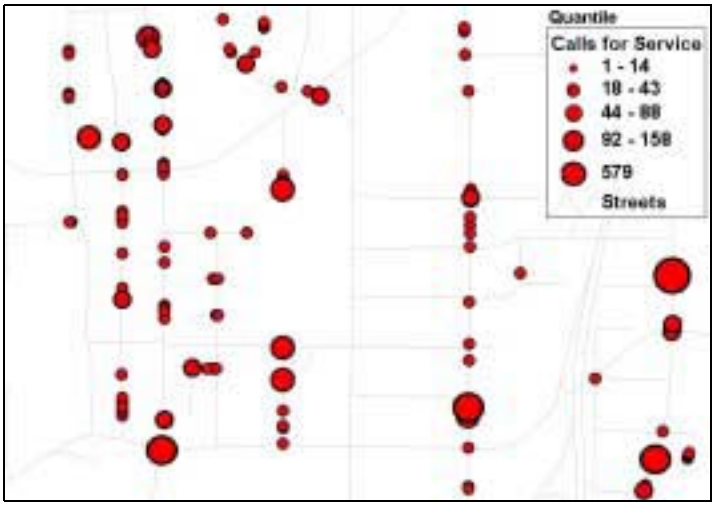


Quantile

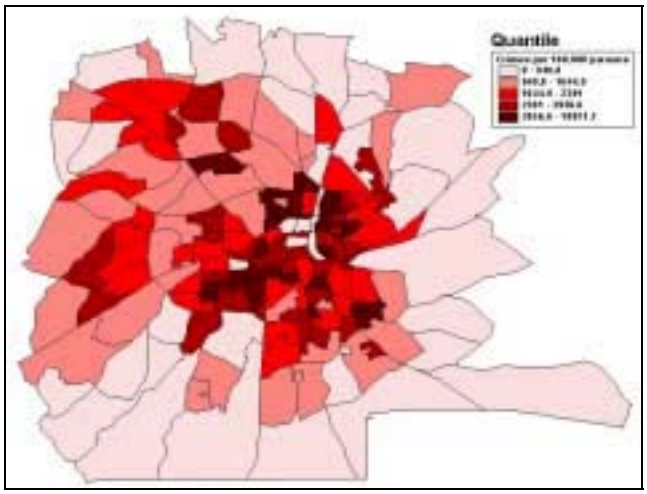
Each class contains the same number of data points.

That is, if there are 100 cases in the data, the GIS sorts them by their values and with five categories, includes the value range for the first 20 cases, the second 20, and so on. Similar to the natural breaks classification, the quantile classification is data dependent.

The following is an example of points graduated by size. Again, the categories do not make much sense, but if we were to look at the data we would see that there are the same number of cases in each category.



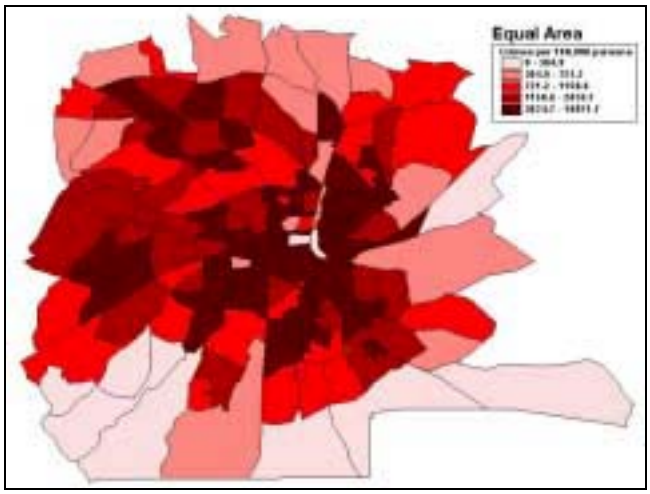
The following is an example of polygons graduated by color.



Equal area

> *This classification applies to polygon features only and determines categories so that the total area of the polygons in each class is approximately the same.*

This method is similar to the quantile classification; however, it looks to the square mileage or other appropriate units of the geographic areas in each class versus the number of data points. Thus, in a legend with five classifications, each category will contain polygons that make up 20% of the total area of the polygons in the analysis. The following is an example of polygons graduated by color.

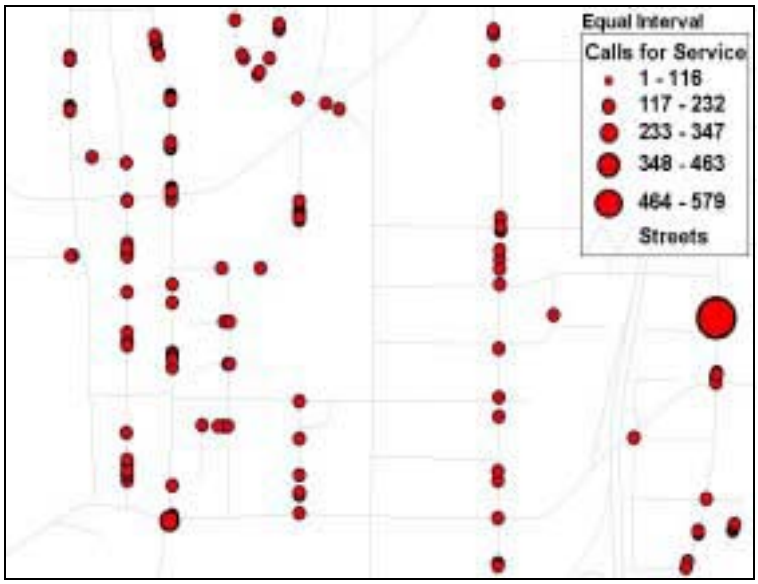


Equal interval

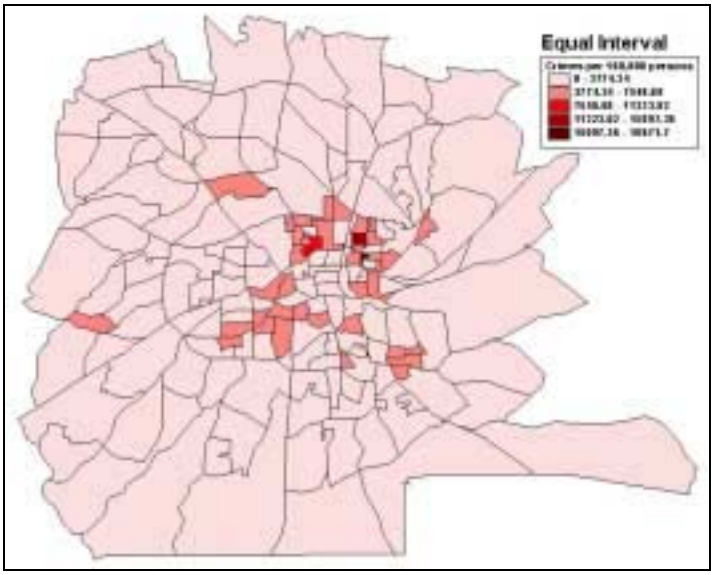
Divides the range of attribute values into equal size sub-ranges.

The GIS determines the range of the values of the distribution and divides by the number of categories to determine the range. For example, if the number of assaults in all the beats of a city ranged from 1 assault to 100 assaults, the categories would be 1-20, 20-40, 40-80, etc. Note that even though the categories seem to overlap, they in fact do not. In this case, all beats with 1 to 20 assaults would be in the first category, but beats with 20.00001 to 40 assaults would be in the second. Even if this is not realistically possible, it is mathematically possible, and it is very important to explain the breakdown system to those individuals using the maps.

The following is an example of points graduated by size. In this case, the categories are even. This classification is still dependent on the data distribution, since as the range of the distribution changes so does the categories. For example, in a data distribution ranging from 1 to 200, the categories would be 1-40, 40-80 and so on, which is different than the categories in the example above.



The following is an example of polygons graduated by color.

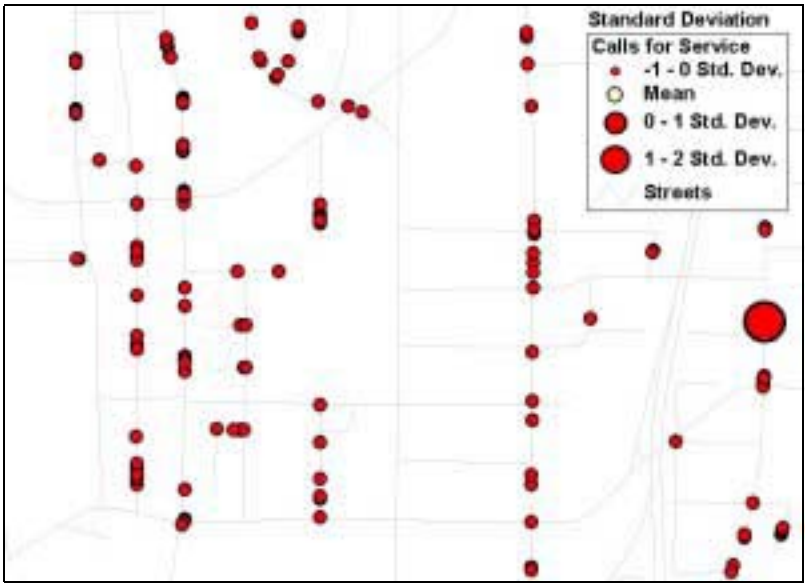


Standard deviation

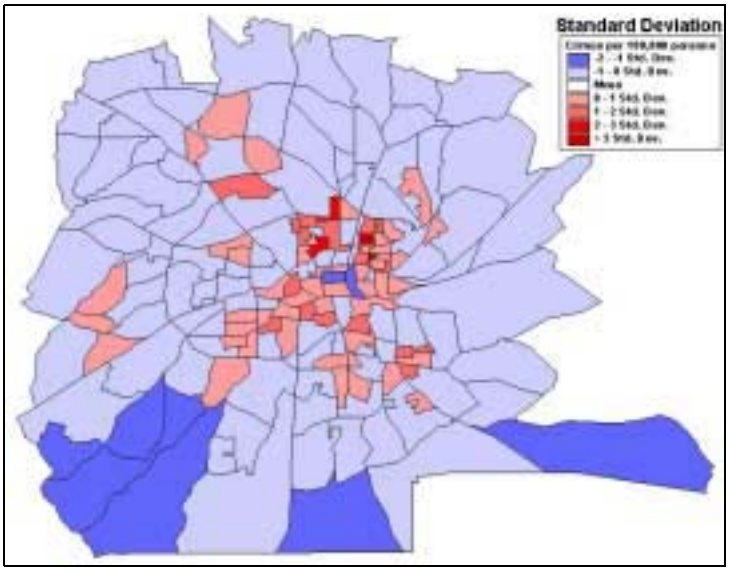
> *The mean value and standard deviations of the geographic features are computed, and the features are shaded according to which category they fall within.*

This classification does not display the actual values of the feature but shows categories of one, two, or three standard deviations above or below the mean. The values behind the classification can be viewed through another function, depending on the GIS software. This classification allows identification of outliers in a distribution and comparison of data with different distributions (would be displayed in two different maps), since the measures of a normal distribution give a common denominator of relative difference.

The following is an example of points graduated by size. Once again, this classification is dependent on the data distribution. Notice that the mean value is not displayed on either one of these maps. Also, in this map there is only one standard deviation below the mean and two above. This indicates that most of the points fall closely around the mean.



The following is an example of polygons graduated by color.



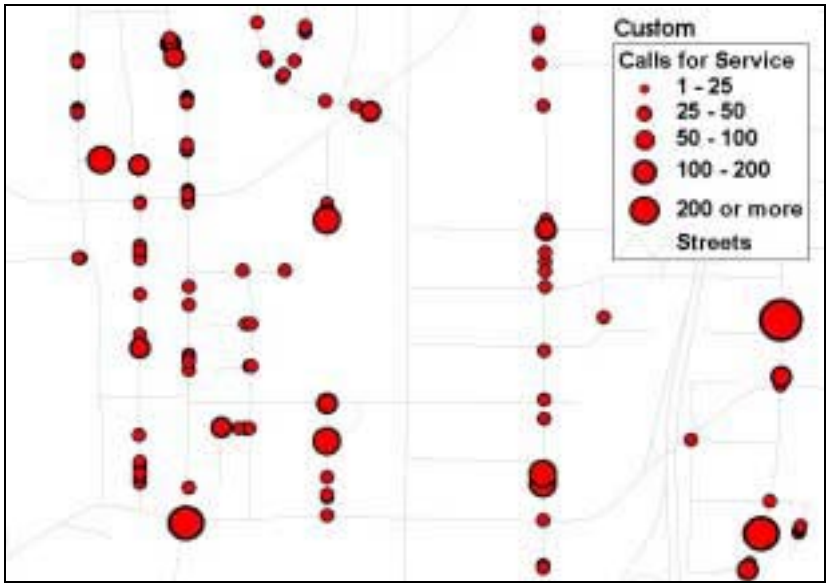
Custom

User determined ranges.

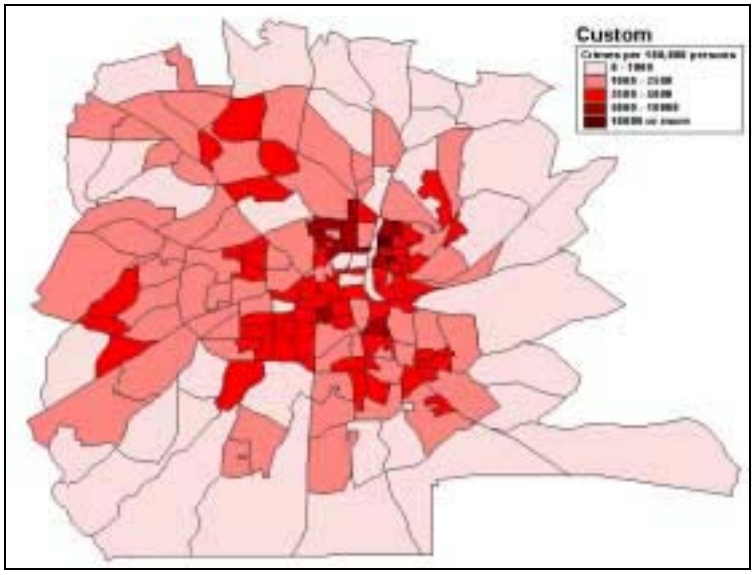
This is the only classification that is not determined by the software and by the characteristics of the data but by the analyst. This method is best for comparing crime or other law enforcement information over time. For instance, calls for service totals and the nature of the distributions tend to be different from month to month. If a classification that is data dependent is used, the colors or size of the symbols will vary in value from map to map. A custom range can be created in which the values for each color or size are the same every month and on every map, which allows comparison.

In order to create custom categories, one might use any of the previous classifications discussed here to get a sense of the data distributions. In addition, it is recommended that when doing a monthly or yearly comparison using custom ranges, that several months or years of data be examined to determine the most appropriate ranges. For this reason, it is best to make the upper limit of the highest range unlimited and use the phrase "or more" as a label (see below) to account for differences. Subjective considerations may also dictate the ranges. For example, in a department that fines properties with more than five false alarm calls for service, the graduation may distinguish between locations with more and less than five calls for service.

The following is an example of points graduated by size.



The following is an example of polygons graduated by color.



VII. Crime Analysis Product Format and Dissemination

The effectiveness of any crime analysis or mapping endeavor has as much to do with the presentation of the results as it does the analysis. If the resulting document of analysis is not legible and understandable to its audience, it is worthless. The following is a discussion of factors to consider when developing a final product, such as methods of dissemination, components of a crime analysis product, and types of crime analysis products. Included also are recommendations for elements of a crime analysis product and elements of a map. These are distinguished from one another since maps include additional elements such as a legend, North arrow, and scale.

Factors to Consider

When developing a crime analysis product, one must consider both the purpose and audience of the product. Crime analysis products can serve many purposes, from informing citizens about recent activity, to assisting the agency in planning, to apprehending a suspected criminal. For example, monthly maps of a town that depict reported crime are useful for providing general information to the public about changes in hotspots of reported crime; however, a detailed map of each hotspot location may be necessary for patrol officers and investigators who need specific information in order to focus their problem solving efforts. In either case, it is important to prepare maps that are appropriate to the purpose.

In addition, there are also many audiences for crime analysis products. They can include police department personnel, the general public, community groups, business groups, school officials, or city council members. By gauging the needs, expectations, and skill level of these individuals, products that are appropriate for each group can be developed. For example, a map of the residences of all known gang members that includes names and case numbers may be useful to gang enforcement officers compiling intelligence information. However, a map with this level of detail would not be disseminated to the public as it may violate an individual's privacy rights or compromise an investigation. It may be appropriate to include a brief notation on the map, such as "law enforcement use only" or "external use" to indicate the intended audience. In general, when producing a crime analysis product, the needs of users of the information need to be balanced with political, legal, and ethical concerns.

Methods of Dissemination

Methods of dissemination of a product inherently rely on the intended purpose and audience. They also rely on the means available, such as the Internet and Intranet capabilities, reverse 911 technology, or the newspaper. For example, a crime analyst

may want to let officers know that there is a sexual assault pattern happening in a certain part of the city and provide them with detailed information about the pattern. The analyst, of course, would not provide this information on the Internet for the public to see, but instead may include selected information on fliers to hand out at a briefing, send a department-wide (internal) e-mail, or attend the briefings of the officers in the affected areas. Thus, the purpose, informing the patrol officers in an area, dictates how that information should be disseminated.

The analyst must also consider what is the most efficient and effective method of dissemination, because frequently, the easiest method is not the most effective. For example, it may be simple to publish a crime pattern bulletin and e-mail it to the department or place fliers on a table in the briefing room for officers to read. But if the officers do not regularly check their e-mail or the table is full of other similar fliers, these methods of dissemination may be ineffective and a more time-consuming method, such as attending briefings, may be warranted. The most effective way to disseminate information depends on the current specific circumstances of the department, and the analyst should continually pay attention to what is appropriate and effective.

Components of Crime Analysis Products

A crime analysis product can include one or more of several types of analytical output, which can include tables, charts, graphs, maps, images, and narratives. In a law enforcement setting, a balance of one or more of these components should be used in any one product, and including all or just one component should be avoided. For example, a two-page essay on the recent burglary activity in Beat 33 will not be as effective as a simple description of the pattern, a table of the relevant information, a chart depicting the time of day and day of week of the activity, and a map that indicates where the activity is occurring. Conversely, a crime analysis product should not contain only a map or a chart. Even though a map or chart should be produced to stand on its own, the crime analyst should also include additional information such as interesting findings, interpretation of the results, and recommendations for future analysis.

Types of Crime Analysis Products

The following are some general types of crime analysis products.

> ***Crime bulletins.*** Short one to two-page documents that describe a tactical short-term trend or pattern.

Memos. A document in letter form that summarizes a request, explains the analysis, highlights the interesting findings, and, in some cases, makes recommendations for response or further analysis. These should be included as cover letters for research and special reports.

Weekly/monthly/quarterly reports and maps. Documents and maps that convey the same information in regular intervals to inform about activity and allow for identifying problems. These products should be consistently formatted to ensure recognizability by customers and allow comparison.

Annual reports. Reports that provide information aggregated by year and are published on a yearly basis. They would include breakdowns by geography, months, and types of activity (e.g., types of crime, types of calls, and accidents) and comparisons among years. They might also include comparisons to other similar jurisdictions as well as to state and national figures.

Research reports. Reports that provide a description of the data, methodology, and analysis of a research project (i.e., problem solving project or evaluation of a program) as well as the results of the analysis, interpretations of the findings, and recommendations for response or future research.

Special reports. These are reports that are requested on an ad hoc basis and address a particular issue such as traffic accidents around schools or efficient allocation of a new squad of officers. The analysis that makes up these reports is less rigorous than the research reports and subsequently takes less time. These special reports make up much of the daily work of the crime analyst.

These general categories can include information about crime, calls for service, arrests, and accidents. They also can be specific to a particular area such as street segment, neighborhood, beat, district, and the entire city. Other more specific types may include lists of incidents, "attempt to locate" bulletins, gang information bulletins, missing persons fliers, and FI card summaries. For template of such reports, see the Police Foundation's product, *Crime Analysis and Mapping Templates* (2001) that are documents that provide guidelines and actual templates (computer files in which the analyst insert his/her own agency and analysis information) for producing these types of reports and maps.

General Crime Analysis Product Elements

The following are the general elements of a crime analysis product.

Title. Includes the nature of the data and geography included as well as the time span included. For example, "Citizen Generated Calls for Service in Precinct 9: January 1, 2001 through June 30, 2001."

File path. This is where the document is located. This is important, so that future requests for the report, an update, or similar report can be easily filled. This assists the analyst in finding the product versus redoing it. An example: F:\Part I Crime 2001\Auto Theft\JanuaryReport.doc.

Credits/date. This includes the name or divisions of the individual(s) who created the report and the date it was created. This allows for the analysts to get credit, for others to direct questions about the product to the appropriate people, and for everyone to know when the product was disseminated. For example, "Prepared by Crime Analysis Unit, December, 2001" or "Prepared by Jane Doe, 01/06/02."

Text, tables, graphics, and/or maps. This is the substantive content of the product and what is included varies from product to product.

Analysis summary. This is an interpretation of the data and interesting findings and is important to ensure appropriate interpretations of the data and results by others. This section is often omitted from crime analysis products.

Disclaimers. This information details what the data and analysis results do not say. For example, conclusions drawn from any report containing crime information can only be made about crimes known to the police, not all crime. Another example is the use of calls for service in lieu of crime data. The difference between the two data sources should be noted as should the limitations of using calls for service (e.g., time and date of call may not be time and date of the criminal incident).

Recommendations. This section would contain suggestions for future analysis or actions based on the results. It is considered optional and may not always be included in a crime analysis product.

Because these elements can be included and combined in an infinite number of ways, a specific example of a crime analysis product is not included here. See below for an example of the map design elements.

Map Design Elements

Maps differ substantively from other components of a crime analysis product, and they contain specific features unique to maps. The following are guidelines for map design elements.

Title. Similar to the title of a general crime analysis product, the title of a map should contain the nature of the data and geography included as well as the time span included.

Legend. This element lists the tabular and geographic data sources displayed in the map and indicates the symbols that are used to represent each data source. In addition, in the case of a map that includes graduation by color or size, the classification used should also be listed. This will allow the reader to understand the divisions of the categories and the analysis that has been conducted. For example, "Classification = Natural Breaks" or "Quantile Classification."

Geocoding rate. As with statistics and tables that are presented in social science, data that are missing from the map should be noted. In the case of a map, this would be displayed as a percentage of the data that have been successfully geocoded. For example, "Geocoding Rate = 99%."

Labels. Should be used in moderation and where appropriate within the map. Labels should orient users to the map as well as highlight analytical results.

Scale Bar. Describes the distance units used in the map.

North Directional. Indicates the geographic orientation of the map.

Credits/date. As in the general crime analysis product, this contains the name or division of the individual who produced the map as well as the date it was created.

Remember, these elements are specific to maps and even though maps should basically stand on their own, supplemental description and interpretation of the analysis should be included. The next page shows an example of a map with all of these elements.

Evaluating the Utility of Crime Analysis and Mapping Products

Finally, a feedback mechanism for crime analysis products is important to determine both their relevance and effectiveness. Customer surveys, informal discussions, and/or focus groups can be used to learn whether a product is serving its intended purpose and is useful to its audience. In addition, it is necessary for the analysts themselves to review and reevaluate current crime analysis products. As noted in the following figure, this process is ongoing. Changes in focus of the department, capabilities of customers, the nature of criminal activity, and information technology are only a few of the factors that could influence needs and purposes of crime analysis products.

This project was supported by Cooperative Agreement #2007-CK-WX-K015 by the U.S. Department of Justice Office of Community Oriented Policing Services. Points of view or opinions contained in this publication are those of the author and do not necessarily represent the official position or policies of the U.S. Department of Justice or Michigan State University. References to specific agencies, companies, products, or services should not be considered an endorsement by the author or the U.S. Department of Justice. Rather, the references are illustrations to supplement discussion of the issues.

Letter from the COPS Office

January 2009

Dear Colleague:

This second edition of *Law Enforcement Intelligence: A Guide for State, Local, and Tribal Law Enforcement* captures the vast changes that have occurred in the 4 years since the first edition of the guide was published in 2004 after the watershed events of September 11, 2001.

At that time, there was no Department of Homeland Security, Office of the Director of National Intelligence, Information-Sharing Environment, or Fusion Centers. Since the advent of these new agencies to help fight the war on terror, emphasis has been placed on cooperation and on sharing information among local, state, tribal, and federal agencies. The successes of community policing are evident, not just within law enforcement, but also through agencies' work with the community to protect civil liberties and civil rights. A strong foundation between the police and the community also yields valuable information for fighting crime and terrorist threats. Through community policing and the wide array of approaches that fall under its umbrella—hot spots, CompStat, problem-oriented policing, and Intelligence-Led Policing—law enforcement can gather and share information that will enhance public safety.

Years of partnership building and problem solving with the community, the private sector, nonprofit organizations, elected officials, social service providers, and other key stakeholders have created an environment in which Intelligence-Led Policing and information sharing is more viable because of the strong relationships established through community policing.

This *Guide* serves as a road map to understanding criminal intelligence and its related methodology, standards, processes, management, and resources. In fact, nearly 85 percent of the material in this second edition is new. I am proud to add this valuable publication to the COPS Office library. My thanks to Dr. David Carter for synthesizing the vast body of law enforcement information and intelligence into one volume that I know will be an indispensable knowledge resource for law enforcement agencies around the country. During these challenging times, community policing is more important than ever.

Sincerely,

Carl Peed
Former Director
Office of Community Oriented Policing Services

Preface

When the first edition of *Law Enforcement Intelligence* was published, it documented unprecedented changes in law enforcement intelligence that occurred largely in response to the September 11, 2001 terrorists' attacks. Indeed, the new initiatives reflected philosophical and operational changes that represented a geometric evolution in law enforcement intelligence in only 3 short years. The first edition of the *Guide* described a broad array of cutting-edge issues and practices. At the time, it seemed implausible that such dramatic changes would occur again. Nevertheless, since the publication of the first edition, a staggering number of significant developments affecting law enforcement intelligence have occurred:

- There were only a few Regional Intelligence Centers across the U.S. that are now evolving into a nationwide network of fusion centers.
- The *Fusion Center Guidelines* had not been written.
- There had been no national fusion center conferences and regional fusion center groups did not exist.
- The Fusion Process Technical Assistance Program, a joint Department of Justice and Department of Homeland Security project, did not exist.
- The Office of the Director of National Intelligence (ODNI) did not exist.
- The Information Sharing Environment did not exist.
- The FBI's Intelligence Directorate did not exist.
- The DEA's National Security Branch of the Office of Intelligence did not exist.
- The National Criminal Intelligence Resource Center did not exist.
- Many intelligence training programs that are now taken for granted did not exist.
- The Joint Regional Information Exchange System—which is now virtually gone— was "the system" for information sharing and analysis.
- "All-hazards" intelligence was not in our lexicon.
- Intelligence-Led Policing was in its infancy.
- What is now the expansive Open Source Center which, as part of the ODNI is aggressively reaching out to state, local, and tribal law enforcement was a narrowly focused program called the Foreign Broadcast Information Service operated by the CIA.
- Relatively few law enforcement agencies had any type of intelligence capacity.
- Suspicious Activity Reporting (SAR) was largely limited to "tips and leads" and there were no unified standards or formal processes to report suspicious activities.

This second edition of *Law Enforcement Intelligence* describes these and many more changes in the philosophy, national standards, and practice of law enforcement intelligence while maintaining the core goal of being a primer on "all things intelligence" for the law enforcement community.

The *Guide* is intended to support policy in law enforcement agencies and seeks to objectively provide the best knowledge and practice of law enforcement intelligence at the time of publication. It is not meant as an academic work nor does it look at theoretical issues or arguments. It is not directed as a guide to the intelligence community except to explain the roles, responsibilities, and restrictions of the intelligence community's state, local, and tribal law enforcement partners.

The Internet references cited in this publication were valid as of June 2009. Given that URLs and web sites are in constant flux, neither the author nor the Office of Community Oriented Policing Services can vouch for their current validity. Please note that some of the sites referenced require a user name and/or password to gain access.

Acknowledgments

In completing this second edition, first and foremost I want to thank Carl Peed, former Director of the Office of Community Oriented Policing Services (the COPS Office). Carl's support for both editions of *Law Enforcement Intelligence* was consistent, strong, and unwavering. Carl, I sincerely appreciate all you have done for this project.

I also thank the membership of the Criminal Intelligence Coordinating Council for taking the time to review the original draft of this *Guide* to ensure that it reflected the information needed by the law enforcement intelligence community. Many people assisted me in the preparation of this *Guide*. Their contributions, large and small, helped in developing the comprehensive contents. While I hope to not leave out anyone, I particularly want to thank: Bill Harris (Delaware Information Analysis Center), Bob Hipple (Indianapolis [Indiana] Metropolitan Police Department), Bruce Parker (Brevard County [Florida] Sheriff's Office, Retired), Ed McGarrell, Steve Chermak, Natalie Hipple, and Jeremy Carter (Michigan State University [MSU]), Hal Wilson (Drug Enforcement Administration), Kathy Suey (Las Vegas Metropolitan Police Department), Kelly Stone (North Central Texas Fusion Center), Lance Ladines (Washington Joint Analysis Center), Mark Johnson (Open Source Center), Merle Manzi (Florida Department of Law Enforcement, Retired), Norm Beasley (Maricopa County [Arizona] Sheriff's Office), Ray Guidetti (New Jersey Regional Intelligence Operations Center), Rick Stephens (FBI), Ritchie Martinez (Arizona High Intensity Drug Trafficking Area), Roger Bragdon (Chief, Spokane [Washington] Police Department, Retired), Sabra Horne and Craig Manly (Office of the Director of National Intelligence), Scott Whitney (Customs and Border Protection), and Tom Martinelli (Wayne State University).

I expressly want to thank those who volunteered to review the *Guide*: Dan Oates (Aurora [Colorado] Police Department), Bob Casey (FBI), Ed McCarroll (Department of Homeland Security [DHS]), Kevin Saupp (DHS), Lisa Palmieri (DHS and International Association of Law Enforcement Intelligence Analysts), Mark Gage (National White Collar Crime Center) and Michael Ronczkowski (Miami-Dade Police Department). I know you were all a little surprised when you discovered the size of the document.

I also had assistance from friends whose work went well beyond "a little help," particularly reading and reviewing drafts. I thank Russ Porter (Iowa Department of Public Safety) for not only his review but also for giving me ideas and perspectives on many issues. Larry Shaw (Florida Department of Law Enforcement) for helping me navigate through the maze of information systems and networks. I sincerely appreciate the extra time and work of Doug Bodrero and Phil Ramer (both of the Institute for Intergovernmental Research) for giving me ideas, reviewing materials, and providing me with comprehensive comments while they were traversing the country on various projects, all for the promise of a meal and a drink.

To Amy Schapiro, COPS Office Social Science Analyst: your constant support and facilitation to make the processes go smoothly are appreciated. To Josh Reinsch of the Michigan State University Intelligence Program, I thank you for your quick

work and willingness to make the extra effort in all that you do for us. And to Robyn Nielsen, also of the MSU Intelligence Program, I truly appreciate your hard work, quick responses, unquestioned dedication, and support for this and other projects. You make my life a lot easier.

To my longtime friend and coconspirator Andi Bannister (Wichita State University): I cannot thank you enough for meticulously reviewing every word of this document and providing suggestions for content, wording, and presentation. As always, you made my work go much smoother (with fewer mistakes!) with all of the time and effort you put into reviewing this *Guide*.

Also important, I thank my wife Karen, children Hilary, Jeremy, and Lauren and son-in-law Joseph O'Donnell who put up with the time I worked on this and other projects—you are always in my thoughts.

Last, I dedicate this *Intelligence Guide* to a beautiful, smart, sweet, bundle of energy who always makes me smile: my granddaughter, Shey Catherine O'Donnell.

David L. Carter, Ph.D.
Michigan State University

Executive Summary

Law Enforcement Intelligence: A Guide for State, Local, and Tribal Law Enforcement Agencies is a policy oriented review of current initiatives, national standards, and best practices.

The first two chapters provide definitions and context for the current state of law enforcement intelligence. Chapter 2 also provides a discussion of homeland security—or "all-hazards"—intelligence. While more law enforcement agencies and fusion centers are embracing the all-hazards approach, its application remains somewhat unclear. This discussion provides a framework for homeland security intelligence policy.

Chapter 3 is a historical perspective that has multiple purposes. First, it provides a discussion of past abuses by law enforcement intelligence because it is important to understand the problems of the past in order to prevent them in the future. Next, the chapter provides a framework for national recommendations and professional standards for the practice of intelligence. Finally, the discussion identifies the various working groups and committees that are framing the current intelligence model and the relationship of those groups to federal agencies and professional law enforcement organizations.

Fundamental to all types of intelligence is a system for managing the flow of information for analysis. This is alternately called the Intelligence Process or the Intelligence Cycle. Chapter 4 is a descriptive discussion of the process as it applies to law enforcement agencies. While there are different models for the Intelligence Process, this discussion relies on the model used in the *National Criminal Intelligence Sharing Plan*.

Recommendations from both the *National Criminal Intelligence Sharing Plan* and the COPS Office-funded International Association of Chiefs of Police intelligence summits urge law enforcement agencies to adopt Intelligence-Led Policing (ILP). The challenge, however, is that there is no universally accepted definition or process for understanding and implementing ILP. Chapters 5 and 6 amalgamate the diverse literature on ILP to provide a holistic view. Chapter 5 focuses on the concept of ILP as it applies to American law enforcement, with a perspective on the British approach from which the concept originated. Chapter 6 focuses on the organizational and administrative processes for implementing ILP.

There is no issue more topical (or controversial) in law enforcement intelligence than the protection of civil rights and privacy. Chapter 7 is a broad examination of the issue identifying the concerns expressed by citizens and illustrating some of the problems faced with intelligence operations through the use of two federal civil rights cases. Integrated into the chapter is a detailed discussion of 28 CFR Part 23 and its application for placing information that identifies individuals or organizations in a criminal intelligence records system. The discussion expands the issues further with a detailed discussion of intelligence records and civil rights liability. The chapter ends with a discussion of how a law enforcement agency can immunize itself against civil rights lawsuits related to the intelligence function.

As a mechanism to enhance widespread information sharing among state, local, and tribal law enforcement agencies, the intelligence fusion concept grew rapidly. This growth was further spurred when fusion centers were embraced by the Information Sharing Environment (ISE) to be the critical information-sharing clearinghouse for terrorism information between law enforcement and other ISE information-sharing partners. Chapter 8 describes the fusion concept and the processes by which a fusion center operates. This chapter also addresses the concerns that critics have expressed about fusion centers.

Every major national standard for intelligence—the *National Criminal Intelligence Sharing Plan*, the *Fusion Center Guidelines*, the *Information Sharing Environment Implementation Plan* and the Department of Homeland Security's *Target Capabilities List*—has recommended establishing a public-private partnership for information sharing to support the intelligence function. Few, however, have established a substantive information-sharing relationship with the private sector. There are difficult hurdles to establishing such a relationship but it certainly is possible. Chapter 9 discusses the recommendations, the issues, and the processes for making public-private partnerships for intelligence a reality.

At the heart of all intelligence activities is the need to manage a wide array of information. A number of critical issues in this process are important to understand. Chapter 10 addresses these issues in a comprehensive manner, relying on best practices and national standards. In a logically organized approach, the key topics discussed are: *Suspicious Activity Reporting* (SAR); defining and using *intelligence requirements;* the *information collection process* including the development of a *collection plan;* the role of *analysis* (from a consumer's perspective); and *intelligence outputs and products*. With the increase of different information-sharing initiatives, one of the challenges has been to ensure that the right information gets in the hands of the right people who can use the information to develop policy and operational responses. This chapter includes a discussion of information-sharing practices to avoid.

A new initiative of the Office of the Director of National Intelligence is the National Open Source Enterprise. The goal of open source information and intelligence is to exploit open sources as "the source of first resort" in any intelligence endeavor. The reasons are that open sources are easier, faster, pose less risk to civil rights, and are less controversial for the agency. Part of this new initiative is to include law enforcement intelligence in open source information sharing. Chapter 11 provides a detailed discussion of open sources, the different types of information that can be obtained, how it can be obtained, and caveats for analysis.

A wide—and confusing—array of federal intelligence resources, including networks, systems, analytic services, applications and products, is available to state, local, and tribal law enforcement. Many have a specialized expertise or a limited area of application, while others are very broad in their application. Chapter 12 discusses federal intelligence resources, starting with a discussion of classified information, including a description of the process for a state, local, or tribal law enforcement officer to obtain a federal security clearance. Most

law enforcement officers, however, will not have a clearance and will be dealing with Sensitive But Unclassified (SBU) information. A discussion is provided of the meaning and rules for SBU information sharing. Important to note: SBU information is going through a government-wide transition to become categorized as Controlled Unclassified Information (CUI) and has some distinct issues for sharing and storing the information. The chapter provides a detailed discussion of CUI and the guidelines imposed for its use. The last part of the chapter is an encyclopedic listing of diverse federal information and intelligence systems and resources.

One of the recommendations of the *National Criminal Intelligence Sharing Plan* is that every law enforcement agency, regardless of size, should develop an intelligence capacity. For some agencies this will be an entire unit, while for other agencies it will be a part-time assignment of one person. In either case, there are management concerns related to the intelligence function. Chapter 13 focuses on management concerns that have relative uniqueness to the intelligence function. It begins with a comprehensive list of factors to consider when developing the intelligence capacity. This is followed by a detailed description of developing a Concept of Operations (ConOps) that serves as the road map for developing and implementing the intelligence function. Finally, a wide range of management issues are discussed, ranging from developing policies to human resources concerns.

The final chapter examines critical issues and challenges for the future and a model for implementing change. The *Guide* also includes comprehensive resources for all aspects of intelligence, a glossary of intelligence terms, and appendixes to support the various discussions. Included in the appendixes are two intelligence audit checklists.

Chapter 1:
Introduction

Introduction

To protect the United States from threats to our security and sovereignty, current initiatives at the federal, state, local, and tribal levels seek to develop a "culture of information sharing."[1] This is a significant challenge that requires the integration of new law, policy, procedure, training, and organizational change.

The National Strategy for Information Sharing focuses on five core principles:

1. Effective information sharing comes through strong partnerships among federal, state, local, and tribal authorities, private-sector organizations, and our foreign partners and allies.
2. Information acquired for one purpose, or under one set of authorities, might provide unique insights when combined, in accordance with applicable law, with seemingly unrelated information from other sources. We, therefore, must foster a culture of awareness in which people at all levels of government remain cognizant of the functions and needs of others and use knowledge and information from all sources to support counterterrorism efforts.
3. Information sharing must be woven into all aspects of counterterrorism activity, including preventive and protective actions, actionable responses, criminal and counterterrorism investigative activities, event preparedness, and response to and recovery from catastrophic events.
4. The procedures, processes, and systems that support information sharing must draw on and integrate existing technical capabilities and must respect established authorities and responsibilities.
5. State and major urban area fusion centers represent a valuable information-sharing resource and should be incorporated into the national information-sharing framework. This will require fusion centers to achieve a baseline level of capability to gather, process, share, and utilize information, and operate in a manner that respects individuals' privacy rights and other legal rights protected by U.S. laws.[2]

To achieve the culture of information sharing, every law enforcement agency in the United States, regardless of size, must have the capacity to understand the implications of information collection, analysis, and intelligence sharing. Each agency must have an organized mechanism to receive and manage intelligence as well as a mechanism to report and share critical information with other law enforcement agencies. In addition, it is essential that law enforcement agencies develop lines of communication and information-sharing protocols with the private sector, particularly those related to the critical infrastructure, as well as with those private entities that are potential targets of terrorists and criminal enterprises.

Not every agency has the staff or resources to create a formal intelligence unit, nor is it necessary in smaller agencies. Even without an intelligence unit, a law enforcement organization must have the ability to effectively consume the information and intelligence products being shared by a wide range of

[1] Program Manager–Information Sharing Environment. *Information Sharing Environment Implementation Plan.* Washington, D.C.: Office of the Director of National Intelligence, 2006.

organizations at all levels of government. State, local, and tribal law enforcement (SLTLE) will be most effective when a single source in every agency is the conduit of critical information, whether it is the Terrorist Intelligence Unit of the Los Angeles Police Department, the sole intelligence analyst of the Lansing (Michigan) Police Department, or the patrol sergeant who understands the language of intelligence and is the information-sharing contact in the Mercedes (Texas) Police Department. Each law enforcement agency must have an understanding of its intelligence management capabilities, regardless of its size or organizational structure.

This document describes common language and processes for developing and employing an intelligence capacity in SLTLE agencies across the United States as well as articulating a uniform understanding of concepts, issues, and terminology for law enforcement intelligence. While terrorism issues are the most pervasive, the discussion of intelligence in this *Guide* is directed toward "all crimes, all threats, and all hazards." As such, the principles of intelligence discussed in this document apply beyond terrorism and include organized crime and entrepreneurial crime in all forms.

Drug trafficking and the associated crime of money laundering, for example, continue to be a significant challenge for law enforcement. Transnational computer crime, particularly Internet fraud, identity theft cartels, and global black marketeering of stolen and counterfeit goods, are entrepreneurial crime problems that are increasingly relegated to SLTLE agencies to investigate simply because of the volume of criminal incidents. Similarly, local law enforcement is increasingly drawn into human trafficking and illegal immigration enterprises and the often-associated crimes related to counterfeiting of official documents, such as passports, visas, driver's licenses, social security cards, and credit cards. Even the trafficking of art and antiquities has increased, often bringing a new profile of criminal into the realm of entrepreneurial crime. Most recently, the application of intelligence to pervasive violence in America's communities is also an important focus. All require an intelligence capacity for SLTLE, as does the continuation of historical organized crime activities such as auto theft, cargo theft, and virtually any other scheme that can produce profit for an organized criminal entity.

To be effective, the law enforcement community must interpret intelligence-related language in a consistent manner. In addition, common standards, policies, and practices will help expedite intelligence sharing while at the same time protecting the privacy of citizens and preserving hard-won community policing relationships.

Perspective

At the outset, law enforcement officers must understand the concept of law enforcement intelligence, its distinction from national security intelligence, and the potential problems an SLTLE agency can face when the two types of intelligence overlap. A law enforcement executive must understand what is meant by an "intelligence function" and how that function can be fulfilled through the use of different organizational models. Related executive decisions focus on staffing, particularly when there are fiscal limitations. Complicating this mission are two new intelligence responsibilities that have emerged: 1. Information sharing with national security and homeland security partners as part of the Information Sharing Environment and 2. developing a capacity for Homeland Security—or "all-hazards"—Intelligence.

Another important—and pervasive—challenge is to ensure that all new intelligence initiatives fully protect the privacy and civil rights of all persons. Critical issues and new initiatives for this responsibility are discussed throughout the *Guide*, with one chapter devoted specifically to this topic.

These issues pose a wide range of important questions: What kinds of information does the law enforcement agency need (that is, what are its intelligence requirements) from the federal government to most effectively counter terrorism? How are those needs determined? How is the information requested? When and in what form will the information be received? Will a security clearance be needed to review the information that an executive requests? Beyond terrorism, what types of threats exist in a community? How are these threats identified? What kinds of threats are included in "all-hazards" intelligence? What are the best sources and methods (that is, a collection plan) for understanding these threats and developing actionable intelligence? How do we engage the community and private sector in the intelligence process? What are the limitations on collecting and disseminating information between law enforcement and the community and private sector? The answers are not easy, but they are attainable.

From a policy and process perspective, what is meant by information sharing? What information can be collected? What information can be retained in a criminal intelligence records system? How long may the records be retained? When does a person transcend the threshold of exercising his or her rights to posing a threat to community safety? What resources exist to aid an SLTLE agency in accomplishing its intelligence goals? How can the entire law enforcement agency be integrated into the intelligence function? If a law enforcement organization is to be effective, the answers to these questions must be a product of written policy.

The intent of this document is to provide answers—or at least alternatives—to these questions. To begin the process, every law enforcement administrator must recognize that intelligence and information sharing can be effective in preventing terrorism and fighting organized crime. To realize these ends, however, the intelligence process for law enforcement at all levels of government requires the following:

- Reengineering some of the organization's structure and processes so that they are consistent with national initiatives and national standards of good practice in law enforcement intelligence.
- Developing a shared vision of the terrorist or criminal threat.
- Establishing a commitment to participate and follow through with threat information.
- Overcoming the conceptual difficulty of intelligence processes that some personnel find difficult to grasp.
- Committing an agency's resources, time, and energy to the intelligence function.
- Establishing policies and practices that protect individuals' civil rights and privacy.
- Embracing and using contemporary technology, including electronic access to information and an electronic communications capability through a secure connection.
- Having proactive people using creative thought to identify "what we don't know" about terrorism and international organized crime.
- Requiring a law enforcement agency to think globally and act locally.
- Engaging in public-private partnerships for intelligence.
- Engaging the community to participate in the intelligence process.
- Being committed and patient.

Conclusion

The amount of change in the law enforcement intelligence process that has occurred during the past 4 years is unprecedented. The roles and responsibilities for state, local, and tribal law enforcement are challenging from operational, policy, and fiscal perspectives. Despite these challenges, comprehensive plans and new resources have become available to achieve the goal of protecting our communities.

Chapter 2:

Understanding Contemporary Intelligence for Law Enforcement Organizations: Concepts and Definitions

Understanding Contemporary Intelligence for Law Enforcement Organizations: Concepts and Definitions

In the purest sense, intelligence is the end product of an analytic process that evaluates information collected from diverse sources; integrates the relevant information into a logical package; and produces a conclusion, estimate, or forecast about a criminal phenomenon by using the scientific approach to problem solving (that is, analysis). Intelligence, therefore, is a synergistic product intended to provide meaningful and trustworthy actionable knowledge to law enforcement decision makers about complex criminality, criminal enterprises, criminal extremists, and terrorists.

The law enforcement intelligence function has essentially two broad purposes:

1. Prevention involves gaining or developing information related to threats of terrorism or crime and using it to apprehend offenders, harden targets, and use strategies that will eliminate or mitigate the threat. Two generally accepted types of intelligence are specifically oriented toward prevention:
    a. Tactical Intelligence. Actionable intelligence about imminent or near-term threats that is disseminated to the line functions of a law enforcement agency for purposes of developing and implementing preventive, and/or mitigating, response plans and activities.
    b. Operational Intelligence. Actionable intelligence about long-term threats that is used to develop and implement preventive responses. Most commonly, operational intelligence is used for long-term inquiries into suspected criminal enterprises and complex multijurisdictional criminality.
2. Planning and resource allocation provides information to decision-makers about the changing nature of threats, the characteristics and methodologies of threats, and emerging threat idiosyncrasies for the purpose of developing response strategies and reallocating resources, as necessary, to accomplish effective prevention.
    a. This is known as strategic intelligence. It provides an assessment of the changing threat picture to the management of a law enforcement agency for purposes of developing plans and allocating resources to meet the demands of emerging threats.

While investigation[1] is clearly related to the information collection[2] and intelligence processes, the intelligence function is often more exploratory and more broadly focused than a criminal investigation, per se. For example, a law enforcement agency may have a reasonable suspicion to believe that a person or group of people have the intent, capacity, and resolve to commit a crime or terrorist act. Evidence, however, may fall short of the probable cause standard, even for an arrest for criminal attempt or conspiracy. Moreover, there may be a compelling community safety reason to keep an inquiry open to identify other criminal offenders—notably leaders—and weapons that may be used.

[1] "Investigation" is defined as the pursuit of information based on leads and evidence associated with a particularly defined criminal act to identify and apprehend criminal offenders for prosecution in a criminal trial.

[2] "Information collection" in the context of law enforcement intelligence is the capture of information and data to determine if suspicious activities have a criminal nexus and/or to understand the operation of crime phenomena.

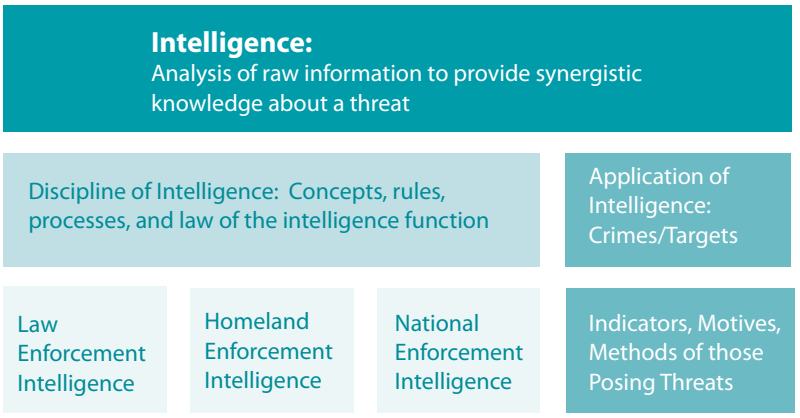
Because of this broader role, the need to keep information secure, and the necessity of keeping records that identify individuals and organizations for whom evidence of criminal involvement is uncertain or tangential,[3] rigid guidelines must be followed. These guidelines are designed to protect the constitutional rights of citizens while at the same time permitting law enforcement agencies to proceed with an inquiry for purposes of community safety. The guidelines are also designed to facilitate accurate and secure information sharing between law enforcement agencies because the nature of terrorism and criminal enterprise threats are inherently multijurisdictional. Further, if law enforcement agencies at all strata of government subscribe to the same guidelines, information sharing can be more widespread because there is certainty that regardless of with whom the information is shared, the security and integrity of the records will remain intact.

Defining Intelligence

There are many misconceptions about the meaning and application of "intelligence;" not only among the lay public but also within law enforcement. Colloquial uses of the term provide an intuitive understanding, such as "Officer Jones collected some good intelligence." These uses, however, lack precision and are unable to account for the diverse applications and rules associated with the intelligence function.

As a primer, there are two broad classes of intelligence, as illustrated in Figure 2-1. The first category is the "discipline" of intelligence, which refers to the set of rules, processes, and lexicon of the intelligence function. This *Intelligence Guide* is solely about the discipline of intelligence. Within the framework of the discipline, there are three types of intelligence of concern for the present discussion:[4] 1. Law enforcement (or criminal[5]) intelligence, 2. Homeland security—also known as "all-hazards"—intelligence, and 3. National security intelligence. While there are important similarities across these three categories, there are also distinct differences. These critical factors are discussed throughout this *Guide* as they specifically relate to state, local, and tribal law enforcement (SLTLE) agencies.

Figure 2-1: Classes of Intelligence



[3] This includes information that would be in the intelligence records system "Temporary File" as well as "Non-Criminal Identifying Information" as defined by 28 CFR Part 23.

[4] This is not an exclusive categorization of intelligence. The discipline of intelligence may be divided into other categories; for example, National Security Intelligence may be divided into "policy intelligence" and "military intelligence." One may also consider "business intelligence," "geospatial intelligence," or "cyber intelligence," among others. The categorization used above is the best model to illustrate critical points for the current discussion.

[5] The author uses the phrase "law enforcement intelligence" because a realm of study in the field of criminal psychology addresses "criminal intelligence" as it relates to the criminal personality and the propensity and processes by which criminals behave.

The second broad class is the "application of intelligence," which deals with knowledge related to a specific crime type. Intelligence analysis that produces information about new methods and indicators in the uses of improvised explosive devices (IED) by jihadists, for example, is the "application of intelligence." Another illustration would be indicators drawn from an analysis of international financial transactions that are characteristic of a money laundering enterprise. An essential ingredient for the application of intelligence is an understanding of the nature and constituent elements of the crime phenomenon of concern. For example, if a community is threatened by multijurisdictional gang activity that operates as a criminal enterprise, an understanding of the gang culture, signs, symbols, hierarchy, and other gang-specific characteristics is essential for analysts and officers to be effective in combating the crime problem. While the two classes of intelligence are inextricably linked for purposes of training and application, it is nonetheless essential to understand the unique aspects of each.

With an understanding of the classes of intelligence, attention will be directed toward the definitions of each.

Law Enforcement Intelligence

This *Guide* uses definitions based on generally accepted practice and standards by the law enforcement intelligence community at the local, state, and tribal levels. This does not mean that other definitions of terms are wrong, but this approach provides a common understanding of words and concepts as most applicable to the targeted audience of this *Guide*.

Before defining intelligence, it is essential to understand the meaning of "information" in the context of this process. Information may defined as "pieces of raw, unanalyzed data that identify persons, organizations, evidence, events or illustrates processes that indicate the incidence of a criminal event or witnesses or evidence of a criminal event."[6] As will be seen, information is collected as the currency that produces intelligence.

The phrase "law enforcement intelligence," used synonymously with "criminal intelligence," refers to law enforcement's responsibility to enforce the criminal law. Oftentimes, the phrase is used improperly, and too often, intelligence is erroneously viewed as pieces of information about people, places, or events that can be used to provide insight about criminality or crime threats. It is further complicated by the failure to distinguish among the different types of intelligence.

Figure 2-2: Diverse Information Collected for Intelligence Analysis

[6] Global Intelligence Working Group. *Criminal Intelligence for the Chief Executive. A Training Program for the Chief Executive. Glossary.* Washington, D.C.: Global Justice Information Sharing Initiative, U.S. Department of Justice, 2004.

Pieces of information gathered from diverse sources, such as wiretaps, informants, banking records, or surveillance (see Figure 2-2), are simply raw data that frequently have limited inherent meaning. Intelligence is when a wide array of raw information is assessed for validity and reliability, reviewed for materiality to the issues at question, and given meaning through the application of inductive or deductive logic. Law enforcement intelligence, therefore, is "the product of an analytic process that provides an integrated perspective to disparate information about crime, crime trends, crime and security threats, and conditions associated with criminality."[7] The need for carefully analyzed, reliable information is essential because both policy and operational decisions are made using intelligence; therefore, a vigilant process must be in place to ensure that decisions are made on objective, informed criteria, rather than on presumed criteria.

Often "information sharing" and "intelligence sharing" are used interchangeably by persons who do not understand the subtleties, yet importance, of the distinction. In the strictest sense, care should be taken to use terms appropriately because, as will be seen in later discussions, there are different regulatory and legal implications for "intelligence" than for "information" (See Table 2-1) As such, the subtleties of language can become an important factor should the management of a law enforcement agency's intelligence records come under scrutiny.

Table 2-1: Comparative Illustrations of Information and Intelligence

Information	Intelligence
• Criminal history and driving records • Offense reporting records • Statements by informants, witnesses, and suspects • Registration information for motor vehicles, watercraft, and aircraft • Licensing details about vehicle operators and professional licenses of all forms • Observations of behaviors and incidents by investigators, surveillance teams, or citizens • Details about banking, investments, credit reports, and other financial matters • Descriptions of travel including the traveler(s) names, itinerary, methods of travel, date, time, locations, etc. • Statements of ideologies, beliefs, and practices	• A report by an analyst that draws conclusions about a person's criminal liability based on an integrated analysis of diverse information collected by investigators and/or researchers • An analysis of crime or terrorism trends with conclusions drawn about characteristics of offenders, probable future crime, and optional methods for preventing future crime/terrorism • A forecast drawn about potential victimization of crime or terrorism based on an assessment of limited information when an analysts uses past experience as context for the conclusion • An estimate of a person's income from a criminal enterprise based on a market and trafficking analysis of illegal commodities

[7] Carter, David L. *Law Enforcement Intelligence Operations.* 8th ed. Tallahassee, Florida: SMC Sciences, Inc. 2002.

Definitions and Context

State and local law enforcement have consistently defined law enforcement intelligence as containing the critical element of "analysis" before any information can be characterized as "intelligence." For example, the International Association of Chiefs of Police *Criminal Intelligence Sharing* plan funded by the Office of Community Oriented Policing Services observes that:

> …intelligence is the combination of credible information with quality analysis—information that has been evaluated and from which conclusions have been drawn.[8]

Similarly, the Global Intelligence Working Group, a project that is funded by the Office of Justice Programs and is part of the Global Justice Information Sharing Initiative, discusses law enforcement intelligence by observing:

> …the collection and analysis of information to produce an intelligence end product designed to inform law enforcement decision-making at both the tactical and strategic levels.[9]

Following a consistent vision, the International Association of Law Enforcement Intelligence Analysts states that intelligence is an analytic process:

> …deriving meaning from fact. It is taking information collected in the course of an investigation, or from internal or external files, and arriving at something more than was evident before. This could be leads in a case, a more accurate view of a crime problem, a forecast of future crime levels, or a hypothesis of who may have committed a crime or a strategy to prevent crime.[10]

In creating standards for state, local, and tribal law enforcement, the Commission on Accreditation for Law Enforcement Agencies (CALEA) seeks to provide specific guidance on policies and practices that ensures efficacy and protection from liability on all aspects of law enforcement duties. With respect to intelligence, CALEA's standards note:

> Certain essential activities should be accomplished by an intelligence function, to include a procedure that permits the continuous flow of raw data into a central point from all sources; a secure records system in which evaluated data are properly cross-referenced to reflect relationships and to ensure complete and rapid retrieval; a system of analysis capable of developing intelligence from both the records system and other data sources; and a system for dissemination of information to appropriate components.[11]

It is clear not only from these discussions, but also from the legacy of law enforcement intelligence from various national crime commissions examining intelligence-related activities at the state and local level, that a common thread is that information must be analyzed before it is classified as intelligence. Chapter 3 will show that there is a fundamental reason for this: regulations applying to state, local, and tribal intelligence records must[12] meet standards of assessment that do not apply to federal agencies.[13] As a consequence, the analytic component is essential for the definition.

[8] International Association of Chiefs of Police. *Criminal Intelligence Sharing: A National Plan for Intelligence-Led Policing at the Federal, State, and Local Levels.* A Summit Report. Alexandria, Virginia: IACP, 2002, p. v.

[11] Commission on Accreditation of Law Enforcement Agencies. *Standards for Law Enforcement Accreditation.* "Standard 51.1.1 – Criminal Intelligence." Washington, D.C.: CALEA, 2002.

[12] Most notably, 28 CFR Part 23 as well as various court decisions.

[13] These issues are described in detail, in both Chapter 3 and Chapter 7.

It is often stated that for every rule there is an exception. The definition of law enforcement intelligence fits this axiom. As a matter of functional practicality, the FBI Directorate of Intelligence (DI) categorizes intelligence somewhat differently. As observed by one FBI DI official in a confidential interview:

> In the law enforcement/national security business, [intelligence] is information about those who would do us harm in the form of terrorist acts or other crimes, be they property crimes or violent crimes. … [The FBI DI] produces both "raw" (or unevaluated intelligence) and "finished" intelligence products (those that report intelligence that has had some degree of analysis).

Given the nature of the FBI DI's responsibilities and the need to get the critical threat information into the hands of the law enforcement community quickly, this definition is more appropriate for its role. Law enforcement executives need to be aware of the different roles and the different context when interpreting information. These differences are not in conflict; rather, they coexist to support the different missions and responsibilities of agencies at all levels of government. Similarly, the need for a different approach to the "Intelligence Cycle" exists for the FBI compared to SLTLE because of different intelligence demands.

The remedy is simple: Those responsible for the intelligence function need to understand these differences and apply policies and practices (described later) that are most appropriate for the types of intelligence being produced and consumed.

Homeland Security (All-Hazards) Intelligence

While the phrase "homeland security intelligence" is relatively new, it integrates well-established law enforcement responsibilities, most notably the "order maintenance" function of law enforcement.[14] These new intelligence responsibilities have emerged within the homeland security framework requiring that intelligence activities at the state, local, and tribal levels must assess threats posed by "all hazards." While there certainly are gray areas within this framework, the key factor for law enforcement agencies is to focus on threats posed by hazards that have implications for responsibilities for public safety and order maintenance. Within this context, the author defines homeland security intelligence as the collection and analysis of information concerned with noncriminal domestic threats to critical infrastructure, community health, and public safety for the purpose of preventing the threat or mitigating the effects of the threat.

A public health emergency or natural disaster, for example, will necessarily involve a law enforcement agency to assist in maintaining order and executing operations to maintain public order until the crisis is resolved. Homeland security intelligence may identify community safety vulnerabilities emerging from the emergency or disaster and give this information to law enforcement agencies so that appropriate precautions can be put into place. In yet other cases, information may begin as homeland security intelligence and become law enforcement intelligence, such as a general threat to critical infrastructure that evolves into a

[14] For a discussion of "order maintenance" responsibilities see Carter, David L. *Police and the Community.* 7th ed. Upper Saddle River, New Jersey: Prentice Hall, 2000.

threat where an individual is identified. If an individual is identified as related to a critical infrastructure threat, in all likelihood a criminal nexus has emerged and a law enforcement intelligence inquiry may proceed jointly with homeland security intelligence.

This form of intelligence presents many challenges because it is not purely criminal, yet addresses responsibilities that law enforcement agencies have to manage within their communities. Homeland security intelligence is not clearly delineated either as a matter of law or of policy, yet it is increasingly prevalent because of the impact of Department of Homeland Security (DHS) responsibilities, particularly in the arena of critical infrastructure.

As noted above, in some cases law enforcement intelligence and homeland security intelligence may overlap. This is illustrated by an actual case study appended at the end of this chapter related to a threat associated with zebra mussels that has both homeland security and criminal implications. The value of the case study is to illustrate not only homeland security intelligence but also law enforcement intelligence as applied to a nontraditional threat.

National Security Intelligence

In understanding the broad arena of intelligence, some perspective of national security intelligence (NSI) is useful for SLTLE agencies. This primer is meant to familiarize the law enforcement reader with basic terms, concepts, and issues, and is not intended as an exhaustive description.

NSI may be defined as "the collection and analysis of information concerned with the relationship and homeostasis of the United States with foreign powers, organizations, and persons with regard to political and economic factors as well as the maintenance of the United States' sovereign principles."[15] NSI seeks to maintain the United States as a free, capitalist republic with its laws and constitutional foundation intact, and identify and neutralize threats or actions that undermine United States sovereign principles.

NSI embodies both policy intelligence and military intelligence. Policy intelligence is concerned with threatening actions and activities of entities hostile to the U.S., while military intelligence focuses on hostile entities, weapons systems, warfare capabilities, and order of battle. Since the fall of the Soviet Union and the rise of threats from terrorist groups, both policy and military intelligence have evolved to grapple with the character of new threats. The organizations responsible for NSI are collectively known as the Intelligence Community (IC).

The IC is a federation of 16 executive branch agencies and organizations that work within their own specific mission as well as in an integrated fashion to conduct threat assessment and intelligence activities necessary for effective foreign relations and the protection of United States national security. These activities include the following:

- Collection of information needed by the President, the National Security Council, the Secretaries of State and Defense, and other Executive Branch officials for the performance of their duties and responsibilities

[15] Carter, David L. *Law Enforcement Intelligence Operations*. 8th ed. Tallahassee, Florida: SMC Sciences, Inc., 2002.

- Production and dissemination of intelligence related to national security and the protection of U.S. sovereign principles from interference by foreign entities
- Collection of information concerning, and the conduct of activities to protect against, intelligence activities directed against the U.S., international terrorist and international narcotics activities, and other hostile activities directed against the U.S. by foreign powers, organizations, persons, and their agents
- Administrative and support activities within the U.S. and abroad that are necessary for the performance of authorized activities such as foreign relations, diplomacy, trade, and the protection of interests of our allies
- Such other intelligence and activities as the President may direct as related to national security and the U.S. relationship with foreign entities.

The 16-member IC consists of the following organizations:[16]

1. Air Force Intelligence.
2. Army Intelligence.
3. Central Intelligence Agency.
4. Coast Guard Intelligence.
5. Defense Intelligence Agency.
6. Department of Energy.
7. Department of Homeland Security.
8. Department of State.
9. Department of the Treasury.
10. Drug Enforcement Administration.
11. Federal Bureau of Investigation.
12. Marine Corps Intelligence.
13. National Geospatial-Intelligence Agency.
14. National Reconnaissance Office.
15. National Security Agency.
16. Navy Intelligence.

As seen in the definition and descriptions of NSI, there is no jurisdictional concern for crime. As a result, constitutional restrictions that attach to criminal cases that law enforcement faces on information collection, records retention, and use of information in a raw capacity do not apply to IC responsibilities where there is no criminal investigation.

SLTLE agencies have no direct jurisdiction as related to NSI; however, this does not mean that they will not encounter NSI or receive collection tasks to support NSI. Indeed, given that the Federal Bureau of Investigation (FBI) is a member of the IC, there is a strong likelihood that SLTLE officers serving on a Joint Terrorism Task Force will encounter or be exposed to NSI. Similarly, since the Drug Enforcement

[16] www.intelligence.gov/1-members.shtml

Administration (DEA) is also a member of the IC, officers working on an Organized Crime Drug Enforcement Task Force may also encounter this intelligence. In both instances the officers typically will have Top Secret or Secret security clearances that provide access to classified documents which may provide additional insights about the information, including the source of the information and the method of collection. Nonetheless, it is a slippery slope for SLTLE officers to rely on this information for a criminal investigation because there is a strong likelihood that the methods of collecting the NSI would not meet constitutional muster in a criminal trial.

Even if it appeared that constitutional standards may be met, there are other potential problems when using the information in a criminal enquiry. Since the accused in a criminal proceeding has the right to be confronted by his or her accusers, the exercise of this right could compromise sensitive sources and methods. While the Classified Information Procedures Act (CIPA) provides a mechanism to deal with the process, some find that it is cumbersome and may result in greater complications than would otherwise be necessary.[17]

The next issue deals with constitutional law. If the information was collected from NSI sources in a manner inconsistent with the Constitution, it is likely, based on the "Fruits of the Poisonous Tree Doctrine," that any subsequent evidence developed during the course of that investigation would be subject to the Exclusionary Rule. Consequently, the evidence would be inadmissible.

Liability is a final issue concerning state, local, and tribal officers' access to NSI. Specifically, in a criminal investigation, if SLTLE officers used NSI that was collected in a manner inconsistent with constitutional standards or if that information (including personal records) was kept as intelligence records that were under the custodianship of a state, local, or tribal law enforcement officer, it is possible that the officer(s) and the chain of command (through vicarious liability) of that officer's agency could be liable under 42 USC 1983, Civil Action for Deprivation of Civil Rights. Under this provision, as most officers are well aware, if a state or local officer, acting under the color of state law, violates the civil rights of a person, the officer and his or her chain of command may be sued in federal court. Even though that officer may be working on a federal task force under the supervision of a federal officer, such as an FBI Supervisory Special Agent, the applicable test is whether the officer is paid by and bound by the employment rules of his or her state or local employing jurisdiction.[18]

Based on authorities from the National Security Act of 1947; Executive Order 12333; various executive directives, and the U.S. Attorney General Guidelines, the FBI is the lead agency in domestic intelligence collection. It is important that SLTLE understand the distinction between the authority of IC agencies to collect and retain information and that of SLTLE agencies.

A new challenge emerges with the Information Sharing Environment (ISE) created by the Intelligence Reform and Terrorism Prevention Act of 2004. As will be discussed in the next chapter, the ISE seeks to share all information related to

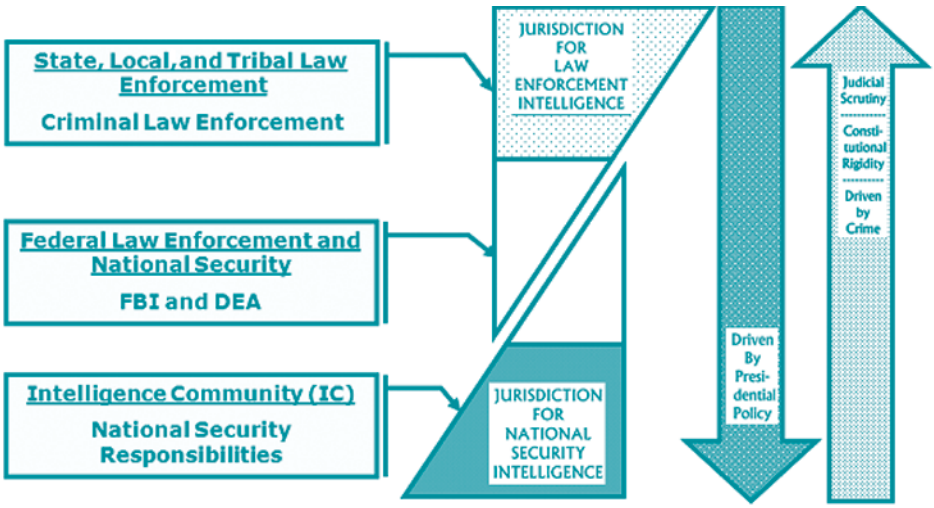
[17] The author has elected not to discuss CIPA in any detail because it deals with federal investigations rather than state, local, and tribal criminal investigations. For the person interested in further exploring CIPA, see www.usdoj.gov/usao/eousa/foia_reading_room/usam/title9/crm02054.htm.

[18] The FBI and DEA may keep such records in their custody on the basis of their national security responsibilities. While it is possible to hold a federal officer liable based on what is known as a "Bivens Suit"—derived from the case of *Bivens* v. *Six Unknown Agents* 403 US 388 (1971)—it would be difficult, particularly under the conditions of counterterrorism.

threats to the homeland. The challenge arises particularly if SLTLE agencies collect or retain information related to a national security threat rather than to a crime. SLTLE agencies sole jurisdiction as related to intelligence is based in their statutory authority to enforce the criminal law. As such, there is extensive constitutional rigidity and judicial scrutiny of their processes as well as the information that is collected and retained in a criminal intelligence records system (See Figure 2-3). Conversely, constitutional protections do not attach in the same way to the collection and retention of information by the IC. As a result, these agencies have greater latitude in the types of information they possess.

The processes are complicated further regarding the collection of information domestically (within the territory of the United States) that is related to national security threats. The primary responsibility for collecting domestic information for national security falls within the authority of the DHS, the FBI, and the DEA, which can produce intelligence for dissemination to SLTLE. U.S. foreign intelligence agencies, however, are prohibited from working with state and local law enforcement in a manner that could be interpreted as "tasking intelligence collection." As a result, SLTLE agencies should rely on their relationship with the DHS, the FBI, and the DEA on matters of domestic intelligence, including when those matters involve international terrorism activity. (See Figure 2-3)

Figure 2-3: Law Enforcement and National Security Intelligence Authority Comparison



Effective policy and processes must be implemented and enforced to ensure that SLTLE agencies do not maintain improper information about individuals and organizations in their records system as a product of the ISE. These issues will be discussed in greater detail in the chapter on civil rights.

The lessons learned from this brief review of national security intelligence are threefold:

1. State, local, and tribal law enforcement officers have no jurisdiction to collect or manage NSI.
2. Use of NSI in a criminal investigation by a state, local, or tribal law enforcement officer could derail the prosecution of a case because of civil rights protections.
3. Use of NSI in a criminal investigation by an SLTLE officer and/or retention of NSI in a records system or in the personal records of an SLTLE officer could open the possibility of civil liability from a Section 1983 lawsuit.

Emerging Intelligence Initiatives Associated with Homeland Security/All-Hazards Intelligence

While the range of activities that could be encompassed by homeland security intelligence is broad, two initiatives are moving forward with greater rapidity: the Fire Service Intelligence Enterprise and Public Health/Medical Intelligence.

Fire Service Intelligence Enterprise

The Fire Service Intelligence Enterprise (FSIE), a new initiative that is in its infancy, is epitomized by this observation from *Fire Chief* magazine:

> Does the fire service, or emergency services in general, have a role in the world of intelligence? This question probably would never have been asked prior to Sept. 11, 2001, but it is being asked now. Given that firefighters are among the country's first responders to terrorist incidents, natural disasters, industrial accidents, and everyday emergencies, the answer is a resounding yes.[19]

Asking law enforcement about the fire service role in intelligence operations does not evoke a response with the same vigor. The reason, for the most part, is uncertainty: Law enforcement is uncertain about the types of information they can share with the fire service and whether the fire service holds a unique role beyond the private sector.

Exploration has resulted in the FSIE experimental initiative. Based on a test program from the Fire Department of New York (FDNY) along with joint efforts from within DHS—the Intelligence & Analysis Directorate (I&A) and the Federal Emergency Management Agency (FEMA)—the concept is being further explored.[20]

> Though not a federally sanctioned establishment or organization, its establishment by state and local fire service officials and industry groups was a result of advice and support provided by the State and Local Program Office to the FDNY and FEMA's United States Fire Administration. This relationship contributed to a draft approach for state and local fire services to share threat and related information among the country's nearly 1.2 million firefighters

[19] Pitts, Diane, "Getting the 411," *Fire Chief,* January 1, 2008. firechief.com/leadership/incident-command/intelligence-community-information-sharing-0101/index.html

[20] For a list of the intelligence and information requirements of the FSIE, see: Office of Intelligence and Analysis. *National Strategy for the Fire Service Intelligence* Enterprise. Washington, D.C.: U.S. Department of Homeland Security, 2008, pp.14–21.

and EMS customers. I&A continues working with the United States Fire Administration and the National Fire Academy in Emmitsburg, Maryland, to incorporate intelligence training into their course curriculum and ensure that our first responders better understand the events surrounding or leading up to their involvement in an incident.[21]

FSIE's objective is to establish a direct information conduit between the fire service and both DHS and local law enforcement, largely through a fusion center. The law enforcement agency would pursue a direct information-sharing relationship with the fire service per a directive of the National Response Plan. The National Response Plan mandates the alignment of federal coordinating structures, capabilities, and resources into a unified, all-discipline, and all-hazards approach to domestic incident management.[22]

Through sharing pre-incident information and intelligence and real-time incident updates, situational awareness will be enhanced to support the preparedness efforts of both local fire departments and the DHS. Rapid and comprehensive information sharing also is imperative to establishing a common operational picture on the local and national levels during a major incident.[23]

The difficulty for the FSIE concept is that it predominantly exists within the "all-hazards" framework of intelligence about which law enforcement is still attempting to identify and resolve its intelligence role. Further, the issues of information sharing and civil rights remain difficult to resolve unequivocally. Similarly, some members of the fire service are not overly enthusiastic about being associated with the law enforcement intelligence function.

Amalgamating the fusion concept with the all-hazards approach to intelligence requires a critical review of operating processes, responsibilities, and roles. The jury is out on whether the FSIE will be a fruitful initiative. Nonetheless, law enforcement executives and intelligence commanders should be aware of the FSIE concept and explore the role, if any, it holds in the local law enforcement intelligence structure.

Medical Intelligence: Protecting the Public Health

A growing component of the all-hazards responsibility in homeland security intelligence deals with public health threats. Medical intelligence assesses public health trends, organizations, and related events that can affect the health of a community. There has been significant growth in the military on medical intelligence where the focus is broader, notably looking at foreign medical trends. Comprehensive resources on medical intelligence can be found at these resources:

- The Armed Forces Medical Intelligence Center[24]
- The WWW Virtual Library collection on Epidemiology[25]
- The Biodefense and Public Health Database[26]
- The Centers for Disease Control and Prevention (CDC) WONDER Database of Health and Risks.[27]

[21] Tomarchio, Jack. " Focus on Fusion Centers: A Progress Report." Prepared statement before the Ad Hoc Subcommittee on State, Local and Private Sector Preparedness and Integration, Committee on Homeland Security and Government Affairs, United States Senate, April 17, 2008, p. 7.

[22] Ibid

[23] Pitts, Op. Cit.

[25] www.epibiostat.ucsf.edu/epidem/epidem.html

[26] www.biohealthbase.org

[27] wonder.cdc.gov

The significant points to note are these:

1. There is a distinct trend toward medical intelligence as a tool to assist in the protection of our communities.
2. Medical intelligence will become an increasingly important intelligence responsibility as a result of the all-hazards mandate.
3. There are resources to assist in identifying public health threats.

Gang Intelligence

Gang intelligence provides challenges to fully understanding the application of current law, regulation, policy, and practice for law enforcement intelligence. As noted previously, intelligence is the output of the analytic process; however, with those persons specializing in gang investigations, the term "intelligence" is commonly used more broadly. Typically, gang specialists include "indicators" under the rubric of intelligence; for example, information about gang behaviors, signs and symbols of different gangs ("colors" and "tagging"), the modus operandi of different gangs, and trends in the different gang activities. Frequently, much of this information is not analyzed, or at least not analyzed in the same sophisticated manner as the intelligence process. As a practical element of the discussion in this section, the recognition of this fact is functional; thus, when discussing gang intelligence, this common application of the term by gang investigators will be used.

Certainly there is an important role for analysis when dealing with gangs; however, gang data and information are not subject to analysis as frequently as they should be. This should change not only with the expansion of analytic expertise in law enforcement agencies, notably through fusion centers, but also as a result of approval of the *Guidelines for Establishing and Operating Gang Intelligence Units and Task Forces*[28] by the Global Intelligence Working Group.

The following is information from the FBI:

- "Today, gangs are more violent, more organized, and more widespread than ever before."
- "There are approximately 30,000 gangs, with 800,000 members, impacting 2,500 communities across the U.S."
- Latino gangs are sowing violence and crime in big cities like Los Angeles, Chicago, and New York, but are also spreading to rural and suburban areas.
- The violent gang MS-13—composed mainly of Central American immigrants from El Salvador, Honduras, and Guatemala—"has a significant presence in Northern Virginia, New York, California, Texas, as well as places as disparate and widespread as Oregon City, Oregon; and Omaha, Nebraska." MS-13 is estimated to have some 8,000 to 10,000 hard-core members—and is growing increasingly sophisticated, widespread, and violent.[29]

With many criminal gangs taking on the characteristics of transjurisdictional criminal enterprises, the need for information sharing and analysis of threats is essential. The tools and resources of intelligence can be important factors in effectively dealing with gang problems.

[28] Global Intelligence Working Group. *Guidelines for Establishing and Operating Gang Intelligence Units and Task Forces.* Washington, D.C.: Bureau of Justice Assistance, U.S. Department of Justice, 2008.

[29] www.fbi.gov/page2/april05/swecker042005.htm

Gang intelligence provides challenges in the application of current law, regulation, policy, and practice for law enforcement intelligence. As noted previously, intelligence is the output of the analytic process. For those specializing in gang investigations, however, "intelligence" is commonly viewed more broadly, typically including information about gang behavior, indicators, modus operandi, and trends that are largely derived from raw information learned from investigations rather than analysis. As a practical element of this discussion, the subtle distinction between what is meant by "intelligence" by gang investigators as compared to the meaning of "intelligence" by those working in the law enforcement intelligence community should be recognized.

What Is a Gang?

The initial vision when hearing the word "gang" is a group of young males, typically in the inner city involved in "turf battles" and who spray paint gang symbols on property and is involved in violent, often deadly, confrontations with other collectives of young men. Typically, a vision of the well-known Los Angeles-based "Crips" and "Bloods" gangs is part of that picture. While these kinds of gangs certainly exist, gangs encompass a much larger population.

The National Gang Threat Assessment[30] divided gangs into six broad categories:

1. National and Regional Street Gangs.
2. Gangs and Organized Crime.
   - Asian Organized Crime
   - Russian Organized Crime
3. Gangs and Terrorist Organizations.
   - Domestic Terrorist Groups
   - International Terrorist Groups
4. Prison Gangs.
5. Hispanic Gangs.
6. Outlaw Motorcycle Gangs.

As can be seen from these categories, the line between gangs and organized crime may be blurred. Similarly, the line between gangs and terrorist organizations can also be difficult to discern because often both use the tactics of intimidation and fear to accomplish their goals.

While each state has its own statutory definitions of a gang, most use a model similar to that of the Violent Gang and Terrorist Organization File (VGTOF) of the National Crime Information Center (NCIC). According to VGTOF guidelines, a gang member must be characterized as, and have at least two of, the following criteria:

- Has been identified as a gang member by an individual of proven reliability.
- Has been identified as a gang member by an individual of unknown reliability, and that information has been corroborated in significant respects.

[30] National Alliance of Gang Investigators Associations. *National Gang Threat Assessment.* Washington, D.C.: Bureau of Justice Assistance, U.S. Department of Justice, 2005.

- Has been observed by law enforcement members to frequent a known gang's area, associate with known gang members, and/or affect that gang's style of dress, tattoos, hand signals, or symbols.
- Has been arrested on more than one occasion with known gang members consistent with gang activity.
- Has admitted membership in a gang at any time other than at the time of current arrest/incarceration.[31]

As can be seen, the value of intelligence and information sharing for both identifying and classifying a person as a gang member can be an important tool. This is particularly true because gangs are often transjurisdictional. Both tactical and strategic intelligence can provide important information to law enforcement agencies about gang threats and trends.

Two initiatives have been developed that serve to enhance the use of intelligence when dealing with the gang threat: The National Gang Intelligence Center and the *Guidelines for Establishing and Operating Gang Intelligence Units and Task Forces.*

National Gang Intelligence Center

The National Gang Intelligence Center (NGIC) integrates the gang intelligence assets of all Department of Justice agencies and has established partnerships with other federal, state, and local agencies that possess gang-related information, thereby serving as a centralized intelligence resource for gang information and analytical support. This enables gang investigators and analysts to identify links between gangs and gang investigations, further identify gangs and gang members, learn the full scope of their criminal activities and enterprises, determine which gangs pose the greatest threat to the United States, identify trends in gang activity and migration, and guide the appropriate officials in coordinating their investigations and prosecutions to disrupt and dismantle gangs. The NGIC's mission is to support law enforcement agencies through timely and accurate information sharing and strategic and tactical analysis of federal, state, and local law enforcement intelligence focusing on the growth, migration, criminal activity, and association of gangs that pose a significant threat to communities throughout the United States.[32]

The NGIC focuses on gangs operating on a national level that demonstrate criminal connectivity between sets of common identifiers. In addition, because many violent gangs do not operate on a national level, the NGIC will also focus on selected regional-level gangs. To maximize effectiveness, the NGIC produces intelligence assessments, intelligence bulletins, joint agency intelligence products, and other nonstandard intelligence products for its customers.[33]

Guidelines for Establishing and Operating Gang Intelligence Units and Task Forces

Developed by the Gang Intelligence Strategy Committee (GISC) of the Global Justice Information Sharing Initiative, the *Gang Guidelines* seek to develop an integrated strategy to deal with gangs by cohesively linking both intelligence and operational responses to gang threats through task forces. On the issue

[31] National Gang Center. *Brief Review of Federal and State Definitions of the Terms "Gang," "Gang Crime," and "Gang Member."* Undated and unpublished web document. www.nationalgangcenter.gov/documents/definitions.pdf.

[32] "Attorney General's Report to Congress on the Growth of Violent Street Gangs in Suburban Areas," Washington, D.C.: U.S. Department of Justice, 2008, p. 14. www.usdoj.gov/ndic/pubs27/27612/27612p.pdf.

[33] www.usdoj.gov/criminal/ngic

of intelligence, the *Gang Guidelines* stress the importance of analysis and recommend the use of the intelligence process to manage and assess raw information. Similarly, the Gang Guidelines embrace the *National Criminal Intelligence Sharing Plan* as the intelligence model that should be used in all gang intelligence initiatives. Finally, the *Gang Guidelines* recognize the important role that intelligence can fulfill by more efficiently and effectively directing task forces responses to gang threats.

The *Gang Guidelines* are new, having been approved in late 2008; however, with their endorsement by the Criminal Intelligence Coordinating Council there will likely be widespread adoption by law enforcement agencies, fusion centers, and gang task forces.

Conclusion

The intent of this chapter was to provide the reader with insight into the meaning of intelligence, the diverse types of intelligence, its role, and some of the complications that emerge from using the term. Law enforcement intelligence, for example, is defined somewhat differently by the FBI and the DEA than it is by SLTLE agencies. The reason for the difference is based on the sources of information used by the FBI and the DEA as well as the responsibilities these federal law enforcement agencies hold for disseminating unique critical information in a timely fashion. The important point is that the consumer simply needs to know the different definitions and the different context. With this knowledge, information can be interpreted and used most effectively.

Also introduced in this chapter was the concept of homeland security intelligence and the unique role it fulfills for law enforcement agencies. While not a traditional activity for law enforcement, homeland security intelligence seeks to enhance public safety and order while protecting the community from nontraditional threats.

Finally, Chapter 2 addressed the meaning of NSI and the complications it conceivably can pose for SLTLE agencies. Once again, it is important to understand the issues and parameters of each type of intelligence. The proverbial bottom line is that understanding the definitions and their application is an essential foundation for the remaining topics discussed throughout this *Intelligence Guide*.

Chapter Annex 2-1: Law Enforcement and Homeland Security Intelligence Case Study

This illustration is based on an actual case. It demonstrates the interrelationship between the two types of intelligence.

Threats Posed by Zebra Mussels

A congressman from a Midwestern state was a vocal supporter of legislation to ban Internet gaming in the U.S. An individual who opposed this legislation made a threat to the congressman's office that if the congressman voted for the legislation, the individual would introduce zebra mussels into some of his state's lakes.

Zebra mussels (*Dreissena polymorpha*) are an invasive species native to the Black Sea and Caspian Sea regions of Eurasia. In 1988 they were introduced to U.S. fresh water in Lake St. Clair— between Lake Erie and Lake Huron on the Michigan, U.S.—Ontario, Canada, border— through ballast water discharged from transoceanic vessels. The zebra mussel competes with native species of mussels and is particularly prone to clogging pipes, valves, and drains that affect drinking water, hydroelectric plants, and a wide variety of manufacturing firms. According to the Nonindigenous Aquatic Species Program of the U.S. Geological Survey, "Zebra mussels can have profound effects on the ecosystems they invade…and represent one of the most important biological invasions into North America".[33] Zebra mussels are small and easily transported in a plastic bag, jar, or bucket. They can stay alive out of the water for several days in cool, humid conditions by simply closing their shell tight. Under the right environmental conditions, it would take as few as three zebra mussels to begin an "invasion" in a body of water.[34]

The congressman voted for the ban on Internet gaming. Recently, zebra mussels have been appearing in local lakes in the congressman's state. The immediate issue: Is the presence of the newly discovered zebra mussels in the congressman's state a product of the threat?

[33] See nas.er.usgs.gov/queries/FactSheet.asp?speciesID=5.

[34] Personal Correspondence, Nonindigenous Aquatic Species Program biologist, U.S. Geological Survey, Gainesville, Florida.

Criminal Intelligence

Zebra mussels are explicitly included in the United States Code (42 USC §42 and §43–the Lacey Act). Mere transportation of zebra mussels is a federal misdemeanor. If an individual intentionally causes damage or loss of property as a result of the introduction of zebra mussels, or conspires to do so, this can be the federal crime "Animal Enterprise Terrorism," punishable as a felony, depending on the value of property loss.

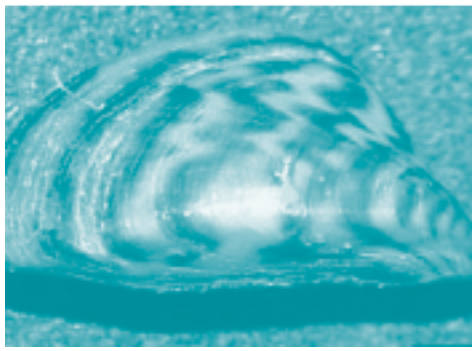
Other possible federal and state crimes include extortion, terroristic threat, and criminal environmental law violations.

Homeland Security Intelligence

A determination should be made of hazards posed to the community and economy by this threat. Are threats posed to other bodies of water as a result of this act? What preventive/protection measures should local critical infrastructure or key resources vulnerable from this threat take? Intelligence requirements need to identify persons with zebra mussels in their possession and determine the reason. Businesses and government entities whose operations could be affected by the zebra mussels must be identified and notified.

Case Intelligence Requirements

- What information is available about the individual who made the threat?
  - Has the congressman received threats in the past? If so, collect all related information.
  - Are there vocal activists against the ban on Internet gaming who could be reasonably tied to the congressman and/or the state?
  - Are there any links between these individuals and environmental issues?
- How can zebra mussels be introduced into a new environment?
  - What do zebra mussels look like?
  - What are the different methods/processes that might be used for introduction?
  - What are the indicators of zebra mussels being introduced?
- What evidence is needed to prove:
  - The zebra mussels were intentionally introduced?
  - There was intent to cause damage or a loss of property?
- What damage was caused by the zebra mussels?
  - What is the evidence that supports this?



Standing Intelligence Requirements

- If someone is identified with zebra mussels in his or her possession:
  - Identify the individuals and the reasons for their possession of the zebra mussels.
  - Document precautions taken to avoid introduction of the zebra mussels to the local environment?
  - Document any evidence to support the elements of applicable state and/or federal laws?
    - What additional evidence may be needed?

Homeland Security Intelligence Requirements

- Is there a need for the fusion center to forecast their spread and impact or can this be handled more effectively by another agency?
  - If so, which agency?
  - Is there a memorandum of understanding in place to work with this agency?
- What are the characteristics of the new host environment that would help target places where the zebra mussels may be introduced and flourish?
- Do any of the identified host environments have characteristics that increase the seriousness of the invasion (for example, public water supply, hydroelectric plant, manufacturing, commercial, or recreational body of water)?

Chapter 3:

A Brief History of Law Enforcement Intelligence: Past Practice and Recommendations for Change

A Brief History of Law Enforcement Intelligence: Past Practice and Recommendations for Change

Controversies have surrounded law enforcement intelligence because of past instances where the police maintained records of citizens' activities that were viewed as controversial, not traditional, suspicious, or perceived as anti-American, even though no crimes were being committed. This, of course, violates fundamental constitutional guarantees and offends the American sense of fairness concerning government intrusiveness. Unfortunately, the boundary is not precise about the types of information the police can collect and retain. Some legal guidelines lack clarity and the application of law to factual situations is often difficult. Beyond the legal ramifications, law enforcement's early intelligence initiatives often lacked explicit focus and typically maintained a shroud of secrecy. We can learn important lessons from these historical experiences that provide context and guidance for law enforcement intelligence today.

Aggravating these factors was an unclear relationship between law enforcement intelligence and national security intelligence that has changed continuously since the mid-20th century. The changes have been both politically and legally controversial as these initiatives sought to respond to changing sociopolitical events in American history, most recently through post-9/11 counterterrorism efforts. As a result, there is value in understanding selected portions of history from both types of intelligence to gain context and understand the lessons learned.

Law Enforcement Intelligence: The Years of Evolution

Early law enforcement intelligence units going back to the 1920s used a records process known as the "dossier system." Essentially, intelligence files were nothing more than dossiers—files containing a collection of diverse raw information—about people who were thought to be criminals, thought to be involved with criminals, or persons who were thought to be a threat to the safety and order of a community. Bootleggers during prohibition and many of the high-profile criminals of the early twentieth century—for example, Bonnie and Clyde, the Barker Gang, Machine Gun Kelly, Al Capone—were the typical kinds of persons about whom police agencies kept dossiers.

During the depression of the 1930s, little was done in the law enforcement intelligence arena. Other priorities were higher: the pervasive threat to the country was the economy, not criminality. Circumstances began to change in the latter part of the decade as communism —or the "Red Scare"—became predominant. The police relied on the only system they knew: the dossier.

In 1937, U.S. Representative Martin Dies (D-Texas) became the first chairman of the House Committee on Un-American Activities. Dies, a supporter of the Ku Klux Klan, fueled the fire of concern about communism in the United States, including labeling people as Communists who appeared "un-American," which often resulted in their loss of jobs and functional displacement from society. Concern

about communism was pervasive, but was of secondary interest in the 1940s because of World War II. After the war, when the Soviet Union was formed and built its nuclear arsenal, the Red Scare reemerged with even greater vigor.

The fires were fanned significantly in 1950 by Senator Joseph McCarthy (R-Wisconsin) who was using this national concern as the foundation for his floundering reelection bid to the Senate. McCarthy railed against the American Communist Party and called for expulsion from government, education, and the entertainment industry anyone who was an avowed Communist or Communist sympathizer. Because of fear about the Soviet Union among the American public, the war on communism resonated well.

Responding to expressions of public and government concern, local law enforcement agencies began creating intelligence dossiers, known as "Red Files," on persons who were suspected Communists and Communist sympathizers. Law enforcement agencies, therefore, were keeping records about people who were expressing their political beliefs and people who were known to sympathize with these individuals. The fact that these people were exercising their constitutional rights and had not committed crimes was not considered an issue because it was felt that the presence of, and support for, communism within the nation was a threat to the national security of the United States.[1]

The dossier system had become an accepted tool for law enforcement intelligence; therefore, when new overarching challenges emerged, it was natural for law enforcement to rely on this well-established mechanism for collecting and keeping information. In the 1960s, law enforcement met two challenges where intelligence dossiers appeared to be an important tool: the Civil Rights movement and the anti-Vietnam War movement. In both cases, participants appeared to be on the fringe of mainstream society. They were vocal in their views and both their exhortations and actions appeared to many as being "un-American." This was aggravated by other social trends: World War II baby boomers were in their teens and 20s, exploring their own newly defined world of "sex, drugs, and rock n' roll" and contributing to the stereotype of the "long-haired, dope-smoking, commie-hippie spies"—a sure target for a law enforcement traffic stop.

An overlap among these social movements was viewed by many as conspiratorial. Moreover, rapidly changing values, stratified in large part along generational and racial lines, created a sense of instability that appeared threatening to the mainstream. Rather than being culturally unstable, as we have learned in hindsight, it was simply social evolution. Because of the dissonance in the 1960s and the largely unsupported assumption that many of the activists and protestors "might" commit crimes or "might" be threats to our national security, law enforcement agencies began developing dossiers on these individuals "just in case." Typically, dossier information was not related to specific crimes, rather, it was kept as a contingency should the information be needed in some future investigation. There is little doubt that law enforcement was creating and keeping these dossiers with good faith to protect the community from activities then viewed as threats; however, that faith does not mitigate unconstitutional practices.

[1] It was rationalized that such activities were warranted on the grounds of a "compelling state interest." This argument, however, did not meet political or constitutional scrutiny.

There was additional concern during this time because of the activist nature of the U.S. Supreme Court during the era of Chief Justice Earl Warren (1953–1969). Many of the "liberal decisions" of the Warren Court were met with disfavor and the often-expressed belief that the Court's decisions[2] were "handcuffing the police." With regard to the current discussion, perhaps most important was that the Warren Court led a generation of judicial activism and expanded interpretations of the Constitution. Moreover, it symbolically motivated activist attorneys from the 1960s to try new strategies for the protection of constitutional rights. Among the most successful was reliance on a little-used provision of the Civil Rights Act of 1871, codified as Title 42 of the U.S. Code, Section 1983–Civil Action for Deprivation of Rights.

Commonly referred to as "1983 suits," this provision essentially provides that anyone who, acting under color of state or local law, causes a person to be deprived of rights guaranteed by the U.S. Constitution or federal law may be civilly liable. The initial lawsuits focused on whether a city, police department, and officers could be sued for depriving a person of his or her constitutional rights. The Supreme Court held that they could. A significant aspect of the case was that the police could be sued if there was "misuse of power possessed by virtue of state law and made possible only because the wrongdoer is clothed with the authority of state law."[3] This opened the floodgates for lawsuits against law enforcement (and correctional institutions).

Initial lawsuits focused on various patterns of police misconduct such as excessive force and due process violations. The reach of lawsuits against law enforcement grew more broadly with decisions holding that the police chain of command could be held vicariously liable for the actions of those under their command, as well as their parent jurisdiction. Moving into the late 1960s and early 1970s, such lawsuits moved toward law enforcement intelligence units. It was increasingly discovered that law enforcement agencies were keeping intelligence files on people for whom there was no evidence of criminality. The practice of keeping intelligence dossiers on a contingency basis was found to be improper, serving no compelling state interest and depriving those citizens of their constitutional rights. As a result, the courts repeatedly ordered intelligence files to be purged from police records and in many cases police agencies had to pay damage awards to plaintiffs. The decisions also permitted citizens to gain access to their own records. Many activists publicized their intelligence files as a badge of honor, often to the embarrassment of the police.[4] Law enforcement intelligence operations were cut back significantly or eliminated as a result of the embarrassment and costs associated with these lost lawsuits. The lessons learned from this era suggest caution in the development of intelligence records—information must be collected, retained, reviewed, and disseminated in a manner that is consistent with legal and ethical standards.

This lesson is reinforced by the findings of the United States Senate Select Committee to Study Governmental Operations with Respect to Intelligence Activities[5] —the Church Committee, named after its chairman, Frank Church (D–Idaho)[6]—which held extensive hearings on domestic intelligence, most notably

[2] Among the most often cited are *Miranda* v. *Arizona* (police must advise arrestees of their Fifth and Sixth Amendment rights prior to a custodial interrogation); *Mapp* v. *Ohio* (applying the Exclusionary Rule to the states); *Gideon* v. *Wainwright* (right to appointed counsel); and *Escobedo* v. *Illinois* (right to counsel when the process shifts from investigatory to accusatory).

[3] *Monroe* v. *Pape* 365 U.S. 167 (1961).

[4] For example, it was not uncommon to find notations and even photographs of an "intelligence target" having dinner or attending a public event such as a movie or the theater. The citizen would then pose a rhetorical question, "Is this how you want your tax dollars spent?"

[5] United States Senate, Select Committee to Study Governmental Operations with Respect to Intelligence Activities. *Intelligence Activities and the Rights of Americans, Book II, Final Report*. Washington, D.C.: Library of Congress, 1976.

[6] Alternately known as the Church Commission.

the Federal Bureau of Investigation's (FBI) Counter Intelligence Program, which spanned the years 1959 to 1971. The committee's conclusion:

> Domestic intelligence activity has threatened and undermined the Constitutional rights of Americans to free speech, association and privacy. It has done so primarily because the Constitutional system for checking abuse of power has not been applied.

Concern was widespread about all aspects of intelligence. The combined effect of these diverse factors prompted the U.S. Department of Justice (DOJ) to develop guidelines for the management of criminal intelligence records that were maintained by state and local law enforcement agencies.

Codified as 28 CFR Part 23[7]—Criminal Intelligence Systems Operating Policies,[8] the regulation governs interjurisdictional and multijurisdictional criminal intelligence systems that are operated by or on behalf of state and local law enforcement agencies and that are funded with federal funds. The regulation, created in 1979, stemmed from an amendment to the Omnibus Crime Control and Safe Streets Act of 1968.

The Justice System Improvement Act of 1979 created significant changes in DOJ organizations and stimulated regulatory changes, including creation of this regulation by the DOJ Office of Legal Policy. The regulation arose out of concern about aggressive information collection and intelligence activities by state and local law enforcement agencies that frequently involved collecting and retaining information about citizens who were expressing unpopular beliefs but whose actions were not criminal.

Since the federal government cannot mandate policy to state and local governments, the only method by which such policy could be leveraged was to make the policy implementation a condition for the acceptance of federal funds. The regulation provides guidelines on the collection, retention, review, dissemination, and purging of criminal intelligence records. Essentially, the regulation requires that, before information that identifies an individual or an organization may be retained in the criminal intelligence records system of a state or local law enforcement agency, there must be sufficient evidence to establish a reasonable suspicion that the individual [or organization] is involved in criminal behavior. When the regulation was created, many viewed this as a significant barrier to effective intelligence operations. Hindsight, however, has proven that the regulation is an important tool for maintaining citizens' civil rights without placing an undue burden on intelligence activities.

Congressional Inquiries into Intelligence Activities

During this era, inquiries into the Intelligence Community (IC) moved away from assessing the efficiency of intelligence operations and toward assessing the legality and propriety of the actual operations conducted. As will be seen, the recommendations made by three congressional committees would result in major changes in both the jurisdiction and roles of IC members with respect to law enforcement and national security intelligence. This would lead to the separation

[7] Code of Federal Regulations.

[8] www.iir.com/28cfr

of the two types of intelligence activities—the so-called "wall between domestic and international intelligence."

In 1975, the Rockefeller Commission (Commission on CIA Activities within the United States) recommended limiting the Central Intelligence Agency's (CIA) authority to conduct domestic intelligence operations. Furthermore, the commission also recommended that the director of central intelligence and the director of the FBI set jurisdictional guidelines for their respective agencies. In 1976, the House Select Committee on Intelligence (the Pike Committee, chaired by Otis Pike, D–New York) also made recommendations to further limit the jurisdictional overlap between agencies responsible for national security intelligence and agencies primarily responsible for law enforcement intelligence. It was the recommendations of the Church Committee, however, that were the most profound in developing the wall of separation.

The Church Committee, an inquiry formed by the U.S. Senate in 1976, examined the conduct of the IC in a broader fashion than did the Rockefeller Commission.[9] The recommendations made by this inquiry led to jurisdictional reformations of the IC. Most of the recommendations were directed at developing new operational boundaries for the FBI and the CIA. Out of the committee's 183 recommendations, the following illustrate how law enforcement intelligence was separated from national security intelligence:[10]

- The committee recommended that agencies such as the National Security Agency, the CIA, and military branches not have the power to conduct domestic intelligence operations (that is, law enforcement intelligence functions). Specific attention was given to the role of the CIA, noting that "the CIA should be prohibited from conducting domestic security activities within the United States."[11]
- The committee recommended that the FBI have "sole responsibility" for conducting domestic intelligence investigations of Americans.
- The FBI should "look to the CIA as the overseas operational arm of the intelligence community."[12]
- All agencies should ensure against improper intelligence activities.

The recommendations of the Church Committee have been widely recognized as a primary reason for the separation of law enforcement intelligence from national security intelligence. The call for this separation, however, did not mean that the agencies should stop working with each other. In fact, the Church Committee also recommended that the FBI and the CIA continue sharing information and make a better effort to coordinate their initiatives. This was operationally complicated: How do the two agencies work together and coordinate initiatives when there are substantial limitations on the kinds of information that can be collected and shared? Moreover, what, if any, role did state, local, and tribal law enforcement (SLTLE) intelligence have in this arrangement? The result was increased compartmentalization both between the agencies and within each agency.[13] Recommendations to improve law enforcement intelligence, however, have not been limited to the federal level. Such recommendations have also been made for state and local law enforcement agencies.

[13] For example, because of the regulations—or at least the interpretation of the regulations—FBI agents working within the former Foreign Counter Intelligence Division were often barred from sharing information with agents working on criminal investigations.

National Crime Commissions and New Initiatives Influencing the Evolution of State, Local, and Tribal Law Enforcement Intelligence

Since 1931, 15 national crime commissions have examined a wide array of crime issues in the United States, ranging from street crime and drug trafficking to organized crime and terrorism. Most have included assessments and recommendations related to some aspect of law enforcement intelligence. Understanding the broad intent of the commissions, followed by those with specific intelligence recommendations, demonstrates a well-established legacy for establishing law enforcement intelligence operations that are objective, analytic, and respectful of privacy and civil rights. While the recommendations reflect forward thinking, not all recommendations were embraced immediately—largely because they represented a change in the police occupational culture of the era. Nonetheless, important concepts were established that served as the foundation for today's law enforcement intelligence practices.

The Commissions and their Purpose

The National Commission on Law Observance and Enforcement (known as the Wickersham Commission) issued a series of reports and memoranda from 1928 to 1931 examining all aspects of serious crime in the United States. The intent was to address the growth of organized crime (particularly that arising from Prohibition) and increases in violent crime that appeared to correlate with growing industrialization and urbanization. The Commission also sought to understand the failure of law enforcement, the courts, and corrections to manage America's crime problem effectively. For the next 3 decades there were no major national commissions examining crime, in large part, no doubt, because of Americans' preoccupation with the Great Depression, followed by World War II, and post-World War II concerns about the growing nuclear threat from the Soviet Union. Indeed, these global events were largely responsible for virtually none of the Wickersham Commission's recommendations being implemented.

In November 1963, the assassination of President John F. Kennedy prompted President Lyndon B. Johnson to create what came to be known as the Warren Commission (U.S. Supreme Court Chief Justice Earl Warren). While the Commission's goal was to determine the circumstances leading to the assassination, the less controversial results of the Commission examined the relationships among federal, state, and local law enforcement, their communications, and generally their ability to work together for a common purpose: protecting the President of the United States. Unbeknownst at the time, the assassination was a harbinger of a violent and paradigm-changing decade to come.

As the 1960s progressed, increased concern about crime was emerging because of the growth of violence, the increase in drug use, the greater awareness of organized crime, and concerns about inequities in the administration of justice, particularly as related to minorities. To address these concerns, in 1965 President Johnson created the President's Commission on Law Enforcement and

Administration of Justice, an inquiry that complemented President Johnson's domestic social agenda known as "The Great Society." The President's Commission investigated all aspects of the criminal justice system, as well as specific inquiries into narcotics and organized crime, in a series of task force reports that were released 1967.

Recognizing that the 1960s was the "decade of social revolution" on many fronts, there were concerns about problems ranging from violence, riots in our cities, increases in the use of narcotics, a growth of illegal dangerous drugs, to concerns about moral decay, often illustrated by the increasing presence of pornographic materials. In 1967, a series of violent demonstrations in cities throughout the U.S. spurred by the Civil Rights Movement led to the creation of the National Advisory Commission on Civil Disorders (known as the Kerner Commission, chaired by Governor Otto Kerner of Illinois) as an attempt to understand the dynamics of civil disobedience and civil disorders as well as to evaluate the government's response. The following year, 1968, saw the creation of two additional commissions: The National Commission on the Causes and Prevention of Violence and the U.S. Commission on Obscenity and Pornography.

The social upheaval of the 1960s was characterized by many factors, including a significant rise in the abuse of illegal drugs, as learned in earlier commission reports. As a result, a new inquiry was created specifically to examine this issue more closely; the U.S. Commission on Marihuana and Drug Abuse (1970).

One of the signature components of the 1967 President's Commission was the attempt to professionalize all aspects of the criminal justice system. Following this lead was the Justice Department's National Advisory Commission on Criminal Justice Standards and Goals (1973) as well as a series of reports from working groups of that commission known as the *National Advisory Committee on Criminal Justice Standards and Goals* (1976).

National inquiries, seeking to identify causes of various crimes as well as providing blue-ribbon advice on the best tactics, recommended strategies and programs to deal with crime. These included the Justice Department's National Advisory Committee for Juvenile Justice and Delinquency Prevention (1980); the Attorney General's Task Force on Violent Crime (1981); the President's Commission on Organized Crime (1983); and the Attorney General's Commission on Pornography (1986).

Throughout the 1990s there were no national commissions on crime issues as had been so prevalent in the previous 3 decades. There was, however, a significant increase in government-sponsored research and program development on a wide array of crime-related issues from the National Institute of Justice, the Bureau of Justice Assistance, the Bureau of Justice Statistics, the Office of Juvenile Justice and Delinquency Prevention; and the newest Justice Department agency, created in 1994, the Office of Community Oriented Policing Services (the COPS Office). In many ways, the products of these agencies were a surrogate for the national commissions.

Table 3-1: National Crime Commissions in the U.S., 1931–2004

- U.S. Commission on Obscenity and Pornography, 1968
- U.S. Commission on Marihuana and Drug Abuse, 1970
- National Advisory Commission on Criminal Justice Standards and Goals, 1973
- National Advisory Committee on Criminal Justice Standards and Goals, 1976
- National Advisory Committee for Juvenile Justice and Delinquency Prevention, 1980
- Attorney General's Task Force on Violent Crime, 1981
- President's Commission on Organized Crime, 1983
- Attorney General's Commission on Pornography, 1986
- Advisory Panel to Assess Domestic Response Capabilities for Terrorism Involving Weapons of Mass Destruction (Gilmore Commission), 1999
- National Commission on Terrorist Attacks Upon the United States (9/11 Commission), 2004

In the late 1990s, there was a growing concern about terrorism, particularly after attacks on the U.S. military and the U.S. embassy bombings in Africa, as well as a general increase in terrorist attacks throughout the Middle East. As a result, the U.S. Congress mandated a 5-year annual inquiry into the susceptibility of the U.S. to attacks using weapons of mass destruction (WMD). The Advisory Panel to Assess Domestic Response Capabilities for Terrorism Involving Weapons of Mass Destruction (known as the Gilmore Commission, chaired by former Virginia Governor James Gilmore) issued its first report in 1999.

In 2004, the latest significant commission, the National Commission on Terrorist Attacks Upon the United States (9/11 Commission), issued its report. It had implications for the criminal justice system but addressed much wider issues. They are discussed later in this chapter.

The National Crime Commissions and Law Enforcement Intelligence

Not all of these commissions addressed the issue of intelligence directly; however, all called for increased use of diverse analytic techniques to not only understand crime and criminal justice but also to aid in forecasting crime for purposes of prevention—a fundamental construct of the intelligence process.

The Wickersham Commission observed there was a need to study and understand the crime environment (that is, analysis) as an important tool for capturing criminal offenders. Thirty-three years later, one of the earliest explicit recommendations for intelligence and information sharing between federal

agencies and state and local law enforcement came from the 1964 President's Commission on the Assassination of President Kennedy (the Warren Commission). While the majority of the Commission's recommendations were directed at federal agencies, notably the Secret Service and the FBI, it also recommended that these agencies work more closely with local law enforcement. Specifically, the Commission called for increased information sharing and stronger liaison between local and federal agencies.[14]

The 1967 reports of the President's Commission on Law Enforcement and Administration of Justice emphasized many of the same factors, but provided significantly more research, more detail, and explicit recommendations. Moreover, the year following the release of the President's Commission reports, Congress passed landmark legislation—the Omnibus Crime Control and Safe Streets Act of 1968—which, among other things, provided funding for implementing many of the Commission's recommendations. Within the intelligence arena, the President's Commission recommended:

> Police departments in every major city should have a special intelligence unit solely to ferret out organized criminal activity and to collect information regarding the possible entry of criminal cartels into the area's criminal operations.[15]

Interestingly, the President's Commission noted that "criteria for evaluating the effectiveness of the [intelligence] units, other than mere numbers of arrests, must be developed".[16] That debate remains. The President's Commission went on to recommend that the "…Department of Justice should give financial assistance to encourage the development of efficient systems for regional intelligence gathering, collection, and dissemination."[17] This would become a reality roughly a decade later when the Regional Information Sharing System (RISS) and its six regional intelligence centers were created by the Justice Department.[18]

While the intelligence focus of the President's Commission was largely on organized crime and to a lesser extent on narcotics control, the Kerner Commission's focus was on civil disobedience and violent civil disorders. With respect to the riots and civil disorders experienced by America's cities, the Kerner Commission made this observation:

> No particular control tactic was successful in every situation. The varied effectiveness of control techniques emphasizes the need for advance training, planning, adequate intelligence systems, and knowledge of the [inner city].[19]

Further, the Kerner Commission recommended that law enforcement agencies should do the following:

> Establish an intelligence system to provide police and other public officials with reliable information that may help to prevent the outbreak of a disorder and to institute effective control measures in the event a riot erupts.[20]

The National Commission on the Causes and Prevention of Violence made similar observations:

[20] Ibid., p. 16.

> A major weakness of many police departments is the absence of a reliable intelligence system. The absence has gravely handicapped police and public officials in anticipating and preventing trouble, and in minimizing and controlling a disorder that has broken out. In large part, this happens because of a failure to learn about and to understand neighborhood problems and grievances and to develop reliable information concerning community organizations and leaders. Related to this problem is the need for a reliable mechanism to monitor, to collect, and to evaluate rumors and also the need for an effective program to counter false and provocative rumors which can aggravate tension and incite violence.[21]

The recognition that intelligence could be a valuable tool for forecasting threats and dealing with complex criminality was growing slowly as a wide range of systemic crime-related social problems were examined by these national inquiries. Intelligence was being viewed more broadly as evidenced by the most comprehensive recommendation yet from the National Advisory Commission on Criminal Justice Standards and Goals. The National Advisory Commission developed a standard expressly for intelligence operations—ironically, it is Standard 9.11—that states, in part:

> Every police agency and every state immediately should establish and maintain the capability to gather and evaluate information and to disseminate intelligence in a manner which protects every individual's right to privacy while it curtails organized crime and public disorder.[22]

The standard is remarkably similar to a recommendation from the *National Criminal Intelligence Sharing Plan* that was released 31 years later. Interestingly, the standard notes that "information" is collected and "intelligence" is disseminated. This reference to analysis had not been articulated clearly in the previous commission reports. Moreover, the attention to individual privacy that was included in the standard is also an important ingredient that is critical to all law enforcement intelligence activities today.

Furthermore, included in the National Advisory Commission's report were recommendations directed at the structure and operations of the intelligence functions for state and local law enforcement agencies. These recommendations included the following:

Establishing Intelligence Functions

- Each state should develop a centralized law enforcement intelligence function with the participation of each police agency within the state.[23]
- States should consider establishing regional intelligence networks across contiguous states to enhance criminal information-sharing processes.[24]
- Every local law enforcement agency should establish its own intelligence function in accordance with its respective state's intelligence function.[25]

Intelligence Function Operations

- Each state and local intelligence function should provide support to federal agencies.

[25] Ibid

- Operational policies and procedures should be developed for each local, state, and regional intelligence function to ensure efficiency and effectiveness.[26]
- Each agency should have a designated official who reports directly to the chief and oversees all intelligence operations.
- Each agency should develop procedures to ensure the proper screening, securing, and disseminating of intelligence-related information.[27]

In 1976, the concept and operating policies for intelligence were expanded even further by the National Advisory Committee on Criminal Justice Standards and Goals. The Committee's publication, *Organized Crime–Task Force Report on Organized Crime* has a chapter on intelligence that provides more detail than that provided by any previous commission or inquiry. Beyond recommendations for the creation of an intelligence unit, the standards include recommendations for maintaining privacy, the use of the "need-to-know" and "right-to-know" standards for dissemination, standards for purging intelligence records, and the need to maintain individual and organizational accountability in the intelligence function.[28] While the recommendations focus on organized crime, including drug trafficking, compared to the "all crimes, all hazards" approach used by law enforcement in the post-9/11 environment, many of the 1976 standards and discussions of intelligence are consistent with today's vision of good practice in law enforcement intelligence.

Created in 1983, the President's Commission on Organized Crime was a comprehensive examination of all aspects of organized crime, ranging from "traditional" organization crime (that is, the Mafia, La Cosa Nostra) to drug trafficking cartels, sophisticated money laundering operations, and entrepreneurial crime of all types and commodities. The intent was to provide a comprehensive insight into organized crime, its structure, its effects, and how best to control it. It recognized that effective intelligence analysis was a critical tool to enable law enforcement to deal successfully with multijurisdictional complex criminality.[29]

By the mid-1980s, criminal enterprises had grown dramatically and encompassed a diverse array of illegal activities, from drug trafficking to counterfeiting consumer commodities. Investigators and intelligence units had neither the expertise nor the personnel to contain the problem effectively. This was aggravated by a failure of law enforcement to generally understand the nature of organized crime and by poor information sharing among law enforcement agencies at all strata of government.[30] Organized crime was characterized as a "rapidly changing subculture" that was outpacing the capability of law enforcement to control it. Increasingly, organized crime was viewed largely as a federal responsibility that would be supported by state and local law enforcement through information sharing and participation on task forces.

Similar to the issues of organized crime, the Attorney General's Commission on Pornography (1986) recognized that intelligence operations would be a useful tool for stopping interstate traffic in obscene and pornographic materials. However, state and local law enforcement tended to view this as a low priority and not a good investment of time and resources.

[30] President's Commission on Organized Crime. *Final Report.* Washington, D.C.: U.S. Government Printing Office, 1987.

In the 1990s, following an increased number of terrorist attacks in the Middle East and particularly after the bombings of U.S. embassies in Dar es Salaam, Tanzania, and Nairobi, Kenya, questions began to emerge about the United States mainland as a terrorist target and the ability of the U.S. to effectively forecast, manage, and respond to an attack "at home"—particularly an attack involving WMD. As a result, in 1999 the U.S. Congress mandated the creation of the Advisory Panel to Assess Domestic Response Capabilities for Terrorism Involving Weapons of Mass Destruction (the Gilmore Commission). The annual reports, issued between 1999 and 2003, went beyond WMD and explored terrorism more broadly—particularly after 9/11—and what the U.S. Government needed to do to effectively protect the homeland. In addition to recommending more robust intelligence and information sharing, the Gilmore Commission urged policymakers to move beyond simply reacting to the September 11 terrorist attacks and develop forward-thinking efforts by government at the federal, state, and local levels, and by the private sector as well. In its 2002 report, the Gilmore Commission stated the following:

> Intelligence—its timely collection, thoughtful analysis, and appropriate dissemination—is the key to effective prevention of terrorist attacks. From the inception of our deliberations, we have said that "more can and must be done to provide timely information—up, down, and laterally, at all levels of government—to those who need the information to provide effective deterrence, interdiction, protection, or response to potential threats."

While improvements have been made, that statement is still true today.[31]

That message was reinforced, particularly with regard to information sharing, in a staff report from the National Commission on Terrorist Attacks Upon the United States (the 9/11 Commission). One issue of concern was the effectiveness of information sharing by the FBI with state and local law enforcement. The commission's staff report stated, in part, the following:

> We heard complaints that the FBI still needs to share much more operational, case-related information. The NYPD's Deputy Commissioner for Counterterrorism, Michael Sheehan, speculated that one of the reasons for deficiencies in this information sharing may be that the FBI does not always recognize what information might be important to others. … Los Angeles Police Department officials complained to us that they receive watered-down reports from the FBI. … We have been told that the FBI plans to move toward a "write to release" approach that would allow for more immediate and broader dissemination of intelligence on an unclassified basis.[32]

These issues are being addressed through the *National Criminal Intelligence Sharing Plan* (NCISP) and, more specifically through the development of law enforcement intelligence "requirements" by the FBI. Moreover, former FBI Executive Assistant Director for Intelligence Maureen Baginski specifically stated in remarks at the 2004 COPS Office National Community Policing Conference that the initiatives of the FBI Office of Intelligence included a revised report-writing style that would facilitate information sharing immediately, including sharing with intelligence customers who did not have security clearances.[33]

[33] Baginski, Maureen. Remarks in a keynote address at "Community Policing for America's Future: National Community Policing Conference," Office of Community Oriented Policing Services, Washington, D.C.: June 22, 2004.

Interestingly, the 9/11 Commission's staff report on reformation of the intelligence function included many of the issues and observations identified in previous commission reports during the previous 40 years. The difference, however, is that substantive change is actually occurring, largely spawned by the tragedy of September 11, 2001.

The 9/11 Commission Report issued a wide range of recommendations related to intelligence. Cooperative relationships, the integration of intelligence functions, and a general reengineering of the intelligence community were at the heart of their recommendations. In commentary, the Commission noted the role of state, local, and tribal law enforcement agencies:

> There is a growing role for state and local law enforcement agencies. They need more training and work with federal agencies so that they can cooperate more effectively with those authorities in identifying terrorist suspects.[34]

The 9/11 Commission went on to recognize the following:

> The FBI is just a small fraction of the national law enforcement community in the United States, a community comprised mainly of state and local agencies. The network designed for sharing information, and the work of the FBI through local Joint Terrorism Task Forces, should build a reciprocal relationship in which state and local agents understand what information they are looking for and, in return, receive some of the information being developed about what is happening, or may happen, in their communities.[35]

The 9/11 Commission also recommended creation of a new domestic intelligence entity that would need to establish "…relationships with state and local law enforcement…"[36] In proposing a new National Counterterrorism Center (NCTC), the Commission stated that the Center should "… [reach] out to knowledgeable officials in state and local agencies throughout the United States."[37] Implicit in the Commission's recommendations is that terrorism is a local event that requires critical involvement of state and local government in prevention and response.[38]

The inquiries into crime and justice from the Wickersham Commission through the 9/11 Commission have the same themes: Attack the root causes of crime; understand all aspects of the crime dynamic; attack crime from a holistic approach; work with and share information between agencies; move beyond traditional approaches; and protect the privacy and civil rights of individuals. Whether the crime is strong-armed robberies or terrorism, these principles run true. Certainly, the practice of law enforcement intelligence has listened to and learned from these lessons in a frenzy of change during the post-9/11 era.

Law Enforcement Intelligence Initiatives in the Post-9/11 Environment

Several important initiatives have been spurred by the terrorist attacks of September 11, 2001 that have had a significant and fast effect on the evolution of law enforcement intelligence. The more significant developments occurring during this time are listed in Table 3-2.

[38] Ibid.

In October 2001, about 6 weeks after the 9/11 attacks, the International Association of Chiefs of Police (IACP) held its annual meeting in Toronto, Ontario, Canada. There, the Police Investigative Operations Committee discussed the need for SLTLE agencies to reengineer their intelligence function as well as the need for national leadership to establish standards and direction for SLTLE agencies. From this meeting, the IACP, with funding support from the COPS Office, held the Intelligence Summit in March 2002. The summit developed a series of recommendations, a criminal intelligence sharing plan, and adopted *Intelligence-Led Policing*.[39]

The Global Justice Information Sharing Initiative (Global), a group funded by the U.S. Office of Justice Programs, was already in existence with the charge of developing processes and standards to efficaciously share information across the criminal justice system. In response to the IACP Intelligence Summit of 2002, Global created a new subgroup, the Global Intelligence Working Group (GIWG). The purpose of the GIWG was to move forward with the summit's recommendations. The first GIWG product was the *National Criminal Intelligence Sharing Plan*.

- Fusion Center Guidelines
- Department of Homeland Security (DHS) Target Capabilities List (TCL)
- Intelligence Reform and Terrorism Prevention Act of 2004 (IRTPA)
  - Creation of the Office of the Director of National Intelligence (ODNI) and appointment of the Assistant Deputy Director of National Intelligence (ADDNI) for Homeland Security and Law Enforcement
  - Creation of the Directorate of Intelligence (DI) at the FBI
  - Creation of the National Counterterrorism Center (NCTC)
  - Creation of the Information Sharing Environment (ISE)
- Creation of the Interagency Threat Assessment and Coordination Group (ITACG)
- National Strategy for Information Sharing (NSIS)
- Second COPS/IACP Intelligence Summit

Formally announced at a national signing event in the Great Hall of the U.S. Department of Justice on May 14, 2004, the *National Criminal Intelligence Sharing Plan* (NCISP) signified an element of intelligence dissemination that is important for all law enforcement officials. With formal endorsements from the DOJ, DHS, and the FBI, the NCISP provided an important foundation on which state, local,

[39] International Association of Chiefs of Police. *Criminal Intelligence Sharing: A National Plan for Intelligence-Led Policing at the Local, State and Federal Levels.* Alexandria, Virginia: International Association of Chiefs of Police, 2002.

and tribal law enforcement agencies could create their intelligence initiatives. The intent of the plan was to provide SLTLE agencies (particularly those that do not have established intelligence functions) with the necessary tools and resources to develop, gather, access, receive, and share intelligence.

The NCISP[40] established a series of national standards that have been formally recognized by the professional law enforcement community as the role and processes for law enforcement intelligence today. The plan is having a significant effect on organizational realignment, information-sharing philosophy, and training in America's law enforcement agencies.

The NCISP also recognized the importance of local, state, and tribal law enforcement agencies as a key ingredient in the nation's intelligence process and called for the creation of the Criminal Intelligence Coordinating Council (CICC) to establish the linkage needed to improve intelligence and information sharing among all levels of government. Composed of members from law enforcement agencies at all levels of government, the CICC was formally established in May 2004 to provide advice in connection with the implementation and refinement of the NCISP. Members of the CICC serve as advocates for local law enforcement and support their efforts to develop and share criminal intelligence for the purpose of promoting public safety and securing our nation. Because of the critical role that SLTLE play in homeland security, they must have a voice in the development of policies and systems that facilitate information and intelligence sharing. The CICC serves as the voice for all levels of law enforcement agencies by advising the U.S. Attorney General and the Secretary of Homeland Security on the best use of criminal intelligence as well as the capabilities and limitations of SLTLE agencies related to information sharing.[41]

During the same period that these initiatives were occurring, many states and regions somewhat independently were developing multijurisdictional intelligence capabilities intended to maximize the diverse raw information input for analysis and examine potential acts of terrorism that may occur within regions. The units, called "fusion centers," were embraced by the DHS, which began providing funding to enable some of the centers to operate. The concept of "intelligence fusion" caught on rapidly as an efficient and effective mechanism for developing intelligence products. With recognition that other crimes, such as financial crime and weapons offenses, may have a nexus with terrorism, the centers' foci broadened to "all crimes." Moreover, with the broad mission of the DHS, which was increasingly providing substantial amounts of funding, the fusion centers' focus broadened further to encompass "all crimes, all hazards, all threats."

Recognizing the benefits of standardization to enhance the quality of work being done by the fusion centers, the GIWG created the *Fusion Center Guidelines*[42] for developing a series of recommendations and good practices for law enforcement agencies that are participating in the intelligence fusion process. While primarily focusing on criminal intelligence, the *Guidelines* also give attention to the law enforcement information-sharing relationship with the private sector, as well as public safety issues related to homeland security intelligence. The fusion process

[40] it.ojp.gov/documents/NCISP_Plan.pdf

[41] www.iir.com/global/council.htm

[42] it.ojp.gov/topic.jsp?topic_id=209

seeks to have as many law enforcement agencies as possible as information-sharing partners. Analytic outputs will be more robust as law enforcement participation increases because there will be a wider array of diverse information being entered into the analytic process. The recommendation from the NCISP and the second COPS/IACP Intelligence Summit that all agencies, regardless of size, should develop an intelligence capacity is clearly an important ingredient for increased agency participation with fusion centers.

At virtually the same time, the DHS was developing plans to meet its mission, mandated in Homeland Security Presidential Directive-8 "…to prevent, respond to, and recover from threatened and actual domestic terrorist attacks, major disasters, and other emergencies…".[43] A critical part of this initiative was to define critical knowledge, skills, abilities, and processes (that is, "capabilities") that were necessary for law enforcement and emergency services personnel to perform these tasks. These capabilities have been articulated in detail in the *Target Capabilities List*[44] (TCL). Intended to protect the nation from all hazards, "…the TCL is a national-level, generic model of operationally ready capabilities defining all-hazards preparedness."[45] The list is broken down into different "areas" associated with prevention and response. The "Prevent Mission Area" has two specific intelligence-related target capabilities: "Information Gathering and Recognition of Indicators and Warnings" and "Intelligence Analysis and Production." The "information gathering" capability is focused on "…the continual gathering of only pure, unexamined data…" that can be used in the intelligence process to identify threats and indicators of threats. This is the type of information that is essential for effective analysis and is the currency that fusion centers rely on law enforcement agencies to submit to the fusion process, typically through tips, leads, suspicious activity reports, and observation of terrorism or criminal indicators.

> The "intelligence analysis" target capability involves "…the merging of data and information for the purpose of analyzing, linking, and disseminating timely and actionable intelligence with an emphasis on the larger public safety and homeland security threat picture. This process focuses on the consolidation of analytical products among the intelligence analysis units at the Federal, State, local, and tribal levels for tactical, operational, and strategic use. This capability also includes the examination of raw data to identify threat pictures, recognize potentially harmful patterns, or connect suspicious links to discern potential indications or warnings."[46]

The discussion of both of these target capabilities in the *Target Capabilities List* refers to both the *NCISP* and *Fusion Center Guidelines* as standards and processes to accomplish the capabilities. The integration of these initiatives strives to create a culture of information sharing that inextricably includes state, local, and tribal law enforcement.

Building on these initiatives—and on other new programs and activities in the Intelligence Community as well as recommendations from the 9/11 Commission—Congress passed the Intelligence Reform and Terrorism Prevention Act of 2004 (IRTPA). Among the many important aspects of this legislation are four particularly

[46] Ibid., p. 91.

important factors that are significant for the current discussion: creation of the Office of the Director of National Intelligence (ODNI), creation of a Directorate of Intelligence (DI) in the FBI, creation of the National Counterterrorism Center (NCTC), and mandating the creation of the Information Sharing Environment.

The first factor of the IRTPA provisions related to SLTLE was creation of the ODNI. The Director of National Intelligence (DNI) serves as the head of the Intelligence Community and as a principal advisor to the President on issues related to national security. One of the unprecedented aspects of this office is the formal recognition that SLTLE has a role in both national security and homeland security. The staff of the ODNI includes an Assistant Deputy Director of National Intelligence (ADDNI) for Homeland Security and Law Enforcement. While the role and functions of this position are still evolving, essentially the ADDNI is responsible for policy issues related to information sharing between the Intelligence Community and SLTLE. Moreover, the ADDNI advises the Intelligence Community on law enforcement capabilities, operations, and restrictions related to national security.

The second factor was creation of the FBI Directorate of Intelligence (DI) to manage all FBI intelligence activities.[47] The DI is organized as part of the FBI's National Security Branch and is embedded in all investigative domains—counterterrorism, counterintelligence, WMD, cyber, and criminal inquiries.[48] A key responsibility of the DI is identifying threats and sharing threat information with SLTLE agencies and the Intelligence Community. The DI's goal is to be a "full and trusted partner who can be relied on to proactively bring FBI resources to the table to help resolve threats."[49] The IRTPA mandate firmly established and expanded the DI's authority over the management of the FBI's intelligence functions, including oversight of field intelligence operations and coordination of human source development and management.

The third factor was the creation of the National Counterterrorism Center (NCTC). The NCTC serves as the primary organization for integrating and analyzing all intelligence pertaining to terrorism with the exception of purely domestic terrorism. The NCTC also serves as the central knowledge bank on terrorism information and provides all-source intelligence support to government-wide counterterrorism activities. Its mission is essentially to "get the right counterterrorism information into the right hands of the right people" in DHS, the FBI, the Intelligence Community and, indirectly, SLTLE. The NCTC seeks to bring intelligence from across the federal government into one place to integrate and analyze it then disseminate the integrated intelligence to customers.[50]

The final IRTPA factor of concern to SLTLE is creation of the Information Sharing Environment (ISE). The IRTPA required the President to establish an ISE "for the sharing of terrorism information in a manner consistent with national security and with applicable legal standards relating to privacy and civil liberties." It also required designation of a program manager for the ISE who is charged with planning and overseeing the ISE's implementation and management.

[47] Rather than create a new domestic intelligence agency, as recommended by the 9/11 Commission, the legislation increased the intelligence authority and responsibilities of the FBI.

[48] www.fbi.gov/intelligence/intell.htm

[49] Statement by FBI Assistant Director Wayne Murphy, Directorate of Intelligence, at the 2007 IACP Intelligence Summit, Washington, D.C., November 27, 2007.

[50] www.nctc.gov/nic

The Information Sharing Environment Implementation Plan[51] is designed to increase the sharing of terrorism information among and between the 16-member Intelligence Community, law enforcement agencies at all levels of government, and the private sector as well as foreign partners. The ISE seeks to "…implement an effective, widespread culture of information sharing, balanced with a need for security and the protection of privacy and civil liberties…"[52] The Implementation Plan provides a detailed process and action steps that indicate significant expectations for state, local, and tribal law enforcement to be participants in the ISE. *The Implementation Plan* further stipulates that each state must identify a primary state fusion center that will be the information-sharing nexus between the federal ISE and SLTLE agencies.[53]

As is evident from the above initiatives, information sharing has become the fundamental principle for intelligence processes to protect the United States. Despite new programs, legislation, and regulations, information sharing across governmental levels was still problematic. In an attempt to remedy this, key decision-makers and representatives of all levels of the ISE were to meet on a consistent basis and resolve information-sharing problems as members of the new Interagency Threat Assessment and Coordination Group[54] (ITACG) within the NCTC. ITACG members include the DHS, the FBI, members of the Intelligence Community, and state and local law enforcement representatives. A key role of the ITACG is to support the efforts of NCTC to produce "federally coordinated" terrorism-related information products intended for dissemination to state, local, and tribal officials and private-sector partners.

ITACG members, particularly at the state and local levels, help define the intelligence products needed by each type of consumer. Because each level of government has different priorities, ITACG members provide advice, counsel, and subject matter expertise to the Intelligence Community regarding the operations of SLTLE agencies, including how such entities use terrorism-related information to fulfill both their counterterrorism responsibilities and their core mission of protecting their communities.

Beyond these responsibilities, a key role of the ITACG is to coordinate the production and timely dissemination of specific intelligence products to SLTLE officials. The intelligence products include the following:

- Alerts, warnings, and notifications of time-sensitive terrorism threats to locations within the United States
- Situational awareness reporting regarding significant events or activities occurring at the international, national, state, or local levels
- Strategic assessments of terrorist risks and threats to the United States.[55]

The ISE was evolving beyond a plan and moving into actual policy and processes. Taking the next step, in October 2007 the White House released the *National Strategy for Information Sharing* (NSIS).

> The Strategy will assist the Administration in ensuring that Federal, State, local, and tribal government employees responsible for protecting our Nation from future attacks or responding should an attack occur understand the

[51] www.ise.gov/docs/ise-impplan-200611.pdf

[52] Ibid. Program Manager's Office, p. 83.

[53] In November 2007 a letter, jointly signed by the U.S. Attorney General and Secretary of Homeland Security, was sent to each state governor concerning the designation of a primary fusion center. The letter stated, in part, "…Guideline 2 states that DOJ and DHS will work with governors or other senior state and local leaders to designate a single fusion center to serve as the statewide or regional hub to interface with the federal government and through which to coordinate the gathering, processing, analysis, and dissemination of terrorism, law enforcement, and homeland security information in an all-crimes approach. … it is imperative for your office to designate one fusion center to serve as the statewide hub. … In designating a single fusion center, please give consideration to developing an inclusive strategy that is consistent with the federal efforts to constitute the ISE."

[54] www.whitehouse.gov/nsc/infosharing/sectionIV.html

[55] Ibid.

> Administration's expectations and plans for achieving improvements in the gathering and sharing of information related to terrorism. [56]

The strategy goes on to note:

> The President's guidelines recognized that State, local, and tribal authorities are critical to our Nation's efforts to prevent future terrorist attacks … The informational needs of State, local, and tribal entities continue to grow as they incorporate counterterrorism and homeland security activities into their day-to-day missions. Specifically, they require access to timely, credible, and actionable information and intelligence about individuals and groups intending to carry out attacks within the United States, their organizations and their financing, potential targets, pre-attack indicators, and major events or circumstances that might influence State, local, and tribal preventive and protective postures.[57]

The role of state, local, and tribal law enforcement intelligence is undeniable.

In many ways, post-9/11 intelligence developments came full circle with the second IACP/COPS Intelligence Summit. While many important and substantive changes have been made in law enforcement intelligence, the *2008 Summit Report* observed the following:

> The participants in the follow-up IACP Criminal Intelligence Sharing Summit nevertheless made it clear that many of the nation's law enforcement agencies do not participate in the criminal intelligence sharing plan. Too many state, local, and tribal agencies, it would seem, underestimate their importance to the criminal intelligence sharing process, overestimate the burdens of full participation, and/or remain unaware of how to contribute to the vital work of the plan.[58]

Clearly, challenges remain.

Collateral Developments

A number of other activities were either already in place or were in development concurrently with the above initiatives. The distinction of these activities is that they have helped facilitate the goals and processes of the strategies described above.

Counter-Terrorism Training Coordination Working Group (CTTWG)[59]

The CTTWG was formed in 2002 to facilitate interagency coordination, information exchange, and sharing of innovative training initiatives among federal agencies involved in terrorism and antiterrorism training. The group was later expanded to include representation from the major law enforcement and law enforcement training organizations. Further expansion of the CTTWG included policy-level agency representatives from a broad range of federal agencies; law enforcement organizations involved in federal, state, local, and tribal law enforcement training; and academe. The CTTWG recognized that, increasingly, training issues and programs being brought before them were focusing on the discipline of

intelligence. As a result, greater attention was focused on intelligence training and how to maximize the use of limited resources by ensuring that the intelligence training conveys a consistent, quality message; is not duplicative; is consistent with national standards; and meets the needs of law enforcement. Among the new intelligence initiatives was the creation of an online Law Enforcement Intelligence Master Training Calendar.[60] The group also assumed responsibility for preparing Version 2.0 of the Minimum Criminal Intelligence Training Standards.

Minimum Criminal Intelligence Training Standards[61]

Recognizing that the intelligence capacity of America's law enforcement community could not be realized without effective training, the CTTWG developed the *Minimum Criminal Intelligence Training Standards*. The standards identify six law enforcement focal areas— Chief Executive, Intelligence Commander/Manager, Intelligence Analyst, Criminal Intelligence Officer, General Law Enforcement Officer, and Train-the-Trainer— critical to successful intelligence activities. For each area, a group of experienced law enforcement intelligence professionals articulated learning objectives and identified key knowledge, skills, and abilities that are needed to execute intelligence responsibilities. With position-specific knowledge of the intelligence process increased within the law enforcement community, the willingness and ability to proactively contribute to the ISE increases significantly. Version 2.0 of the standards was approved in October 2007.

Global Justice Extensible Markup Language Data Model (GJXDM)

Because of the administrative independence among and between each component of the criminal justice system, many criminal justice information systems evolved in a manner that would not easily permit electronic information sharing. Frequently relying on proprietary data models from vendors, information often had to be exchanged in hard copy or be reentered. The Global Justice Information Sharing Initiative took on the task of developing a common data model that could serve as a standard used by all system components. The GJXDM is an Extensible Markup Language (XML) standard designed specifically for criminal justice information exchanges, providing law enforcement, public safety agencies, prosecutors, public defenders, and the judicial branch with a tool to share data and information effectively and in a timely manner.[62] There are three primary parts to GJXDM: the Data Dictionary (identifying content and meaning), the Data Model (defining structure and organization), and the Component Reuse Repository (a database). While the intent of the data model was to enhance criminal justice information sharing, the model has been embraced as a means of enhancing electronic sharing of criminal intelligence data. As a result, the GJXDM serves as an important technological component to support the ISE.

National Information Exchange Model[63] (NIEM)

A joint initiative of the DOJ and the DHS, NIEM embraced the GJXDM data model and built an information-sharing policy framework that met the mandates of the Homeland Security Act of 2002, the Intelligence Reform and Terrorism Prevention Act of 2004, and Homeland Security Presidential Directive 5 (HSPD-5).

[60] The Intelligence Master Training Calendar is available on the public side of the National Criminal Intelligence Resource Center web site: mastercalendar.ncirc.gov.

[61] The standards are available at: www.it.ojp.gov/documents/min_crim_intel_stand.pdf.

[62] it.ojp.gov/topic.jsp?topic_id=228

[63] See www.niem.gov.

> Rather than nationwide integration of all local, state, tribal, and federal databases, NIEM focuses on cross-domain information exchanges between key domains and communities of interest across all levels of government—whether between individual local law enforcement agencies, law enforcement and emergency service agencies, and other domains, or between local, state, tribal, regional, and federal agencies.[64]

The development of a common data standard and data-sharing model is clearly an important thread that permeates the culture of information sharing.

Grants for Training, Technical Assistance, and Technology

Various agencies and bureaus within both the DOJ and the DHS have been committed to providing grant support to further the intelligence mission. A wide variety of intelligence training programs have been supported, special activities to provide technical assistance, and assistance in purchasing technology and information systems— consistent with GJXDM and NIEM—have been critical to the development of the information-sharing culture. A factor that is particularly important to note is that many of the intelligence-related initiatives have been collaborative partnerships between the DOJ and the DHS. Beyond the support these initiatives have provided, this collaboration demonstrates information sharing in practice.[65]

Implications

The ISE *Implementation Plan* states that there is a need to "promote a culture of information sharing across the Information Sharing Environment." While a great deal of work and resocialization remains, a review of the initiatives discussed above demonstrates that significant strides have been made. While the ISE will face challenges to meet its ultimate goal, the changes that have been made in a comparatively short amount of time represent important milestones and are a significant leap forward.

Collectively, these initiatives have changed the philosophy of law enforcement intelligence that reflects the following:

- A commitment to information sharing both within and between law enforcement agencies
- The need to establish an objective, thoughtful intelligence function that has consistent national professional standards
- The recognition that state, local, and tribal law enforcement agencies have an important role in both homeland security and national security
- A process committed to preventing terrorism and multijurisdictional criminality
- A commitment to pursuing the intelligence function in a manner that is consistent with privacy and civil rights protection.

[64] *Introduction to the National Information Exchange Model.* Washington, D.C.: NIEM Program Management Office, February 12, 2007, p. 3.

Law Enforcement Intelligence at the State, Local, and Tribal Levels

Although the recommendations provided by the various national crime commissions were designed to strengthen law enforcement's capabilities to fight organized crime, by the mid-1980s, criminal enterprises had grown dramatically and encompassed such a diverse array of illegal activities, that the ability of SLTLE agencies to deal with these problems was limited. Investigators and intelligence units had neither the expertise nor the personnel to contain the problem effectively. This was aggravated by a failure of law enforcement to generally understand the nature of the problem and by poor information sharing among law enforcement agencies at all strata of government.[66] Organized crime was characterized as a "rapidly changing subculture" that was outpacing the capability of law enforcement to control it. As a result, law enforcement intelligence units were often relegated to being little more than an information clearinghouse or, in some cases, viewed as a failed initiative.[67]

Despite the lack of success, many within the law enforcement community still viewed the intelligence function as important to law enforcement agencies. A primary limitation of state and local intelligence units, however, was their inability to move beyond the collection of information to a systematic method of analyzing the collected data. The solution, then, was to have "the analytical function… guides the data collection [procedure]" rather than vice versa.[68]

Another limitation of law enforcement intelligence was that many law enforcement executives either did not recognize the value of intelligence and/or did not have the skills necessary to use intelligence products effectively. Furthermore, intelligence personnel did not possess the analytic (and often reporting) skills needed to produce meaningful intelligence products. The need for training was considered an important solution to this problem, and still is.

A historical issue was that intelligence units tended to be reactive in nature, often viewed as a repository of sensitive information rather than a proactive resource that could produce information critical for preventing crime and apprehending offenders. Similarly, intelligence units tended not to produce consistent, specifically defined products. Instead, intelligence reports tended to be written on an ad hoc basis to address critical matters.

A final limitation was that intelligence products were not disseminated in a timely or comprehensive manner. This, perhaps, was the greatest setback because the character of organized crime was constantly changing: different commodities were being trafficked, methods of operations tended to change, and participants in the operation of the enterprise changed. The need for timely and relevant information was seen as a necessary component for improving law enforcement intelligence operations.

While the majority of the past recommendations focused on the development and operations of intelligence units, recommendations have also been made regarding the ethical issues associated with state and local intelligence operations.

[66] President's Commission on Organized Crime. *Final Report.* Washington, D.C.: U.S. Government Printing Office, 1987.

[67] Martens, F., "The Intelligence Function," in *Major Issues in Organized Crime Control: Symposium Procedings, Washington, D.C.,* September 25–26, 1986. ed. Herbert Edelhertz, Washington, D.C.: U.S. Department of Justice, National Institute of Justice, Government Printing Office, 1987.

[68] Ibid.

Similar to the concerns that led to the formation of the Church Committee at the federal level, potential abuses of power was also a concern at the state and local levels. Accordingly, recommendations were made to ensure that citizens' civil rights remain intact.

For example, the *Law Enforcement Intelligence Unit File Guidelines*[69] were created to provide a practical policy and procedures that were intended to facilitate an effective intelligence process that was compliant with 28 CFR Part 23 and protected citizens' rights. Similarly, the Commission on Accreditation for Law Enforcement Agencies (CALEA) has recommended that every agency with an intelligence function establish procedures to ensure that data collection on intelligence information is "limited to criminal conduct that relates to activities that present a threat to the community" and to develop methods "for purging out-of-date or incorrect information."[70] In other words, the CALEA standard identified the need for law enforcement agencies to be held accountable for abuses of power associated with their intelligence activities. The latest revision of the CALEA intelligence standard embraces the *National Criminal Intelligence Sharing Plan* and its recommendations.

As will be seen later, the development of the Intelligence-Led Policing concept and the creation of the *National Criminal Intelligence Sharing Plan* have been important milestones in the evolution of law enforcement intelligence. By creating both an overarching intelligence philosophy and a standard for operations, state, local, and tribal law enforcement intelligence is becoming more professional. It is embracing more sophisticated tools, developing greater collaboration as one voice from the law enforcement intelligence community, and moving with a greater sense of urgency because of 9/11.

Conclusion

While we have evolved in our expertise and professionalism, many of the same issues remain. What are the lessons learned from history?

- Building dossiers full of raw, diverse information provides little insight—analysis is needed to give meaning to the information.
    - The improper collection of information can have a negative impact on our communities, including a chilling effect on the constitutional right of freedom of speech.
- To be effective, intelligence units must be proactive by developing unique products and disseminating the products to appropriate personnel on a consistent and comprehensive basis.
- A clear distinction is needed between law enforcement intelligence and national security intelligence. While some information can support the goals of both forms of intelligence, the competing methodologies and types of information that may be maintained in records mandates that the distinction remain clear and that overlap occurs only for clear purposes of public safety, including the apprehension of offenders and prevention of criminal and/or terrorists' acts.

[69] it.ojp.gov/process_links.jsp?link_id=3773

[70] Commission on Accreditation for Law Enforcement Agencies. *Standards for Law Enforcement Agencies*. 4th ed., 1998.

- Targeting people is unlawful without some evidence of a criminal predicate.
  - If the reason for the target is their support of an unpopular cause.
  - If they are being targeted because of their political beliefs, religion, race, ethnicity, or other attribute or characteristic (such as people who are perceived to be Muslim).
  - Targeting without lawful justification can result in civil rights suits and vicarious liability lawsuits, which can be both costly and embarrassing to the police department.
- The need to institute a privacy policy and civil rights protections are essential professional objectives.
- Monitoring an individual's behavior is proper if reasons can be articulated that reasonably support the notion that…
  - The person may be involved in criminality now or in the future.
  - There is a reasonable threat to public safety.
- Retaining information in intelligence files about an individual or an organization is improper if there is no reasonable suspicion of his or her criminal involvement, unless that information is used only as noncriminal identifying information and is labeled as such.
- A full-time law enforcement intelligence function should be organized professionally and staffed with personnel who are specifically trained in analysis and intelligence product preparation.
- There must be clear lines of communication between the intelligence unit and decision-makers.
- Law enforcement intelligence units must be evaluated regularly to ensure functional utility and operational propriety.
- Information sharing remains an important priority.

While past abuses of the intelligence function were no doubt done in a good faith effort to protect the community, nonetheless they were abuses. The changes that have occurred, particularly in the post-9/11 environment, and the professional development of the law enforcement intelligence function have demonstrated a respect for civil rights, a reliance on the scientific approach to problem solving, and a commitment to keeping America's communities safe.

Chapter 4:

The Intelligence Process (Cycle) for State, Local, and Tribal Law Enforcement

The Intelligence Process (Cycle) for State, Local, and Tribal Law Enforcement

Regardless of the type of intelligence, the single function that permeates all activities is the Intelligence Process (also known as the Intelligence Cycle). This process provides mechanisms to ensure the consistent management of information that will be used to create intelligence. This chapter is an overview of the Intelligence Process. Many of the issues introduced here will be discussed in detail in the remaining chapters of this *Guide*.

The Intelligence Process has been depicted in a variety of ways throughout the intelligence literature. The number of phases in the process may differ, depending on the model used, but the intent of each model of the Intelligence Process is the same:

> To have a systemic, scientific, and logical methodology to comprehensively process information to ensure that the most accurate, actionable intelligence is produced and disseminated to the people who provide an operational response to prevent a criminal threat from reaching fruition.

The process applies to all crimes, whether terrorism, drug trafficking, gangs, or any other criminal enterprise. Indeed, the process also helps identify circumstances where there is a nexus among these different types of crimes.

National Criminal Intelligence Sharing Plan: Training Recommendation for the Intelligence Process

Recommendation 18: Training should be provided to all levels of law enforcement personnel involved in the criminal Intelligence Process. The training standards, as contained within the *National Criminal Intelligence Sharing Plan*, shall be considered the minimum training standards for all affected personnel. Additionally, recipients of criminal intelligence training, as recommended in the *National Criminal Intelligence Sharing Plan*, should be recognized and awarded certificates for successful completion of training.

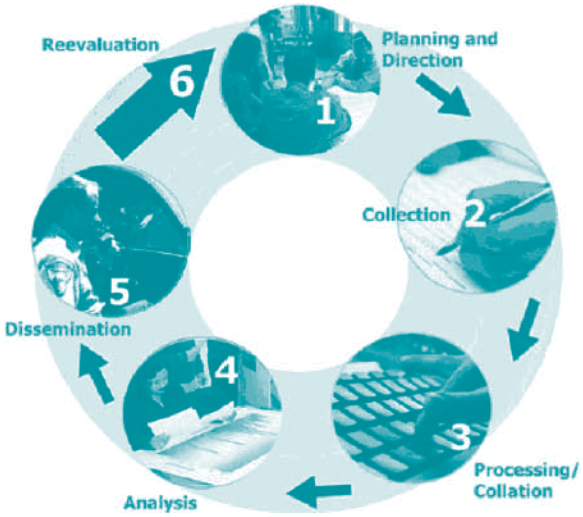
To be consistent with established national standards, the model used in this discussion is the one prescribed in the *National Criminal Intelligence Sharing Plan* (NCISP). While often depicted as "steps," in practice the different components of the process are phases, and there is a constant ebb and flow of information between phases as information is processed and shared. The Intelligence Process, therefore, is not a series of independent steps that are mechanically processed in an unbending sequential order; rather, they represent a recipe for intelligence and information sharing that will frequently change according to the availability of "ingredients" and the "nutritional needs" of the consumer.

The model of the Intelligence Process used in the NCISP (Figure 4-1) has six phases:

1. Planning and Direction.
2. Collection.
3. Processing/Collation.
4. Analysis.
5. Dissemination.
6. Reevaluation.

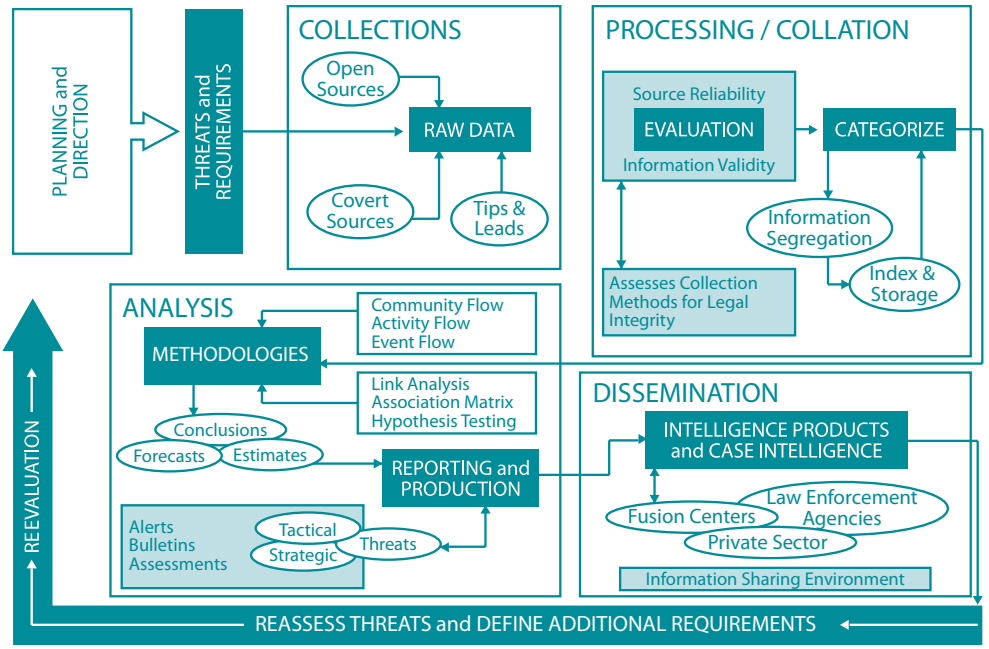
Each phase may be broken down into subprocesses (Figure 4-2) that collectively contribute to an effective information management and analysis system.

Figure 4-1: Intelligence Process, NCISP



In many ways, the Intelligence Process acts like a radar sweep across a community. The process seeks to identify potential threats, determine the status of suspicious activity, and provide indicators of criminality so that operational units can develop responses. An illustration of the ebb and flow of the Intelligence Process: An intelligence bulletin may describe certain indicators. An officer observes behaviors that are consistent with these indicators, collects further information that is processed through the cycle, thereby providing an analyst with more raw data to help refine the analysis. When a more refined analysis is once again disseminated back to operational units, the likelihood increases of providing more explicit intelligence that operational units may use to prevent a crime or a terrorist attack.

Figure 4-2: Intelligence Process and Subprocesses



As an illustration, an intelligence bulletin describes an emerging threat of Eastern European organized crime operating protection rackets in a major midwestern city. A police officer working neighborhoods with large populations of Russian immigrants has noticed an increase in thefts and property damage to small businesses largely operated by immigrants. In light of the intelligence bulletin, the officer provides information to the intelligence unit that crimes reported as simple thefts and property destruction within this area of the city may, in reality, be symptoms of "enforcer" activities of Eastern European organized crime protection schemes. The analyst corroborates the information with practices of the organized crime group in other cities and provides the additional information to officers in a revised bulletin. To be most effective, the Intelligence Process requires this ongoing two-way flow of information.

Planning and Direction

The intelligence function involves the coordination of many activities. Similar to intermeshed gears, there must be a plan for how each moving part will operate in concert with other elements and how the gears will collectively manage a change in the environment. The gears of the Intelligence Process are prioritized and synchronized in the first phase of the cycle: Planning and Direction.

Former FBI Executive Assistant Director for Intelligence Maureen Baginski often stated, "The absence of evidence is not the absence of a threat." As part of the Planning and Direction process, it is important to recognize not only the threats that have been identified, but also dynamic threats where evidence indicating their presence may appear serendipitously. A threat may emerge within a jurisdiction or region for a wide variety of reasons; therefore, personnel must be trained to be vigilant in looking for evidence of threats (that is, indicators). This, however, must be a pragmatic process.

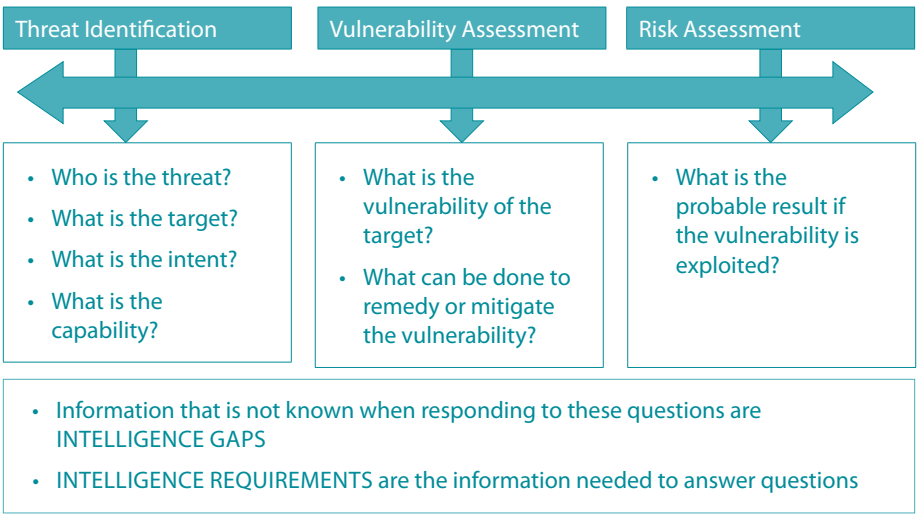
While a common perspective is that the Intelligence Process should take an "all-crimes/all-threats approach," pragmatically, these threats are not "equal" and must be prioritized considering the probability of their presence and the nature of the harm they pose to a community. This process is described in detail in Chapter 6. Threat prioritization is part of the "Direction" component of the first phase. This is done through ongoing threat assessments that are constantly refined by information that is processed through the Intelligence Cycle. A threat must be assessed on multiple criteria as illustrated in Figure 4-3.

The first threat component is threat identification. When evidence of a threat is identified, the Intelligence Process must assess where the threat lies on a multivariate continuum of probability. While quantifying a threat would add an element of precision, typically the variables related to a threat can be measured only on an ordinal scale:[1] for example, based on qualitative data a judgment can be made on the relative value of a threat variable on a scale of 1 to 10. As illustrated in Figure 4-4, the first two variables (A and B) measure the quality of the information. The second two variables (C and D) measure the probable outcome of the threat. Combined, they provide guidance for decision-making. A moderate assessment of the quality of information may produce a different operational

[1] An "ordinal scale" is a scale of measurement whereby data are put in a rank order, but where there is no fixed amount of difference between the points on the scale. For example, college sports rankings will rate the top 20 teams. The ranking, however, does not mean that the team ranked first is 20 times better than the 20th-ranked team.

response as the severity of the threat increases. As severity decreases, a higher quality of information may be desired before an operational response is made. This is basically a method to weigh risk/outcome tradeoffs.

Figure 4-3: Threat Assessment Components for Planning and Direction



The next step is a vulnerability assessment of probable targets. When a threat is identified, the universe of targets is typically narrowed. Regardless if the probable number of targets is large or small, some judgments can be made on how vulnerable the targets are. As vulnerability increases, so does the seriousness of the threat. As an example, assume that a small group of eco-terrorists plans on fire-bombing the sales inventory of various automobile dealers who sell large trucks. Most dealership sales lots are easily accessible 24 hours a day. As such, their vulnerability increases and so does the threat. In a different scenario, assume that the same group of eco-terrorists plans to fire-bomb tanks at a military installation to protest fuel consumption and damage done to the environment by the tanks traversing their training range. In this case, target vulnerability is low because of the inaccessibility to the tanks on the military base and the ability of the tanks to withstand Molotov cocktails should the intruders get near them. As should be apparent, target vulnerability is an important variable in any threat assessment.

Figure 4-4: Simplified Threat Assessment Illustration[2]

Making Threats										Posing Threats
	Low	----------								High
	1	2	3	4	5	6	7	8	9	10
Variable A	Reliability and Validity of Information on Threat									
	Low	----------								High
	1	2	3	4	5	6	7	8	9	10
Variable B	Weight of Evidence of Threat									
	Low	----------								High
	1	2	3	4	5	6	7	8	9	10
Variable C	Severity of Threat									
	Low	----------								High
	1	2	3	4	5	6	7	8	9	10
Variable D	Probability of Occurrence									

Once threats and target vulnerability have been identified, a risk assessment is made. Risk is epitomized by the question: "What is the probable result if the vulnerability is exploited?" In the above illustration, the risk to the automobile dealers may be high and the risk to the military installation may be low; however, before a conclusion may be drawn on risk, more information is needed to corroborate judgments and determine if there are other, previously undiscovered, compounding factors. This process helps define further intelligence requirements—information that needs to be collected to better understand the threat.

Essentially, the threat assessment process seeks to make a distinction on whether an intelligence target is "making a threat" or "posing a threat." This is obviously subjective; hence, as much information as practicable should be collected and analyzed on these three factors. In most instances, there will be insufficient information to make a meaningful assessment of each component of the threat assessment model. As a result, answers to the "requirements" questions will help clarify the threat picture. Obtaining additional information will increase the quality of intelligence by identifying and eliminating error.

It should also be recognized that previously undefined threats may also emerge. Changes in the character of a community may stimulate new threats, the presence of a particular target may draw a threat, or the threat simply may appear as a result of the combined effect of many factors. The point to note is that law enforcement personnel must be trained to identify behaviors that are more than merely suspicious, record the behaviors with as much detail as possible, and forward this information to the intelligence analysts.

The importance of the threat assessment model in Planning and Direction lies within the ability to maximize resources and operational initiatives for those crimes and circumstances which pose the greatest risk to public safety and

[2] This scale is not intended to be a threat assessment tool, but an illustration of the threat assessment concept in the discussion.

security. In many ways, the Intelligence Process looks for images through a lens that is out of focus. The two-way exchange of information helps focus the lens to understand if a threat is present and the degree of risk it poses. The Planning and Direction process constantly monitors changes in the environment and helps define changing priorities as well as new two-way information sharing needs.

Beyond resource issues, Planning and Direction requires the identification of threat priorities to focus awareness training for officers on how to recognize all threats. It also requires policy and procedural mechanisms to make the organization sufficiently nimble to respond effectively to the changing threat environment. Just like the Intelligence Process itself, the Planning and Direction phase is characterized by an ebb and flow of information that provides insight so that the evolving threat environment can be managed efficaciously.

Collection

Collection is the gathering of raw information that will be used by analysts to prepare intelligence reports and products. As a way to better envision the Collection phase of the process, law enforcement personnel typically will gather information in five basic forms:

1. A response to *intelligence requirements.*
2. A response to terrorism or criminal *indicators.*
3. *Suspicious Activity Reports* (SAR) of activities observed by or reported to officers.
4. *Leads* that officers develop during the investigation of unrelated cases.
5. *Tips* that may come from citizens, informants, or the private sector.

The response to *intelligence requirements* is information that is intentionally and specifically sought to answer certain questions. That information may be sought from open sources or may be a product of law enforcement methods, such as interviews, surveillance, undercover operations, or other law enforcement processes. A response to *indicators* would be law enforcement officers collecting information based on their observation of circumstances or behaviors they recognize because of information they gained from training and/or intelligence bulletins that describe such indicators. Typically, indicators will include the signs and symbols of criminal activity such as graffiti, the symbol of an extremist group on a wall or a car, or unusual activity at a location that is consistent with threat activity described in an intelligence report.

Typically, information collected from *SARs* is based on behavior observed by law enforcement officers who, relying on their training and experience, believe the individual may be involved in criminal activity, in the past or the future, although a specific criminal nexus is not identified. The term *leads* refers to information that officers develop about a probable emerging threat that is largely unrelated to the current investigation but comes to light during the inquiry. *Tips* reflect information that has been observed by citizens and submitted to a law enforcement agency for further inquiry.

Information Collection Disciplines Used by the Intelligence Community

In light of the Information Sharing Environment (ISE), there is a benefit to understanding some of the terminology used in the Intelligence Community (IC) even though it is generally not used by law enforcement intelligence. With regard to information collection, five general "collection platforms" or "collection disciplines" are used by the IC:

1. Human Intelligence (HUMINT) is the use of human beings to collect or confirm information through overt, covert, or clandestine methodologies.
2. Signals Intelligence (SIGINT) is an umbrella term for different methods of intercepting and exploiting electronic signals, whether intercepted on the ground, via aircraft, or by satellite. There are three forms of SIGINT:
   - Communications Intelligence (COMINT), which is the collection and exploitation of communications signals including any form of electronic voice communications, fax, wireless devices, and voice over Internet protocol (VOIP).
   - Electronic Intelligence (ELINT) is the interception of noncommunications transmissions such as radar, transponder, motion detectors, and so forth.
   - Foreign Instrumentation Signals (FISINT) is the interception and exploitation of performance and tracking data (usually telemetry) during tests of weapons systems and space vehicles.
3. Imagery Intelligence (IMINT) is derived from visual photography, infrared image capture, lasers, electro-optics, visual radar, and satellite imagery.
4. Measurement and Signatures Intelligence (MASINT) is the analysis of electronic emanations from equipment and seeks to detect information patterns in a different part of the electronic spectrum not previously captured by other methods.
5. Open Source Intelligence (OSINT) is the analysis of information available to the public without legal process or covert methods.

The collection process must seek to establish a criminal nexus with any person or organization that is identified in criminal intelligence records. This nexus is referred to as a *criminal predicate*. The standard for that criminal predicate is reasonable suspicion that is more than mere suspicion that the identified person is committing or is about to commit a crime. In practice, law enforcement agencies collect information on individuals where no criminal predicate exists. Examples are SARs, tips, and leads. This may appear to be a contradiction, but it is an inherent part of the Intelligence Process that has a remedy. The law enforcement agency has an obligation to determine if there is veracity to the criminal allegations found in SARs, leads, or tips. This is the purpose of the two-tiered "Temporary File" and "Permanent File" records system used for intelligence records. In practice, *retention* of collected information becomes the critical issue for demonstrating the criminal predicate.

The reader should note that care was taken to specify that the criminal predicate must be established when collecting and retaining information that *identifies people or organizations*. The critical point to note is that constitutional rights attach when identity is established.

The Intelligence Process will also seek to collect information about crime trends, methods of criminal operations, ideologies of extremists groups, and other nonidentifying information that helps describe and understand criminal

phenomena. The criminal predicate rule does not apply to these types of information because individuals are not identified.

A final issue of Collection—and the entire Intelligence Process—is operations security (OPSEC). OPSEC focuses on identifying and protecting information that might provide an intelligence target with clues to an inquiry, and thereby enable the target to thwart the inquiry.[3] To protect the integrity of the intelligence inquiry, it is essential to maintain the security of collection sources, methods, and content.

Processing/Collation

This phase of the Intelligence Process, Processing/Collation, has four distinct activities, as illustrated in Figure 4-5. The first is to evaluate raw data from the collection phase to determine its utility for analysis. An assessment should first examine the *reliability* of the source of the information. Ideally, the individual who was the primary collector should record a statement of reliability. The importance of this assessment relates to the confidence level an analyst will give the information when making judgments during the analysis. The conclusion drawn by an analyst when using information derived from a completely reliable source will be different from a source deemed unreliable.

The next assessment during evaluation examines the *validity* of the raw information. Validity is epitomized by the question: "Does the information actually portray what it seems to portray?" Validity assessment may be done by the collector and/or the analyst. The collector may believe that if information comes from a reliable source and it is logical, then validity is high. Conversely, the analyst may have competing information that questions the validity. In such cases, the analyst should define intelligence requirements to collect additional information in order to gain the most accurate raw information for a robust analysis. The Intelligence Cycle, therefore, starts over, even though this is only the third phase.

Source reliability and information validity are often initially assessed using the ordinal scales similar to those depicted in Figure 4-6. These rudimentary scales nonetheless provide important fundamental guidelines for intelligence assessments. As such, law enforcement personnel should be trained to provide these assessments when collecting information for the Intelligence Cycle.

A next form of evaluation is to assess the *method* by which the information was collected to ensure that it meets constitutional standards. Recommendation 6 of the NCISP states:

> All parties involved with implementing and promoting the *National Criminal Intelligence Sharing Plan* should take steps to ensure that the law enforcement community protects individuals' privacy and constitutional rights within the Intelligence Process.[4]

[3] See www.belvoir.army.mil/dptms/opsec.asp

[4] Global Intelligence Working Group. *National Criminal Intelligence Sharing Plan*. Washington, D.C.: Global Intelligence Working Group, 2003, p. 21.

Figure 4-5: Processing and Collation Activities

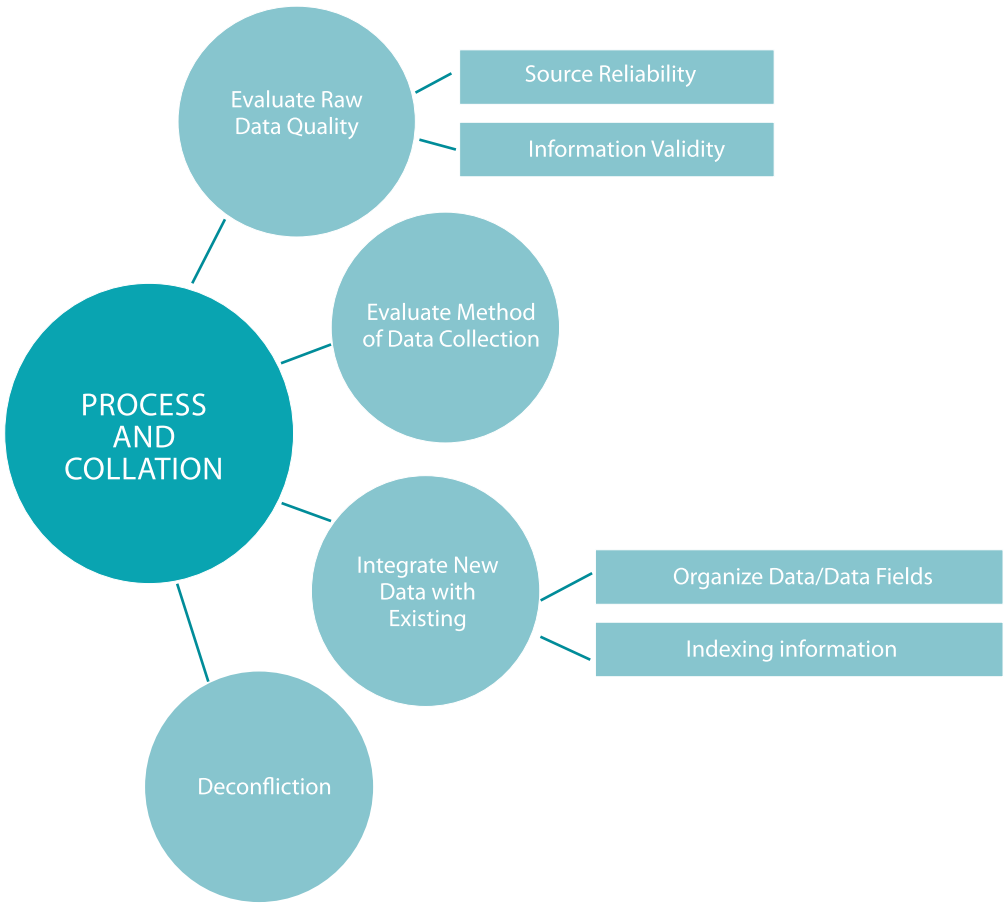


Figure 4-6: Example of Reliability and Validity Rating Scales

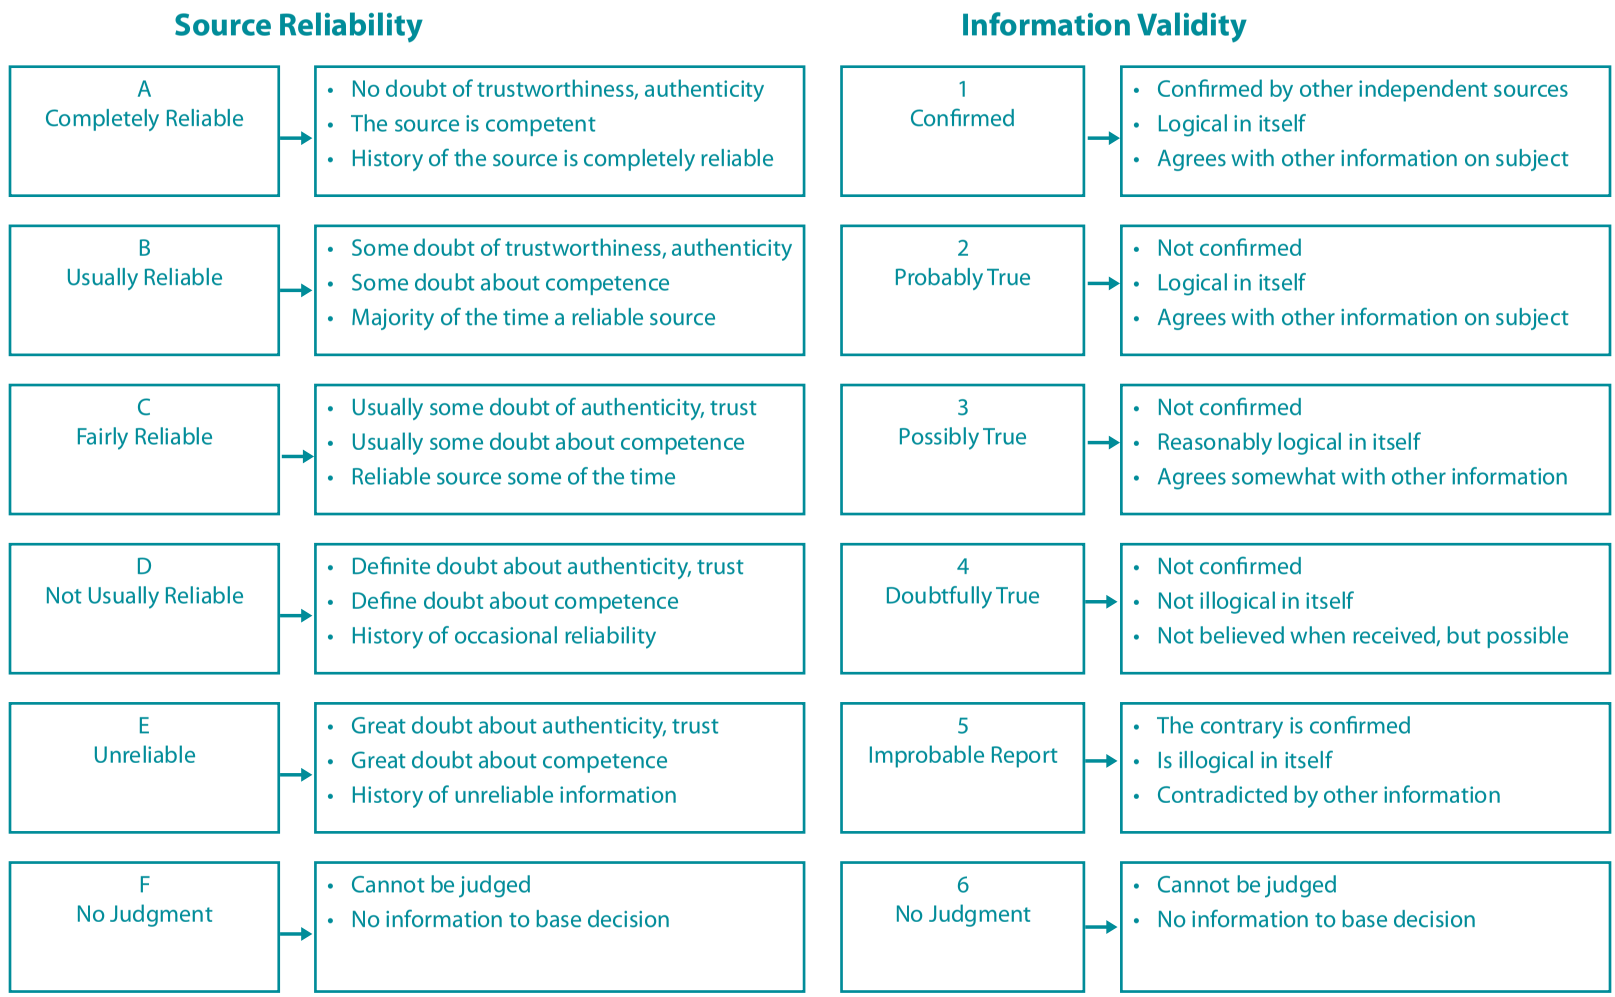

One of the first issues of information collection is the assessment of the *method* used to collect the data. When a law enforcement agency is collecting information, it must follow lawful processes; for example, information collected about a person should be consistent with constitutional standards (including the four exceptions[5] to the Fourth Amendment search warrant requirement). The issue of lawful collection methods is important for three reasons: First, it is a constitutional guarantee that law enforcement officers have sworn to uphold. Second, if there is a criminal prosecution of the intelligence target, critical evidence could be excluded from trial if the evidence was not collected in a lawful manner. Third, if a pattern emerges that information about individuals was collected on a consistent basis that does not meet constitutional standards, this may open the agency to civil liability for civil rights violations.

Not only is this assessment a professional obligation, it also is particularly important should the intelligence target be prosecuted. Once again, training should seek to ensure that the information was lawfully collected and the facts of the collection are carefully documented.

The third activity in the collation/processing phase is to integrate the new information with existing data. During this process, in consideration of all other information that has been collected, the following questions may be asked:

- Does it meet the criminal predicate test?
- Is the information relevant and material (as opposed to being just "interesting")?
- Does the information add new questions to the analysis?
- Does the information need corroboration?
- Does the information support the working hypotheses of the inquiry or does it suggest a new or alternative hypothesis?

The answers to these questions will help define requirements and directions for the inquiry. This process also includes organizing and indexing the data to standardize the data fields and enhance the ability to make accurate data comparisons.

A final activity during this phase is "deconfliction," the process or system used to determine whether multiple law enforcement agencies are conducting inquiries into the same person or crime. This is accomplished in several ways, including using deconfliction information systems such as the National Drug Pointer Index (NDPIX) managed by the Drug Enforcement Administration (DEA). The deconfliction process not only identifies if multiple inquiries exist, but a system like NDPIX also notifies each agency involved of the shared interest in the case and provides contact information. This is an information- and intelligence-sharing process that seeks to minimize conflicts between agencies and maximize the effectiveness of the inquiry.

In sum, the Processing/Collation phase of the Intelligence Cycle is important for two reasons: 1. It seeks to provide quality control of information through the process and 2. It provides important insights into defining intelligence requirements.

[5] These are: 1. Consent; 2. the Plain View Doctrine; 3. A search incidental to a lawful arrest; and 4. Exigent circumstance.

Analysis

Analysis is the heart of the Intelligence Process. Entire books have been written on analytic methodologies and the critical thinking process. The intent of the current discussion is not to repeat this information, but provide some insights into analytic responsibilities that will be of benefit to the intelligence consumer.

The analytic process is essentially the scientific approach to problem solving. It is the use of established research methodologies—both quantitative and qualitative—that seek to objectively integrate correlated variables in a body of raw data in order to derive an understanding of the phenomena under study. It is synergistic in nature; the completed analysis provides knowledge rather than a simple recitation of facts. The outcome, however, is only as good as 1. The quality of the raw information submitted for analysis and 2. The quality of the analysis. Effective training, policy direction, supervision, and an operational plan for the intelligence function are essential for the analytic process to produce robust and actionable intelligence.

The phrase "actionable intelligence" has two fundamental applications for law enforcement. The first is tactical, wherein the output of analysis must provide sufficient explicit information that operational units can develop some type of response. In some cases that response is minimal, such as providing indicators of terrorism or criminal activity for patrol officers to observe. In other cases, it may involve a complex operational activity to make arrests. The second application of actionable intelligence is strategic, describing changes in the threat picture of a jurisdiction or region; that is, the intelligence may describe changes in crime types, crime methodologies, or both.

The output of the analytic process is reports, referred to as *intelligence products*. During the course of the analysis, the intelligence analyst will prepare explicit inferences about the criminal enterprise in order to understand its effects. These are typically expressed in the form of *conclusions, forecasts,* and *estimates* that are explained in the products.

A *conclusion,* as the term infers, is a definitive statement about how a criminal enterprise operates, its key participants, and the criminal liability of each. A forecast[6] describes the expected implications of the criminal enterprise, the future of the enterprise, changes in the enterprise or its participants, and threats that are likely to emerge from the enterprise. An *estimate* focuses on monetary effects, changes in commodity transactions, and/or likely future effects of the criminal enterprise; for example, profits from a new criminal enterprise, economic losses associated with a terrorist attack, or the increase of contraband if new smuggling methods are used.

There are different consumers of intelligence, each of whom has somewhat different needs. Line officers need to have information that concisely identifies criminal indicators, suspects, addresses, crime methodologies, and vehicles thought to be associated with a criminal enterprise. Administrators and managers need information about the changing threat environment that has implications

[6] Sometimes the word "prediction" is used instead of forecast. Prediction is a definitive statement of the future that in reality is virtually impossible to determine. Intelligence analysis is probabilistic in nature; hence the term "forecast" is used to describe what is likely to occur in light of the currently known facts.

for the deployment of personnel and expenditure of resources. Analysts need a comprehensive package of information that includes raw data sources, methods, and intelligence requirements. Intelligence reports that contain little more than suppositions, assumptions, rumors, or alternative criminal scenarios are not "actionable."

Dissemination

An intelligence product has virtually no value unless the system is able to get the right information to the right people in a time frame that provides value to the report's content. Dissemination—or information sharing—seeks to accomplish this goal. Many issues could be discussed related to dissemination, including the various intelligence and information records systems, privacy issues, information system security issues, operations security of shared information, the means of dissemination, interoperability issues, and the *Global Justice Data Standards*.[7] However, the intent of the current discussion is to describe the general philosophy and rules of intelligence dissemination.

Pre-9/11, the general philosophy of intelligence dissemination tended to focus on "operations security;" that is, intelligence records were not widely disseminated out of the concern that critical information would fall into the wrong hands, thereby jeopardizing the inquiry as well as possibly jeopardizing undercover officers, informants, and collection methods. While these issues still remain important, the post-9/11 philosophy is radically different. Indeed, law enforcement seeks to place as much information in the hands of as many authorized people who need it to prevent threats from reaching fruition. Basically, the idea is that the more people who receive the information the greater the probability of identifying and interrupting a threat. Perhaps the critical question is, "Who is considered an authorized person?"

Right to know and need to know

Even with this changed philosophy, important rules of dissemination seek: 1. to protect individuals' civil rights and 2. maintain operations security as needed. To accomplish these goals, the first rules of dissemination provide criteria to determine who should receive the intelligence. The accepted standard has a two-pronged test:

1. Does the individual to which the information is to be disseminated have the *right to know* the information? This is determined by the recipient's official capacity and/or statutory authority to receive the information being sought.
2. Does the recipient have a bona fide *need to know* the information? The information to be disseminated is pertinent and necessary to the recipient in order to prevent or mitigate a threat or assist and support a criminal investigation.[8]

Intelligence products that provide information about criminal indicators and methodologies are intended to receive wide distribution so that officers are aware of these factors during the course of their daily activities. As a general rule, it can be assumed that anyone working in law enforcement meets the right-to-know and need-to-know tests for these types of intelligence. However,

[7] As a comprehensive resource, see it.ojp.gov.

[8] Adapted from: Law Enforcement Intelligence Unit. *Criminal Intelligence File Guidelines, Section IX: File Dissemination.* Sacramento, California: Law Enforcement Intelligence Unit, revised 2002.

intelligence reports related to a specific criminal inquiry that identifies individuals or organizations would have a significantly more limited dissemination. While all law enforcement officers would have the right to know this information, only those officers working on some aspect of the inquiry have the need to know the information.

With the changing intelligence philosophy and the recognized need to involve the private sector and nonlaw enforcement government personnel in the ISE, the application of *right to know* and *need to know* has changed somewhat from the pre-9/11 era.[9] For example, anyone in law enforcement has the *right to know* intelligence (by virtue of his or her employment). Similarly, a member of the National Guard or a Department of Homeland Security (DHS) intelligence analyst working in a state fusion center would also have the *right to know* intelligence by virtue of his or her assignment, even though he or she is not a law enforcement employee. In yet a different application, the corporate security director of a nuclear power plant would have the right to know intelligence that is related only specifically to the security director's responsibilities of protecting the plant.

Once again, because of the new intelligence philosophy a significantly broader range of law enforcement officers have the *need to know* intelligence. The rationale, as stated previously, is that all officers need to be aware of threats to increase the probability of stopping the threat. The need to know certain intelligence by nonlaw enforcement personnel should be determined on a case-by-case basis. For example, in all likelihood there is no need for a DHS analyst to know intelligence related to auto thefts; however, the DHS analyst would need to know the information related to a criminal enterprise smuggling cocaine from Colombia because of the value of communications between the DHS analyst and other federal agencies such as the DEA or Immigration and Customs Enforcement.

Third Agency Rule

Another information-sharing restriction is found in what is commonly called the Third Agency Rule. Essentially, if an officer receives intelligence from an intelligence source (such as a fusion center), that officer cannot disseminate the intelligence to a third party without permission from the original source. As an example, Officer Adam receives intelligence from the Central Fusion Center. Officer Adam cannot give the intelligence directly to Officer Baker without first gaining permission from the Central Fusion Center. This is a general rule—with some exceptions that will be discussed later—and it will be stated or applied differently between agencies. Consumers of intelligence need to be aware of the local applications of the Third Agency Rule.

There are two types of intelligence: case intelligence and intelligence products. Case intelligence identifies people; intelligence products provide general information about threats and indicators. For case intelligence, it should be assumed that the Third Agency Rule is intact, while for intelligence products, it may be assumed that the Third Agency Rule is waived. Fundamentally, the reason is that when individuals or organizations are not identified in intelligence products, civil rights do not attach. Again, a review of agency policy will determine the exact applications of the rule locally.

[9] A review of the goals and action steps in the *Information Sharing Environment Implementation Plan* clearly demonstrates the mandate for these additional intelligence consumers. See www.ise.gov/docs/ise-impplan-200611.pdf.

It should be reinforced that in law enforcement intelligence, both the right-to-know and need-to-know provisions as well as the Third Agency Rule, serve two purposes: 1. To protect individuals' civil rights and 2. To maintain operations security of intelligence inquiries.

Classified Information[10]

A great deal of detailed information has been written about classified information. For the most part, these regulations apply to the intelligence community and federal law enforcement. As a rule, unless working in a fusion center or assigned to a Joint Terrorism Task Force, most state, local, and tribal law enforcement (SLTLE) officers will not have security clearances or access to classified information; however, having a basic understanding of information classification provides perspective for the following discussion. Essentially, classified information is a designation of information that is critical to the security of the United States. Explicit processes and procedures for classifying, storing, providing access, and generally handling this information have sanctions, including federal criminal violations, if the processes are violated.

There has been a great deal of debate about the need for security clearances for SLTLE personnel. Law enforcement executives and managers argue that they need a security clearance to have access to information about threats within their jurisdiction. On this same theme, a report from the Congressional Research Service stated the following:

> … these officials might need some access to classified information, for example, "real time" intelligence information concerning terrorism threats, to adequately plan, coordinate, and execute homeland security activities.[11]

Federal authorities respond that they will provide all information needed to SLTLE personnel about threats within a community—a response met with some skepticism.[12]

Another issue to be aware of is that federal security clearances are not universal; for example, if a law enforcement executive has a security clearance from the Department of Defense as a result of his or her military reserve status or if an officer has a DEA clearance that was investigated by the U.S. Office of Personnel Management as part of a Organized Crime Drug Enforcement Task Force, those clearances often are not recognized by the FBI for having access to classified information for which the FBI is the custodian. These are issues about which the reader should be aware—they remain to be resolved.

Chapter 10 discusses a range of issues related to classified information and security clearances. Suffice it to note at this point that classified information may be disseminated only to an individual who has the appropriate type of security clearance, which establishes the right to know. The need to know still must be determined before dissemination, even if the individual has the appropriate level of clearance.

[10] For detailed information on classified information see the Information Security Oversight Office at www.archives.gov/isoo/policy-documents/eo-12958-amendment.html#1.2.

[11] Reese, Shawn. *State and Local Homeland Security: Unresolved Issues for the 109th Congress.* Washington, D.C.: Congressional Research Service, Library of Congress, 2005, p. 11.

[12] In a joint publication by the Major Cities Chiefs Association and the Major County Sheriffs' Association, a resolution to handle the backlog of security clearances applications for SLTLE personnel was offered as follows:

> Chiefs and sheriffs will join with DHS to implement a comprehensive plan to eliminate the backlog of pending applications and expedite the security clearance process. Features of the plan include:
>
> 1. Reduction in requests for TOP SECRET/Sensitive Compartmented Information (TS/SCI) clearances and accesses.
> 2. Focus primarily on faster and more useful SECRET-level clearances.
> 3. Law enforcement agencies propose to conduct background investigations and expedite adjudication of SECRET level clearances.
> 4. DHS agrees to provide training on clearance process.
> 5. DHS agrees to assist major law enforcement agencies in expediting priority security clearances.
> 6. Per federal statutes/regulations, DHS commits to accept clearance granted by other agencies.
>
> Source: *Intelligence and Information Sharing: DHS and Law Enforcement.* Major Cities Chiefs Association and Major County Sheriffs' Association, 2007, p. 3. (Unpublished report.)

Sensitive But Unclassified Information (SBU)/Controlled Unclassified Information (CUI)

SBU—or "tear line"[13]—Information does not have any formal restrictions, clearances, or sanctions as found with classified information. Rather, the SBU designation is more akin to a professional responsibility that is expected to be honored in light of one's professional obligations. While most SLTLE officers will not have a security clearance, virtually all will have access to SBU information. SBU information may have been previously classified but typically "sources" and "methods of collection" have been removed, thereby declassifying the information and rendering it SBU. In other cases, the inherent sensitivity of the information based on its character, such as an analysis of terrorists' tactics that produces indicators of terrorist activity, may warrant the SBU label.

Among the many forms of SBU labels, particularly at the federal level, the two most commonly used in law enforcement are *Law Enforcement Sensitive (*LES*)* and *For Official Use Only* (FOUO). As a general rule, LES information may be shared with anyone in the law enforcement community (sworn or nonsworn) who has the right to know and a need to know the information. FOUO means that the information may be shared with anyone who has the right to know and the need to know. For example, information about a threat to a nuclear power plant would be shared with the corporate security director and manager of the plant. These are general rules which, in practice, have no enforceable sanctions should they be violated. Rather, they provide guidance on disseminating sensitive information and rely on the professional decisions of those who receive the information to maintain security.

Because of the lack of explicit guidance and the wide range of SBU dissemination labels, there is both uncertainty and inconsistency in dissemination processes. As a result, one of the mandates of the Intelligence Reform and Terrorism Prevention Act of 2004 was to develop the ISE which included, as one of the ISE program manager's responsibilities, the creation of a labeling protocol for SBU information that had a consistent meaning and application across the entire ISE. This is particularly true given the important role of sharing unclassified terrorist information with state, local, and tribal law enforcement. There is a need to disseminate information; that is, share important information with others, but that information sharing must be controlled—protecting information and ensuring that it is not disseminated inadvertently.

As a result, the federal government is in the process of changing SBU label markings with a new information control model called *Controlled Unclassified Information* (CUI). A number of new factors with CUI provide more specific and universal direction than has existed with SBU labels. Although Chapter 10 contains a discussion of these details, it should be noted for purposes of dissemination in the Intelligence Process that there are controls for establishing the right to know for unclassified information that need to be safeguarded.

[13] The "tear line" refers to a classified report where there is a summary of the report at the bottom that excludes information about the sources of information and/or methods of information collection. This summary may be torn off the report; hence, it is referred to as tear line information and it is SBU.

Reevaluation

The classic definition of a "system" is a series of interconnected component processes that have an interrelated purpose of which a change in one component will affect the other components. The Intelligence Process is indeed a system. As each component—or phase—processes information, it will affect the body of knowledge in the other components as related to the intelligence inquiry. Just like any system, homeostasis—that is, a "steady state" of the system—must be maintained. This is the purpose of reevaluation: To ensure that all information is being processed in a comprehensive manner, the Intelligence Process must be ongoing with each new piece of information in the process being added to the full body of new knowledge to aid in developing the most precise intelligence possible. Reevaluation also serves as a measurement to determine if the intelligence products created by this process have value. Are threats accurately identified? Are all components of the Intelligence Process functioning as intended? Are effective operational interventions able to be developed based on the intelligence?

Conclusion

This chapter described the Intelligence Process (or cycle) as depicted in the *National Criminal Intelligence Sharing Plan*. The introduction of key terminology and concepts provides perspective on how they relate to the Intelligence Process and, as will be seen, the role of the Intelligence Process in other intelligence initiatives, including Intelligence-Led Policing.

Chapter Annex 4-1: Federal Bureau of Investigation Intelligence Cycle

This illustration is based on an actual case. It demonstrates the interrelationship between the two types of intelligence.

The FBI Intelligence Cycle

The Federal Bureau of Investigation (FBI) Directorate of Intelligence (DI) has significantly different intelligence responsibilities than state, local, or tribal law enforcement agencies. This difference is a result of its national criminal intelligence responsibilities and the FBI's national security responsibilities. One model of the Intelligence Cycle is not "better" than the other; rather, they are just slightly different approaches based on different operational responsibilities. The following brief description of the FBI DI Intelligence Cycle will provide an understanding of the FBI's approach and terminology that can be valuable for SLTLE personnel when they are communicating with the FBI's intelligence personnel.

The Intelligence Cycle is the process of developing unrefined data into polished intelligence for use by policymakers. It consists of the six steps described in the following paragraphs. The graphic below shows the circular nature of this process, although movement between the steps is fluid. Intelligence uncovered at one step may require going back to an earlier step before moving forward

Requirements are identified information needs—what we must know to safeguard the nation. Intelligence requirements are established by the Director of National Intelligence according to guidance received from the President and the National and Homeland Security Advisors. Requirements are developed based on critical information required to protect the United States from national security and criminal threats. The Attorney General and the Director of the FBI participate in the formulation of national intelligence requirements.

Planning and Direction is management of the entire effort, from identifying the need for information to delivering an intelligence product to a consumer. It involves implementation plans to satisfy requirements levied on the FBI, as well as identifying specific collection requirements based on FBI needs. Planning and direction also is responsive to the end of the cycle, because current and finished intelligence, which supports decision-making, generates new requirements. The Executive Assistant Director for the National Security Branch leads intelligence planning and direction for the FBI.

Collection is the gathering of raw information based on requirements. Activities such as interviews, technical and physical surveillances, human source operation, searches, and liaison relationships collect intelligence.

Processing and Exploitation involves converting the vast amount of collected information into a form usable by analysts. This is done through a variety of methods including decryption, language translations, and data reduction. Processing includes entering raw data into databases where the data can be used in the analysis process.

Analysis and Production is the conversion of raw information into intelligence. It includes integrating, evaluating, and analyzing available data, and preparing intelligence products. The information's reliability, validity, and relevance are evaluated and weighed. The information is logically integrated, put into context, and used to produce intelligence. This includes both "raw" and finished intelligence. Raw intelligence is often referred to as "the dots"—individual pieces of information disseminated individually. Finished intelligence reports "connect the dots" by putting information into context and drawing conclusions about its implications.

Dissemination—the last step—is the distribution of raw or finished intelligence to the consumers whose needs initiated the intelligence requirements. The FBI disseminates information in three standard formats: *Intelligence Information Reports*, *FBI Intelligence Bulletins*, and *FBI Intelligence Assessments*. FBI intelligence products are provided daily to the Attorney General, the President, and to customers throughout the FBI and in other agencies. These FBI intelligence customers use the information to make operational, strategic, and policy decisions that may lead to the levying of more requirements, thereby continuing the FBI Intelligence Cycle.

Chapter 5:

The Concept of Intelligence-Led Policing (ILP)

The Concept of Intelligence-Led Policing (ILP)

Participants in the International Association of Chiefs of Police (IACP)/Office of Community Oriented Policing Services (the COPS Office) 2002 intelligence summit recommended the adoption of Intelligence-Led Policing (ILP) by America's state, local, and tribal law enforcement (SLTLE) agencies in the post-9/11 era. ILP was envisioned as a tool for sharing information that would aid law enforcement agencies in identifying threats and developing responses to prevent those threats from reaching fruition in America's communities.[1] This was reinforced by a recommendation in the *National Criminal Intelligence Sharing Plan*[2] (NCISP) to adopt ILP and has been echoed broadly by law enforcement leaders and reflected in new programming by the U.S. Department of Justice and the U. S. Department of Homeland Security.

The challenge, however, is that there are differing views of the ILP concept and its application. Indeed, there is a movement toward the adoption of ILP without a universally accepted definition or a manual of practice. The intent of the discussion in this chapter is to provide a perspective of ILP in the context of contemporary developments in law enforcement intelligence, integrating the more commonly accepted applications of ILP, and particularly focusing on the processes required to implement the concept.

Implementation of ILP requires a realistic understanding of the current intelligence capacity across the spectrum of American law enforcement and a flexible approach to meet the capabilities and needs of major cities and counties as well as small departments and rural communities.

Conceptual Foundations

The NCISP states, "The primary purpose of *Intelligence-Led Policing* is to provide public safety decision-makers [with] the information they need to protect the lives of our citizens."[3] How is this accomplished? There is no manual of practice for ILP because, like community policing, it must be tailored to the characteristics of the individual agency. ILP may be characterized as follows:

> …an underlying philosophy of how intelligence fits into the operations of a law enforcement organization. Rather than being simply an information clearinghouse that has been appended to the organization, ILP provides strategic integration of intelligence into the overall mission of the organization.[4]

The concept of ILP must be created through an inclusive development process to ensure that it is integrated with an agency's goals and functions, its capabilities, and the characteristics of both the agency and the jurisdiction it serves. It is not an add-on responsibility of the agency but an adaptation to more efficiently and effectively deal with multijurisdictional threats and serious crime that touch communities. There are no shortcuts in the process—it requires creativity, organizational introspection, and a willingness to adapt the organization. The following discussions provide a framework for understanding the diverse aspects

[1] www.theiacp.org/Portals/0/pdfs/Publications/intelsharingreport.pdf

of the ILP concept. Building on this understanding, the next chapter (Chapter 6) discusses the policy and organizational dynamics necessary to effectively implement ILP.

Defining ILP

There is no universally accepted definition of ILP, although the components of most definitions are the same, or at least similar. In 2009, the Bureau of Justice Assistance (BJA), in partnership with the Global Justice Information Sharing Institute, produced two definitions of ILP in which the conceptual foundation was articulated as building on the lessons of Problem-Oriented Policing and CompStat and applying these principles to a threat-based environment of multijurisdictional complex criminality. The conceptual foundation embraces recent initiatives in law enforcement intelligence, ranging from the operation of the Regional Information Sharing System (RISS), to the products of the Global Justice Information Sharing Initiative, to the development of the National Information Exchange Model.

In the document, the BJA states that ILP is:

> ILP can be defined as a collaborative law enforcement approach combining problem-solving policing, information sharing and police accountability, with enhanced intelligence operations.

However, for the purposes of their document, BJA narrowed the definition to the following:

> ILP is executive implementation of the intelligence cycle to support proactive decision making for resource allocation and crime prevention.[5] In order to successfully implement this business process, police executives must have clearly defined priorities as part of their policing strategies.

Building on these foundations, this author proposes an operational definition of ILP as follows:

> The collection and analysis of information related to crime and conditions that contribute to crime, resulting in an actionable intelligence product intended to aid law enforcement in developing tactical responses to threats and/or strategic planning related to emerging or changing threats.

Breaking the definition down to its critical components will provide a better understanding.

Collection

An essential part of the intelligence process is the collection of raw information that may be used in the analysis. Collection should be focused to identify and understand threats that emerge in a jurisdiction. This focus, often determined by an analyst who will define intelligence requirements, is based on information received from officers, confidential sources, and citizens in the form of tips, leads, and Suspicious Activity Reports. The key point is that collection seeks raw information within defined parameters that is essential for effective analysis.

Analysis

Analysis is the scientific approach to problem solving. It relies on deductive and inductive reasoning to define requirements and forecast threats. Analysis may be

[5] Global Justice Information Sharing Initiative. Navigating Your Agency's Path to Intelligence-Led Policing. Washington, DC: U.S. Department of Justice, Office of Justice Programs, Bureau of Justice Assistance, 2009, p. 2.

quantitative, notably for strategic analysis, but frequently it is qualitative, for both tactical and strategic analysis. The Office of the Director of National Intelligence (ODNI) has stated that analysis is "a process in the production of intelligence in which intelligence information is subjected to systematic examination in order to identify significant facts and derive conclusions."[6] The ODNI goes on to make the following distinctions between raw information and analyzed information (that is, intelligence):

- Raw information:
  - Provides input
  - Builds awareness
- Analyzed information (intelligence):
  - Provides understanding
  - Reduces uncertainty
  - Enables better decisions

The analytic process is synergistic, providing integrated meaning and deriving knowledge from diverse raw facts. Moreover, analysis is used to define "intelligence gaps" and articulate "requirements."

Crime and Conditions that Contribute to Crime

ILP focuses on threats and it becomes essential to identify variables within a community and the surrounding region that support the generation and maturation of crime. These variables can be wide-ranging: The emergence of organized criminal elements within the region who traffic in drugs or guns; the emergence of an extremist group that articulates hate or violence; conflict within a region that may be a breeding ground for violence between racial, ethnic, or religious groups; and a variety of unique characteristics that are idiosyncratic to a given community, such as proximity to an international border. It is important that the information collected provide insight into the existence of the conditions, factors that will exacerbate the conditions and individuals who may be instrumental in exploiting the conditions to commit terrorism or crime.

Actionable Intelligence

Paraphrasing former FBI Executive Assistant Director for Intelligence Maureen Baginski, intelligence helps law enforcement officers make decisions. Essentially, for intelligence to be useful it must provide direction for developing and executing plans. A law enforcement agency must be able to take an intelligence report and implement some type of activity that will prevent or mitigate crime. This means that the intelligence produced by an analyst will drive operational responses to, and strategic planning for, threats.

With actionable intelligence, a law enforcement agency has sufficient information to develop preventive interventions to threats. The report may describe either imminent threats to a community or region, wanted persons who may pose threats, or threat methodologies about which law enforcement officers should be aware. The basic premise is that the agency must be able to use the information in some manner. Moreover, actionable intelligence should ensure that the right information is placed into the hands of the people who can do something about the threat.

[6] Ramsey, Theresa. *Global Maritime Intelligence Integration (GMII) Enterprise.* PowerPoint Presentation. Washington, D.C.: Office of the Director of National Intelligence, May 9, 2007.

Tactical Responses to Threats

Both tactical and strategic intelligence are extensions of actionable intelligence. Depending on the nature of the threat, a wide array of tactical responses may be deemed appropriate, ranging from increasing mass transit security procedures to being aware of suspicious activities at a potential intelligence target. Tactical intelligence is all about prevention: Using information related to terrorism and crime threats for strategies that will eliminate or mitigate short-term and immediate threats. Tactical intelligence is epitomized by the question, "What type of operational response can be developed using this intelligence?"

Strategic Planning Related to Emerging or Changing Threats

Threats within a community typically change over time. Strategic analysis is used primarily for planning and resource allocation to understand the changing nature of the threat picture. Information is provided to decision-makers about the changing nature, characteristics, and methodologies of threats and emerging threat idiosyncrasies so that they can develop response strategies and reallocate resources. If, for example, a community has never had a problem with right-to-life extremists and a new clinic opens that offers abortion procedures, a strategic analysis may provide insight into whether the clinic and its personnel will be subject to any type of threat by extremist groups.

By using strategic analysis, plans may be developed to either prevent a threat from maturing or mitigate the threat should it emerge. It is epitomized by the question, "What future plans and resources must be configured, and how must they be configured, to meet threats defined in the strategic analysis?"

Fundamental Perspectives on the History of ILP: The British Experience

To refine our vision of ILP, context is needed. Specifically, one needs to understand the dynamics within the American law enforcement environment that will influence the implementation of ILP as well as limitations to adopting the British National Intelligence Model for U.S. law enforcement.

Perspective 1: The Current State of American Law Enforcement Intelligence

Some evidence suggests that ILP can provide an important element to community security to prevent (or at least mitigate) terrorism, violence, criminal extremism, and complex criminality. This author agrees. The concern, however, is how ILP is implemented. At one meeting, a strong ILP advocate urged law enforcement leaders to take the Nike® approach and "just do it." The problem is that American law enforcement is neither structurally nor substantively ready to support the ILP infrastructure. Just like a building, the foundation must first be in place—most American law enforcement agencies have gathered some bricks, but they are a long way from completing the foundation.

During the past 20 years, this author has provided intelligence training to literally thousands of law enforcement personnel representing hundreds of agencies at all levels of government from every state and most territories.[7] Yet this is a

[7] Also, as a means of comparison, this author has provided intelligence training to law enforcement agencies in Europe, Asia, and Australia.

small proportion of American law enforcement. What has been learned is that agencies that have an intelligence capacity are the exception, rather than the rule. Moreover, what is commonly called an intelligence unit or capacity in most agencies is, in practice, more of a hybrid organizational entity that may be doing crime analysis and/or investigative support. In many cases, there is also the integration of crime analysis and intelligence analysis despite the fact that these are different.[8] In other cases, there may be multiple intelligence capacities that are function-specific, such as gang intelligence, drug intelligence, and/or organized crime intelligence. Once again, many of these activities are more akin to investigative support than to intelligence.

Historically, the vast majority of American law enforcement agencies have had no intelligence capacity or training on the intelligence function and processes—typically, they were viewed as something needed only by the largest agencies. Of the agencies that had an intelligence capacity, the legacy has been somewhat problematic. Early law enforcement initiatives typically did not conduct analyses. Instead, they kept dossiers on individuals who were "suspicious" or were deemed to be threats of some sort, often based on intuitive, rather than empirical, threat criteria. In the 1960s and 1970s, many agencies were sued under federal civil rights legislation[9] for maintaining intelligence records on people who had not committed crimes but were engaged in behaviors and ideologies that were deemed to be unconventional or un-American. While these practices generally no longer exist, the legacy lives on, with many members of the public remaining suspicious of current law enforcement intelligence activities.

Beyond the civil rights issues, the intelligence function was often ill-defined, typically remaining out of the mainstream of state and local law enforcement activities. There were few analysts and many were poorly trained, often inheriting the title of "analyst" as a result of longevity, not expertise. It was often difficult to distinguish what the intelligence unit, as an organizational unit, contributed to the total law enforcement mission. While there were certainly exceptions to such a characterization, it was the status quo for most American law enforcement intelligence initiatives. Although this has changed dramatically, the history remains a difficult obstacle to overcome.

This change began in the post-9/11 era, leading to an increased awareness of intelligence and growing intelligence capacities, In particular, this was the result of the IACP/COPS Office intelligence summit; the efforts of the Global Intelligence Working Group (GIWG); the release of the NCISP; the creation of the Criminal Intelligence Coordinating Council (CICC); the growth of intelligence fusion centers; and the wide array of new law enforcement intelligence training programs typically available at no charge to SLTLE agencies. Nonetheless, this is a long way from being comprehensive. The next step of being active participants in the Information Sharing Environment (ISE) is, in reality, barely on the horizon for most SLTLE agencies.

Increasing numbers of agencies have some form of intelligence capacity, yet comparatively, the numbers are still small. Moreover, many agencies—even

[8] Crime analysis assesses the interactive effects and covariance of explicit variables of crimes that have occurred in order to determine a perpetrator's methodologies with the intent to clear the crimes and prevent future incidents by apprehending the perpetrator. Intelligence analysis deals with threats, whether from terrorism, criminal extremism, or organized crime, through the analysis of information that suggests a threat, the identification of intelligence requirements, and the use of both target and vulnerability assessments, with the intent of preventing the threat from reaching fruition.

[9] Specifically, 42 United States Code, Section 1983—Civil Action for Deprivation of Civil Rights.

moderate-sized departments—either do not see the need for an intelligence capacity or feel they cannot justify devoting resources to develop an intelligence capacity because of competing demands, notably, increasing violent crime rates and managing calls for service. For the vast majority of these agencies, the chief executive—as well as others in the chain of command—typically relies on historically based assumptions about intelligence and does not understand the rapid evolution and value of the modern law enforcement intelligence function. In light of these factors, there is limited motivation for such agencies to adopt ILP. The issue is not that agencies do not want to participate in fusion centers and the ISE; they often do not see the value in light of other responsibilities.

Based on these issues, an earlier point warrants repeating: Most American law enforcement agencies do not have the foundation to implement ILP. An intelligence foundation must first be constructed.

Perspective 2: The British National Intelligence Model and Challenges in Adapting It to U.S. Law Enforcement

When seeking to make use of a new concept, we often look to other models in an attempt to learn what works and adopt (or adapt) that practice. The British have a longer and more sophisticated legacy in law enforcement intelligence than U.S. law enforcement. All provincial British constabularies have had some form of a fairly long-standing intelligence unit to deal with organized crime, drugs, and other complex crimes unique to their jurisdictions. As an example, many of the British constabularies have a Football Intelligence Unit to deal with hooliganism at soccer matches. At a national level, the National Drugs Intelligence Unit was created in the 1980s to deal with the significant increase in transnational drug trafficking and associated crime, such as money laundering. The service relied on personnel assigned (that is, "seconded") from police forces throughout England and Wales. In 1992, the unit was expanded and renamed the National Criminal Intelligence Service (NCIS) to deal with all forms of organized crime. In particular, the NCIS evolved in response to the changing political environment associated with the European Union (EU), where, among other factors, immigration and customs checkpoints were eliminated for persons traveling between the EU member countries. In 2006, a new agency was created, the Serious Organised Crime Agency (SOCA), that integrated the NCIS along with a national investigative body, the National Crime Squad, and the drug enforcement functions of Her Majesty's Revenue and Customs Service.[10]

In the 1990s, the British government began implementing a business plan philosophy for all elements of government service. It had two fundamental initiatives: either "privatise" portions of government service, or apply a business model to the remaining government services. The move had wide-ranging effects: for example, the British National Rail Service—BritRail— was sold in pieces to various private companies. Similarly, local governments "privatised" such functions as vehicle maintenance and the janitorial service. The national police training function in England and Wales was also changed to a quasiprivate organization called CENTREX, which in April 2007 evolved to be part of the

[10] SOCA is an intelligence-led agency responsible for dealing with major organized crime. The United Kingdom (U.K.) Security Service (MI5) is responsible for dealing with threats to U.K. national security with the greatest emphasis on terrorism, but also espionage, including domestic intelligence. The Secret Intelligence Service (MI6) is responsible for collecting intelligence outside of the U.K.

National Police Improvement Agency (NPIA). The point is that the mandate to use business processes permeated virtually every aspect of British government, including the police.

As part of this movement, in the late 1990s, NCIS, with advice from Her Majesty's Inspectorate of Constabulary[11] (HMIC), developed the British National Intelligence Model[12] (NIM), which was initially released in 2000 and formally adopted in 2002 as accepted policy by the British Association of Chief Police Officers (ACPO), which is a national police policymaking body. The NIM followed the government policy of using a business process model to deal with crime control.

The adoption of the NIM by ACPO meant that the chief constables of the 43 provincial police forces in England and Wales agreed to adopt the NIM and adapt it to meet the needs of their policing area.[13] The intelligence function within the constabularies largely deals with violent crime, football hooliganism, nonserious (local) organized crime, and unique local recurring crime problems.

The British police movement to ILP in accordance with the NIM has not been easy. Many did not understand the concept because it required a reallocation of resources and added a significant analytic component to each police force. The NIM was criticized by many as being an esoteric model that created a great deal of data and new processes that were not providing good value for money. Its full implementation has been much slower than anticipated, and as one might assume, some of the police forces have embraced the concept much more openly than others, who, in some cases, are using the NIM largely in name only.

Despite these problems, there have also been important successes as a result of the NIM. Many lessons learned from the NIM can be adopted in the United States, and a unique body of model practices, including analytic models, are available from the HMIC[14] (of course, needing adaption to the United States). American law enforcement agencies, however, have a significantly different experience in law enforcement intelligence that prohibits wide-scale adoption of British ILP, with some notable exceptions in the predominantly larger U.S. major cities and counties. Some perspective will provide greater understanding.

As mentioned previously, England and Wales have 43 police forces, the result of the amalgamation of many smaller police agencies in the 1960s. The smallest of these constabularies has around 900 sworn constables who are policing sizeable geographic areas that have both urban and rural characteristics. Most of the agencies have 1,200 to 1,600 sworn personnel. While not a national police force, national standards apply to all agencies for training, promotion, operations, and salary. Indeed, personnel may transfer laterally between the constabularies.

Given the size of these police forces and their reasonable operating budgets,[15] all have the resources to hire analysts and the flexibility to reassign personnel to meet the needs of a comprehensive new initiative such as ILP. This is not meant to infer that the constabularies are flush with money and people; rather, one finds significantly more flexibility, resources, and diverse expertise in large agencies than in the small departments typically found in the United States. Moreover,

[11] The HMIC is an organization in the British Home Office responsible for inspecting the British police forces to ensure that they are efficient organizations using "good practice" and providing "good value for money" in their service.

[12] More detail on the National Intelligence Model can be found in the ACPO document at www.acpo.police.uk/asp/policies/Data/nim2005.pdf.

[13] England and Wales have 43 provincial constabularies, whose chief constables are responsible to the local police authority (somewhat akin to a board of police commissions). The commissioner of the London Metropolitan Police reports to the British Home Secretary and has much broader authority and flexibility. While ACPO policy is not binding on the London Metropolitan Police, it has also adopted the NIM. An additional police service, the City of London Police, which is the smallest police agency in the U.K., is responsible for a small geographic area known as "the square mile" that largely encompasses the London financial district.

[14] Go to the HMIC web site at inspectorates.homeoffice.gov.uk/hmic and search for "intelligence."

[15] The national budget, through the Home Office, provides 51 percent of the funding for each provincial police force; 49 percent comes from local funds. This permits the Home Office to exert greater influence for national standards and priorities, although in practice, each chief constable retains significant autonomy.

having a solid history of sophisticated law enforcement intelligence analysis, the British police service was able to adopt the NIM and ILP with greater ease.

Comparing U.S. and U.K. Law Enforcement Intelligence

Compared with the British police structure, America's roughly 18,000 law enforcement agencies, most of which have 10 or fewer sworn officers, have diverse policing standards both between and within states. They often have limited budgets, all of which typically come from local funds, with some exceptions in the form of short-term federal grants. Federal standards and recommendations are largely unenforceable unless tied explicitly to special conditions in a grant.

In light of these radical differences and the significantly different history of law enforcement intelligence, when one compares U.S. and U.K. policing, it is unreasonable to assume that the basic practices of the NIM, as found in the United Kingdom, and, by extension, ILP, can be implemented effectively in the United States on a short-term wholesale basis. In America, we need to start at a far more basic level. A functional model of ILP must be developed that has both the flexibility and applicability to the American law enforcement landscape.

At the outset, ILP should be viewed as a philosophy, not a process. Indeed, American law enforcement agencies should rely on this philosophy to develop new intelligence-based processes that functionally balance each agency's jurisdictions, characteristics, and resources. The lessons learned from community policing can be a valuable guide.

Developing ILP in a law enforcement agency requires two developmental activities: 1. Devising the information collection framework to manage threats within a jurisdiction and 2. Developing the organizational infrastructure to support the ILP initiative. These will be discussed in detail in Chapter 6.

ILP And Community Policing, Problem Solving, and CompStat

A common concern expressed by police executives is that the shift toward ILP—largely the result of increased counterterrorism responsibilities—may require a shift of resources away from community policing. It becomes a question of how community policing and ILP are integrated. As will be seen, there are more commonalities between the two than one may intuitively expect. Indeed, new dimensions of ILP depend on strong community relationships. Crime will continue to be a critical responsibility for the police as will the need for community support. Moreover, with increased social tension resulting from the homeland security environment, the need is even greater to maintain a close, interactive dialog between law enforcement and the community.

Community policing has developed skills in many law enforcement officers that directly support new ILP responsibilities: The scientific approach to problem solving, environmental scanning, effective communications with the public, fear reduction, and community mobilization to deal with problems are among the

important attributes community policing brings to this challenge. The NCISP observed these factors, noting the following:

> Over the past decade, simultaneous to federally led initiatives to improve intelligence gathering, thousands of community-policing officers have been building close and productive relationships with the citizens they serve. The benefits of these relationships are directly related to information and intelligence sharing: COP officers have immediate and unfettered access to local, neighborhood information as it develops. Citizens are aware of, and seek out COP officers to provide them with new information that may be useful to criminal interdiction or long-term problem solving. The positive nature of COP/citizen relationships promotes a continuous and reliable transfer of information from one to the other. It is time to maximize the potential for community-policing efforts to serve as a gateway of locally based information to prevent terrorism, and all other crimes.[16]

Furthermore, the Office of Domestic Preparedness Guidelines for Homeland Security describe the roles community policing has in the intelligence process. These include the following:

- Providing examples and materials that may aid in the recognition of terrorism to community policing contacts to make members of the community aware of those actions, behaviors, and events that constitute "suspicious."
- Organizing community meetings to emphasize prevention strategies, vigilance, and public awareness.
- Ensuring that members of the community are aware of the means of, and processes for, relaying observed data to police officers and police organizations, just as they are, or should be, aware of methods to relay information to community policing officers.
- Encouraging prevention, proactive policing, and close working relationships between the police and the community.[17]

These factors precipitated the development of ILP as an underlying philosophy of how intelligence fits into the operations of a law enforcement organization. Rather than being simply an information clearinghouse that has been appended to the organization, ILP provides strategic integration of intelligence into the overall mission of the organization. In many ways, ILP is a new dimension of community policing, building on tactics and methodologies developed during years of community policing experimentation. Some comparisons illustrate this point. Both community policing and ILP rely on these activities:

- Information Management
  - Community policing—Information gained from citizens helps define the parameters of community problems.
  - ILP—Information input is the essential ingredient for intelligence analysis.
- Two-way Communications with the Public
  - Community policing—Information is sought from the public about offenders. Communicating critical information to the public aids in preventing crime and reducing fear.

[16] it.ojp.gov/ncisp

[17] www.ojp.usdoj.gov/odp/docs/ODPPrev1.pdf

- ILP—Communications from the public can provide valuable information for the intelligence cycle. When threats are defined with specific information, communicating critical information to citizens may help prevent a terrorist attack and, like community policing, will reduce fear.

- Scientific Data Analysis
  - Community policing—Crime analysis is a critical ingredient in the CompStat[18] process.
  - ILP—Intelligence analysis is the critical ingredient for threat management.
- Problem Solving
  - Community policing—Problem solving is used to reconcile community conditions that are precursors to crime and disorder.
  - ILP—The same process is used for intelligence to reconcile factors related to vulnerable targets and trafficking of illegal commodities.

The importance of these factors is illustrated in the comments of FBI Director Robert Mueller in announcing an increased concern for terrorism at major national events during the summer of 2004. When referring to the photographs of seven terror suspects believed to be in the United States, Director Mueller stated:

> We need the support of the American people … to cooperate when called upon, as agents will be reaching out to many across the nation to help gather information and intelligence … to be aware of your surroundings and report anything suspicious … to "BOLO" [Be On the Lookout] for those pictured above. … Have you seen them in your communities? Have you heard that someone might be helping them to hide? Do you have any idea where they might be? If so, we need you to come forward.[19]

These words reflect the operational essence of the interrelationship of law enforcement intelligence and community policing. Like community policing, ILP requires an investment of effort by all components of the organization as well as the community. Gone are the days when intelligence units operated in relative anonymity. Based on the precepts of the ILP philosophy and the standards of the NCISP, law enforcement intelligence is an organization-wide responsibility that relies on a symbiotic relationship with residents.

Comparing ILP and CompStat

The CompStat process, with its origins in the New York Police Department, has been an important tool for law enforcement agencies to effectively deal with crime trends on a timely basis. The process has been adopted in varying forms and with consistent success by many midsized and large law enforcement agencies across the United States and in several foreign countries. A solid foundation of research supports CompStat as a crime-management tool that demonstrates the value of innovative approaches to law enforcement problems.[20]

As law enforcement personnel grapple with understanding ILP, many have suggested that it is the same as CompStat. Certainly, there are important similarities that will help in the adoption of ILP; however, there are also important substantive differences that must be recognized. At the heart of the matter is

[18] For a good contemporary discussion of CompStat, see: Shane, Jon, "CompStat Process." *FBI Law Enforcement Bulletin* 73 (2) (April 2004): 12–23.

[19] www.fbi.gov

[20] A great deal of research and literature can be found at www.ncjrs.org. Use the search utility for "CompStat."

the fact that CompStat and ILP are different because of a number of functional variables that are illustrated in Figure 5-1.

As can be seen, ILP is concerned with "all crimes and all threats," not just terrorism; however, the nature of crime that ILP focuses on typically is multijurisdictional and often complex criminality, such as criminal enterprises.

The value of CompStat is its identification of emerging, significant crime series or serious crime within a jurisdiction (that is, hot spots), based on a timely analysis of incident reports. The analysis of data captured by crime reporting can provide important information—such as geographical parameters and modus operandi—that can be used to forecast continued criminal incidents in the immediate future, aid in problem solving, and provide descriptive information, such as behaviors, targets, and criminal instruments that operational units may use to apprehend perpetrators, disrupt criminal activity, or alter crime-generating environments.

Conversely, ILP focuses on threats rather than crimes that have occurred (although a threat may also include a threat emerging from a crime series, such as a serial murder). The threat information may be derived from Suspicious Activity Reports filed by an officer, tips and leads submitted by community members, significant changes in sociodemographics within a region or other indicators (some of which may be collateral crimes) that reasonably suggest the presence or emergence of a serious multijurisdictional crime problem. Rather than analyze information and evidence derived from incident reports, the intelligence analyst must define intelligence requirements consisting of information that the analyst needs to more definitively identify the threat and factors that are contributing to the threat's evolution.

Similarly, to be effective, both community policing and ILP require feedback on information analysis—whether it is crime analysis or intelligence analysis—to be consistently informed of potential problems or threats that may be encountered during the course of a shift.

In this regard, what kind of information do street officers need from the intelligence unit? Ideally, intelligence analysis should address four broad questions:[21]

1. Who poses threats? This response identifies and describes people in movements or ideologies who pose threats to community safety.
2. Who's doing what with whom? This includes the identities, descriptions, and characteristics of conspirators or people who provide logistics in support of terrorism and criminal enterprises.
3. What is the modus operandi of the threat? How does the criminal enterprise operate? What does the terrorist or extremist group typically target and what are the common methods of attacking? How do members of the extremist group typically integrate with the community to minimize the chance of being discovered?
4. What is needed to catch offenders and prevent crime incidents or trends? What specific types of information are being sought by the intelligence unit to aid in the broader threat analysis?

[21] On a related note, following the terrorists' attacks of September 11, 2001, the FBI developed a series of interview questions for persons who may have knowledge about terrorism. State and local law enforcement were asked to participate in the questioning of some persons who were in the U.S. on visas. There was a mixed response, largely based on the perspective of local government leaders. Despite this, the questions were also intended to provide insight and information for officers. More information, as well as the protocol questions, can be found in: General Accounting Office. Homeland Security. *Justice Department's Project to Interview Aliens After September 11, 2001*. Report to Congressional Committees. Report Number GAO-03-459, April 2003. www.gao.gov.

Both CompStat and ILP are prevention-oriented and are driven by an information flow coming from the line level upward. Intelligence awareness training for street officers recognizes that officers on patrol have a strong likelihood of observing circumstances and people that may signify a threat or suggest the presence of a criminal enterprise. The patrol officer must be trained[22] to regularly channel that information to the intelligence unit for input into the Intelligence Cycle for analysis. Like community policing, this requires new responsibilities for patrol officers and organizational flexibility to permit officers to explore new dimensions of crimes and community problems that traditionally have not been part of their responsibilities.

While there are fundamental similarities, the methodology and focus of ILP is notably different from, and more difficult than, CompStat because of the differences in the raw data. Understanding these differences and, more important, the role ILP fulfills is an important foundation for the following discussions.

Figure 5-1: Comparison of CompStat and Intelligence-Led Policing

Similarities of CompStat and Intelligence-Led Policing: Important Lessons Learned from CompStat Can Be Applied to ILP

- ✓ Both have a goal of prevention
- ✓ Commitment to the concept by the chief executive is essential
- ✓ Analysis serves as the basis for operational responses
- ✓ Processes for constant raw information flow for analysis must be in place
- ✓ Community engagement is critical for reporting suspicious activities
- ✓ Intervention activities are driven by definable evidence of crime and threats
- ✓ Administrative and organizational flexibility are required
- ✓ Research and lessons learned serve as the basis for creative intervention
- ✓ Managers and supervisors are held demonstrably accountable

While principles and processes are similar, there are also substantive differences

CompStat	Intelligence-Led Policing
• Intrajurisdiction	• Multijurisdiction
• Incident-driven	• Threat-driven
• Analysis based on known facts from reported crime data and investigations	• Analysis-based tips, leads, suspicious activity reports, and information collection
• Focuses on crime sprees and incident trends with intent to apprehend specific offenders	• Focuses on root causes and conditions that contribute to serious crime and terrorism
• Relies on crime mapping, incident analysis, modus operandi analysis	• Relies on link analysis, commodity flow, transaction analysis, association analysis
• Time-sensitive (24 hour feedback/ response)	• Strategic (inherently long-term)
• Predominant focus on street crime (burglary, robbery, homicide, assault, theft, etc.)	• Predominant focus on criminal enterprises (terrorism, organized crime, violence, etc.)
• Reported criminal incidents drive collection and analytic parameters	• Intelligence requirements drive collection and analytic parameters

[22] Training—including line officer training—is discussed in detail, including line officer training, in a later chapter.

Ethical Issues

Another important characteristic similar to both community policing and ILP is the emphasis on ethical decision-making. In community policing, the need for ethical decision-making was based on the need to develop trust between the police and community, among other reasons. Without this trust, the public would not provide the critical information needed for crime control. The need for ethical decision-making in ILP is similar, but goes a step further. Because of concerns about the types of information being collected by law enforcement and how that information is retained in records, concerns have been expressed that law enforcement may violate citizens' rights in the quest for terrorists. As a result of these concerns, the aura of ethical decision-making and propriety of actions must be unquestioned in the law enforcement intelligence function.

Civil Rights and ILP

A unique challenge in dealing with ILP is maintaining privacy and protecting individuals' civil rights. CompStat and crime analysis each have an entirely different set of legal rules. Typically, CompStat deals with aggregate data of criminal incidents and the attributes of those incidents. In those types of analysis, individuals are not identified; therefore, civil rights do not attach to the data. If the crime analysis focuses on the identification of individuals, the identification is a result of evidence obtained during the criminal investigation leading to probable cause for arrest. The law of criminal evidence and procedure applies to the further collection of evidence, and the information is retained in the law enforcement agency's records management system (RMS), which has rules of wide latitude for keeping information about criminal suspects, witnesses, and victims.

Conversely, as noted previously, ILP deals with threats and conditions that may facilitate the threats. At this point, there are no civil rights issues of consequence. However, as the intelligence process identifies individuals and organizations for which there is only a reasonable suspicion that they may take advantage of the conditions to commit criminal acts in the future, the information is classified as "criminal intelligence information." As such, this information may only be entered into a separate "criminal intelligence records system," not the RMS. Consequently, there must be adherence to the guidelines of 28 CFR Part 23.[23] Failure to do so could open the law enforcement agency to civil liability.

For the current discussion of ILP, the point to note is simply this: There are significantly different rules for the collection, retention, and dissemination of "criminal intelligence information" compared to "criminal investigation information." Beyond the information management differences, there are conceivable differences in the method of analysis that is performed when individuals are identified as either intelligence targets or witnesses. As such, there must be a separate records system and supporting policies developed for ILP as well as training on the proper method of processing information used in ILP.

[23] Technically, 28 CFR Part 23 applies only to federally funded multijurisdictional criminal intelligence records systems operated by state, local, and tribal law enforcement agencies. In practice, however, it must be assumed that 28 CFR Part 23 applies to all state, local, and tribal agencies for two reasons: 1. The NCISP recommends that all agencies adopt these guidelines as a national standard of good practice and 2. Precedent in federal civil rights cases suggests that adherence to the federal guidelines can be an affirmative defense should a civil rights case be brought against an agency for the types of information being retained in a criminal intelligence records system.

Public Education

As noted previously, public education is critical for effective ILP. The lessons learned from community policing provide important insights. The public encompasses many different groups and different public education initiatives need to be provided to each constituent group. For example, what does the agency want to accomplish with a public education program: Reducing fear? Developing volunteers for the police department? Resolving community tensions, such as demonstrated resentment toward the Muslim community? Is the goal simply to give citizens information about terrorism indicators to aid in prevention? The important point to note is that a specific goal should be related to the public education initiative.

Such a program may also stratify the community in order to give specific types of information to different targeted audiences. Who in the community should be targeted for an education program: The business community? Civic and church groups? Graduates of the Citizens' Police Academy (CPA)? Nonlaw enforcement government employees? Teachers and students? The general community? Demographically defined segments of the community?

Different segments of the community may have different needs. For example, since approximately 85 percent of America's critical infrastructure is owned by the private sector, a special public education program may focus on threat-related issues for this narrowly defined community. Conversely, a completely different kind of public education may be directed toward graduates of the CPA who may be trained to work as volunteers during crises or a heightened alert status. Yet a different public education agenda would be directed toward a particular ethnic or religious community within a city. Each segment of the community has a different goal. In this case, the business sector to harden potential targets, the CPA graduates to aid the police in response to increased service demands, and the ethnic community to gain information about suspicious persons and their actions.

These segments may be further divided, particularly if there are unique targets within the community. The business community, for example, may be broken down into different segments: Different threats may target a nuclear plant or telecommunications switching station (both are critical infrastructure) or a meat processing plant or university genetic research laboratory (both of which may be a target of domestic environmental extremists).[24] The law enforcement agency will have to conduct a threat assessment to fully understand the character of the threat within the community as well as to understand the agency's intelligence requirements.[25] Collectively, these elements have a symbiotic relationship to aid in the development of a public education program.

[24] At times, targets may not be readily apparent in a community. Does East Lansing, Michigan, appear to be a terrorist target? In 1992, the Animal Liberation Front started a fire in the Michigan State University (MSU) mink research facility and caused more than $2 million in damages. On December 31, 1999, a fire in MSU's Agricultural Hall caused $700,000 in damages and destroyed years of research. Earth Liberation Front claimed responsibility, targeting genetic research.

[25] The threat assessment and intelligence requirements will be discussed in a later chapter.

Community education programs should also intend to have a specific outcome. Whether it is to reduce fear or to enlist support for volunteer efforts, all public education initiatives should incorporate five factors related to the intelligence function:

1. Know how to observe.
2. Know what is suspicious.
3. Know how to report.
4. Know what to report.
5. Know what happens next.

To maximize the quality and quantity of information provided by the community, law enforcement must provide a framework of knowledge. The more that law enforcement can educate the community, the more robust the feedback from the community.[26] In this regard, Tables 5-1 and 5-2 illustrate a range of items that may be incorporated into a public education program from both a topical and an outcome perspective.

Community Members as Law Enforcement Volunteers

Oftentimes, community members ask what they may do to aid in counterterrorism. One important element is serving as a volunteer for the law enforcement agency. Experience has shown that community volunteers can save the agency money as well as often provide unique expertise. Money can be saved when citizens are able to perform tasks that would otherwise have to be performed by a law enforcement employee; for example, the Austin (Texas) Police Department uses volunteers as part of its Civil Defense Battalion to accomplish these goals.

Obviously, an agency needs to develop some means of screening volunteers as well as provide structure for their work agreement and for administrative controls when they are performing activities on behalf of the law enforcement agency. In this regard, an important resource is Volunteers in Police Service (VIPS).[27] The VIPS web site provides a wide array of resources, documents, policies, and tips that can make a law enforcement volunteer program functional and easy to manage.

Volunteers with unique occupational experience may be particularly valuable to the intelligence function. An attorney, accountant, people with experience in researching land titles, and academic researchers and scholars are illustrations of professional volunteers who could provide important assistance to the intelligence function. Of course, background checks and nondisclosure agreements must be required of all such volunteers.

[26] www.policevolunteers.org

[27] Ideally, the law enforcement agency would be able to provide feedback to the citizen about information that was reported. Many times this is not feasible in the intelligence environment; however, it serves as positive reinforcement to the citizen when feedback is provided.

Table 5-1: Examples of Topics in a Public Education Program

- Understanding terrorism
- What is terrorism (defined/explained)
- Why people commit terrorist acts
- Perspectives of terrorism
- Asymmetric warfare
- An act of terror is defined by the victim
- How terrorism can touch a community…
  - » As a target
  - » Logistics and support provided to terrorists
  - » Activities that fund terrorist organizations
- New preparedness resources for local emergency services
- What is being done at the national level
  - » National strategies developed
  - » National threat assessment by FBI
  - » FBI reprioritized and reorganized to aid state and local law enforcement
- What is being done at state and local levels
  - » Participation in Joint Terrorism Task Forces
  - » Officers receiving antiterrorism training
  - » New communications and information sharing (Automated Trusted Information Exchange, RISS, Law Enforcement Online) that give local law enforcement more access

Table 5-2: Examples of Actions the Public Can Take

- Keep informed to know what to look for and report to the police
  - » Law enforcement must be prepared to share information with public
- Be aware, yet be fair
- Be cognizant of threats, but avoid stereotyping and hyperbole
- Information on how to talk/deal with children regarding terrorism
  - » www.ed.gov/admins/lead/safety/emergencyplan/index.html
  - » www.fema.gov/kids/
  - » www.atf.gov/kids/index.htm
- Information on how to protect family www.ready.gov
- Safety checklist
- Communications information
- What "awareness" means
- Explain the Alert System
- How to help children cope with fear
- Safety issues
- Equipment and resource checklist
- Understand the Homeland Security Advisory System and its effect

Conclusion

As noted in a recent publication from the Office of Community Oriented Policing Services:

> For the past 20 years, community policing has encouraged law enforcement to partner with the community to proactively identify potential threats and create a climate of safety. Its emphasis on problem-solving has led to more effective means of addressing crime and social disorder problems. In the 21st century the community policing philosophy is well-positioned to take a central role in preventing and responding to terrorism and in efforts to reduce citizen fear.[28]

The prudent executive will explore these avenues as part of a comprehensive, community wide homeland security strategy. Because of the concern for terrorism and Islamic extremism, the need to embrace all elements of the community becomes an even higher priority. As noted by the Muslim Public Affairs Council: "Ultimately, U.S. counterterrorism efforts will require a partnership between policymakers and the American Muslim community…".[29]

Chapter 6:

Developing and Implementing Intelligence-Led Policing

Developing and Implementing Intelligence-Led Policing

Chapter 5 established the concept and issues associated with Intelligence-Led Policing (ILP). Building on those concepts, this chapter will identify the processes and elements required to implement ILP in a state, local, and tribal law enforcement (SLTLE) agency. Because of the conceptual nature of ILP, it must be designed to meet the explicit needs of a given agency. This is complicated by the fact that there are a wide range of resource and environmental variables that will also influence implementation.

The important point to note is that there is not a single model of ILP that can be plugged into an agency. Rather, as will be seen, there are tools that can be used to identify the intelligence needs of an agency and then craft the policies and processes to make ILP functional for each department.

Essentially, intelligence is about managing information; specifically, the information that is needed to identify threats of concern to a community, and having sufficient information about the threat to develop operational responses to prevent or mitigate the threat. As depicted in Figure 6-1, this is a three phase-process as related to the integration of ILP into a law enforcement organization. The first phase examines the elements necessary for the information management process to be effective and it begins with developing the information management plan. The second phase is creating the organizational infrastructure to make the information management plan functional. The third phase is implementation. The following discussions address these three phases.

Figure 6-1:
Three Phases of ILP Development in an SLTLE Organization

Establishing a Framework for Strategic Priorities and Information Processing: The Information Management Plan

The information management framework is a business plan that guides a focused series of processes for the intelligence function. This plan identifies priority problems and institutionalizes a process for monitoring the problems through the application of seven critical components. A rudimentary approach is used in Table 6-1 to explain each component by indicating the kinds of questions each component is intended to answer and the organizational positions most likely to be responsible for answering the questions.

Table 6-1: Seven Components of the Information Management Plan

The Concept...	Asks the question…	Responsibility…
Strategic Priority	What problems are important to me?	Executive
Intelligence Requirements	What additional information do I need to better understand each problem, its causes, and its effects?	Executive, Commander, and Analyst
Collection Plan	Where (sources) and how (methods) will I get the additional information that I need to better understand the problem?	Commander and Analyst
Analysis	Collectively, what does the new information mean and what new insights does it provide about the problem?	Analyst with review by Supervisor
Intelligence Products	What actionable information do I need to tell other people in order to prevent or control the problem?	Analyst with Commander's Advice
Operational Responses	What explicit operational activities may be implemented to prevent or mitigate the priority problems? What resources are needed?	Intelligence and Operations Commanders
Process Review	From this process: • Was the information accurate and useful? • Could the problem be altered as a result of the information? • What will make the process better?	Intelligence and Operations Commanders with Feedback to Executive

Integrated within the information management plan is the Intelligence Process (discussed in Chapter 4). The six phases of the Intelligence Cycle operationalize the acquisition and processing of information needed for the intelligence function. The information management components collectively create the information management plan; the Intelligence Cycle is the mechanism for ensuring that information is collected, assessed, and processed in a manner that is scientific and consistent with accepted practice.

As illustrated in Figure 6-2, the Intelligence Process is a critically important subsystem of the information management plan. The current discussion, however, focuses on the essential components necessary develop and implement the plan. It lays the foundation for operationally responding to threats as well as providing a quality control mechanism for both information management and information processing.

Figure 6-2: Structure of the Information Management Plan

The Information Management Plan

The seven core components of the management plan integrate the intelligence function with all other agency responsibilities. It should be emphasized that these are management components, not functional components, per se. For example, the "analysis" component of the management plan focuses on the role analysis plays in information management. Conversely, the analysis phase of the Intelligence Process is focused on developing intelligence from raw data. The following discussions provide a brief description of each of the plan's components.

Establishing Strategic Priorities for Intelligence-Led Policing

Intelligence strategic priorities are the articulated criminal and terrorist threats that must be monitored and managed by a law enforcement agency in light of the impact these threats have on public safety and security. A strategic priority must be specified in the context of the local community and the law enforcement agency's intent to manage that priority.

Defining intelligence priorities can become a complex process because law enforcement organizations have a wide range of potential responsibilities ranging from traffic control to counterterrorism. Pragmatically, because of resource limitations, these different responsibilities cannot be treated equally. Each responsibility must be given a priority that will guide the allocation of resources and the amount of organizational effort that will be devoted to addressing it.

Even within each responsibility there will be additional prioritization. To use a familiar example, it is inescapable that virtually every SLTLE agency will have a strategic priority related to traffic control. Within the traffic control strategic priority there will be subpriorities such as these:

- Traffic accident investigation
- Driving under the influence enforcement
- Speed enforcement
- Vehicle registration and regulatory enforcement
- Parking enforcement.

This does not mean there will be no parking enforcement, but under normal circumstances parking enforcement may occur only when there is a complaint. Priorities can also change with circumstances. As an example, parking enforcement may be given a high priority when vehicles have to be moved from an emergency snow route or a hurricane evacuation route when warranted by the weather conditions. It is essential, therefore, that a law enforcement agency identify priorities within a dynamic framework that prescribes the conditions under which priorities will change and how the priority will be addressed (for example, parking enforcement only on the emergency routes but no attention to parking enforcement in commercial loading zones).

Strategic priorities are influenced by the systemic influence of several environmental factors. These include the following:

- Known public safety threats
- The seriousness of each threat
- Political priorities within a community
- Resources of the law enforcement agency
- Expertise of the law enforcement agency
- Special funding obligations (such as the conditions of a grant award or legislative mandates)
- Obligations in partnership agreements with other law enforcement agencies, public safety agencies, or the private sector
- Personal/professional priorities of the law enforcement executive.

These are legitimate factors because their effects on organizational prioritization are a product of an interactive balance among the factors. This process applies throughout the law enforcement organization, including intelligence.

Obviously, there are many different foci that ILP may address, particularly in light of the "all-crimes, all-threats, all-hazards" approach to intelligence. Important information must be gained by executives, both empirically and ideologically, that will help focus the prioritization process. In setting strategic priorities for ILP, the law enforcement executive may seek answers to a variety of questions, such as the following:

- ILP and the Overall Agency Mission
  - What is the priority of ILP in relation to the mission, responsibilities, and other strategic priorities of the law enforcement agency?
    - What proportion of the agency's work force will be exclusively dedicated to ILP?
    - What facility, equipment, supply, and service needs are required to support the various ILP full-time assignments?
    - What are the time and resource requirements to support personnel who devote a portion of their time to ILP (including training)?
- Threat-Related Assessment Factors
  - What known threats to public safety exist within the jurisdiction?
  - What threats may emerge?
  - What critical infrastructure is in the jurisdiction?
  - What key resources are in the jurisdiction?
  - What unique characteristics exist within the community that may heighten or aggravate either a criminal or homeland security threat? (For example, proximity to an international border, ports, refineries, geographic area that is disproportionately susceptible to natural disasters.)
  - What unique crime problems in the community need to be addressed? (For example, firearms violence, gangs, drug trafficking.)

- Administrative and Environmental Factors
  - What political mandates exist that are related to real or perceived threats that must be addressed?
  - What resources and expertise does the agency have or have access to that will support ILP? (For example, analysts, analytic software, fee-based information systems.)
  - What intelligence-related agreements has the agency entered into that obligates the agency and its resources? (For example, fusion center, Joint Terrorism Task Force, regional task forces.)
  - What obligations does the agency have to focus on specific intelligence-related initiatives, processes, and/or outcomes as a result of grants or special funding (such as a crime-control tax)?
- Executive Prerogatives
  - What personal and/or professional commitments and/or philosophies of the chief executive must be addressed in establishing strategic priorities?

The answers to these and other questions unique to the jurisdiction will provide the framework within which strategic priorities for ILP may be articulated and prioritized. The next phase is to operationalize the priorities. For example, assume that a law enforcement agency identified four ILP strategic priorities, in no particular order of importance, as the following:

1. Terrorism.
2. Homeland security.
3. Violence by firearms.
4. Gangs.

Within each of these priorities there will be a subset of priorities that must be operationally defined as they apply to the agency. For example, the FBI's definitions of international and domestic terrorism are as follows:

> International terrorism involves violent acts or acts dangerous to human life that are a violation of the criminal laws of the United States or any state, or that would be a criminal violation if committed within the jurisdiction of the United States or any state.
>
> Domestic terrorism is the unlawful use, or threatened use, of force or violence by a group or individual based and operating entirely within the United States or Puerto Rico without foreign direction committed against persons or property to intimidate or coerce a government, the civilian population, or any segment thereof in furtherance of political or social objectives.[1]

[1] Federal Bureau of Investigation. Counterterrorism Division. *Terrorism: 2002–2005*. Washington, D.C.: Federal Bureau of Investigation, undated, p. v.

While suiting the FBI's needs, these definitions are not likely to be as useful for a state, local, or tribal law enforcement agency that is defining its strategic priorities. Rather, an agency may use a more simplified definition to meet its needs; for example, the strategic priority of terrorism may be articulated simply as this:

- Terrorism[2]
  - Internationally affiliated terrorist groups
  - Individual radicals who support the ideology of internationally based terrorist groups
  - Right-wing criminal extremist
  - Environmental criminal extremists
  - Right-to-life criminal extremists.

With respect to the strategic priority of homeland security,[3] a state, local, or tribal law enforcement agency should define the priority within the context of unique characteristics of a jurisdiction. For example, the homeland security priority of an agency located near the U.S.-Mexico border may include strategic awareness of tuberculoses; a community where there is a high density of cattle raised for beef processing may include mad cow or hoof-and-mouth disease; an agricultural community that raises crops may focus on the accidental or intentional introduction of a communicable crop disease such as soybean rust. The significant point to note is that with the current all-hazards approach to homeland security intelligence, factors beyond the traditional expertise of law enforcement need to be explored when identifying threats (hazards) and defining strategic priorities for homeland security.

In light of the "all-crimes, all-threats, all-hazards" approach used in contemporary intelligence activities, the strategic priorities for intelligence will tend to be broader than was historically the case. Strategic priorities for the law enforcement agency will be defined throughout the organization and take many different forms (see Chapter Annex 6-1 for selected, and diverse, statements of strategic priorities from three law enforcement agencies). Specifically for ILP, an example of strategic priorities may be simply listed as illustrated in Table 6-2.

Within the framework of strategic priorities, an assessment must be made of what information is already known about the nature of each priority. Gaps in the information are then articulated as intelligence requirements.

[2] Note that each subcategory specifically includes the conditional modifier of "terrorist" or "criminal." This is an important factor because state, local, and tribal law enforcement agencies may collect and retain only information that identifies individuals and organizations where there is a criminal nexus, not just an extreme ideology.

[3] The reader should recall that homeland security intelligence deals with all hazards that have implications for law enforcement public safety and order maintenance functions.

Table 6-2: Examples of ILP Strategic Priorities

The Anytown Police Department's strategic priorities for Intelligence-Led Policing are:

- Terrorism
  - » Internationally affiliated terrorist groups
  - » Individual radicals who support the ideology of internationally based terrorist groups
  - » Right-wing criminal extremists
  - » Environmental criminal extremists
  - » Right-to-life criminal extremists
- Homeland Security
  - » Critical Infrastructure
    - ▪ Anytown water treatment plant
    - ▪ Anytown Naval Air Station
    - ▪ Anytown electrical substation
  - » Key Resources
    - ▪ FastCar Assembly Plant of Anytown
    - ▪ Anytown Grain Elevator Complex
    - ▪ GoodBeef Stockyards and Auction Barn
- Violence by Firearms
  - » Homicide by firearm
  - » Robbery by firearm
  - » Assault by firearm
- Gangs
  - » All criminal gang activity
- Organized crime activity
  - » Loan sharking
  - » Credit card fraud

Intelligence Requirements

While the use of intelligence requirements has been a long-standing practice of the Intelligence Community, it is a relatively new practice for law enforcement. Again, because of jurisdictional differences, requirements have slightly different applications for the law enforcement community.

Information that is missing but needed to understand a threat, target, or suspect is an "intelligence gap." Information that is identified to fill this gap is an "intelligence requirement." Requirements help administrators make decisions, and those decisions vary widely, such as these examples:

- Determining if a reasonable suspicion exists
- What resources to deploy
- Whether to prepare for a new threat
- Determining if a new target exists within a community
- Alternatives for preparing for a new threat or hazard
- Determining if new partnerships need to be developed to manage a change in the threat picture
- Determining if a new expertise needs to be developed to manage a threat
- Identifying new training personnel that an agency will need to deal with the changing threat picture.

The significant point to note is that requirements define the types of information that has to be collected to address the strategic priorities. Collecting information to fill the intelligence requirement requires a proactive deployment of resources. This may include open sources, law enforcement and intelligence information systems, human sources, undercover officers, patrol officers, informants, community partnerships, public-private partnerships, or the use of technical surveillance resources. These are articulated in the collection plan.

Collection Plan

The collection plan is a systematic procedure for gathering relevant information from all lawful sources that responds to intelligence requirements to produce an intelligence product. Usually the collection plan includes a specified time frame; although in the case of a standing intelligence requirement that time frame may be ongoing. The collection plan is related to the strategic priorities via the intelligence requirements by collecting targeted information about threats from both strategic and tactical perspectives. Some factors to be considered in the collection plan include the following:

- Is the requirement sufficiently clear to locate and identify the specific information that is needed?
- Have open sources been used as the "source of first resort"?
- Has any portion of the information already been collected in the form of tips, leads or Suspicious Activity Reports (SAR)?
- Do partnerships exist that can assist in responding to the intelligence requirement? (For example, private sector partnerships, the fusion center, community partnerships, and so forth.)

- If not available from open sources or previously collected information, what method(s) will be used to collect the information?
- What sources will be used to collect the information?
- What unique technological methods, if any, are needed to collect the information?
- Are there legal and/or administrative restrictions on collecting the information?
- Are there explicit notifications or approvals required for the collection of specific types of information?
- Can source validity and information reliability be accurately assessed? If not, other collection sources and methods should be explored.

Collected information is processed using the constructs of the Intelligence Cycle. As sufficient valid and reliable information is collected and analyzed, intelligence products are developed to monitor the strategic priorities and determine what, if any, operational responses are needed to address threats in each priority area.

Analysis

Raw data collected in accordance with the collection plan has little value until it has been analyzed. Relying on the scientific approach to problem solving, logical reasoning, and objective interpretation of data, the analytic process gives an integrated meaning to diverse individual pieces of information. Analysis establishes connections between the different data, cause and effect, and correlations of activities and behaviors. The new knowledge derived from analysis can provide insights into imminent and emerging threats, as well as potential intervention methods.

Certainly a goal of effective analysis is to ensure that the conclusions drawn from the process are "actionable"; that is, when the information from the analysis is given to operational units in the law enforcement agency, there is sufficient detail that enables the operational units to develop specific plans to prevent and/or mitigate threat. This actionable information is presented in a written form known as the intelligence products.

Intelligence Products

Intelligence products are the reports and delivery mechanisms that convey the findings of the analytic process. Ideally, an intelligence unit or fusion center will establish a menu of products that meet the specific needs of its various consumers. The products should have a consistent format and appearance (that is, a "brand") that will aid consumers in selecting the products most applicable to their responsibilities. For example, when a threat is identified and reported, managers will need different types of information than line officers will need. Situational awareness, a strategic assessment, and tactical indicators represent intelligence products that have a different focus on the same threat.

Each intelligence unit and fusion center will determine the types of intelligence products it will produce. Important, the products are the primary methods that the intelligence function will communicate with their customers. The overall

utility of the intelligence unit will be judged by the intelligence products it disseminates. The products must be of sufficient quality, substance, and utility that operational units of the agency are able to develop tactics and strategies to prevent threats from reaching fruition.

Ensuring that these characteristics are embodied in each intelligence product will maximize the utility of the product which, in turn, contributes to public safety and security.

Operational Responses

Identifying threats through the Intelligence Process is an important ingredient for public safety. Intelligence, however, is only part of the security equation: the critical next element is for operational commanders to develop intervention activities that will stop or mitigate the threat. Some of the operational responses will be fairly simple, such as providing indicators of the threat so that officers will be aware of them while carrying out their daily responsibilities. Other interventions may be more sophisticated such as using suppression tactics (saturation patrol, for example), proactive intervention (such as consistent car stops and field interviews of persons and their associates reasonably believed to part of the threat), target hardening, community education, development of a task force, and aggressive use of traditional investigative tactics that may serve to identify and apprehend offenders. It is important to note that operational units should rely on the intelligence function as a resource when developing intervention strategies. The analyst has the most comprehensive insight into the threat and may provide valuable feedback to operational planning.

Implementing operational responses inevitably requires the expenditure of resources. While resource allocation is part of the operational commander's responsibility when developing intervention methods, the intelligence function can assist in prioritizing and focusing strategies. This can translate to a more efficient use of resources.

Review of the Process

A final step of the information management plan is to review the process to establish what intelligence was developed and if any new gaps have emerged. It should ask such questions as these:

- Was the information or intelligence accurate?
  - Was the threat accurately identified?
  - Was the nature of the threat and its characteristics accurately identified?
- Was the target accurately identified?
  - Were the vulnerabilities of the target accurately identified?
- What was learned from victims, witnesses, offenders, and locations?
- Was there useable intelligence from any technical or surveillance activity?
- What was learned about intelligence gaps and is there information that can be collected on a standing basis to prevent future intelligence gaps?

- Did the threat change after the operational response? If so, why?
- Did the operational activity cause displacement which, in turn, will cause new threats to emerge in a different geographic area?
- What operational responses were used and are the threats vulnerable to the same approach in the future?
- Have new threats been identified or have new threats emerged?
- Were partner agencies (include private sector) involved in any aspect of collection or response?
    - What were the benefits?
    - What feedback have they provided?
    - What feedback have they received?
- What measures have been put in place to minimize the possibility of the threats arising again?[4]

The review is an important tool for evaluating the information management plan, Intelligence Process, operational responses, and the status of strategic priorities. Indeed, the review can also be critical for defining new intelligence requirements and reordering the priorities.

Summary

The information management plan is like a skeletal structure linking the components together. It serves as the framework to make the organizational components functional for ILP.

Organizational Infrastructure for ILP

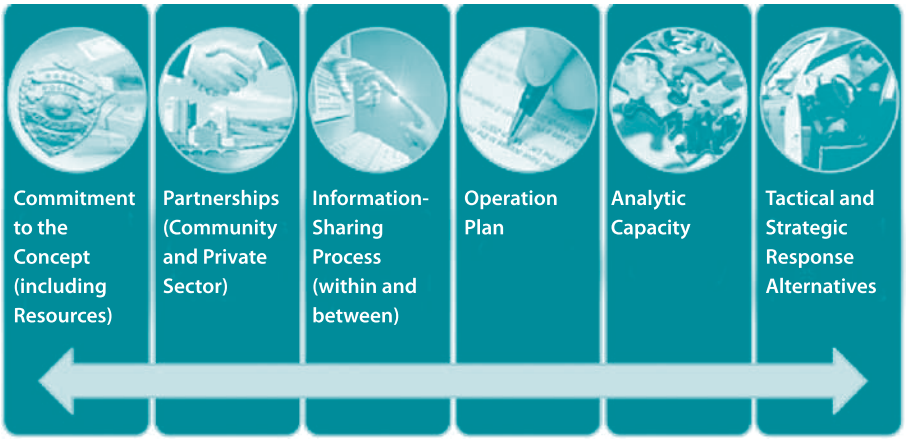
Before the ILP concept can be introduced into a law enforcement agency, a number of components (see Figure 6-3) must be developed, each of which complements the definition of ILP provided in Chapter 5. The complexity and detail of these ingredients vary widely between agencies, depending on such factors as these:

- Size of the agency
- Resources
- Demographics of the jurisdiction
- Location of the jurisdiction
- Character of the jurisdiction (industrial, commuter population, central city, suburb)
- Relationship with the community (supportive, conflictive, large undocumented population)
- Perspective on intelligence by elected officials and community leaders.

An assessment of these variables—many of which will be intuitive to the agency—will help guide the development of each ILP component.

[4] Based on: National Centre for Policing Excellence. *Guidance on the National Intelligence Model.* London, U.K.: Association of Chief Police Officers, 2005, p. 94.

Figure 6-3: Components of ILP



Commitment

The change to ILP must start with the chief executive because if the leadership of a law enforcement agency does not understand and buy in to the concept, it will never be functionally adopted. The law enforcement executive's commitment must be demonstrated through allocation of personnel and resources to develop and implement the concept. If agency personnel do not believe the leader is committed to the new program, implementation efforts will not be effective.

An excellent example of a leader's demonstration of commitment is seen in the following experience:

> When Dr. Gerry Williams was chief of police in Aurora, Colorado, in the late 1980s, he decided to implement community policing. There was a great deal of resistance, and he recognized the need to educate Aurora police personnel on the concept. He asked that a team from the National Center for Community Policing at Michigan State University prepare a 4-hour awareness program that would be mandatory for all Aurora police employees to attend on the change in policing philosophy. He also asked the team to offer the training at 12 different times throughout the day (over a 2-week period) that would cover every shift so all personnel would have the opportunity to attend the mandatory training on their regularly scheduled duty time. At each of the 12 sessions—whether offered in the middle of the night or the middle of the day—Chief Williams opened the training by making a firm statement that the movement to community policing was going to be the unquestioned policing philosophy to be used by the Aurora Police Department and that resources would be committed to ensure the change would take place. Chief Williams then sat down in the middle of the front row where everyone was certain to see him and sat through every one of the 12 sessions. It did not take long for the word to spread through the department that "the chief is serious about this" because he set other duties aside to attend the entirety of all the sessions. This was an important sign of commitment. Moreover, the chief answered questions during the sessions and interacted with officers on the breaks to reinforce his commitment.

Commitment begins with the chief executive's true understanding of the concept. In some cases, this has occurred after the chief executive has attended a training program developed exclusively from the executive's perspective (such as the BJA program, "Criminal Intelligence for the Chief Executive"). A program such as this provides fundamental concepts that show the value of intelligence, demonstrates how intelligence integrates with the department's overall mission, and permits the chief to interact with others who may not only provide reciprocal support but also may permit an exchange of ideas on how ILP may be used.

The chief executive should also formally articulate his or her support of the concept in a policy statement. The policy statement provides the organizational parameters of ILP and gives all members of the agency a tangible reference point for understanding how ILP is to be implemented and used.

Perhaps the best symbol of commitment is the dedication of resources to ILP. Training agency personnel, assigning them to the intelligence function, and dedicating funding to the development and execution of ILP sends a strong message to agency personnel about the executive's commitment.

It is also critically important to gain commitment to the concept from commanders and managers because they are responsible for the actual execution of ILP. If commanders and managers have neither a clear understanding of how ILP can benefit the agency nor of their ILP responsibilities for directing personnel under their command, full implementation will not occur, regardless of the chief executive's support. In all types of organizations, there have been instances in the management process in which middle managers have defeated a new initiative simply by not thoroughly ensuring that personnel under their command perform the duties necessary to make the initiative work. This reflects an old adage in management: "Managers may not be able to turn the water on, but they can easily turn it off."

Component 1—Key Takeaways

- The chief executive must understand and support the concept of ILP:
  - How ILP fits into the department's mission
  - Articulated commitment to the concept
- Commitment of people and resources:
  - Training
  - Infrastructure development
- Commitment must extend throughout the chain of command

Partnerships

Effective ILP requires the development of a range of partnerships. There are good examples of this in the counterterrorism area (such as the Terrorism Early Warning Groups) as well as the precedent established in community policing. The range of partnerships includes the private sector, nonlaw enforcement government service, and the community. Each can be an important source of information for the intelligence process. The fundamental rationale for public-private partnerships

is based on the fact that when more people know what to observe and how to report it to law enforcement, the greater the probability of collecting information that may be used to stop a terrorist attack or criminal enterprise.

There is a precedent of success for including community members as part of the information-collection process, as seen in programs used by the Turkish National Police, Israeli Police, and the London Metropolitan Police. Each has developed programs aimed at the community to report specific types of information—essentially, "intelligence requirements"—to the police to aid in preventing terrorism. Certainly, if community partnerships are effective in these diverse cultures, they can be effective in the United States. Moreover, public-private partnerships are a simple extension of many current programs used throughout the United States that deal with crime, ranging from Neighborhood Watch to Volunteers in Police Service.

One question that emerges is whether the average community member is interested in participating in ILP programs. A pilot program offered by the Regional Community Policing Institute at Wichita State University extended an open invitation to local residents in Wichita, Manhattan, and Topeka, Kansas, to attend a public awareness session on citizen reporting of suspicious activities possibly related to terrorism. More than 600 people attended the sessions in the heartland because of their concern about the threat and their desire to contribute to counterterrorism initiatives.

Engaging the community can significantly increase the information-collection parameters for the intelligence process. Several key factors make these partnerships work effectively for ILP.

- The law enforcement agency must establish trusted relationships with people through local law enforcement officers. Typically, a "meet and greet" alone will not suffice. Information that may be sensitive, confidential, or even fearful may need to be exchanged. As a lesson learned from community policing, the bond of trust established through an ongoing dialog becomes a critical element.
- Once trust is established, an effective means of two-way communication must be established with each individual. In some cases, this may be technological, such as e-mail or telephone. In other cases, individuals may feel comfortable sharing the information only on a one-to-one basis with their trusted law enforcement partner.
- Just as with officers, training—or public awareness—about the signs and symbols of terrorism and organized crime is important for enabling the partner to identify substantive information that should be reported. For example, a community partner may see a symbol, tattoo, or foreign word that is symbolic of a terrorist or criminal entity, but if he or she has not been trained to recognize these symbols, the information will not be reported. Similarly, community and private partners should receive information about behaviors that are unusual and which suggest criminality in order to enhance their specific awareness.[5]

[5] A good example of behaviors is found in the Michigan State Police video, *Seven Signs of Terrorism,* which is available for public distribution. www.michigan.gov/msp/0,1607,7-123-1564-155763--,00.html.

- Partner training should also include instruction on the type of information that should be documented for reporting to law enforcement. While documentation of behaviors, evidence, vehicles, and personal descriptions are second nature to law enforcement officers, it is not a customary practice for nonlaw enforcement personnel. Explaining what kinds of information should be reported—along with date, time, and location—is an important element in partner training.
- The agency should develop a policy and process to protect the privacy and safety of community partners. As will be discussed in detail in a subsequent chapter, there should be a privacy policy to protect business partners' proprietary information that may need to be disclosed during the information-sharing process. Partners need to be informed of these policies in order to reinforce the trusted relationship.

Illustrations of Partnerships in Other Countries

Israel. During the height of the Al-Aqsa Intifada, the Israeli Police sought alternative methods for gaining information about planned terrorist attacks. One technique was to establish community partnership patrols that worked with the residential Palestinian population is such cities as Tel Aviv and Jerusalem. The Israeli community partnership officers developed trusted, often confidential, relationships with many Palestinian citizens in these cities with the expressed intent to gain information or indicators about possible terrorist attacks. The motives of the Palestinians were quite simple: Many of the Palestinians who worked and resided in Israeli cities had been victims of terrorists' attacks alongside the Israeli victims.

Turkey. After a series of terrorists attacks in Istanbul in November 2003, the Turkish National Police (TNP) interviewed captured terrorists to learn how they were recruited into the PKK (Kurdistan Workers' Party) and the Turkish al-Qaida. It was learned many were recruited in high school and often initially participated with the group out of social pressure rather than commitment to the group's cause. As a result, the TNP began outreach and education programs in the high schools both to dissuade young people from joining these groups and to gain information that could be used in the intelligence process.

A number of good partnerships have emerged, notably in larger law enforcement agencies. The New York (City) Police Department's SHIELD[6] is a comprehensive information-sharing and public information program. The Delaware Information Analysis Center[7] has established formal relationships with nonlaw enforcement government organizations and targeted private-sector entities for information sharing over the secure Automated Trusted Information Exchange network. The Nassau County (New York) Police Department created the Security/Police Information Network as a comprehensive public-private information-sharing network that is stratified by sectors and divided between vetted and nonvetted information-sharing partners using e-mail and periodic meetings. There are certainly other examples, but the point is clear: Partnerships are critical, there are models to provide guidance, and partnerships must be established throughout America's communities, not just in major metropolitan areas.

[6] See www.nypdshield.org.

[7] See dsp.delaware.gov/Intelligence.shtml.

As may be expected, the development process and expected outputs differ somewhat between community partners and private sector partners

Community Partnerships

Just as with any other crime or community problem, it is important to enlist the support of the community. In the intelligence arena, two factors make community partnerships more challenging. First, the agency is concerned about threats, and second, many community members are uncomfortable with the intelligence role in law enforcement. On the issue of threats, it is insufficient to simply tell citizens to be aware of suspicious activities. More guidance is needed. In many instances, citizens have reported something to this effect: "A man who looks like he's from a Middle-Eastern country is taking a picture of a bridge." In such cases, whether intentional or not, citizens are often falling prey to a stereotype. Beyond this factor, there is virtually no value to such information alone. Citizens need to be given guidance about looking at behaviors that are suspicious and instruction on how to document those behaviors when reporting the information to a law enforcement agency. This reduces the possibility of stereotyping people and provides more valuable information to the law enforcement agency.

With respect to the intelligence role, many people have expressed concern that forming community partnerships for intelligence is akin to turning citizens into informants on their neighbors. This belief goes hand in hand with the belief that many people hold that law enforcement agencies are collecting as much information as possible on all citizens—or at least on citizens who do not share "law enforcement beliefs." Many individuals assume that intelligence activities routinely violate citizens' privacy and civil rights. The challenge is to educate skeptics about the process and the importance of citizen involvement in ILP simply because citizens are often in a place to observe suspicious behaviors more often than are law enforcement officers. The notion of citizen participation goes back to one of the most fundamental principles of modern law enforcement articulated by Sir Robert Peel in developing the London Metropolitan Police in 1829: "The police are the public and the public are the police."

As noted previously, training sessions for citizens can be quite helpful in this process. In a number of communities, both in the United States and abroad, citizen training programs have resulted in reasonable degrees of success. The programs should tell citizens 1. What to look for, 2. What kind of information they should document, and 3. How to report the information to a law enforcement officer or agency.[8] Providing such information increases efficiency and decreases the possibility of stereotyping.

Component 2a—Key Takeaways

- Enlist community support
- Establish trusted lines of communication with community members
- Provide community training so community members will recognize the signs and symbols of terrorism, crime, and other threats facing the community
- Tell the community what kinds of information are needed by the agency
- Tell the community how to report information

[8] Chapter Annex 6-1 is a community handout used by the Wichita State University Regional Community Policing Institute to emphasize these points.

Public-Private Partnerships

Public-private partnerships are more structured than community partnerships. While all businesses are subject to partnerships, those that are prone to threats (in light of specific threats that are identified in a region) should be given the highest priority. The private sector has a great deal to offer in information sharing—many have global contacts and communications systems that can also be of value to a law enforcement agency. Whether it is the use of delivery persons who can be alert to suspicious behaviors, security personnel at corporate facilities, or salespersons who can be aware of unusual or suspicious purchases, the value of raw information exchanged with the private sector can be robust.

In some cases, a law enforcement agency may develop an intelligence liaison contact with a company to serve as the primary two-way point of contact between the company and the law enforcement agency. Such a partnership will increase the efficiency and effectiveness of the information-sharing process. As with community partnerships, the law enforcement agency will need to train appropriate company personnel and in some cases, special training may be provided that is unique to a given corporate sector. This is conceptually similar to the terrorism early warning (TEW) group concept that has been instituted in many communities throughout the United States.[9] Given that law enforcement intelligence focuses on all crimes and all threats, the intelligence liaison contact will be concerned with threats broader than terrorism.

When law enforcement agencies work more closely and have more detailed information exchanges with the private sector, two issues of particular importance must be addressed. The first is protection of citizens' privacy. Instances occur in which a citizen's or lawful U.S. resident's identity may be provided to the private sector, for example, between law enforcement agencies and the airline industry. While there are bona fide reasons for providing information about individuals, care must be taken to ensure accuracy of the information provided and protect the individuals' privacy. The second issue is protecting the proprietary information of companies. In some instances, a company may provide information about its products or business processes to a law enforcement agency as a means of identifying and mitigating threats. It is incumbent on the law enforcement agency to ensure that any such proprietary information is protected.

Component 2b—Key Takeaways

- Enlist support of the private sector:
    - Give priority to threat-prone sectors, particularly in light of regional threats
- Create an intelligence liaison contact
- Provide training to recognize the signs and symbols of terrorism, crime, and other threats that may be encountered
- Tell the partners the types of information the agency needs
- Protect citizens' privacy
- Protect proprietary information

[9] A wide range of information on TEW groups may be found by using the search utility on www.llis.gov.

Information-Sharing Processes

The heart of effective intelligence is the capture and sharing of critical raw information. It is logical that each law enforcement agency must develop an effective mechanism to record and manage this array of information that is distinct from or segregated from other records in the agency's records management system. This mechanism will have a significantly different structure between law enforcement agencies, depending on the agency's size and resources. Despite these differences, a number of questions must be answered when developing an intelligence or sensitive information records capability in a U.S. law enforcement agency. Among these are the following:

- Where and how will this information be stored? It should be noted there are still agencies in American law enforcement that, because of their small size and rural—sometimes remote—locations, do not have networking capabilities. Some still operate with paper records, photocopies, and faxes.
- How will SARs, tips, and leads be assessed, managed, and stored?
- How will source reliability and information validity be evaluated?
- How will overall accuracy of information (including the documentation trail) be ensured?
- Who has the authority to enter information into the system, and how will entries be audited?
- How will the information be secured?
- Who will have access to the information, and under what circumstances is access permitted?
- Is the records system meant for raw information storage or for criminal intelligence records? If the latter, a 28 CFR Part 23-compliant policy should be developed.
- What are the information-sharing rules, and who makes the dissemination decisions?
- Have adequate measures been taken for security of information?
- For electronic systems, are data compatibility standards in place? Are data standards consistent with the Global Justice Extensible Markup Language Data Model[10] and the National Information Exchange Model?[11]

While each question could be discussed at length, for the current discussion it must be recognized that all of these issues must be addressed as part of building an ILP structure. For large agencies, these issues typically have been resolved, but for the majority of law enforcement agencies, many of which have only a few police officers, this is new ground. Yet if they are expected to collect raw information for the fusion centers and the Information Sharing Environment (ISE), the questions must be addressed.

Finally, as a result of articulated national standards and precedence in civil law, every agency that develops a criminal intelligence records system should ensure that it meets accepted regulatory and legal standards.[12]

Component 3—Key Takeaways

- Explicit processes and policies must be developed to ensure that the right information is disseminated to the personnel who need it
- Ensure that information-sharing mechanisms are two-way
- Policies must address both intra- and extradepartmental processes

[10] See it.ojp.gov.

[11] See www.niem.gov.

[12] In particular, the records system should be 28 CFR Part 23-compliant and a privacy policy should be in place. See it.ojp.gov/privacy/206/28CFR_Part_23.PDF and it.ojp.gov/default.aspx?area=privacy&page=1260, respectively.

Operational Plan

Most law enforcement agencies have an operational plan in place that includes a mission statement, goals, objectives, and a system of directives. Many of these elements apply directly to ILP without any change; for example, standards of personnel conduct or officer safety guidelines apply uniformly. Elements of a departmental operational plan, however, typically are directed toward criminal investigation and apprehension. Consequently, the ILP operational plan must deal with the operational components of managing threats. The goals and objectives of ILP should be clearly articulated. Operational differences between intelligence and investigations should be spelled out, as should the relationship of ILP to the agency's criminal apprehension mission. Even such issues as personnel evaluation will differ in ILP compared with traditional performance measures.

The operational plan is the road map to executing ILP as an agency strategy.

Component 4—Key Takeaways

- The *National Criminal Intelligence Sharing Plan* states, "For *Intelligence-Led Policing* to be effective, the process must be an integral part of an agency's philosophy, policies, and strategies and must also be integral in the organization's mission and goals" (p. 7)
- Each element of the agency's operational plan should be coordinated to include the ILP mission
- An ILP operational plan should be developed to guide the agency's intelligence activities

Analytic Capability

Without analysis, there is no intelligence; however, most American law enforcement agencies do not have an analyst because they simply do not have the budget. In addition, political and collective bargaining implications often need to be addressed if a chief executive explores the hiring of an analyst. On the political side, it is often difficult for lay citizens—including city council members—to understand why funding should be allocated in a small law enforcement agency for an analyst when there is an increase in crime. Unfortunately, in many communities, it would be more difficult to add a police employee who was a nonsworn analyst than to add another sworn officer. Furthermore, in states where there is mandatory collective bargaining, such as Michigan, it is difficult to add positions that are law enforcement-related without either obtaining concessions from the collective bargaining unit or a renegotiated collective bargaining agreement.[13] As a result, many agencies need to explore options for developing an analytic capability. An agreement with the fusion center, a shared analyst between agencies, the use of volunteer analysts, or the use of college interns as analysts are among the alternatives that an agency may use to develop an analysis capability.

While not perfect, creative options may be the only recourse; for example, a fundamental analysis performed by officers may be the only alternative. There is precedent for this with officers using problem analysis as part of problem-oriented policing. The Center for Problem-Oriented Policing[14] offers a downloadable model

[13] The strength of collective bargaining units and contents of collective bargaining agreements vary widely, even in states with binding arbitration. As a result, each collective bargaining agreement must be examined separately.

[14] www.popcenter.org

problem-oriented policing curriculum that provides instruction on analysis. While not designed for ILP, it can assist in developing the analytic skills that officers need for threat analysis.

The point to note is that rather than relying on intuition, agencies should use an objective assessment of facts to provide a stronger foundation for ILP.

Component 5—Key Takeaways

- Analysis is the key to effective intelligence:
  - Of necessity, the analytic capability of agencies varies widely, ranging from sophisticated to simple
- Sometimes the analytic process is similar to the basic analysis individual officers do in problem-oriented policing
- An important element is to develop the analytic mindset

Tactical and Strategic Response Alternatives

The distinction between tactical and strategic analysis was discussed earlier. Developing response alternatives to criminal threats represents a different way of thinking about crime. The FBI Counterterrorism Division, for example, historically worked cases with the intent of making an arrest as soon as probable cause was developed. The intelligence-led approach now used in FBI counterterrorism is to gain as much information as possible about all investigative targets rather than making immediate arrests. One approach may be to "turn" a target to become an informant, permitting the informant to continue to operate. In other cases, a target may remain under constant surveillance, despite the presence of probable cause, so that the agency can identify as many associates as possible, as well as understand the way the targets communicate, finance, and generally operate their enterprise, with the goal of disrupting the criminal organization. While many of these targets will eventually be arrested—as is often the case in ILP—arrest is not the only goal. Rather, an important goal is to dismantle the criminal organization to eliminate the threat. As noted by Ratcliffe and Guidetti,

> Intelligence-led policing is a conceptual framework for conducting the business of policing. It is not a tactic in the way saturation patrolling is, nor is it a crime-reduction strategy in the way situational crime prevention is. Rather, it is a business model (John and Maguire, 2003) and an information-organizing process that allows police agencies to better understand their crime problems and take a measure of the resources available to be able to decide on an enforcement tactic or prevention strategy best designed to control crime.[15]

Component 6—Key Takeaways

- Unlike operational activities used to suppress crime or apprehend offenders, new tactics must be used to deal with threats
- Instead of immediately arresting criminal suspects, the agency may monitor the suspects' behavior for further intelligence value
- Depending on the nature of threats, creative new initiatives need to be developed to prevent threats; often this may not involve arrests

[15] Ratcliffe, J.H. and R. Guidetti. "State Police Investigative Structure and the Adoption of Intelligence-Led Policing." *Policing: An International Journal of Police Strategies and Management,* 2007. www.jratcliffe.net, under research publications, "State Police Investigative Structure and the Adoption of Intelligence-Led Policing"

Next Steps: Implementation

Often, agencies will ask for a template on how to implement ILP. The fact is that there is no universal template. Rather, each agency must examine the ILP philosophy and critical components, design an implementation scheme in light of the needs, resources, and articulated goals, and tailor the practice of ILP to those requirements. The implementation process is an exercise in organizational change to place the components "in action."

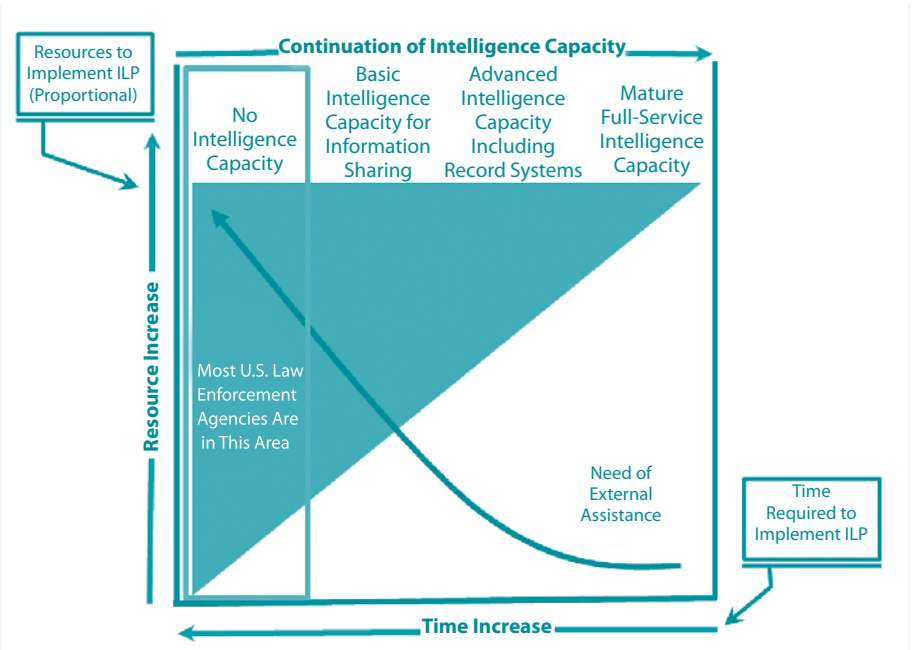
Self-Assessment of the Agency's Intelligence Capacity

In examining the intelligence capabilities of American law enforcement agencies, the author developed a four-point qualitative scale to describe the intelligence capacity based on policies, expertise, and information sharing capabilities.[16] As illustrated in Figure 6-4, the categories are as follows:

- No Intelligence Capacity
- Basic Intelligence Capacity for Information Sharing
- Advanced Intelligence Capacity Including Records Systems
- Mature Full-Service Intelligence Capacity.

While information sharing and connectivity have increased in recent years, most American law enforcement agencies have a minimal intelligence capacity. Time and resources—including specialized expertise—are needed to develop the infrastructure and knowledge within the agency to enable the agency to have a functional intelligence operation. Resources and external assistance include assistance with policy development, training, access to critical information systems, and other infrastructure components.

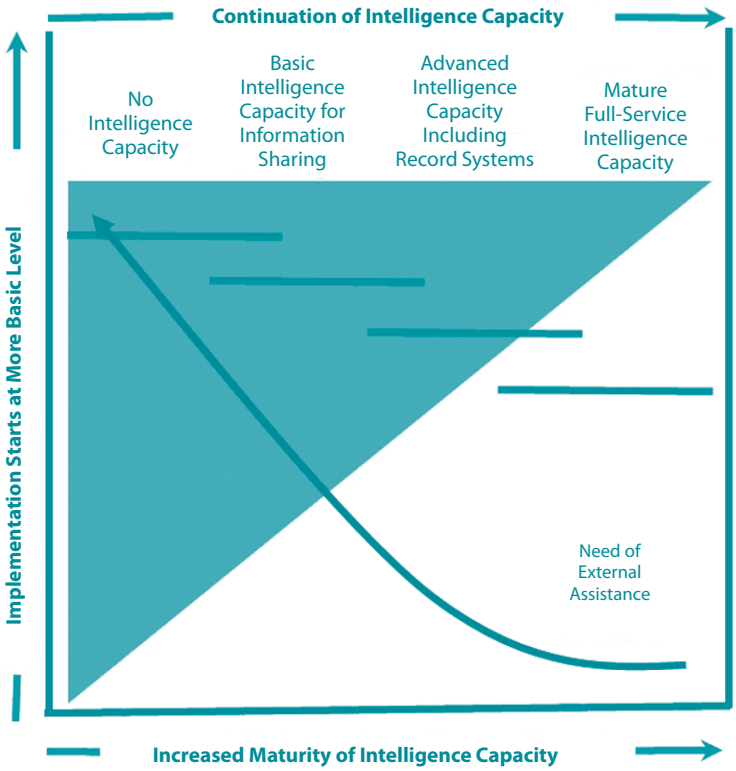
Figure 6-4: ILP Continuum of Variables



[16] As part of Department of Homeland Security-funded intelligence training programs, the author and his colleagues developed a comprehensive self-assessment tool that measures organizational variables across seven dimensions, providing a refined measurement of a law enforcement agency's ILP capacity. Agencies can access this self-assessment at no cost by enrolling in the training. For more details about the training, see intellprogram.msu.edu.

The categories describing the intelligence capacity are not dichotomous, but exist on a continuum. That is, depending on the operational characteristics of the agency's intelligence function, the intelligence capacity will be somewhere on a continuum within that category (see Figure 6-5). As might be expected, the lower on the continuum, the greater the need for external assistance and resources to develop the capacity to a level that is needed for the agency

Figure 6-5: ILP Subcontinuums of Variables



In determining the level of the intelligence capacity, and the place to start for developing or reengineering the intelligence function, a law enforcement agency must conduct a self-assessment of critical variables. Table 6-3 illustrates the operational characteristics that describe the four levels. Below each operational characteristic are action steps that should be taken to at least maintain the current level or move forward.

Certainly the "operational characteristics" and the "action steps" are not absolutes for determining a law enforcement agency's intelligence capability. Rather, they represent important milestones that can be identified and assessed in the implementation process.

The Implementation Starting Point

Any new initiative must have a starting point that provides an accurate picture of the organization's current state of knowledge and capabilities. In the United Kingdom, when the National Intelligence Model was introduced to the provincial constabularies, the starting point was fairly unified across all police forces with a strong foundation, given their history. In the United States, the starting point is at a significantly more fundamental level. To determine this starting point, several questions must be answered in each law enforcement organization:

- What is the knowledge level of the chief executive and command staff regarding the current philosophy and practice of law enforcement intelligence, including ILP?
- Is there an intelligence unit or intelligence capacity in the law enforcement agency?
  - Does the current intelligence capacity operate in a manner consistent with current practice, including the NCISP and the Minimum Standards set by the Counterterrorism Training Coordination Working Group?[17]
  - Has the current intelligence capacity developed a privacy policy?
  - What processes have been addressed and considered in extending the current intelligence capacity to ILP?
  - Is the law enforcement agency accredited by the Commission on Accreditation for Law Enforcement Agencies (CALEA)? If so, what compliance commitments and policies have been put in place to meet the CALEA standard for intelligence?
- What is the level of general awareness and knowledge of all law enforcement personnel concerning law enforcement intelligence?
- What internal resources are available to assist in developing and implementing ILP?
- What external resources are available to assist in developing and implementing ILP?
- Has the law enforcement agency established a particular relationship and/or processes related to the state or regional fusion centers?
  - Does the agency have someone assigned full- or part-time to a fusion center?
- Are there particular obstacles or challenges that must be resolved before implementing ILP?[18]

The intent of these questions is to collectively establish a profile of the agency's intelligence capacity, if any, so that the law enforcement agency has a clear picture of its starting point. This assessment will help guide the agency toward the next step in the implementation process.

As noted previously, a critical tool for socialization is providing fundamental knowledge to personnel. The need for training cannot be overemphasized, particularly awareness training for line personnel. New policies and procedures will have little meaning if personnel do not understand the concepts. Once again, the vast majority of America's uniformed law enforcement officers simply are unaware of the intelligence process and their role in it because our pre-9/11

[17] www.it.ojp.gov/documents/criminal_intel_training_standards.pdf

[18] These can be wide-ranging. For example, some agencies that operate under binding collective bargaining may have to resolve duty changes and training in a new collective bargaining agreement. Another example is that in some localities, the city council has forbidden a law enforcement agency from developing an intelligence capacity because of privacy and civil rights concerns. In yet other agencies that are operating under an intelligence-related court order or consent decree, changes may need to be made in the order prior to developing and implementing ILP.

Table 6-3: Organizational Self-Assessment Factors of an Intelligence-Led Policing Capacity

No Intelligence Capacity	Basic Intelligence Capacity for Information Sharing	Advanced Intelligence Capacity Including Intelligence Records Systems	Mature Full-Service Intelligence Capacity
Operational Characteristics: • No systematic intelligence training has been provided to personnel. • No intelligence policy or procedures. • No connectivity to intelligence records systems. • No systematic intelligence initiatives in the agency beyond sharing some intelligence products received from FBI, Department of Homeland Security, fusion center, etc.	**Operational Characteristics:** • Limited intelligence training, typically an investigator. • Generic intelligence policy. • No criminal intelligence records system. • No or minimal connectivity to intelligence records systems. • Intelligence activity limited to an individual or two identifying and sharing intelligence products and some BOLOs (be on the lookout).	**Operational Characteristics:** • One or two criminal intelligence analysts. • A formal criminal intelligence records system. • Connectivity to RISS.net (Regional Information Sharing System), LEO and/or LEIU (Law Enforcement Intelligence Unit).	**Operational Characteristics:** • Multiple analysts • Multisource connectivity • Advanced analyst training • Comprehensive records system
Action Steps: • Develop intelligence capacity as per *National Criminal Intelligence Sharing Plan* (NCISP) standards • Awareness training for all agency personnel as per the Minimum Criminal Intelligence Training Standards for United States Law Enforcement and Other Criminal Justice Agencies (Minimum Standards) • Develop operational plan • Establish logistics to receive and store Controlled Unclassified Information (CUI) • Develop privacy policy • Designate intelligence liaison officer (ILO) for fusion center • Establish community partnerships • Establish connectivity with RISS.net and/or Law Enforcement Online (LEO)	**Action Steps:** • Review policies related to intelligence operational plan • Awareness training for all agency personnel as per the Minimum Standards • Establish public-private partnerships • Establish community partnerships • Ensure that CUI meets security standards • Ensure that privacy policy is in place or create one • Establish an ILO	**Action Steps:** • Ensure that intelligence records are 28 CFR Part 23-compliant • Write/review privacy policy for consistency with ISE guidelines • Ensure that all officers have received intelligence awareness training • Review operational plan as per the NCISP • Ensure that analyst training is compliant with the Minimum Standards • Identify a fusion center liaison • RISS, LEO, and LEIU memberships • Community partnerships established • Public-private partnerships established	**Action Steps:** • Ensure that all processes are NCISP-compliant • Advanced analyst training • ILO training program • Fusion center liaison • RISS, LEO and LEIU Memberships • Community partnerships established • Public-private partnerships established • Review privacy policy with ISE guideline
Assumption for all four categories: The Global Intelligence Working Group and ISE standards and guidelines are sufficiently new that most agencies have not fully addressed the standards, if at all.			

philosophy that intelligence was to have very limited information sharing for operational security purposes. The paradigm has shifted dramatically, and local American law enforcement has a significant learning curve ahead of it.

When a commitment has been made to implement ILP, one of the top priorities is to provide training at two cognitive levels.[19] The first is awareness, which in reality, is more like education than training because the intent is to understand the concept of intelligence, how it works, and how it will contribute to the law enforcement mission. The second level is the development of skills and applications of intelligence, such as information collection, reporting processes, and proper use of intelligence reports. Beyond the cognitive-level training, there must be training that is explicitly directed to the different organizational levels and assignments within an agency that need the knowledge and skills to effectively perform in the ISE. The Minimum Standards provide the critical foundation content that is needed in any of these training initiatives. Moreover, the flexibility inherent in the Minimum Standards permits each agency to tailor the training program to its particular needs.

Change is a difficult process that most people initially resist; therefore, an early step in the process to introduce ILP is to overcome this resistance or dogmatism. The most effective way to accomplish this is by developing an understanding of ILP and demonstrating the benefits the change will produce for the individual and the organization. In a nutshell, people at all levels of the organization must be sold on the new concept—in this case, ILP. Changing attitudes, values, and beliefs—that is, resocializing people—is a difficult process requiring proactive initiatives, vigilance, patience, and the recognition that some people will never accept the change.

One of the key methods to help the socialization process is to demonstrate commitment and allocate resources to ILP.

With the resocialization process under way in a law enforcement agency, an operational plan must be developed that articulates the mission and processes of the agency's intelligence capacity. Indeed, the first recommendation of the *National Criminal Intelligence Sharing Plan* addresses the need for an intelligence infrastructure for all American law enforcement agencies regardless of size.[20] Once again, the operational plan will be unique to each agency. While there are certain components that can be modeled, the vast differences between agencies minimize the ability to use a true model operational plan. Instead, assistance should be provided in the process of developing an operational plan that meets the needs and capabilities of each SLTLE agency.

After training has been provided and the operational plan developed and disseminated throughout the agency, the plan should be implemented through a formal notification to all personnel. Regardless of the level of planning, some aspects of the plan simply will not work. The need to obtain feedback from personnel to determine what works and what does not is essential. Plans that do not work should not be viewed as failures but as part of the fine-tuning process to make the plan work as effectively as possible.

[19] Government-sponsored or -endorsed intelligence training can be found on the Intelligence Master Training Calendar at www.ncirc.gov.

[20] Global Intelligence Working Group. *National Criminal Intelligence Sharing Plan. Recommendation 1.* Washington, D.C.: Office of Justice Programs, 2003, page v.

Finally, an important, yet often overlooked tool for effective ILP is a performance evaluation system that recognizes and rewards those individuals who are practicing ILP, as well as a performance assessment of the entire ILP initiative.

If a traditional evaluation system for assessing individual performance is in place that is based purely on quantitative variables—number of citations issued, number of reports written, number of arrests made, number of calls answered, and so forth—then the largely qualitative character of an officer's activities will not be considered in the performance evaluation system. Employees know that organizational success is inextricably tied to the evaluation process; therefore, if success in ILP is going to be achieved, there must be a personnel assessment system that values the practice.

Similarly, the agency's overall success in effectively implementing ILP must be measured, as well. Goals from the operational plan should be stated in a measurable form so that ongoing assessments may adjust the components and modify implementation as necessary to ensure efficient and effective practice of ILP.[21]

Conclusion

A theme that has permeated this discussion is that the introduction of ILP is an exercise in organizational change—a process that is always difficult. While important lessons can be learned from the British National Intelligence Model as well as from other countries that have experimented with ILP, such as Australia, American law enforcement agencies have a significantly different experiential and structural demography that prevents a comprehensive adoption of the model at this point. Most law enforcement agencies in the United States are just beginning to enter the intelligence arena and, therefore, the introduction of ILP must start at a basic level.

In summary, as agencies begin to introduce ILP, a number of important lessons from the organizational change process can help guide this transformation:[22]

- There must be a stimulus for change. There must be a leader with a vision willing to take the first step in challenging the status quo—a change agent. Important, this stimulus must be ongoing and widespread. Given this, a change agent must address two significant elements: 1. vigilance in effort and 2. diversity in focus.
- There must be administrative commitment. The effective administrator must provide ongoing support for a new initiative or program; that is, provide consistency between what is said and what is done. If administrators are not willing to try such things as reallocation of resources, amending policies and procedures, or experimenting with new ideas, then there is little reason to believe the sincerity of their pronouncements. If commitment is not shown to either employees or politicians, the probability for success will be reduced significantly.

[21] One method for monitoring implementation status and success is to use the ILP Self-Assessment Tool prepared as part of the Michigan State University (MSU) "Sustaining Intelligence" training program funded by the U.S. Department of Homeland Security. More information on this tool may be obtained by contacting the MSU School of Criminal Justice Intelligence Program – intellprogram.msu.edu.

[22] Modified from: Carter, David L. *The Police and Community. 7th ed.* Upper Saddle River, New Jersey: Prentice Hall, 2002, chapter 9.

- Any change must be grounded in logical and defensible criteria. While it is somewhat of a cliché, it is worth noting that changing to simply shake up the organization would be dysfunctional rather than productive. If politicians and employees are going to tie their professional fortunes to change, they must be given good evidence to support the change. Moreover, since change consumes resources, it is wasteful to pursue it unless this change is well-grounded in logic and evidence.
- People at all levels must be able to provide input. For a new endeavor, the importance of team-building cannot be understated. Any initiative must have participation from as many people as possible. Not only will this diverse input provide new insights, but team-building provides ownership and, hence, a sense of investment and responsibility by members of the team.
- There must be sufficient time for experimentation, evaluation, and fine-tuning of any new program or idea. When a new initiative is started, it will inherently contain bugs because not every malady or problem can be anticipated, and some ideas will not work as originally conceived. Just because operational problems arise, it does not mean the idea was bad. Administrators, politicians, and employees must be flexible, adjusting their activities until there has been sufficient time to actually evaluate the initiative's true effects.
- Before change is introduced, the plan must be communicated to all persons and their support must be enlisted. Politicians, citizens, and employees alike must understand clearly what is being done and why. There is a tendency to assume that everyone knows and understands the issues of a new endeavor to the same extent as those who are immersed in the planning. Lack of communication is something that can destroy a new activity but, fortunately, is fairly easy to avoid. Remember that communication is more than sending messages; it also involves gaining feedback from the messages. Be cognizant of the issue, recalling the admonishment, "Don't leave people in the dark."
- Change takes time in order to have an effect; major change may take a generation. Americans are generally a short-term and impatient culture. When implementing major organizational and behavioral change such as ILP, a key ingredient is resocialization of employees, citizens, and political leaders. This is inherently a long-term endeavor that requires patience and stamina before positive results can be seen. This sense of time must be instilled in all involved in order to minimize frustration and impatience.
- Recognize that not everyone will buy in to new ideas. For virtually any endeavor that is proposed, we must recognize that complete support is improbable; it is the nature of the human psyche. One must take care, however, to not discount people who oppose new initiatives as being "lost causes" or who are obstructionists. Listen to their concerns—they may raise some valid issues that need to be addressed. If their ideas are used positively, people who oppose a new initiative may become part of the team. Realism dictates, however, that there will still be those who oppose the new system (frequently for personal reasons). In these cases, an administrator's options are: 1. continue to try to convince them to change; 2. Ignore or avoid them; 3. Place employees in an assignment where they can do little damage; 4.

Increase the quality of the relationship with those political leaders and employees who support the initiative; or 5. Tolerate employees or politicians until they resign, retire, or lose their influence.

- Be flexible and open in your view of organizational, philosophical, and programmatic change. No matter how much thought is given to a new initiative and how much effort is invested in planning, we still must recognize that many ideas are losers. We often will not know this until the idea has been tried and evaluated. Even in failure, we can learn something. Unfortunately, given the culture of our political environment, there is a tendency to mandate success—a practice that is tantamount to a search for mediocrity. Both within the police organization and the broader political system, we must maintain the freedom to fail. Without this, creative new ideas will be few and far between.
- The chance always exists that one may be placed on the hot seat from a political perspective. It cannot be denied that any attempt at change carries risks—the more massive the change, the greater the risk. Questioning traditional orthodoxy is not easily accepted by organizations, particularly bureaucratic organizations typically found in government. Proponents of new initiatives must understand that when they are on the forefront of change, their political necks are on the line. In light of this, administrators must be supportive and empathic with the politicians and employees supporting the change.
- Change requires challenging conventional wisdom or, at least, traditions. Debating the value of traditions has not been a politically popular avenue for people to follow, yet it is a necessary one for new ventures to be undertaken. When conventional wisdom is challenged, it will be met with resistance, criticism, and, perhaps, ridicule from doubters, dogmatists, and traditionalists. The astute leader must be prepared to deal with these reactions both personally and professionally. Important, when those who support the leader's ideas of change are attacked, the leader has the obligation to reassert that person's value and contributions to the organization.
- The organization's personnel evaluation system must measure and reward effective involvement in change. Since change requires a personal commitment or investment, there must be some individual benefits that can be accrued from one's participation. Benefits do not have to be monetary, but they can include such things as positive reinforcement, job perquisites, creative freedom, recognition, and awards or commendations. Similarly, awards and expressions of appreciation must also be afforded to those who substantially help usher change. In essence, without rewards, failure is ensured.

ILP holds great potential for American law enforcement. For success, however, the change process to implement ILP must begin at the most fundamental level; it must be deliberate and be tailored to the needs and resources of the agency.

Chapter Annex 6-1: Community Education Handout

Wichita State University Regional Community Policing Institute

The Citizens' Role in Counterterrorism

OBSERVE

- **Be aware of potential attackers who may be conducting surveillance of a target**
  - Behaviors include unusually long observation of a target, including taking notes, photographs, drawing schematics, and similar documentation, recording or monitoring activities, drawing diagrams, making notes on maps, using vision enhancing devices, possessing floor plans or blueprints
- **Be aware when a stranger attempts to gain information about an important place or potential target**
  - Questions may include the schedule and types of deliveries, security, and operations that go "beyond curiosity"
- **Potential attackers may "test security"**
  - These include walking or driving into prohibited areas as an "accident" to determine the type of security or police response
- **Be aware of strangers acquiring unusual quantities and kinds of supplies that could facilitate an attack**
  - This could include law enforcement, military or security supplies, uniforms, identification badges, explosives, weapons, chemicals; false identities, etc.
- **Be suspicious of people who "don't belong" and/or whose behavior is unusual**
  - For example, furtive conduct, the appearance of a "dry run" of an attack, the deployment of assets or supplies to commit the attack.

DOCUMENT

- Jot down descriptions of people and vehicles
  - People – race/ethnicity, sex, age, complexion, height, weight, clothing
  - Vehicles – "CYMBAL" – Color, Year, Make, Body and License
- Make a note of both:
  - The behaviors that drew your attention to the individuals
  - The types of behavior you observed

REPORT

- Call the local police
- Remember…
  - What may seem to be inconsequential may be an important piece of information in a larger puzzle
  - Follow your intuition

Chapter 7:

Civil Rights and Privacy in the Law Enforcement Intelligence Process

Civil Rights and Privacy in the Law Enforcement Intelligence Process

In the process of providing public safety, an inherent responsibility of all law enforcement agencies is the protection of citizens' civil rights—intelligence activities are no exception. One of the most important and fundamental aspects of American life is the freedoms afforded to every citizen through civil rights protections. Despite the perceptions of some, law enforcement officials accept this responsibility. They understand that the protection of civil liberties is just as important as protecting the community from crime and terrorism. While this is a fundamental truth, there is debate on where the line should be drawn with respect to the degree of intrusion allowed to the government on privacy and personal liberty in order to protect America's citizens and the country's sovereignty from external threats, such as terrorism.

One question that has been debated is whether some civil liberties should be reduced to protect America from terrorism. This issue is embodied in the philosophical question of which is more important—protecting Americans from a terrorist attack that may kill thousands of people or protecting individual civil liberties which are the lifeblood of America's most sacred principles? In truth, when examined objectively, there is no unequivocal right or wrong answer to this question because it is philosophical in nature and depends on each individual's personal philosophy and life's experiences.

Fortunately, the working law enforcement officer does not have to deal with this philosophical debate. Rather, the officer must focus on fairly explicit rules that ensure that constitutional protections for citizens remain intact. These include the following:

- Law enforcement cannot collect information on individuals for intelligence activities unless there is a criminal predicate. The law enforcement officer must have reliable, fact-based information that reasonably infers that a particularly described intelligence subject has committed, is committing, or is about to commit a crime.
- All information collected about an individual for intelligence purposes must be done in a manner that is consistent with the law of criminal procedure.
- Collected information cannot be retained indefinitely. Instead, it may be retained only if there is reliable information that provides sustained evidence of a criminal predicate.
- The law enforcement agency has the responsibility of protecting the privacy of information they collect about individuals in the course of intelligence operations. This protection of privacy extends to the dissemination of information only to officials who have the right to know and a need to know the information to further a criminal inquiry.
- When there is no evidence of a sustained criminal predicate, all intelligence records about an individual must be purged (destroyed).

Each issue will be discussed in the coming pages. Because of the importance and emotions on both sides of the debate, there has been a significant increase in the scrutiny of law enforcement intelligence activities to ensure that information is being collected, used, retained, and disseminated in a proper manner. Indeed, many law enforcement agencies have been criticized for their intelligence function, not only because of perceived abuses, but even for the potential for abuse. This last point deserves special attention.

The "potential for abuse" does not mean abuse will occur, rather it means that the opportunity for abuse exists if there are no control factors in place to prevent abuse. The three most salient factors are these:

1. Policy.
2. Training.
3. Supervision and accountability.

Policy establishes the agency philosophy, standards, expectations, and decision-making boundaries of any organizational task and responsibility.

Training provides the knowledge, skills, and abilities to perform any particular occupational task. It specifies the method of performing, what must be done, how it should be done, and what should not be done. It demonstrates the application of policy and typically informs personnel of implications and sanctions if the task is not performed correctly.

Supervision and accountability are organizational mechanisms to ensure that policy is followed and performed in the manner specified by the training. Subordinates' activities and behaviors are monitored by a supervisor to hold the individuals accountable for performing their responsibilities only in a manner that is sanctioned by the agency.

With clearly defined policy, effective training, and responsible supervision, the potential for abuse is dramatically reduced. Two additional factors that can also affect the potential for abuse are systemic to the organization. First is the type of people the agency employs. What are the requirements? What characteristics are sought in new employees? What factors in the selection process shape the type of person who is hired? The clay used to mold the law enforcement officer will significantly influence the effectiveness of policy, training, and supervision.

The second factor is agency leadership. The tone that the leader establishes for the department, as well as expectations of the leader, will be reflected in the behaviors of the employees. A leader who establishes clear expectations of personnel performance and supports those expectations with both rewards and sanctions, as appropriate, will also significantly lower the probability of abuse from occurring.

The potential for abuse exists with all types of law enforcement assignments, not just intelligence. Modern law enforcement seeks to perform all law enforcement responsibilities in a lawful, professional manner. To conclude that the law enforcement intelligence unit or an intelligence fusion center is inherently flawed simply because of the potential for abuse is a fallacious argument.

Privacy and Civil Rights: A Foundation

To begin, some basic definitions are in order. The term privacy refers to individuals' interests in preventing the inappropriate collection, use, and release of personally identifiable information. Privacy interests include privacy of personal behavior, privacy of personal communications, and privacy of personal data.[1] The U.S. Constitution does not explicitly use the word privacy, but several of its provisions protect different aspects of this fundamental right. Although an explicit federal constitutional right to an individual's privacy does not exist, privacy rights have been articulated in different contexts by the U.S. Supreme Court.[2] Privacy protections are numerous and include protection from unnecessary or unauthorized collection of personal information (e.g., eavesdropping), public disclosure of private facts, and shame or humiliation caused by release of personal information."[3]

Recommendations from the National Criminal Intelligence Sharing Plan (NCISP)

Recommendation 6: All parties involved with implementing and promoting the National Criminal Intelligence Sharing Plan should take steps to ensure that the law enforcement community protects individuals' privacy and constitutional rights within the intelligence process.

Recommendation 9: In order to ensure that the collection or submission, access, storage, and dissemination of criminal intelligence information conforms to the privacy and constitutional rights of individuals, groups, and organizations, law enforcement agencies shall adopt, at a minimum, the standards required by the Criminal Intelligence Systems Operating Policies federal regulation (28 CFR Part 23), regardless of whether or not an intelligence system is federally funded.

The term civil rights is used to imply that the state has a role in ensuring that all citizens have equal protection under the law and equal opportunity to exercise the privileges of citizenship regardless of race, religion, sex, or other characteristics unrelated to the worth of the individual. Civil rights, therefore, are obligations imposed on government to promote equality. More specifically, they are the rights to personal liberty guaranteed to all United States citizens by the Thirteenth and Fourteenth Amendments and by acts of Congress. Generally, the term civil rights involves positive (or affirmative) government action, while the term civil liberties involves restrictions on government.[4] As such, civil liberties refers to fundamental individual rights derived from the Bill of Rights, such as freedom of speech, press, or religion; due process of law; and other limitations on the power of the government to restrain or dictate the actions of individuals. Civil liberties offer protection to individuals from improper government action and arbitrary governmental interference.

Privacy, civil rights, and civil liberties have important implications for the law enforcement intelligence process, particularly in light of past abuses. Critics claim that law enforcement has not changed its intelligence practices and that post-9/11 counterterrorism initiatives have made law enforcement agencies even more intrusive. Understanding this concern and the consequent scrutiny of law enforcement intelligence activities by those concerned about civil rights abuses provides an important perspective.

[1] For a comprehensive review of privacy issues, particularly related to various types of electronic information collection, including the Internet and e-mail, see: Lilly, Jacob R. "National Security at What Price?: A Look Into Civil Liberty Concerns in the Information Age Under the USA PATRIOT Act Of 2001 and a Proposed Constitutional Test For Future Legislation." *Cornell Journal of Law and Public Policy.* 12 (Spring) (2003): 447.

[2] Several state constitutions contain explicit language regarding a right to privacy.

[3] NCISP, p. 5

[4] NCISP, p. 6

Increased Scrutiny of Law Enforcement Intelligence: The Challenge of Balancing Civil Liberties and Community Safety

Why is there increased scrutiny and criticism of law enforcement intelligence activities when there is a demonstrable threat of terrorism that can cause catastrophic effects, as evidence by the human, social, and economic impact of 9/11? There appear to be several factors.

Perhaps at the top of the list are abuses in the past. Unfortunately, there is a documented history of law enforcement (and other government agencies) that improperly collected, retained, and/or disseminated information and behavior about individuals whose public statements and actions were controversial, but not criminal. While in many of those instances law enforcement agencies believed that the intelligence target was undermining American sovereignty,[5] the fact remains that the agencies had no authority to collect or retain the information because it was a noncriminal expressive activity. It must be emphasized that law enforcement authority to perform any kind of intelligence activity is based solely in the statutory authority to enforce the criminal law, hence the obligation to follow the law of criminal procedure. As such, collecting information about citizens without an articulable criminal nexus is improper. Law enforcement agencies remain under scrutiny and are still paying the price for past abuses.

A second reason has its foundation in the civil rights revolution that had its birth in the 1960s and is exemplified by Supreme Court decisions under Chief Justice Earl Warren that expanded the application of civil rights and liberties.[6] The era experienced, for the first time, citizens overtly exercising and testing their rights in the form of public demonstrations and civil disobedience on a major scale as part of the civil rights movement and Vietnam War protests. This atmosphere prompted lawsuits by a new breed of activist civil rights attorneys against police departments and corrections agencies. These actions largely brought a long-standing statute, 42 USC 1983—Civil Action for Deprivation of Civil Rights, out of dormancy. Collectively, these events placed a new emphasis on the rights of Americans and added a new lexicon to the American citizenship experience.

A third factor is that many persons do not understand the distinction between law enforcement intelligence and national security intelligence. As such, they assume that actions of the intelligence community may also reflect actions of a local law enforcement agency. For example, the National Security Agency's capture of international telephone conversations or the FBI monitoring a suspicious person entering the United States identified by the CIA as a possible threat are examples of information collection that a state, local, or tribal law enforcement agency will neither perform nor typically have access to. Yet, there often is an assumption that law enforcement agencies are involved in such activities and, as such, must be monitored in order to protect civil rights.

Fourth, the 24-hour news cycle and evolving news outlets have also contributed to the increased scrutiny of law enforcement operations, including intelligence.

[5] This was particularly true with the fear of communism and members of the Communist Party in the United States, and their sympathizers during the 1950s and 1960s.

[6] As an example of how law enforcement adapts to change, when many of the Warren Court decisions expanded civil rights protections for the criminally accused, there was a loud cry by many that the Court was "handcuffing the police" and that this would lead to more crime. (The *Miranda* v. *Arizona,* 348 U.S. 436 (1966), decision was a particularly significant decision influencing the sentiment at that time.) Sentiments ran so strong that "Impeach Earl Warren" billboards appeared all across America. As new policy and training were put in place in law enforcement agencies, and particularly as new officers were hired, most of whom were college educated, the Warren Court decisions were embraced as "simply the rules we have to follow." It became, in a comparatively short amount of time, a nonissue.

Notwithstanding some changes in the print media, the evolution of the electronic media—both broadcast and Internet—have contributed significantly to the scrutiny of government activities. The increased electronic outlets have added spirited competition to news organizations, increasing competition to capture news stories that will pique the interests of consumers and meet the need for content on a 24/7/365 basis. As a result of these factors, there is more competition for controversial stories that will uniquely resonate with consumers. Moreover, because of the need to fill every hour with content, stories receive greater depth and are often repeated many times throughout a day. The consequent effect is a bombardment of news on a given topic that gives an impression of an issue that is somewhat disproportionate.

A fifth factor contributing to the scrutiny of law enforcement intelligence appears to be the increased partisanship among both elected officials and the electorate. This has developed a dichotomous environment on virtually every social, political, and economic issue where attitudes and behaviors tend to be drawn exclusively along partisan lines with extreme criticism and little conciliation toward opponents' views. Virtually any factor at issue—including law enforcement intelligence—can be caught in some type of partisan dispute.

Next, the growth of civil rights advocacy groups[7] has also clearly influenced public scrutiny of law enforcement. These groups identify incidents and trends that heighten their concerns about privacy protections. Through press releases, white papers, public presentations, and lawsuits, these groups publicize government behaviors they feel are improper. While not always publicly popular, these groups nonetheless bring the issue to the table to open a public debate and, oftentimes, seek to change public policy through litigation or political influence.

Finally, the movement of "open government" invites public scrutiny. Largely beginning in the 1970s with Watergate, a grassroots movement known as "open government" began slowly. The essential concern was that public officials were abusing the authority of their offices and had the obligation to demonstrate that actions of government officials were lawful and in the best interests of all citizens. The movement continued to gain widespread support with government officials slowly responding. Open records acts and open meetings acts were increasingly being passed, federal and state freedom of information acts (FOIA) were expanded, and judicial interpretations of FOIA legislation became increasingly broad. As a result of public demands, elected officials were required to issue financial disclosure statements and public watchdog groups began issuing reports on various actions of officials at all levels of government. Essentially, the movement seeks accountability in government.

Collectively, these factors have contributed to the public expectation of the right to know what's going on in government activities and have increasingly sought explanations and accountability through lawsuits. In recent years, fueled by the growth of the Internet and 24-hour news channels, accountability has grown to second-guessing many government decisions. For example, the recent publication of some classified documents by the media is one artifact

[7] See: Bill of Rights Defense Committee, www.bordc.org; American Civil Liberties Union, www.aclu.org; Electronic Frontier Foundation, www.eff.org; or Center for Democracy and Technology, www.cdt.org. Each has particular areas of concern about privacy, civil rights, and civil liberties as related to all types of governmental policy and actions, not just law enforcement. Each organization provides an important watchdog role, albeit oftentimes with controversy. Of course, an important watchdog or advocacy organization that stimulates controversy is probably not taking much action.

of this movement. As a general rule, mainstream open government advocates recognize the need to maintain secrecy of "content;" however, they expect openness as it relates to processes. That is, the public recognizes the need to keep explicit information confidential, but wants assurances that information is being collected, retained, used, and shared in a manner that protects their rights. These ideals affect law enforcement intelligence activities at all levels of government and necessitate the need to have open processes and privacy policies in place. The ideal that government is "of the people, by the people, for the people" is being increasingly demanded, and must be taken seriously by policymakers. Intelligence is no exception. Indeed, the inherent threat-based confidential nature of the intelligence process invites even more scrutiny. As evidence of this, the American Civil Liberties Union (ACLU) has stated:

> No American is beneath the law's protection. And no one … is above the law's limits. Our system of checks and balances must be maintained if American democracy is to be preserved.[8]

Similarly, the Bill of Rights Defense Committee has stated as its mission…

> ... to promote, organize, and support a diverse, effective, nonpartisan national grassroots movement to restore and protect civil rights and liberties guaranteed to all U.S. residents by the Bill of Rights. Our purpose is to educate people about the significance of those rights in our lives; to encourage widespread participation; and to cultivate and share the organizing tools and strategies needed for people to convert their concern, outrage, and fear into debate and action to restore Bill of Rights protections.[9]

It is important to recognize the need for accountability and the ramifications on a law enforcement agency if accountability is dismissed or ignored. Collectively, these factors represent a significant sociopolitical change in American life and, consequently, emerging law enforcement intelligence initiatives.

Consent Decree Defined

A consent decree is a settlement that is contained in a court order. The court orders injunctive relief against the defendant and agrees to maintain jurisdiction over the case to ensure that the settlement is followed. (Injunctive relief is a remedy imposed by a court in which a party is instructed to do or not do something. Failure to obey the order may lead the court to find the party in "contempt of the court" and to impose other penalties.) Plaintiffs in lawsuits generally prefer consent decrees because they have the power of the court behind the agreements. Defendants who wish to avoid publicity also tend to prefer such agreements because they limit the exposure of damaging details. A court will maintain jurisdiction and oversight to make sure the terms of the agreement are executed.

Lawsuits and Decrees Related to Law Enforcement Intelligence Activities

Perhaps the most controversial area of information-gathering by law enforcement agencies deals with cases where individuals are involved in "expressive activity" that is often controversial, even extreme. People who express extreme views related to animal and environmental protection, antigovernment sentiments, anarchy, white supremacy, or any other belief system are often viewed as a threat, even though their specific actions are not criminal. Indeed, evidence has shown that there is an area of behavior between "extreme" and "criminal" that is dynamic and often difficult to define. The distinction between making a firm statement of belief and making a threat is often a matter of interpretation. In the post-9/11 environment we, as a country, have become hypersensitive about threats, which appears to be leading toward less tolerance of diverse, even extreme, views. The challenge for law enforcement is to make that distinction. The intelligence process seeks to collect information about individuals who pose threats to the community, but the behavior a law enforcement officer may define as having a criminal nexus may be behavior a civil libertarian calls a freedom of expression.

The need to understand the subtleties in these distinctions is important to ensure that law enforcement officers are performing their function lawfully while simultaneously protecting the community from harm. Unfortunately, as noted previously, there is a legacy of law enforcement abuses where agencies have collected information on individuals simply as a result of their political beliefs.[10] While law enforcement agencies have changed significantly during the past several decades, this legacy is difficult to overcome.

The Supreme Court's broad interpretation of the First Amendment-based right of association, as originally defined in *NAACP* v. *Alabama*[11] and most recently in *Boy Scouts of America* v. *Dale*,[12] can protect groups engaged in First Amendment conduct from unjustified political or religious surveillance that causes them cognizable harm. As a result, the state's interest in protecting the community may, in many instances, be outweighed by the protections afforded to expressive activity found in these court decisions. While limitations on surveillance cannot unduly restrict the government's ability to conduct necessary information-gathering, requiring a reasonable suspicion of criminal activity before investigating First Amendment activity can help achieve a suitable balance between public safety interests and associational rights.[13] This evidence of criminal activity, that is, the criminal predicate, establishes the compelling state interest that justifies law enforcement intelligence inquiries.

Two particularly noteworthy court cases concern expressive activity and the law enforcement intelligence function. Understanding the lessons learned from these cases provides insight useful for decision-making related to information collection and retention.

[10] See: Chevigny, Paul G., "National Security and Civil Liberties: Politics and Law in the Control of Local Surveillance." *Cornell Law Review* 69 (April) (1984): 735.

[11] *NAACP* v. *Alabama,* 357 U.S. 449 (1958).

[13] Fisher, Linda E., "Guilt by Expressive Association: Political Profiling, Surveillance and the Privacy of Groups." *Arizona Law Review* 46 (Winter) (2004):. 621.

New York:

Handschu v. *Special Services Division,* 605 F. Supp. 1384(S.D.N.Y. 1985), affirmed, 787 828 (2d Cir. 1986). In the 1960s, the New York Police Department (NYPD) increased surveillance and other investigations to include:

> …more undercover and other surveillance of "groups that because of their conduct or rhetoric may pose a threat to life, property, or governmental administration"; of "malcontents"; and of "groups or individuals whose purpose is the disruption of governmental activities" for the peace and harmony of the community.[14]

While many activists maintained that the NYPD was collecting information on various activists who held nontraditional views but were not committing crimes, they had difficulty demonstrating evidence of this.

During a 1971 trial of 21 Black Panthers charged with attempting to blow up several police stations, information made public through the discovery process, evidence, and testimony revealed that the NYPD kept dossiers on groups defined as radical and activist, as well as others including gay groups, educational reform advocates, and some religious and civic groups.[15] As a result of this new information, the Handschu case was filed as a class action lawsuit against NYPD surveillance activities[16] by 16 individuals affiliated with various ideological associations and organizations.

> In the suit, plaintiffs contended that "informers and infiltrators provoked, solicited, and induced members of lawful political and social groups to engage in unlawful activities"; that files were maintained with respect to "persons, places, and activities entirely unrelated to legitimate law enforcement purposes, such as those attending meetings of lawful organizations"; and that information from these files was made available to academic officials, prospective employers, and licensing agencies and others. In addition, plaintiffs identified seven specific forms of police conduct: 1. the use of informers; .2. infiltration; 3. interrogation; 4. overt surveillance; 5. summary punishment; 6. intelligence-gathering; and 7. electronic surveillance. The complaint alleged, inter alia, that these police practices had had a "chilling effect" on the exercise of freedom of speech, assembly, and association; that they also violated constitutional prohibitions against unreasonable searches and seizures; and that they abridged rights of privacy and due process. The suit requested declaratory and injunctive relief to curtail these practices.[17]

Police officials conceded that their activities included information-gathering for the intelligence process and was "not limited to investigations of crime, but related to any activity likely to result in 'a serious police problem.'"[18] Essentially, the police department asserted that it had a need to collect information about people and their activities which, although absent a criminal predicate at the time, held a demonstrably strong potential for criminal activity and the information collection was necessary for community safety.

[16] Specifically identified for these activities was the Special Services Division of the NYPD Intelligence Bureau.

[17] Koehnlein, Bill. *The History of the Handschu Decree.* New York Civil Liberties Union, 2003.

[18] Handschu, Ibid. p., 1396.

The consent decree in *Handschu* v. *Special Services Division*, which included what is referred to as the Handschu Settlement agreed to in 1985, governs NYPD investigations of groups or individuals engaging in various forms of political activity. The settlement established the Handschu Authority[19] to oversee the activities of the Public Security Section (PSS) of the Intelligence Division.[20] The NYPD could not engage in any investigation of political activity that the settlement defined as "the exercise of a right of expression or association for the purpose of maintaining or changing governmental policies or social conditions."[21] The settlement authorized the PSS to commence an investigation only after the NYPD established the following:

> … specific information [that] a person or group engaged in political activity is engaged in, about to engage in, or threatened to engage in conduct which constitutes a crime.[22]

Information obtained during investigations of individuals, groups, or organizations could be collected or maintained only in conformity with the settlement. Information "from publicly available sources" could not be maintained with the PSS. Officers were allowed to collect only certain, general information about a planned noncriminal event "in order to preserve the peace, deploy manpower for control of crowds, and protect the right[s] of individuals to freedom of speech and assembly."[23] The settlement prohibited developing a file on an individual or group based solely on that individual's or group's "political, religious, sexual, or economic preference." In sum, these are the five key elements of the Handschu consent decree:

1. Political groups can be investigated only when suspected criminal activity is alleged.
2. The NYPD must obtain a written authorization from a three-person panel—the Handschu Authority—after presenting its suspicions.
3. The NYPD is prohibited from videotaping and photographing public gatherings where there is no indication that any criminal activity is present.
4. The NYPD must obtain written agreement from any agency with which it intends to share this information, acknowledging that it will abide by the terms of the Handschu Agreement.
5. The court ordered the panel to prepare annual reports, open to the public, demonstrating the NYPD's requests for surveillance and the number of requests the panel granted.

In light of the threat environment after the 9/11 attacks—an environment which, of course, was particularly pronounced in New York—the NYPD sought and obtained modification of the consent decree.[24] While the NYPD requested fairly broad latitude for information collection about activities of persons who were likely political extremists, the court's modification of the consent decree was narrower, yet still permitting some expansion of the original restrictions. The court acknowledged that there was a change in the public safety environment in New York following the 9/11 attacks and modified the Handschu consent decree to be consistent with the FBI Guidelines[25] issued by the U.S. Attorney General.

[19] The Handschu Authority, similar to an oversight board, consisted of the First Deputy Commissioner of the Police Department, the Deputy Commissioner for Legal Affairs, and a civilian member appointed by the mayor for a term that was revocable at will.

[20] The Public Security Section (PSS) of the NYPD Intelligence Division was the new name of what had been the Special Services Division of the Intelligence Unit when the original class action lawsuit was filed.

[22] Ibid.

[23] Ibid., p. 760.

[24] Steigman, Ibid. p. 746.

[25] The Guidelines are available at: www.justice.gov/ag/readingroom/guidelines.pdf.

> The FBI Guidelines provide for three graduated levels of investigative activity: 1. [permit] checking initial leads [when] information is received of such a nature that some follow-up as to the possibility of criminal activity is warranted; 2. a preliminary inquiry [is] authorized when there is information or an allegation which indicates the possibility of criminal activity and whose responsible handling requires some further scrutiny beyond checking initial leads; and 3. a full investigation [is] authorized when facts or circumstances reasonably indicate that a federal crime has been, is being, or will be committed.[26]

The modification authorized by the court was viewed as a "mixed bag" by both the NYPD and civil libertarians; hence, one may conclude that it was a reasonable compromise. The Handschu Authority for oversight was retained in the modified consent decree. Another motion related to the consent decree requested the court to enjoin enforcement of New York City Police Department Interim Order 47 which established procedures and guidelines for the police department's use of photographic and video equipment, arguing that it was incompatible with NYPD guidelines, violated the plaintiff's First Amendment rights, and violated previous Handschu judgments.[27]

In February 2007, the court rejected the motions on the grounds that the investigations in question are not politically motivated. The court also stated that, since Order 47 did not constitute a First Amendment violation, it would not grant the plaintiffs' injunctive relief. Later in the year, the court further modified its February decision on the enforceability of the consent decree, requiring that plaintiffs show a systemic pattern of violations before the court will enjoin any police department policy.

The lessons learned from Handschu are that, regardless of the threat environment facing a community, surveillance of individuals by a law enforcement agency—including photographs, video, and collecting identities—still requires a criminal nexus. While some flexibility may be given in the post-9/11 environment, the constitutional guarantee of free speech and the freedom of expression remain paramount and must be respected by law enforcement agencies.

Denver:

American Friends Service Committee, et al v. *City and County of Denver,* 2004 U.S. Dist. LEXIS 18474. On March 11, 2002, the ACLU of Colorado publicly disclosed documents demonstrating that the Denver Police Department's (DPD) Intelligence Bureau had been monitoring and recording the peaceful protest activities of Denver-area residents and keeping files on the expressive activities of advocacy organizations about whom there was no evidence of criminal activity. In a letter dated March 11, 2002 to the Denver mayor, the ACLU asked the mayor to take immediate steps to stop the DPD's practice of keeping files on peaceful protest activities and to take four additional actions:

1. Prohibit the police from sharing their criminal intelligence information with other law enforcement agencies.
2. Order a full public accounting about the criminal intelligence information that would answer a number of questions.

[26] *Handschu* v. *Special Services Division,* 71 Civ. 2203 (Feb. 11, 2003) Slip Op. at 33–34.

[27] www.nyclu.org/node/1084, "*Handschu* v. *Special Services Division*"

3. Notify individuals named in the criminal intelligence information and permit them to review the information about them in the files.
4. Preserve the criminal intelligence information because it might be evidence in any forthcoming lawsuits. [28]

At a March 13, 2002 news conference, the Denver mayor made the following statement:

> After a preliminary review of the policy and reviewing a sampling of the files that have been kept on individuals and organizations, it is our conclusion that there was an overly-broad interpretation of the policy that resulted in cases where it may not have been justifiable to include certain individuals or organizations in our· intelligence-gathering activities.[29]

The plaintiffs filed a class action civil rights suit[30] against the DPD for violating U.S. and Colorado constitutional protections by not adhering to police department intelligence records policy and failing to manage its criminal intelligence records system in line with the guidelines in 28 CFR Part 23. The Plaintiffs' Class Action Complaint for Declaratory and Injunctive Relief[31] initially filed on March 28, 2002, challenged a practice of the Denver Police Department of monitoring the peaceful protest activities of Denver-area residents when there was no evidence of criminal activity; maintaining criminal intelligence records files[32] on...

> …the expressive activities of law-abiding individuals and advocacy organizations, many of which the Department has falsely branded with the label of "criminal extremist;" and providing copies of certain Spy Files to third parties.[33]

The complaint further alleged that the DPD had…:

> …singled out and selected the Plaintiffs and the plaintiff class for surveillance and monitoring based upon their advocacy of controversial or unpopular political positions and opinions.[34]

The plaintiffs also expressed concern that individuals would be less likely to join a rally or to participate in other expressive activities if they feared being photographed by the police or that their identities would appear in police criminal intelligence files. The complaint goes on to state that the criminal intelligence records on the plaintiffs…

> … contain nothing but identifying information and facts that show that the targets of the surveillance are engaged in peaceful and legitimate educational activities, political expression, petitioning the government, and political association. The pages contain no facts that suggest that any of the named plaintiffs are involved in criminal activity.
>
> The Department has recorded false and derogatory information about the Plaintiffs. It has mischaracterized the goals and purposes of the Plaintiffs' expressive activity and smeared their personal, political, and professional reputations.
>
> The Department has disseminated the information in the Spy Files to third parties."[35]

[32] The criminal intelligence files in the complaint and subsequent news releases by the ACLU were referred to as the "Spy Files."

[33] American Friends Service Committee, Ibid. p. 2.

[34] Ibid.

[35] Ibid. p. 6.

Supporting their claims, the plaintiffs demonstrated practices in the department, including memoranda to officers from supervisors, that explicitly contradicted the DPD's criminal intelligence records policy, 28 CFR Part 23 and/or constitutional standards. One memorandum from the Intelligence Bureau commander to subordinates stated, in part:

> Please purge, i.e., shread, [sic] toss, or take home, ALL references and files earlier than a 1994 date. The heart of an Intelligence Bureau lies with the ability to maintain integrity of all files and references in the likely event of litigation by political or subversive groups.[36]

In light of the evidence presented in this case, while not admitting "…any fault or liability to Plaintiffs, nor any violation of law,"[37] the City of Denver entered into a Settlement Agreement with the plaintiffs. As part of the Settlement Agreement[38] the department established a new, more restrictive intelligence records policy,[39] created an oversight board, purchased a new computerized intelligence records system, and agreed to semiannual audits of compliance with the Settlement Agreement for 5 years.

The lessons learned from this case reinforces the requirement of a criminal predicate. Beyond this, the Denver case illustrates 1. The importance of supervision to enforce currently existing policy, 2. The importance of using the right-to-know and need-to-know standards of dissemination, and 3. The importance of complying with the 28 CFR Part 23 guidelines.

Implications from Handschu (New York) and American Friends (Denver)

At the heart of civil rights issues related to law enforcement intelligence are collection, retention, and dissemination of information which identifies individuals and organizations whose expressions and expressive activities pose a threat to public safety and security. The proverbial bottom line that is clear from these two cases reinforces the premise that any collection, retention, and dissemination of such information may occur when there is nexus between the behavior and a crime. Simply unpopular, unusual, or extreme expressions, along with assumptions that persons making such expressions may eventually lead to a crime, do not alone meet the test. There must be demonstrable evidence of a crime. Law enforcement officers should be trained to understand the issues associated expressive activity and a criminal predicate.

It is also clear from these cases that simply having a policy on criminal intelligence records is not enough, even if the policy is compliant with 28 CFR Part 23. There must also be supervision to ensure that the policy is followed. Law enforcement personnel must have explicit direction on their information-collection activities, and that direction must be consistent with standards that are characteristic of both professional good practice and the protection of civil rights and liberties. Similarly, it is important to reinforce that the dissemination of any such criminal intelligence information must meet the right-to-know and need-to-know standards.

[39] www.aclu-co.org/spyfiles/Documents/SettleAgreement.pdf

[40] www.aclu-co.org/spyfiles/Documents/SettleAgreementExh1.pdf

These factors will be discussed in detail later. The important point to note is the role these factors played in these two important cases and the subsequent effects which resulted when the standards were not met.

Civil Rights Example: First Amendment Free Expression—Two Views

A common point of conflict over civil rights is found in actions related to free expression by persons involved in protests or demonstrations. Civil rights advocates maintain that their demonstrations are expressive activity protected by the First Amendment. As such, it is improper for law enforcement agencies to collect and retain information about persons who are involved in planning and participating in demonstrations, as well as about advocates of those individuals.

Law enforcement agencies maintain that the only information they collect and retain is that related to persons who commit crimes or pose threats to community safety. Civil rights advocates respond that minor crimes, such as trespassing or minor property destruction, are of such low magnitude that they do not counterbalance the violation of the broader First Amendment guarantees and that law enforcement uses minor crimes as an excuse to collect information about those with whom it disagrees. Law enforcement counters that it has the responsibility to protect the property of all victims and that any demonstration that permits property destruction can quickly spin out of control and result in even greater threats. The debate continues, often with opposing arguments, as illustrated in Table 7-1.

Table 7-1: Counterpositions on First Amendment Information Collection

Position of Protestors	Response of Law Enforcement
1. Government should not attempt to regulate expressive activity, no matter how repugnant, as long as the activity is done without committing a crime.	1. Often, it is difficult to determine, during the course of a protest or rally, if a crime is being committed or going to be committed. Anarchists, for example, have frequently spray-painted private property or have broken windows during the course of a protest. Spray-painting the property of another is "destruction of property," not an expressive activity.
2. Expressive activity is a fundamental right that is essential to the fabric of American life. As such, law enforcement should take no action to repress expressive activity.	2. Law enforcement has the obligation to protect the rights of all Americans, not just those engaged in expressive activity. As such, law enforcement agencies have the responsibility to take reasonable restrictive actions to protect the rights of others as well as to maintain community safety and security.
3. There should be no expressly defined "protest zones" that favor one group over another.	3. Some groups have a history of committing crimes during a protest, more so than others. Protest zones are used only in those cases where there is a history of crime or information that reasonably suggests a crime will be committed during a protest.
4. Law enforcement should not use pens, barricades, or force to regulate expressive activity.	4. In some cases, pens and barricades are used to protect the protestors or to prevent a conflict between protestors and those opposed to the group's expressive activity (e.g., Ku Klux Klan rallies).
5. Law enforcement should not use surveillance and infiltration of political or social groups involved in expressive activity.	5. Where there is reasonable suspicion to believe a crime will occur, the use of surveillance and infiltration is an accepted and lawful method to gather evidence for developing a criminal case for prosecution.
Believe these actions are required to protect civil rights	Balance is required to protect both	Believes this information is required to protect community

These are essentially diametrically opposed positions on the same issue. Which positions are correct? Like most issues where there are clear dichotomous perspectives, truth is somewhere in the middle of the continuum. The reality is that the burden typically falls on the law enforcement agency to show that its actions and the information collected was done in a manner that protects both civil rights and community safety. To minimize allegations of negligence and impropriety, as well as to demonstrate good faith actions by the law enforcement agency, a number of action steps could be performed, such as these:

1. Review the evidence and determine if there is trustworthy information on which a reasonable person would conclude that a crime may occur.
2. Use the least-intrusive means of information collection.
3. Provide specific direction on the types of criminal behavior that is suspected and types of information that needs to be collected to support the criminal predicate.
4. Ensure that supervision is present to monitor the law enforcement officers' information-collection activities.
5. When possible and appropriate, communicate with the protesting group to express concerns about crimes and the procedures that will be followed should a crime occur.
6. Ensure that all personnel understand the policy for information collection.
7. Ensure that all law enforcement activities are documented and explained as a matter of record.
8. Provide information and training to officers about the elements of crimes for which there is specific concern.
9. When the demonstration is over, review all information collected and destroy all information that is not needed to support a criminal case.
10. Prepare an after-action report that reviews processes, issues, and concerns—preferably with assistance from legal counsel—and amend processes that may place the agency in legal jeopardy.

The Need for More Controls of Intelligence Inquiries than Criminal Investigations[40]

At the heart of the diverse reasons why information collection by law enforcement agencies for the intelligence process is met with skepticism and suspiciousness is the belief by many that intelligence inquiries are more dangerous to liberty than criminal investigations. An intelligence inquiry attempts to assess the presence of a threat and the determination if a threat is real, unlike a criminal investigation that occurs after a crime has been discovered. Moreover, intelligence inquiries often engage First Amendment expression, they are more secretive, and they are less subject to after-the-fact scrutiny. Civil rights activists, therefore, argue that intelligence activities should require stronger compensating protections and remedies for violations. Three primary factors support these notions.

First, intelligence inquiries are broader. While they are limited by the criminal code, their breadth goes beyond crimes that have been committed and moves into the arena of threats. An explicit concern of civil rights activists is when law

[40] Based on a policy statement posted by the Center for Democracy and Technology, entitled "Bill Introduced to Reform FBI Data Demands", which can be found at www.cdt.org/publications/policyposts/2007/5

enforcement collects information about First Amendment activities. There often is disagreement about the interpretation of language and behaviors and whether the activity is the exercise of free speech or the exhortation of a threat.

Second, intelligence inquiries are conducted in much greater secrecy than criminal cases, even perpetual secrecy. When a person is accused in a criminal case, normally that person can make public statements about his or her innocence and publicly rebut the criminal assertions in open court proceedings. Moreover, in a criminal investigation the suspect is often aware of the investigation while it is underway. Similarly, most searches in criminal cases are carried out with simultaneous notice to the target. In intelligence cases, by contrast, the target and the individuals scrutinized because of their contacts with the target are rarely told that the government is collecting information about them. While the presumption of evidence is clearly respected in a criminal investigation, it is sometimes argued that there is a presumption of guilt in an intelligence inquiry. This perspective must change.

Third, in a criminal investigation almost everything the government does is ultimately exposed to scrutiny. A prosecutor knows that, at the end of the criminal process, his or her actions will be in public. If the prosecutor is overreaching or is on a fishing expedition, it will be aired with the prosecutor facing public scrutiny, ridicule, and perhaps disbarment.[41] That is a powerful constraint. Similarly, a police department must ultimately account to the public for crime rates and disorder in a community. Most intelligence inquiries never result in a trial or other public proceeding. The evidence may be used clandestinely. Sometimes the desired result is the mere sense that the government is watching.

Intelligence inquiries are broader, more secretive, and subject to less after-the-fact scrutiny; therefore, protections must be built in at the beginning. One important protection is a federal regulation related to criminal intelligence records that are held by state, local, and tribal law enforcement agencies.

Maintaining Privacy in the Intelligence Process

The concept of privacy is broad, encompassing different personal values and interests. A number of privacy-related factors become relevant in the current law enforcement intelligence environment and are intended to address "all crime and all threats."[42] Privacy interests may be characterized as representing a diverse array of issues, such as privacy of a person's beliefs, personal behavior, personal communications, personal attributes (such as health or handicaps), and personal data (information privacy). Private information includes not only information that a law enforcement agency may be collecting about a person's possible involvement in a criminal act, but also information relating to the following:

- Name, address, telephone number, or e-mail
- Race, national, or ethnic origin
- Religion
- Gender
- Marital status
- Fingerprints, blood type, or DNA

[41] This occurred with North Carolina prosecutor Michael Nifong in the allegations of sexual assault against Duke University lacrosse players. For more information, see "Duke Lacrosse Prosecutor Disbarred." CNN. www.cnn.com.

[42] Portions of this discussion are based on information in: National Criminal Justice Association (NCJA). *Justice Information Privacy Guide*. Washington, D.C.: NCJA, 2002, 12–13.

- Financial status, history, or credit condition
- Psychiatric or psychological conditions and history
- Criminal history
- Age
- Sexual orientation
- Education
- Medical history or conditions
- Employment history, including employment dispositions
- Identifying number, symbol, or other character assigned to identify a person (such as a social security number, driver's license number or university student identification number).

In the course of an intelligence inquiry, the law enforcement agency will collect different types of personal information, but has the obligation to maintain the privacy of the information regardless of whether the person is an intelligence target, witness, informant, or information provider (such as a citizen).

> Privacy of personal data (information privacy) is described as when, how, and to what extent you share personal information about yourself. Information privacy involves the right to control one's personal information and the ability to determine if and how that information should be obtained and used. It entails restrictions on a wide range of activities relating to personal information: its collection, use, retention, and disclosure.[43]

The law enforcement organization has an obligation to protect the privacy of all persons about whom the agency collects personal identifying information, including those suspected of committing crimes. Two primary methods are used: security and confidentiality.

Security of personal information means that mechanisms and processes have been put in place to ensure that there is no unauthorized access to private information. Whether the private information is in a computer system or in paper records, there must be an adequate mechanism in place to ensure that the information is not obtained by persons who do not have lawful access to them.

Confidentiality, particularly as related to information sharing, includes behaviors and processes that seek to prevent unauthorized disclosure of the information to third parties. After private information has been collected, the custodian of the information has the obligation to protect it from being shared with others unless there is a bona fide reason for a third party to receive the information. Once again, the standard of sharing personal information to others based on their right to know and need to know the information. This is an illustration of processes to ensure confidentiality. Moreover, there is an expectation that those who receive private information will maintain the confidentiality of personal information entrusted to them. Confidentiality is about limiting access to personal information 1. To those having specific permission for access[44] to the records and 2. Preventing its disclosure to unauthorized third parties.

[43] NCJA, 2002, p. 12.

[44] "Permission to access" private records can include consent by the individual and permission as provided through lawful regulatory procedures and/or the legal process.

To maximize privacy protection, law enforcement agencies should ensure that privacy protections are in place. The *National Strategy for Information Sharing* emphasized this by establishing core privacy principles that all agencies are required to adopt. These are:

- Share protected information only to the extent that it is terrorism information, homeland security information, or law enforcement information related to terrorism.
- Identify and review the protected information to be shared within the Information Sharing Environment (ISE).
- Enable ISE participants to determine the nature of the protected information to be shared and its legal restrictions (e.g., "this record contains individually identifiable information about a U.S. citizen").
- Assess, document, and comply with all applicable laws and policies.
- Establish data accuracy, quality, and retention procedures.
- Deploy adequate security measures to safeguard protected information.
- Implement adequate accountability, enforcement, and audit mechanisms to verify compliance.
- Establish a redress process consistent with legal authorities and mission requirements.
- Implement the guidelines through appropriate changes to business processes and systems, training, and technology.
- Make the public aware of the agency's policies and procedures, as appropriate.
- Ensure that agencies disclose protected information to nonfederal entities—including state, local, tribal, and foreign governments—only if the nonfederal entities provide comparable protections.
- State, local, and tribal governments are required to designate a senior official accountable for implementation.[45]

Protecting privacy is accomplished through the implementation of a privacy policy,[46] along with effective training and supervision.

A privacy policy is a written, published statement that articulates the policy position of an organization on how it handles the personally identifiable information that it gathers and uses in the normal course of business. The policy should include information relating to the processes of information collection, analysis, maintenance, dissemination, access, expungement, and disposition.

The purpose of a privacy policy is to articulate publicly that the agency will adhere to legal requirements and agency policy determinations that enable gathering and sharing of information to occur in a manner that protects personal privacy interests. A well-developed and implemented privacy policy uses justice entity resources wisely and effectively; protects the agency, the individual, and the public; and promotes public trust.[47]

State, local, and tribal law enforcement (SLTLE) agencies have a mandate to establish a privacy policy not only from the NCISP, but also to participate in the ISE. It is clear that there are unequivocal expectations for law enforcement agencies

[45] *National Strategy for Information Sharing*. Washington, D.C.: Executive Office of the President, 2007, 27–28.

[46] The *Privacy Policy Development Guide* may be downloaded at it.ojp.gov/documents/Privacy_Guide_Final.pdf.

[47] Global Justice Information Sharing Initiative. *Privacy Policy Development Guide.* Washington, D.C.: Bureau of Justice Assistance, Office of Justice Programs, U.S. Department of Justice, 2006, 4–1.

to meet national professional standards for privacy and civil rights protections. As such, the obligation is to not only implement the policy, but to also provide training and supervision to ensure that the policy is effectively applied.

28 CFR Part 23 – Criminal Intelligence Operating Policies

As is evident from the preceding discussions, at the heart of the civil rights issues is whether law enforcement agencies are collecting and retaining personal identifying information of persons who are involved in expressive activity. Often, it is difficult to distinguish between expressive activity and activity that is a precursor to a crime. If certain behaviors suggest that a crime is being planned, the law enforcement agency has the responsibility to collect information to verify this and take action, as appropriate. It is not always immediately clear if a crime is in the preparatory stage, so criminal intelligence records are retained until the veracity of the threat is verified or dismissed. Because of this fine line, guidelines must be established as a matter of policy to ensure the information is weighed and appropriately retained or destroyed, depending on what additionally collected information suggests about criminal liability.

The guiding regulation for managing a criminal intelligence records system for SLTLE agencies is the federal regulation entitled Criminal Intelligence Systems Operating Policies codified in the Code of Federal Regulations at 28 CFR Part 23.[48] The regulation was created largely as a response to past practices of law enforcement agencies collecting and retaining information about people based on their activities and/or expressed nontraditional beliefs that were often extreme or unpopular, but not criminal. The regulation seeks to provide procedural guidance for the management of criminal intelligence records systems that is consistent with constitutional guarantees. The federal government, however, cannot mandate this regulation to independently governed state and local governments. Nevertheless, adoption of the regulation is a condition that SLTLE agencies must agree to in order to receive certain federal grant funds. If a local police department, for example, accepted federal funds to purchase a computer system that would be used to maintain a criminal intelligence records system, adoption of 28 CFR Part 23 is a requirement for receiving the funds.

This regulation was the only clear guideline for managing criminal intelligence records and it became the de facto standard that most agencies adopted, whether federal funds were received or not. Broad adoption of the regulation gained further momentum when the NCISP recommended that all law enforcement agencies adopt 28 CFR Part 23. As a result, the regulation became a recognized national professional standard.

Although agencies that embraced the regulation understood the regulatory language, it was not easily translated to policy. Moreover, the regulation had some operational gaps. The Law Enforcement Intelligence Unit (LEIU), therefore, developed a model operational policy and procedures that translated both the language and spirit of the regulation to be more easily adopted by a law enforcement agency. This practical interpretation of 28 CFR Part 23 is known as the LEIU File Guidelines.[49]

[48] The Bureau of Justice Assistance has developed an online training about 28 CFR Part 23 which can be accessed through the secure National Criminal Intelligence Resource Center (www.ncirc.gov) web site, accessible through HSIN Intel, LEO, and RISS.

[49] The LEIU File Guidelines can be found at it.ojp.gov/documents/LEIU_Crim_Intell_File_Guidelines.pdf.

The LEIU File Guidelines represent an important step in the management of criminal intelligence records systems to ensure constitutional integrity. Based on litigation, experience, and concern expressed by civil libertarians, the management of a criminal intelligence records system must also consider elements beyond this practical interpretation of 28 CFR Part 23; therefore, the current best practice is an amalgamation of different sources relying on a conservative integration of accepted practice and regulation. Those sources include 28 CFR Part 23, the LEIU File Guidelines, established law of criminal evidence and procedure, and precedent from lawsuits arising from civil rights lawsuits involving criminal intelligence records. It should be noted that this information reflects general practice, not unique state laws which may have different effects. The decision tree in Figure 7-1 is a visual representation of the following discussion concerning factors that should be considered before entering information into a criminal intelligence record system. This is a conservative interpretation of these factors in order to provide the safest guidance on retaining information in a criminal intelligence records system.

When information is collected, one of the first issues is to determine whether the information identifies either a person or an organization. Identity is not limited to a name but can include any descriptive information from which a person may identify an individual to the reasonable exclusion of others; for example, providing an address and physical description of a person living at that address may constitute identity. Determining if the information identifies an organization is somewhat more challenging because 28 CFR Part 23 includes organizations as protected criminal intelligence information but does not explicitly define organization. Based on precedent and experience, an organization is a distinguishable entity that has a definable purpose, an identifiable organizational leadership structure, and a process or method for members to affiliate with the organization, albeit informal. Certain entities exist, such as anarchist collectives wherein people tend to affiliate with each other around a common belief; however, they do not have the explicit characteristics defined above. In this illustration, the group is more of a movement than an organization. A movement that simply has a discernable ideology that people support, even as a collective, is not an organization.

A common question is why can information be retained in a criminal intelligence records system without establishing reasonable suspicion (i.e., a criminal predicate) if it does not identify a person or organization? Constitutional rights attach to individuals, not aggregate data, philosophical movements, criminal methods, or other information that is descriptive and useful for intelligence analysis but does not explicitly identify a person. Building on the concept from *Katz* v. *U.S.*[50] that the Fourth Amendment protects people, not places, logic says that constitutional protections are afforded to individuals, not aggregate behaviors or other information that are not explicitly linked to individuals. 28 CFR Part 23 explicitly extends protection to organizations as well as individuals.

If the information identifies an individual or organization, the next step is to determine if the information was collected in a manner consistent with lawful

[50] 389 U.S. 347 (1967)

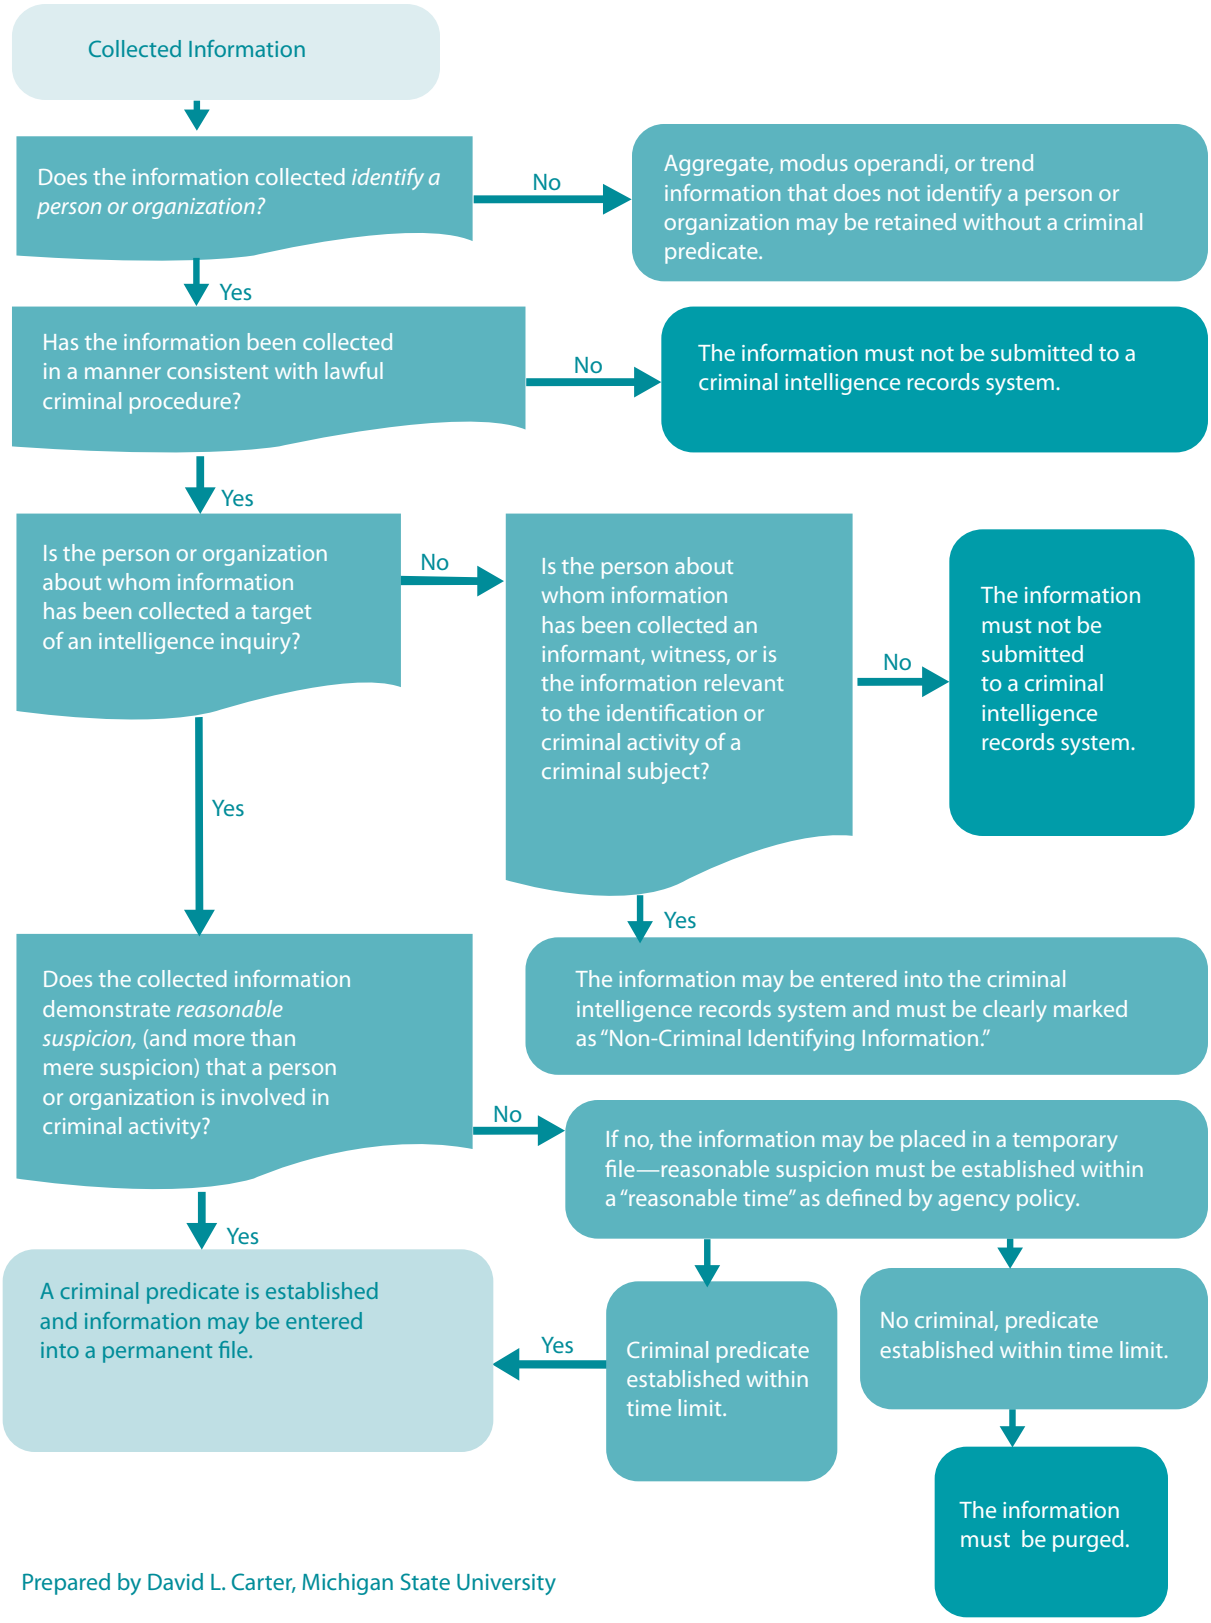
criminal procedure. While this is not a requirement of 28 CFR Part 23, precedence in both criminal and civil law suggests that this is good practice for an agency to follow in the process of deciding what information should be included in a criminal intelligence records system. There are several reasons. First, it is a constitutional protection that should be afforded to individuals; it is part of the fundamental fairness that the American justice system affords to individuals under the due process clauses of the Fifth and Fourteenth Amendments. Second, the sole authority for law enforcement to have criminal intelligence and investigative functions is based in the statutory authority to enforce the criminal law. As such, there is a reasonable probability that criminal intelligence and investigative inquiries may lead to prosecution. If there are violations of criminal procedure, the evidence will likely be excluded from trial. Third, it strengthens the legal integrity of the intelligence or investigative inquiry, thereby reducing the probability of civil liability. Processes that carefully adhere to constitutional guarantees demonstrate good faith and, conversely, are an affirmative defense to negligence by the agency. Fourth, given the scrutiny of law enforcement intelligence and investigative practices by many in the civil rights community, having this step in the process reduces criticism of law enforcement activities. Finally, the practice is consistent with the Privacy Guidelines of the Information Sharing Environment, which state, in part:

i. Seek or retain only protected information that is legally permissible for the agency to seek or retain under the laws, regulations, policies, and executive orders applicable to the agency.

ii. Ensure that the protected information that the agency makes available through the ISE has been lawfully obtained by the agency and may be lawfully made available through the ISE.[51]

[51] Program Manager for the Information Sharing Environment (PM-ISE). *Guidelines to Ensure that the Information Privacy and Other Legal Rights of Americans Are Protected in the Development and Use of the Information Sharing Environment.* Washington, D.C.: PM-ISE, Office of the Director of National Intelligence, Guidelines 2.b.(i) and (ii), September 4, 2006.

Figure 7-1: Intelligence Records Submission Decision Tree



Prepared by David L. Carter, Michigan State University

If information is collected about a person in the intelligence process and done so in a manner that is consistent with constitutional standards, the agency needs to have a reason for collecting it. That reason is to further an inquiry about threats to the community in the hopes of preventing that threat from reaching fruition. As a result, information is collected about individuals because they are either a target of an intelligence inquiry or have some type of information about the threat, even if they are not suspected of a crime. There is a need to lawfully retain both types of information in a criminal intelligence records system.

If a person is not the inquiry's target but has critical information, "Non-Criminal Identifying Information" (NCI) may be entered into a criminal intelligence information file if it is relevant to the identification of the subject or the subject's criminal activity, provided that: 1. Appropriate disclaimers accompany the information, noting that it is strictly identifying information carrying no criminal connotation; and 2. If the information pertains to the political, religious, or social views, associations, or activities of the criminal subject, it must relate directly to criminal conduct or activity. For example, if a criminal subject is known to attend a particular church, synagogue, or mosque, the inclusion of the religious affiliation in the system as NCI Information would be permitted only if it is directly related to the criminal conduct or activity, such as where the evidence indicates that the church, synagogue, or mosque is the site of the criminal activity. If an individual has material information about an acquaintance that supports the intelligence inquiry, this individual may also be entered into the criminal intelligence records system with a clear NCI identifier.

If the person about whom the information has been collected is the target of the inquiry, that information may be retained only if a *criminal predicate* is established. Determining a criminal predicate is a two-fold process. First, there must be a nexus between a person's behavior and a crime or an organization's operations and involvement in criminal activity. Second, for information to be submitted to a criminal intelligence records system as criminal intelligence information, the level of proof is "reasonable suspicion." Under 28 CFR Part 23, "Reasonable Suspicion or Criminal Predicate" is established when information exists that establishes sufficient facts to give a trained law enforcement or criminal investigative agency officer, investigator, or employee a basis to believe that there is a reasonable possibility that an individual or organization is involved in a definable criminal activity or enterprise. Reasonable suspicion is more than "mere suspicion;" that is, a person's behavior may seem suspicious; however, that information must meet the criminal nexus and level of proof tests prior to being retained in a criminal intelligence records system.

Often, intelligence personnel will receive a tip from the public or perhaps a Suspicious Activity Report (SAR) from a patrol officer. Typically, there is no criminal predicate documented in such information. Practically speaking, the intelligence officer should not simply dismiss the information; indeed, the officer has the responsibility to determine the veracity of the information as it relates to a criminal threat. The challenge to resolve is how the information can be lawfully retained if there is no criminal predicate. Since the 28 CFR Part 23 guidelines do

not address this circumstance, a practical interpretation of the regulation, which has been accepted by the courts, was created in the LEIU File Guidelines.[52] The guidelines recommend establishing two types of intelligence files: Temporary files and permanent intelligence files.

A *temporary file* is for information that does not rise to the level of reasonable suspicion but references an event or activity that indicates the possibility of criminal activity, such as a tip, lead, or SAR, none of which constitute criminal intelligence information under 28 CFR Part 23. Since this information is not criminal intelligence information, it must be clearly labeled as such in a temporary file (and defined by policy), whether stored in the same database or accessed or disseminated with criminal intelligence information. The temporary file must have a policy-defined time limit for retaining information in the file (a generally accepted time limit is 60 days). The purpose of the temporary file is simply to have a place to store raw information while an inquiry is made to determine if a criminal predicate can be established. If the criminal predicate is not established within the policy-defined time limit, the information should be purged.

Once a criminal predicate is established, the information is considered criminal intelligence information and may be stored in a *permanent file*. While it is commonly accepted phrasing, the term permanent file is somewhat misleading because the information in this file is subject to the 28 CFR Part 23 5-year review and purge requirement.

It should be stressed that these processes and rules apply only to a criminal intelligence records system that is managed by an SLTLE agency. The guidelines of 28 CFR Part 23 do not apply to a law enforcement agency's investigative records nor to a law enforcement agency's Records Management System[53] (RMS). Sometimes questions about different types of records law enforcement agencies maintain appear to be intelligence-related but are often kept separately from the RMS. The most common questions are associated with Field Interview records and gang records. Because law enforcement agencies vary widely in these types of records, some general questions (Table 7-2) can be asked to reasonably determine if the records are criminal intelligence information for purposes of 28 CFR Part 23.

This discussion was intended to provide general information about the management and use of criminal intelligence records. Often, there are explicit questions about specific systems of a given agency. The best resource for these questions is the 28 CFR Part 23 Training and Technical Assistance program funded by the Bureau of Justice Assistance.[54]

[52] See www.it.ojp.gov/documents/LEIU_Crim_Intell_File_Guidelines.pdf.

[53] The RMS typically stores information such as offense reports, arrest records, traffic accident records, miscellaneous investigations, and similar types of records kept on the daily operations of managing and responding to calls for service and crime.

[54] For more information about this program see www.iir.com/28cfr, or visit www.ncirc.gov for BJA's online 28 CFR Part 23 Training.

Table 7-2: Questions to Determine if Records Must Comply with 28 CFR Part 23 Regulations

If the answer is "Yes" to any of the following questions, the records are criminal intelligence information and should be compliant with 28 CFR Part 23 regulations.	If the answer is "Yes" to any of the following questions, the records are most likely not criminal intelligence records for purposes of 28 CFR Part 23 regulations.
1. Are the records expressly called "intelligence records"? 2. Are the records retained in the same records system as criminal intelligence records? 3. Are the records kept primarily to assess threats with limited or no known criminal history of the intelligence targets? 4. Are records being retained that identify individuals or organizations suspected of criminal activity but are not the subject of a current criminal investigation?	1. Are the records kept for investigative support of known crimes? 2. Are the records kept in support of an active criminal investigation of a crime that has occurred and/or a known continuing criminal enterprise? 3. Are the records kept to monitor the behavior of convicted criminal offenders (e.g., sex offenders), including persons on probation or parole, who are reasonably believed to pose a hazard to public safety? 4. Are the records kept to identify individuals who are affiliated with a known crime group (e.g., persons who have tattoos known to be affiliated with a criminal gang)?

Federal Civil Rights Liability and Intelligence[55]

As evidenced by myriad lawsuits, such as the New York and Denver cases previously discussed, intelligence abuses have occurred. Unfortunately, critics often do not recognize the many changes that have occurred in law enforcement practices, coupled with the more specific professional direction of law enforcement intelligence. Higher educational standards, better training, adoption of ethical standards, and inculcation of law enforcement as a profession, are indicative that the culture of law enforcement has changed, rejecting past practices that contributed to the aforementioned abuses.

Beyond this history, the public generally has a misconception about the law enforcement intelligence function, envisioning it as involving spying, surreptitious activities, and acquisition of information by stealth. The public and media need to be reassured that law enforcement intelligence processes will strictly subscribe to individual constitutional protections when collecting, retaining, and disseminating information. Moreover, the public needs to understand that intelligence analysis is simply the scientific approach to problem solving, similar to the way analysis has been effectively used in community policing. The difference, however, is that community policing focused on crime and community disorder, while intelligence focuses on threats and methods that may be used to prevent such threats from reaching fruition. Generally speaking, critics are not against using information gathering and analysis to combat terrorism or solve crimes; rather, they simply demand that it be conducted in accordance with the constitutional parameters that law enforcement officers are duty-bound to follow.

[55] Based in part on: Carter, David L. and Thomas Martinelli. "Civil Rights and Law Enforcement Intelligence." *The Police Chief*, June 2007.

Because of the importance of protecting citizens' civil rights in all law enforcement activities, including intelligence operations, a remedy is available to citizens when an employee of a state, local and, in some cases, tribal law enforcement agency violates individual civil rights guarantees under the color of law. As noted earlier, this remedy is Title 42 of the United States Code, Section 1983 – Civil Action for Deprivation of Civil Rights (frequently referred to simply as Section 1983).

Section 1983 lawsuits provide civil action for the deprivation of constitutional and federal statutory rights by persons acting under the color of law. This statute was originally created as part of the Civil Rights Act of 1871, which was intended to curb oppressive conduct by government and private individuals participating in vigilante groups, such as the Ku Klux Klan. Section 1983 experienced a period of dormancy until 1961 and the landmark Supreme Court case, *Monroe* v. *Pape*, 365 U.S. 167 (1961) gave individuals a federal court remedy as a first resort rather than only in default of (or after) state action. Today, Section 1983 lawsuits against law enforcement agencies most commonly involve First Amendment issues such as freedom of speech, Fourth Amendment issues like search and seizure or use of force, and Fourteenth Amendment claims of due process violations.

The key elements of the statute:

- Was the individual deprived of a constitutional or federally protected right?
- Did the law enforcement employee act under color of state law?
- Did the law enforcement employee fail to provide the standard of care owed to the individual?
- Was the law enforcement employee's conduct the cause of the individual's deprivation of constitutional right or federal statutory protection?
- Did the law enforcement agency fail to provide due diligence to ensure that agency policy and personnel practices protect civil rights?

For a successful civil rights case to occur, the plaintiffs must show that the law enforcement agency was negligent and that there was a pattern of misconduct associated with that negligence. Typically, this is achieved by providing evidence that the law enforcement agency failed to provide due diligence in protecting individuals' civil rights. To accomplish this, the plaintiffs typically will attempt to demonstrate that the law enforcement agency showed deliberate indifference toward the protection of individuals' privacy and civil rights. In intelligence-related cases, this deliberate indifference may be a product of such things as these:

- Failure to train—the agency does not provide intelligence training to all law enforcement personnel in line with the recommendations of the Minimum Criminal Intelligence Training Standards that have been promulgated by the Global Advisory Committee.
- Failure to direct— the agency does not provide clear policy and procedures on criminal intelligence information collection, retention, review, and dissemination.
- Failure to supervise— the agency does not adequately monitor the intelligence- related activities of personnel and/or does not enforce intelligence policy.

- Failure to establish a privacy policy—the agency does not articulate a clear policy to protect the privacy, civil rights, and civil liberties of citizens as related to intelligence and records management activities.
- Failure to adopt accepted professional standards of good practice— the agency does not adopt the recommendations of the National Criminal Intelligence Sharing Plan or the Intelligence Standards of the Commission on Accreditation for Law Enforcement Agencies.

Hypothetical Example: Federal Civil Rights Liability and Intelligence Records

How could a state or local law enforcement agency be held liable in a federal civil rights lawsuit (42 U.S.C 1983 – Civil Action for Deprivation of Civil Rights) for improperly retaining personal identifying information in a criminal intelligence records system if the system's policies are 28 CFR Part 23 compliant?

- If the officers who were entering personal identifying information on suspicious persons in the criminal intelligence records system did not know that this information could not be entered because there was no criminal nexus, then there is a potential for negligence for failure to train.
- If a law enforcement employee did not understand that people involved in a protest were exercising their First Amendment rights to expressive activity, then there is a potential for negligence for failure to train.
- If the training was not adequate to teach the officers to do the job properly, there could also be negligence by failure to train.
- If a supervisor did not monitor the information being entered into the system or did not take corrective action for improperly entered information, then there is a potential for negligence for failure to supervise.
- If a law enforcement employee who clearly did not understand the policies of the intelligence unit or did not respect/follow the policies of the intelligence unit or if the person was unable to adequate apply the policies, then there is a potential for negligence for negligent retention.
- If command-level personnel learn of improper information being collected and retained and did not take actions to correct the problem, then there is a potential for negligence for failure to direct.

The resulting deliberate indifference is behaviors and processes that cause ongoing negligence in the protection of civil rights and liberties. The following are examples of behaviors or activities that are evidence of ongoing negligence.

- Retaining information that identifies people or organizations where there is no reasonable evidence supporting a criminal nexus.
- Profiling based solely on attributes such as race, religion, ethnicity, or country of origin rather than behaviors where there is a criminal nexus.
- Insinuating guilt by association or guilt based on mere suspicion.
- Inappropriate surveillance and information collection about an individual or organization.
- Knowingly keeping inaccurate information or information that should have been purged.
- Sharing information with other law enforcement agencies that identifies people or organizations with the inference of a criminal involvement when a criminal predicate does not exist and/or without establishing the recipient's right to know and need to know the information.

As noted in the New York and Denver cases, the loss of a civil rights lawsuit can be costly, embarrassing, disruptive of operations, and provide significant new restrictions on intelligence activities. As will be seen, this can be easily avoided with proper policy, training, and supervision in place.

Providing a Transparent Process

An important tool for gaining citizen support for the intelligence function while at the same time minimizing accusations of impropriety is to ensure that the intelligence process is public and transparent. Providing some insight into the need for transparency was a press release by the ACLU of Massachusetts commenting on the opening of the Massachusetts intelligence fusion center. The statement expressed concern about the center's role and activities, specifically stating the following:

> We need a lot more information about what precisely the fusion center will do, what information they will be collecting, who will have access to the information, and what safeguards will be put in place to prevent abuse.

These are reasonable and easily answerable questions. By simply providing this information to the community through a public information document or in town hall presentations, a great deal of conflict, criticism, and cynicism can be avoided. Uncertainty generates citizen consternation that translates into mistrust and allegations of impropriety. Educating the community about the intelligence process can reduce these tensions.

Hypothetical Example: Court Determination of a Criminal Intelligence Records System

A municipal law enforcement agency has a SAR records system that was developed using a federal grant. The agency states, as a matter of policy, that the SAR system is not a criminal intelligence records system. Is it conceivable that this SAR records system could be subject to the 28 CFR Part 23 guidelines?

It is possible that this could occur as a result of a lawsuit. For example, a plaintiff files a federal civil rights lawsuit (42 U.S.C. Section 1983) against a law enforcement agency alleging that the agency is collecting, retaining, and disseminating personal identifying information that is criminal intelligence. The complaint goes on to allege that the new records system is actually a criminal intelligence records system under the guise that the information is "only in SARs."

In its response to this complaint, the agency will no doubt say 28 CFR Part 23 applies only to the criminal intelligence records system and that the SAR records are not criminal intelligence records.

If the plaintiffs successfully argue that, since the primary persons accessing the SAR system are intelligence analysts and personnel assigned to the intelligence unit, this might be persuasive. Moreover, if the law enforcement agency employs an Intelligence-Led Policing philosophy wherein intelligence analysis permeates law enforcement operations and operational decision-making, this could be further evidence supporting the notion that the SAR system is indeed criminal intelligence. The argument would continue that it is irrelevant what the law enforcement agency called the system; rather, the single issue of determination is how the system is used.

If these arguments were successful, the court could rule that the SAR system is, indeed, a criminal intelligence records system irrespective of what the law enforcement agency called it. Consequently, as part of a settlement or injunctive relief, the guidelines of 28 CFR Part 23 could be applied to the SAR system.

In the last few years, many SLTLE agencies have reengineered their intelligence capacity largely through guidance provided by the National Criminal Intelligence Sharing Plan, the Law Enforcement Intelligence Unit File Guidelines, and various intelligence training programs developed under the sponsorship of the Bureau of Justice Assistance[56] and the Department of Homeland Security Training and Exercise Integration.[57] These intelligence programs include instruction on the constitutional guidelines regarding civil rights protections; however, new challenges are emerging that pose renewed concern about abuses.

In particular, there is increasing concern about the ISE[58] that is the product of the Intelligence Reform and Terrorism Prevention Action (IRTPA) of 2004. Largely based on the recommendations of the 9/11 Commission Report, the executive implementation of IRTPA is designed to maximize information-sharing between all levels of government, including sharing terrorism information between the Intelligence Community and SLTLE agencies. The reason, of course, was to ensure that America would be able to have the information and ability to connect the dots when a terrorism threat emerged. Despite this noble goal to protect America from terrorism, many critics felt the legislation went too far.

To address these diverse issues, three fundamental areas emerge where civil rights issues are of concern:

1. Ensure that the collection and retention of information in a criminal intelligence records system are done in a proper manner, both legally and ethically.
2. Ensure that individual privacy rights are protected for all information that has been collected and retained.
3. Ensure the integrity of data quality and data security.

While there are additional intelligence issues that have civil rights implications, these are among the most fundamental and challenging. It bears repeating that these issues are applicable to information and records that identify individuals.

Ensure that the collection and retention of information in a criminal intelligence records system is done in a proper manner, legally and ethically. As noted previously, the authority for SLTLE agencies to perform any type of intelligence operations lies in their statutory authority to enforce the criminal law. As such, any information that is collected and retained in a criminal intelligence records system must be based on a criminal predicate; that is, it must be demonstrated that there is a relationship between the person(s) identified in criminal intelligence records and criminal behavior. The level of that relationship is more than mere suspicion—there must be reasonable suspicion articulated to link the suspected individual to specific criminal behavior.

Ensure that privacy is protected for all information that has been collected and retained. Ensuring that information about individuals is collected and retained with proper legal basis is only one aspect of ensuring that citizens' civil rights are protected.

> A privacy and civil liberties policy is a written, published statement that articulates the policy position of an organization on how it handles the personally identifiable information it gathers and uses in the normal course of business.[59]

[56] These include the Criminal Intelligence for the Chief Executive (CICE) course, the State and Local Anti-Terrorism Training (SLATT) program, and the Criminal Intelligence Commanders course that is in preparation as of this writing. See www.slatt.org.

[57] Most notably the Intelligence Toolbox course. See intellprogram.msu.edu.

[58] See www.ise.gov.

[59] Global Justice Information Sharing Initiative. *Privacy and Civil Liberties Policy Development Guide and Implementation Templates.* Washington, D.C.: Office of Justice Programs, U.S. Department of Justice, rev. 2008, 4–1.

Law enforcement agencies must have mechanisms in place—including proper training, policies, procedures, supervision, and discipline—to make certain that this information is not disseminated to persons who do not have the right to know and the need to know the information. A privacy policy must be developed and implemented with proper safeguards in place. Incorporated within this policy must be a clearly defined process of discipline, demonstrating strict, swift, and certain sanctions for sworn members who fail to strictly comply with the policy's provisions.

Ensure the integrity of data quality and data security. Data quality refers to procedural mechanisms that ensure that raw information is collected and recorded in a valid, reliable, and objective manner. Its intent is to maximize the accuracy of raw information that will be used in the intelligence records system. Security includes processes and mechanisms to ensure that information is not accessed by, or disseminated to, persons who do not have the lawful right and need to know the information. Such security measures reinforce the procedural processes of individual privacy protections without divulging the substance of the intelligence gathered. Procedure over substance is a broad policy philosophy that can be shared with the community to quell mistrust and yet, it does not jeopardize an agency's efforts to protect data quality.

Steps to Ensure Protection of Citizens' Civil Rights

A wide range of issues has been discussed that represent legal flash points related to law enforcement intelligence activities. There are a number of mechanisms that may be easily implemented to ensure that civil rights protections remain intact while addressing the concerns of intelligence critics (See Figure 7-2).

1. Policy Implementation. Every law enforcement agency should implement a privacy policy, security policy, and accepted records management policy, such as the LEIU criminal intelligence file guidelines.[60] Relying on policy models and policy development processes recommended by the Global Intelligence Working Group provides a solid foundation on which to demonstrate that the agency is following accepted national standards. This has a twofold advantage: First, it demonstrates to the community that the law enforcement agency has an intelligence policy foundation that is consistent with nationally recognized standards. Second, in case of a lawsuit, it can be used as an affirmative defense that the agency's policies are consistent with professionally recognized good practice.

2. Training. Training has three fundamental levels. First, every agency should follow the training recommendations of the NCISP and the Minimum Criminal Intelligence Training Standards,[61] which includes an intelligence awareness training program for all officers.[62] Second, beyond these training standards, appropriate personnel within the agency need to receive training on agency policy and fusion center policy related to all aspects of the intelligence function. Special attention should be devoted to collection, retention, and dissemination of intelligence as well as special issues such as SARs, intelligence related to juveniles, and other unique forms of information. Last, as mentioned earlier, sworn personnel need to appreciate the gravity associated with constitutional rights violations as they pertain to intelligence

[60] www.it.ojp.gov/documents/LEIU_Crim_Intell_File_Guidelines.pdf

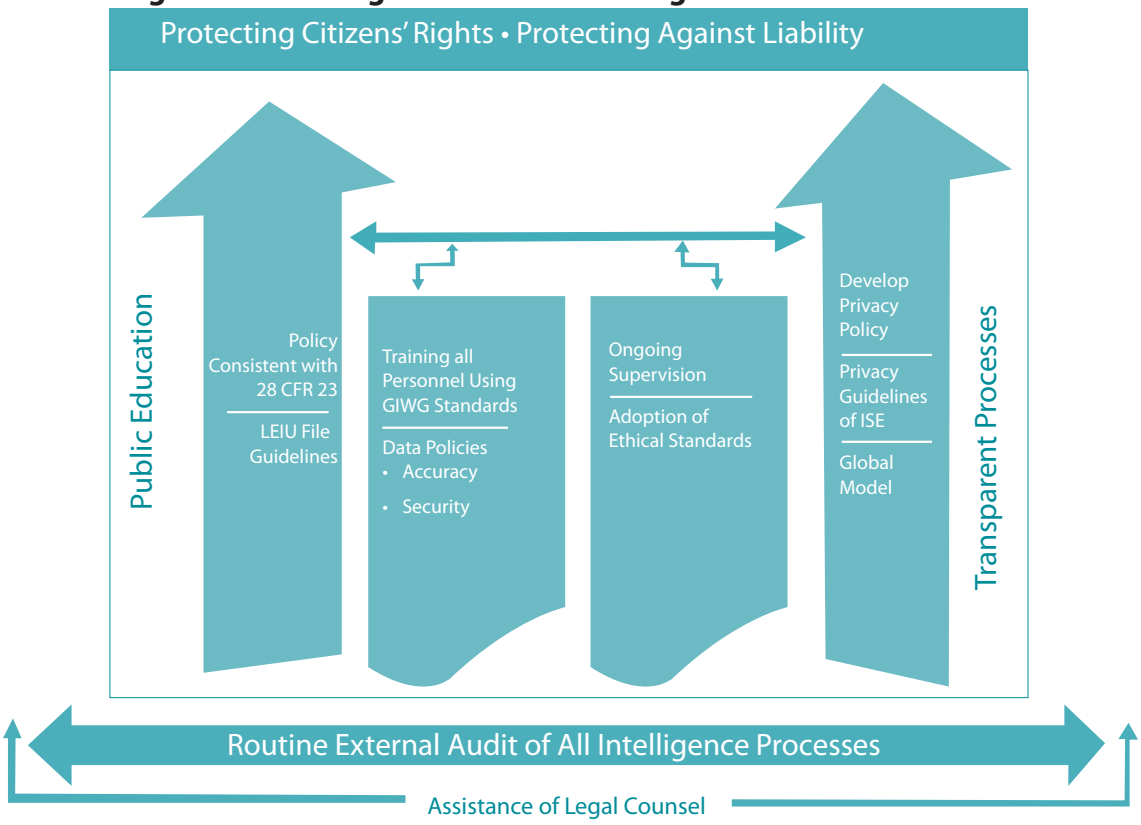
[61] https://it.ojp.gov/documents/min_crim_intel_stand.pdf

[62] Intelligence training resources can be found at: www.slatt.org, www.counterterrorismtraining.gov, and intellprogram.msu.edu.

gathering. Not unlike other critical issues in policing, a zero tolerance policy toward such infractions is mandatory. This policy demonstrates to law enforcement personnel, as well as to the community, that civil rights violations will not be tolerated and immediate disciplinary action will be taken.

3. Supervision. Good policy and training are only part of the equation; an agency must ensure that policies and procedures are being complied with as intended. If personnel are not following policy or are misinterpreting it, there exists a lack of systemic accountability and uniformity when it comes to meting out appropriate discipline. Street-level supervisors must be vigilant in their agency's commitment to constitutional policing and must hold their subordinates to the highest standards of the profession, specifically when dealing with intelligence gathering. When patterns and practices of civil rights violations are uncovered over a period of time, plaintiff attorneys simply have to demonstrate to juries that street-level supervisors and their bosses knew or should have known of these violations and deliberately chose not to take disciplinary action. Deliberate indifference has proven to be very costly for law enforcement agencies that have opted to look the other way when citizens or fellow officers have reported possible civil rights violations.[63]

Figure 7-2: Strategies to Ensure Civil Rights Protections



[63] Martinelli, T.J. and Joycelyn M. Pollock. "Law Enforcement Ethics, Lawsuits, and Liability: Defusing Deliberate Indifference." *The Police Chief* 67 (October, 2000) 10: 52–57

4. Public Education. A critical element of success for law enforcement intelligence is informing the public of law enforcement intelligence initiatives. Once again, there are two critical reasons for this. The first, as noted earlier regarding the ACLU's concerns, is to simply educate the public about the intelligence process. This eliminates erroneous assumptions and second-guessing. Much of the lay public assumes law enforcement agencies perform some type of widespread clandestine information collection and operate in a manner similar to the Intelligence Community. Correcting this misperception can go a long way toward developing positive support for the Intelligence Process. The second benefit to public education is to inform citizens of the signs and symbols of terrorism to assist in the information-collection process. For example, a trial program by the Regional Community Policing Institute at Wichita State University, in association with various police departments in Kansas, provided community training on terrorism and intelligence to educate the community on what to look for and how to report the information. Those attending the training were provided with a document called *Observe – Document – Report* and received instruction regarding the indicators of behavior that were considered suspicious, what kind of information needed to be documented, and how to report their observations to law enforcement. This model also helps citizens feel like they are contributing to the security of their own community and helps minimize the level of distrust toward their agency's efforts to combat crime and terrorism.

5. Transparent Processes. The intelligence function, like all other aspects of an American law enforcement agency, should have clearly understood and transparent processes. While certain information used in the intelligence function must be secured, the process that is used must be open. Critics of law enforcement intelligence argue that the Intelligence Process is secretive and that there is widespread spying on citizens.[64] This argument can be successfully countered by an agency that is open and transparent about how the Intelligence Process works, including relationships of an agency with other organizations, such as a fusion center. Without divulging the substance of intelligence records, an agency's efforts to educate its citizens about the procedural steps taken for information gathering and its data storage policies can go a long way toward achieving buy-in by the citizenry policed.

6. Accountability Audits. It should be a mandatory practice to have periodic internal audits of the intelligence processes within an agency. A two-step process may be involved. First, a supervisor or manager must review and document the intelligence processes following a recognized checklist of variables[65] written in the form of an inspection report. This would be followed by an external auditor, a balanced independent person such as a retired judge or other respected individual, who could review the report and ask challenging questions of both the auditor and chief executive. Important too, the audit should be viewed as a positive process designed to identify weaknesses or concerns that can be remedied. Taking proactive action such as an audit can ensure that all aspects of the process are operating as constitutionally mandated. It can identify unforeseen problems and serve as affirmative evidence that the agency is operating in good faith and without malice.

[64] As an illustration, the reader is urged to conduct an Internet search of the phrase "spy files." The results will provide insight on the breadth of concern about the intelligence process, as well as the issues of concern by many citizens.

[65] Two examples of Intelligence Audit checklists can be found at https://intellprogram.msu.edu/Carter_Intelligence_Guide.pdf and www.it.ojp.gov/documents/LEIU_audit_checklist.pdf.

7. Always Act in Good Faith. All actions of the agency and its personnel should clearly demonstrate that the decisions made in the intelligence process are expressly intended to meet lawful standards. Good faith can be demonstrated in a variety of ways including the implementing policies and procedures, providing training to personnel, and ensuring that appropriate supervision is being performed. Many areas of discretion in the intelligence process often lack definitive legal guidance. If the framework is in place to aid personnel in making the best discretionary decision that protects individuals' rights while maintaining community safety, then the probability of negligence is reduced through these good faith activities.
8. Assistance of Legal Counsel. The case law, as it pertains to police misconduct, relies on best police practice concepts such as good faith, reasonableness, and discretion without malice when judging an officer's conduct in hindsight. Juries typically do not want to find officers guilty for their alleged misdeeds or policy violations and, more times than not, will give the officers the benefit of the doubt. But without clearly drafted policies, in-depth training scenarios, and evidence of an organization's strict compliance with constitutional law issues, an agency's legal counsel may find it difficult to defend one of its own against an allegation of civil rights violations in a court of law. Competent legal counsel may be the best preventive measure that agencies can use to prepare for litigation involving allegations of civil rights violations. Whether it is a sole practitioner or an insurance carrier's legal counsel, an attorney well-versed in municipal law, Section 1983 actions, and police misconduct cases, can assist in drafting an agency's privacy and security policies, as well as formulating the process for gathering and analyzing intelligence data.

With this approach, an agency can be assured that every conceivable step has been taken to comply with the latest Supreme Court rulings pertaining to best police practices in accordance with society's increased need for vigilant police protection in this post-9/11 era. In the past, police ethics trainers have used case law examples and arbitration awards to demonstrate examples of police misconduct that resulted in suspensions or terminations. A municipal legal expert can draft street-level scenarios that engage police trainees in dialog that addresses both best police practices and the need to strictly adhere to the constitutional parameters of police work.

Conclusion

In the evolving world of information sharing that is increasingly being driven by intelligence fusion centers and the information-sharing environment, law enforcement executives face new challenges in managing sensitive information and intelligence. Professional law enforcement accepts the responsibility for protecting citizens' civil rights while protecting the community. Moreover, this same environment will draw greater scrutiny from civil rights activists to ensure that the types of information collected, retained, and disseminated by law enforcement agencies is done so in a lawful manner. We have the knowledge and tools to protect both the community and citizens' rights. The intent of this discussion was to ensure that these tools are accounted for and placed in perspective.

Chapter Annex 7-1: Protecting Civil Rights and Immunizing an Agency from Liability in the Law Enforcement Intelligence Process

The following is a series of action steps and policy actions to ensure that the law enforcement agency protects privacy and civil rights. These same actions will also help protect the agency from a civil rights lawsuit.

Many citizens do not understand the law enforcement intelligence process and express concerns often based on erroneous assumptions. As a foundation, the law enforcement agency should have a publicly available information document that answers these questions:

- What precisely does the intelligence unit or fusion center do?
- What type of information will be collected and retained in the intelligence records system by the law enforcement agency?
- Who will have access to the information?
- What safeguards are in place to ensure proper and lawful use of the information?

Law enforcement agencies can take a number of actions to ensure the protection of citizens' civil rights. The application of some of these items will be dependent on the specific agency, its size, its jurisdiction, and whether it has a full-time intelligence unit or a part-time intelligence capacity. The items below provide a framework for ensuring that civil rights are protected and, consequently, limiting a law enforcement agency's civil liability.

- Adopt the *National Criminal Intelligence Sharing Plan* (NCISP).
  - it.ojp.gov/ncisp
- Adopt and adhere to the Guidelines of 28 CFR Part 23.
  - www.iir.com/28cfr click on "Guidelines"
- Implement court-tested policies and procedures.
  - www.fas.org/irp/agency/doj/lei/app.pdf
- Provide a regular internal audit of the intelligence unit.
  - www.iir.com, under Information Sharing, Global Justice Information Sharing Initiative, National Criminal Intelligence Plan, "Law Enforcement Intelligence Unit (LEIU): Audit Checklist for the Criminal Intelligence Function." www.it.ojp.gov/documents/LEIU_audit_checklist.pdf
- Adopt a privacy policy.
  - it.ojp.gov/documents/Privacy_Civil_Rights_and_Civil_Liberties_Policy_Templates.pdf
- Adopt the IACP Oath of Honor and IACP Model Policy on Standards of Conduct as standards for ethical behavior.
  - www.theiacp.org/PoliceServices/ExecutiveServices/ProfessionalAssistance/Ethics/tabid/140/Default.aspx
  - www.theiacp.org/PoliceServices/ExecutiveServices/ProfessionalAssistance/Ethics/ModelPolicyonStandardsofConduct/tabid/196/Default.aspx

- Appoint an external auditor to regularly review intelligence processes.
- Clearly identify lines of authority and responsibility for intelligence records management, including a two-stage review and approval process for records entry.
- Use the law of criminal evidence and procedure as a guideline for information management whenever in doubt.
- Have a documented process for right to know and need to know.
- All personnel should sign a nondisclosure agreement related to information contained in the criminal intelligence records system.
- Always act in good faith: When a decision is made about information collection, retention, or dissemination where there is a lack of clarity caused by unusual circumstances, write a justification for the decision and the rationale as part of the case file. This memo to the file ensures clarity of the facts and circumstances at the time for the decision in case that decision is challenged or reviewed.
- Review federal and state FOIA and Privacy Act Guidelines and Exemptions. Have a clear policy and procedure to handle FOIA requests particularly related to the intelligence function.
- Provide training for all of the above.

Chapter 8:
The Intelligence Fusion Process

The Intelligence Fusion Process

The intelligence fusion process represents a new chapter in the evolution of law enforcement intelligence. Fusion centers represent a new intelligence structure for most state, local, and tribal law enforcement (SLTLE) agencies to understand and with whom they can interact. Contrary to intuition, the fusion process (developing intelligence from diverse resources) and the creation of fusion centers (the physical plant) is more involved than merely changing the organizational functions of an existing law enforcement intelligence unit. It typically involves either reengineering the entire conceptual framework of the intelligence function in an agency or creating an entirely new entity. It requires engaging a wide array of people and organizations to be contributors and consumers of the intelligence function; it involves changing attitudes and processes of personnel; it requires establishing new functional and information-sharing processes among SLTLE partners; it involves the development of new agreements and functional relationships; the development of new policies and processes; and the inculcation of the Intelligence Led-Policing[1] philosophy.

The challenges are multifold, not the least of which is opening oneself and one's agency to organizational change. Most humans are dogmatic, resisting change; however, if incongruent past practices and erroneous assumptions are not eliminated from intelligence processes, the likelihood of success is diminished. The following discussion is intended to provide insight into different dimensions of the fusion process as well as concerns that have been expressed about intelligence fusion.

Historical Perspective

Initially, intelligence fusion centers were generally referred to as Regional Intelligence Centers (RIC). They took different forms throughout the United States, with no single model for what the intelligence center did or how it should be organized. They evolved largely through local initiatives as a response to perceived threats related to crime, drug trafficking, and/or terrorism within a geographic region. The intent was to marshal the resources and expertise of multiple agencies within that region to deal with cross-jurisdictional crime problems. In some cases, a region was defined as a county (e.g., Rockland County, New York Intelligence Center[2]); as a major urban area (e.g., Los Angeles Joint Regional Intelligence Center[3]); a portion of a state (e.g., North Central Texas Fusion Center[4]), or an entire state (e.g., Minnesota Joint Analysis Center[5]).

The earliest RICs began as the product of counterdrug initiatives in the 1980s. Indeed, the High Intensity Drug Trafficking Area (HIDTA) intelligence centers[6] served as models for successful structures and initiatives as well as for identifying systemic issues that had to be overcome to make the intelligence center functional.[7] In the late 1990s, the Bureau of Alcohol, Tobacco and Firearms (ATF) developed a number of programmatic activities to reduce gun violence. Emerging from these initiatives were ATF Regional Crime Gun Centers. The centers, in some cases, were colocated with the HIDTA RIC and had a number of intelligence-related roles including "…analyzing trace data to identify gun traffickers,

disseminate investigative leads, and coordinate with the HIDTA RIC to identify drug traffickers and their sources of guns."[8] In virtually all cases, both the HIDTA and ATF intelligence centers had a great deal of interaction with SLTLE agencies. The intent was to integrate, that is, fuse, information from diverse sources to better understand and prevent multijurisdictional crime problems.

This laid the foundation for intelligence centers, but beyond idiosyncratic local crime issues, there was little incentive to expand the centers. Of course, this changed after September 11, 2001.

Because of their demonstrated successes and the information-sharing challenges of counterterrorism, additional state and local entities embraced the concept and began developing their own centers. These centers were initially developed by state and local governments. The federal government, at first by the Department of Homeland Security (DHS), saw the value of these initiatives and began providing funding support. Fusion centers were about to experience an expanding role.

> Recognizing that state and local fusion centers represent a critical source of local information about potential threats and a mechanism for providing terrorism-related information and intelligence from federal sources, the Program Manager for the ISE (PM-ISE), the Department of Homeland Security (DHS), and the Department of Justice (DOJ) are taking steps to partner with and leverage fusion centers as part of the overall information-sharing environment.[9]

Building on this observation, a report by the Government Accountability Office (GAO) documented a number of federal efforts underway designed to support fusion centers and address challenges or obstacles identified by fusion center directors. These include the following:

- The DHS, the FBI, and the PM-ISE have taken actions to assist fusion centers in gaining access to, and managing, multiple federal information systems, including classified systems.
- Both the DHS and the FBI have committed to providing security clearances to state, local, and tribal fusion center personnel and reducing the time it takes to process a clearance.
- The DHS and the FBI are assisting fusion centers in obtaining and retaining qualified personnel, both through assignments of federal employees to state fusion centers and through some DHS funding support.
- Federal funds in support of fusion centers have become more readily available and streamlined in operation to make grant awards faster and easier.
- Both the DOJ and the DHS have provided training and technical assistance in support of fusion center development and maturation.[10]

While progress has been made, many of the fusion centers and their governing officers appear to believe that there is still a long way to go before fusion centers will fulfill their envisioned role seamlessly.

[10] GAO, Ibid., pp. 23–39.

Refining the Fusion Center Concept

It was clear after the 9/11 terrorists' attacks that there had been poor information sharing among and between all levels of law enforcement (and the Intelligence Community). As more information was learned about the terrorists and their minor encounters with state and local law enforcement in the weeks and months before the attacks, it was painfully evident that current information systems and processes were simply inadequate to deal with threats of this nature. It was also evident that if a diverse array of raw information was collected by different agencies, it would be essential to have a mechanism to provide data integration and analysis so its meaning would be of value to operational law enforcement personnel.

Increasingly, state and local law enforcement leaders recognized that the experiences of the HIDTAs and RICs could be applied to counterterrorism. Because of the need to have two-way information-sharing directly with federal law enforcement and indirectly with the Intelligence Community, the fusion centers, the FBI, and the DHS reached out to each other to develop fusion centers more holistically. Indeed, "federal departments and agencies—including DHS, FBI, and DOD [Department of Defense]—launched efforts to develop strategies to incorporate these fusion centers into their information and intelligence activities."[11]

The argument that fusion centers represent a vital part of our nation's homeland security relies on at least four presumptions:

1. Intelligence and the Intelligence Process play a vital role in preventing terrorist attacks.
2. It is essential to fuse a broader range of data, including nontraditional source data, to create a more comprehensive threat picture.
3. State, local, and tribal law enforcement and public-sector agencies are in a unique position to make observations and collect information that may be central to the type of threat assessment referenced above.
4. Having fusion activities take place at the subfederal level can benefit state and local communities, and possibly have national benefits, as well.[12]

The initial focus of many new fusion centers was exclusively on terrorism; indeed, that still remains the case for a few of the centers such as the Georgia Information Sharing and Analysis Center.[13] Most of the centers broadened their focus to embrace "all crime and all threats" for two reasons. First, it was recognized that most terrorist acts had a nexus with other crimes, and focusing exclusively on terrorism may miss some important indicators. Second, because there is a wide variety of crime, notably criminal enterprises, that were transjurisdictional and represented complex criminality,[14] it was recognized that the fusion process would be of value in dealing with these crimes.

Further evolution of fusion center responsibilities has moved into the arena of an all-hazards focus (in addition to "all crimes, all threats"). Inclusion of the all-hazards approach has come from two sources: One is a result of the special conditions on some DHS grants to fusion centers that specify all hazards. The second source is from state or fusion center governing board mandates.

[13] www.llis.dhs.gov/channel/channelContentListing.do?channelId=90287&categoryId=5546 (must register).

[14] "Complex criminality" refers to criminal enterprises that are involved in a wide range of criminal activities in support of their core enterprise. A drug trafficking organization, for example, may be involved in drug production, drug trafficking, money laundering, smuggling, corruption of public officials, fraud, and other offenses.

Recognizing that fusion centers were increasingly integrating the concepts of established law enforcement intelligence activities with the "all-crimes, all-threats, all-hazards" model of intelligence, the Homeland Security Advisory Council made the following observation:

Although the primary emphasis of intelligence/information fusion is to identify, deter, and respond to emerging terrorism-related threats and risks, a collateral benefit to state, tribal, and local entities is that it will support ongoing efforts to address nonterrorism related issues by:

- Allowing state and local entities to better identify and forecast emerging crime, public health, and quality-of-life trends
- Supporting targeted law enforcement and other multidisciplinary, proactive, risk-based and community-focused, problem-solving activities
- Improving the delivery of emergency and nonemergency services.[15]

There is no single model of a fusion center because of the diverse needs and environmental characteristics that will affect the structure, processes, and products of a center. In states such as Texas and California with their large land mass, large populations, and international borders, the structure and processes of fusion centers will be significantly different than predominantly land-locked rural states such as Wyoming or Nebraska.

A Congressional Research Service (CRS) report observed that questions have arisen regarding the current and/or potential efficacy of fusion centers. The report notes that in light of the growth of the fusion centers in state and local jurisdictions without a coordinated national plan, "…there appears to be no 'one-size-fits-all' structural or operational model for fusion centers."[16] From a centralized federal perspective—as reflected in the CRS report—the lack of a uniform model is assumed to be a significant flaw. The state and local perspective is somewhat different. Indeed, the ability to build a fusion center around grassroots needs is preferred because this permits state and local agencies to mold the fusion center into a model that best suits the needs and challenges that are idiosyncratic to each jurisdiction. As noted by Johnson and Dorn, describing the New York State Intelligence Center:

> Creating one center for intelligence and terrorism information— to combine and distribute that information to law enforcement agencies statewide—prevents duplication of effort by multiple agencies. Additionally, one state fusion center serving the entire New York law enforcement community provides a comprehensive picture of criminal and terrorists networks, aids in the fight against future terrorists events, and reduces crime.[17]

Within this same line of thought, fusion centers are also structured differently because of legislative or executive mandates. Montana's fusion center (Montana All Threat Intelligence Center), for example, is mandated to focus on "all threats;" the New Jersey Regional Operations Intelligence Center includes emergency operations as well as fusion; the Massachusetts Commonwealth Fusion Center focuses on all crimes; and the Oregon Terrorism Intelligence Threat Assessment

Network limits its focus to terrorism. The variability of fusion center structures is broad because of functional necessity and the inherent nature of local control and states' rights perspectives.

While the structure and operational processes of fusion centers may be different, national professional standards have nonetheless been articulated that outline good practice in critical administrative areas, regardless of the center's mission. That is the intent of the *Fusion Center Guidelines.*[18] See Table 8-1.

Table 8-1: Topics in the Fusion Center Guidelines

- The National Criminal Intelligence Sharing Plan and the Intelligence Process

- Policies and Procedures
- Center Performance Measurement and Evaluation
- Funding

Despite some criticisms, the fact that fusion centers are structured differently is not a weakness, but a strength. It exemplifies that each center is designed to meet local and regional needs and to best integrate the fusion center with existing organizational components (and priorities).

The Michigan State Police, for example, have widespread responsibility for both traffic and criminal law enforcement throughout the state. As such, the Michigan Intelligence Operations Center is organizationally placed in the state police. Florida, however, has two predominant state law enforcement organizations: the Florida Highway Patrol, responsible for traffic law enforcement, and the Florida Department of Law Enforcement (FDLE), responsible for criminal law enforcement. As a result, the Florida Counter Terrorism Intelligence Center is organized as part of the FDLE Office of Statewide Intelligence. The two states structured their fusion center in a manner that best fits existing organizational structures and functional responsibilities.

[18] The *Fusion Center Guidelines* are often referred to as federal guidelines because they are a product of the Global Intelligence Working Group (GIWG) of the Global Justice Information Sharing Initiative (Global), which is funded by, and advisory to, the Bureau of Justice Assistance, Office of Justice Programs, U.S. Department of Justice. It should be noted that the vast majority of GIWG members are from SLTLE agencies. Similarly, the group of subject matter experts assembled to develop the *Fusion Center Guidelines* also comprised predominantly state, local, and tribal representatives.

The point to note is that there are different operational and functional models of law enforcement throughout the United States. Fusion centers are no different because they are an element of state or local government and will have challenges to meet the unique needs of the jurisdiction they serve. As observed in one study:

> Fusion centers [must identify] their mission and their customers, at what level of analytic product they will produce, and to whom. Not all fusion centers will need the same amount of strategic analysis or tactical analysis, but, in order to determine what to produce, they will have to understand their customers' needs and ensure they are educated so they understand the difference between the two products. Fusion centers will also need to determine how they will integrate the emergency responder community.[19]

It is, perhaps, this last point that will be the most challenging to define because all-hazards intelligence and meeting the needs of the emergency responder community are not traditional roles for the law enforcement intelligence function. Some guidance to assist fusion centers in this area is being developed through the identification of "baseline capabilities."

Baseline Capabilities for Intelligence Fusion Centers

As a result of national plans that seek to increase the efficiency and effectiveness of information-sharing efforts, fusion centers will serve as the interlink between SLTLE and the federal Information Sharing Environment for the exchange of terrorism information. As such, it was recognized that there was a need to define fundamental baseline operational capabilities that should be used by fusion centers and major urban area intelligence units to meet the information needs of all consumers of the various intelligence centers. A joint project of the Global Intelligence Working Group, U.S. Department of Justice, U.S. Department of Homeland Security, and the Program Manager-Information Sharing Environment is currently working on the project. The end result will be a companion document to the *Fusion Center Guidelines* that will identify elements that serve as the foundation for integrating state and major urban area fusion centers into the national Information Sharing Environment. The project is based on the fusion process capabilities outlined in the 2007 Fusion Center Assessment and the 2007 and 2008 Homeland Security Grant Program, Fusion Capability Planning Tool Supplemental Resource. In addition to the 2007 Assessment, the baseline operational standards that will be outlined in the project are being developed using guidance provided in the *Fusion Center Guidelines,* the *National Criminal Intelligence Sharing Plan,* the *Information Sharing Environment Implementation Plan,* and the U.S. Department of Homeland Security's *National Preparedness Guidelines* and *Target Capabilities List*. Relying on the guidance of these national standards, development of the baseline capabilities for fusion centers will be guided by the requirements of the National Strategy for Information Sharing.

The baseline capabilities follow the structure of the *Fusion Center Guidelines* and represent a comprehensive articulation of functional standards and performance expectations. As a supplement to the *Baseline Capabilities for State and Major Urban Area Fusion Centers,* baseline capabilities have been prepared for Critical

[19] Nenneman, M. *An Examination of State and Local Fusion Centers and Data Collection Methods.* Monterey, California: A thesis prepared for the Naval Post Graduate School, 2008, p. 109.

Infrastructure and Key Resources, although at this writing the capabilities had not been approved for use. In addition, baseline capabilities for public health and for the Fire Service Intelligence Enterprise have been developed. These additional documents support the all-hazards responsibilities of fusion centers. The reader should monitor the Global Justice Information Sharing Initiative web site[20] and/or the National Criminal Intelligence Resource Center (NCIRC)[21] for the final approved supplement to *Baseline Capabilities for State and Major Urban Area Fusion Centers.*

What Is Intelligence Fusion?

The GIWG national *Fusion Center Guidelines* define a fusion center in the following manner:

> … a collaborative effort of two or more agencies that provide resources, expertise, and/or information to the center with the goal of maximizing the ability to detect, prevent, apprehend, and respond to criminal and terrorist activity. The intelligence component of a fusion center focuses on the intelligence process, where information is collected, integrated, evaluated, analyzed, and disseminated. Nontraditional collectors of intelligence, such as public safety entities and private sector organizations, possess important information that can be "fused" with law enforcement data to provide meaningful information and intelligence about threats and criminal activity.[22]

The fusion process is an overarching methodology of managing the flow of information and intelligence across levels and sectors of government to integrate information for analysis.[23] The process relies on active involvement of state, local, tribal, and federal law enforcement agencies—and sometimes nonlaw enforcement agencies—to provide the raw information for intelligence analysis. As the array of diverse information sources increases, there will be more accurate and robust analysis that can be disseminated as intelligence. Information fusion utilizes the intelligence process[24] for information management and analysis. The fusion center is the physical location where the fusion process occurs.[25]

While the phrase "fusion center" has been used widely, often there are misconceptions about the function of the center. Perhaps the most common misconception is that the center is a large room full of workstations where the staff are constantly responding to inquiries from officers, investigators, and agents. This vision is more accurately a "watch center" or "investigative support center," not an intelligence fusion center. Another common misconception is that the fusion center is minimally staffed until there is a crisis wherein representatives from different public safety agencies converge to staff workstations to manage the crisis. This is an "emergency operations center," not an intelligence fusion center.

In the purest sense, the fusion center is not an operational center, but a support center. It is analysis-driven. The fusion process proactively seeks to identify criminal and homeland security threats and stop them before they occur. Prevention is the essence of the intelligence process. The distinction, however, is that the fusion center is typically organized by amalgamating representatives from different federal, state, local, and tribal law enforcement agencies (and, in

[23] *Local Anti-Terrorism Information and Intelligence Sharing: Information Sharing Overview.* Lessons Learned Information Sharing, U.S. Department of Homeland Security, 2005. www.llis.dhs.gov.

[24] The Intelligence Process, also known as the Intelligence Cycle, involves the systemic steps for collecting, assessing, analyzing, and disseminating intelligence.

[25] Global Justice Information Sharing Initiative. *Fusion Center Guidelines: Executive Summary*. Washington, D.C.: U.S. Department of Justice and U.S. Department of Homeland Security, 2006. it.ojp.gov/documents/fusion_center_executive_summary.pdf.

some cases, the private sector) into one physical location. Each representative is intended to be a conduit of raw information from his or her agency who can infuse that agency-specific information into the collective body of information for analysis. Conversely, when the fusion center has intelligence requirements,[26] the representative is the conduit back to the agency to communicate, monitor, and process the new information needs. Similarly, the agency representative ensures that analytic products and threat information are directed back to the parent agency for proper dissemination. Agency representatives may be physically assigned to the center, but a more common arrangement is for the agency representative—often called a terrorism liaison officer[27] or intelligence liaison officer—to performs his or her fusion center responsibilities along with the officer's other assignments at his or her home agency.

> In short, an intelligence fusion center must be able to: 1. Access and explore all government databases, including intelligence, regulatory, and law enforcement; 2. Integrate the information found in those databases; 3. Make independent judgments about that information; and 4. Provide warning.[28]

Delaware Information Analysis Center use of ATIX

The Delaware Information Analysis Center (DIAC) takes a proactive approach to information sharing and homeland security. To maximize timely, secure, two-way information exchange, the DIAC communicates with all of its local law enforcement partners and private sector critical infrastructure partners through the Internet using the Automated Trusted Information Exchange (ATIX) portal. ATIX provides a wide array of diverse threat and homeland security information as well as content and secure e-mail. A service provided at no charge by RISS.net, ATIX simply requires an Internet connection and the secure ATIX/RISS.NET software. Users, like DIAC, are also able to have secure information exchange "communities" to ensure that only DIAC and its partners have access to specified information. As the fusion center for Delaware, DIAC's proactive approach to local law enforcement through the use of ATIX has been a significant tool for success.

www.riss.net/atix.aspx
dsp.delaware.gov/Intelligence.shtml

Obviously, not every law enforcement agency can contribute a person to work in the fusion center. Instead, the center must develop mechanisms for two-way information sharing that captures information from the nontraditional collectors and provides threat-based intelligence and intelligence requirements back to those who have the need to know. As a result, multiple strategies and technologies need to be developed for diverse two-way information sharing.

Electronic two-way information sharing through various secure electronic information systems—Regional Information Sharing System Network (RISS.NET),[29] LEO,[30] Homeland Security Information Network (HSIN),[31] National Law Enforcement Telecommunications System (NLETS)[32] (now the International Justice and Public safety Network), or ATIX[33]—can be very effective. In the case of ATIX, individuals beyond the law enforcement community who have a demonstrated need—including some private sector persons—may also have access to the

[26] "Intelligence requirements" are information that is needed to help make a comprehensive and accurate analysis of a threat. See: Global Intelligence Working Group, Intelligence Requirements Subcommittee Report. *Recommendations for Intelligence Requirements for State, Local and Tribal Law Enforcement Agencies.* (October 2005).

system and use it for secure two-way information sharing. Another example is the New York Police Department's Operation Nexus:

> The New York City Police Department's [NYPD] Operation Nexus is a nationwide network of businesses and enterprises joined in an effort to prevent another terrorist attack against our citizens. Our detectives [visit] firms that have joined us in this mutual effort. Members of Operation Nexus are committed to reporting suspicious business encounters that they believe may have possible links to terrorism. The NYPD believes terrorists may portray themselves as legitimate customers in order to purchase or lease certain materials or equipment, or to undergo certain formalized training to acquire important skills or licenses. … Through Operation Nexus, the NYPD actively encourages business owners, operators and their employees to apply their particular business and industry knowledge and experience against each customer transaction or encounter to discern anything unusual or suspicious and to report such instances to authorities.[34]

Another model has emerged that is being increasingly adopted throughout the United States. Developed in Los Angeles, the Terrorism Early Warning (TEW) group has multiple functions, including supporting the intelligence fusion center.

> The Los Angeles TEW includes analysts from local, state, and federal agencies to produce a range of intelligence products at all phases of response (pre-, trans-, and post attack) specifically tailored to the user's operational role and requirements. The TEW bridges criminal and operational intelligence to support strategic and tactical users. As part of this process, the TEW seeks to identify emerging threats and provide early warning by integrating inputs and analysis from a multidisciplinary, interagency team. Toward this end, the TEW has developed a local network of Terrorism Liaison Officers at law enforcement, fire, and health agencies, formed partnerships with the private sector to understand threats to critical infrastructure, and has developed and refined processes to analyze and synthesize threat data to support its client agencies.[35]

Regardless of the method of information-sharing, the key factors are: 1. There must be diverse raw input; 2. It must be analyzed; and 3. Actionable intelligence output must be shared with appropriate consumers.

Why Fusion Centers?

The heart of good intelligence analysis is a diverse array of valid and reliable raw information. The more robust the raw information, the more accurate the analytic output (i.e., intelligence). If one thinks of information input in terms of bandwidth, the typical law enforcement intelligence unit has a narrow bandwidth; that is, information is gathered from a fairly narrow array of sources, thereby limiting both the quality of the analysis and the ability to see the big picture of a criminal enterprise. Quite simply, the more limited the input of raw information, the more limited the quality of intelligence, but if the number of sources is broadened to include a wide range of agencies representing much broader geographic

[34] www.nypdshield.org/public/nexus.nypd

[35] Sullivan, John P. *Terrorism Early Warning and Co-Production of Counterterrorism Intelligence.* A paper presented at the Canadian Association of Security and Intelligence Studies. Montreal, Canada, 2005, p. 1.

and jurisdictional parameters, then the bandwidth is much wider. With wider bandwidth, there is a greater and more diverse information flow. With greater information flow, the analysis becomes more accurate and utilitarian. As the quality of analysis increases, the ability to prevent or mitigate the operations of a terrorist or criminal organization increases exponentially.

Recent analyses of both law enforcement and national security intelligence operations found a problem that has been referred to as the stovepipe of information in agencies.[36] That is, each agency would develop a large body of information and analytic products that it would retain and rarely share with other agencies. Analysis was generally limited to the information that came from internal sources and its dissemination was also largely internal. As a result, while agencies were developing information it was simply being stacked and stored in isolation, metaphorically as in a stovepipe. Current thought recognizes that far more value can be derived from information that is widely shared for analysis. Information from one agency may be a key in learning about a threat when integrated with information another agency: there was a need to fuse as much information as possible.

As noted in a report from The Heritage Foundation, the fusion center would not simply duplicate the activities of existing agencies, but would enhance and improve their efforts by providing a service that does not yet exist.[37] Another perspective on their development observed the following:

> Conceptually, fusion centers differ from [state police intelligence units] in that they are intended to broaden sources of data for analysis and integration beyond criminal intelligence, to include federal intelligence as well as public and private sector data. Furthermore, fusion centers broaden the scope of state and local analysis to include homeland security and counterterrorism issues.
>
> Despite being an expansion of existing subfederal intelligence/information activities, fusion centers represent a fundamental change in the philosophy toward homeland defense and law enforcement. The rise of fusion centers is representative of a recognition that nontraditional actors—state and local law enforcement and public safety agencies—have an important role to play in homeland defense and security.[38]

In exploring the need and structure of fusion centers, a project by the Police Executive Research Forum identified five critical questions:[39]

1. **Why do we need a fusion center?** Fusion centers embody the core function of collaboration, and as demands increase and resources decrease, fusion centers serve as an effective tool to maximize available resources and build trusted relationships. What distinguishes fusion centers from intelligence units within local law enforcement agencies is that fusion centers synthesize data gathered from multiple sources and disciplines.
2. **What is a fusion center's mission?** While opinions on the topic vary, many

[39] *What is a Fusion Center?* Washington, D.C.: Police Executive Research Forum, 2008. Brochure available from www.llis.dhs.gov (Must register to access).

in the law enforcement community believe it makes more sense to establish a fusion center with a broader mission and scope, i.e., implement an all-crimes or all-hazards approach, while still maintaining the unique capability to monitor terrorist activity. The value of an all-crimes center is that it increases the ability of law enforcement to detect the traditional crimes that ultimately may be precursors of terrorist activity. The underlying purpose and goal of a fusion center is to provide law enforcement agencies with analyses of local, state and regional activities. Local law enforcement agencies, however, must do their part by feeding information to the center.

3. **Who governs the fusion centers?** Most fusion centers established memoranda of understanding with participating agencies and appointed a governing board of representatives from these agencies to provide oversight and ensure adherence to policies, as per the recommendations put forth in the *Fusion Center Guidelines*.

4. **What major functions and services do fusion centers perform?** Fusion centers are intended to be analytical support centers for law enforcement and other public safety agencies. A fusion center serves as a repository for all information available from open-source and law enforcement agencies throughout the state or region. Fusion centers and the agencies they serve work together to determine the best method for disseminating center analysis and products.

5. **How does law enforcement define value in its relationship with fusion centers?**
   - Providing daily information to law enforcement agencies
   - Interpreting diverse threat information from a local perspective
   - Providing timely actionable intelligence.
   - Connecting the dots from diverse jurisdictions that affect a local area
   - Serving as a one-stop shop for threat information.
   - Managing diverse pieces of information in a coherent form for local law enforcement agencies.

Fusion Centers and the Crime Laboratory: An Analogy

The relationship of the fusion center to a law enforcement agency may be seen in a somewhat familiar analogy: the crime laboratory. The vast majority of law enforcement agencies do not have a crime lab, just as they do not have an intelligence unit; however, they periodically need forensic analysis of evidence for a case. To use the crime lab effectively, each agency must have some type of forensic capacity so that physical evidence can be collected properly (i.e., prevent contamination and maintain the integrity of the chain of custody). The agency must also have established a relationship with the crime lab and know the processes for submitting evidence for analysis.

Most agencies use a state crime lab. While a small agency may use the laboratory only periodically, in those few times forensic analysis is needed. It is essential that the local agency has trained personnel and has access to appropriate resources to use the crime lab's services expeditiously and effectively. Table 8-2 provides a

comparative series of factors that are analogous between crime laboratories and fusion centers.

This analogy illustrates that there is a precedent for many organizational processes and practices that are required for fusion centers. Building on these experiences can make integration of the fusion center into law enforcement agency operations much easier.

Table 8-2: Analogy of a Crime Lab and a Fusion Center

Crime Laboratory	Fusion Center
• Central laboratory operated by the state. • In each law enforcement agency there must be a capacity to collect physical evidence to prevent contamination. • Retain physical evidence to meet chain-of-custody requirements. • Certified agency participant with crime laboratory in order to submit evidence for analysis. • Forensic analysis is performed by specifically trained analysts. • Crime lab provides analytic results of physical evidence.	• Fusion center operated by the state. • In each law enforcement agency there must be a capacity to lawfully collect raw information, building on the criminal predicate. • Retain information to meet 28 CFR Part 23 guidelines. • Certified as a fusion center participant to establish right to know and need to know to receive intelligence product. • Intelligence analysis is performed by specifically trained analysts. • Fusion center provides intelligence products.

Fusion Centers and the Information Sharing Environment

The *Information Sharing Environment (ISE) Implementation Plan* embraced the growth of fusion centers as a critical linchpin serving as information clearinghouses between federal entities (both federal law enforcement and the Intelligence Community), nonfederal law enforcement, and the private sector.

> [M]any states and localities emphatically moved to create and invest in fusion centers in the post-9/11 environment. These fusion centers now play a prominent role in collecting, analyzing, and sharing terrorism information. Individually, these centers represent vital assets for collecting terrorism-related information. Collectively, their collaboration with the Federal Government, with one another (state-to-state, state-to-locality), and with the private sector represents a tremendous increase in both the nation's overall analytic capacity and the multidirectional flow of information. It is important to note that these centers are not homogenous—considerable variations exist in terms of operations and mission focus (e.g., homeland security, law enforcement, emergency response). To date, more than 40 such centers have been established across the United States, and significant effort has gone into developing and adopting standards to facilitate easier information access, sharing, and use.[40]

[40] PM-ISE, (2006). Ibid, pp. 7–8.

To further this plan, the PM-ISE has established a National Fusion Center Coordination Group (NFCCG), led by DHS and DOJ, to identify federal resources to support the development of a national, integrated network of fusion centers. Moreover, the ISE…[41]

> …recognizes the "all-crimes and all-hazards" nature of State and local sharing, where SLT organizations may share and fuse together multiple types of information to address a variety of needs including law enforcement, preparedness, and response and recovery. In many instances, this information may not initially be recognized as terrorism information, but may be information that could ultimately prove crucial in preventing, preparing for, or responding to terrorism. The ISE focus on terrorism information will not impede or interrupt these additional fusion center functions.[42]

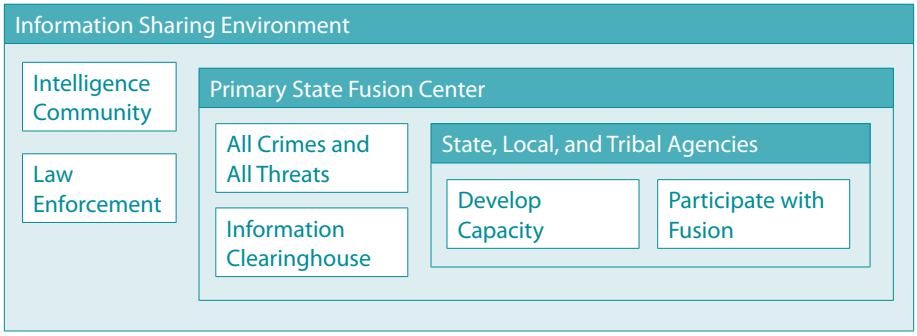
Operationalizing the Fusion Process

As depicted in Figure 8-1, three critical focal areas make the integrated information-sharing strategy functional. While all the factors are essential, the fusion center plays a uniquely critical role.

The process begins with the fundamental step of developing an intelligence capacity in all SLTLE agencies, regardless of size, as per Recommendation 1 in the *National Criminal Intelligence Sharing Plan*.[43] The intelligence capacity must be integrated with a law enforcement agency's proactive participation with the fusion center. The more agencies that participate as a fusion center partner, the greater the value of the center. As noted by the PM-ISE, "state and major urban area fusion centers will be central to implementation at the state and local levels…".[44] Creation of the fusion center, therefore, is only one ingredient; it is essential to have widespread participation.

The outer band of Figure 8-1 is the federal ISE, which consists of both the Intelligence Community and federal law enforcement. Both deal with national security and homeland security from a broad perspective and typically at a classified level. The challenge is to share appropriate threat information with local law enforcement. Similarly, when local law enforcement discovers information that is valuable to the ISE, there must be a mechanism to effectively share the information. The primary state fusion center is intended to fulfill these roles.

Figure 8-1: Organizational Interrelationships and Responsibilities for the Fusion Process and ISE



[41] GAO, Ibid., p. 12.

[42] PM-ISE, (2006). Ibid., p. 11.

[43] Global Intelligence Working Group. "*Recommendation 1.*" *National Criminal Intelligence Sharing Plan.* Washington, D.C.: Bureau of Justice Assistance, Office of Justice Programs, U.S. Department of Justice, 2003, p. 21.

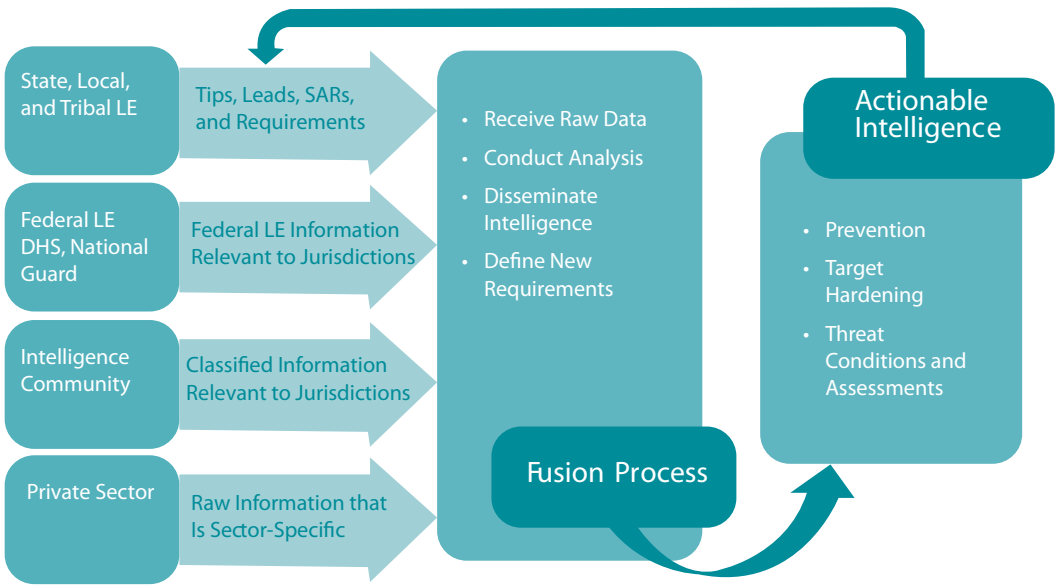
[44] Program Manager-Information Sharing Environment. *Common Terrorism Information Sharing Standards (CTISS) Program Manual.* Washington, D.C.: PM-ISE, 2007, p. 18.

The fusion center is envisioned as serving as an information clearinghouse between the ISE and local law enforcement. Generally speaking, the center will have representatives from all levels of government, experienced analysts, personnel with federal security clearances, and access to a wide range of information systems, sometimes including classified systems. With this foundation, the fusion center can disseminate critical intelligence to local and tribal partners as well as pass critical raw information to the federal ISE that is collected at the local, tribal, and private levels.

A simplified version of the fusion process to accomplish these objectives is depicted in Figure 8-2. A fundamental objective is to gain buy-in by all critical sectors within a state: law enforcement, federal partners within the state, the Intelligence Community[45] as applicable to each state and the private sector. The fusion process receives input (both raw data and intelligence as indicated in the block arrows of Figure 8-2) from a variety of agencies. The analysts integrate the diverse data and provide analytic output that may include information for prevention, target hardening, or threat assessment. In addition, the analysts may also define further intelligence requirements. After analyzing and redefining intelligence requirements, the fusion center disseminates relevant information and intelligence to its participants in the form of actionable intelligence.

It cannot be overemphasized that for intelligence fusion to be successful, as many law enforcement agencies as possible must participate in the process. Every nonparticipating agency represents a weakness in the ability to identify and prevent threats.

Figure 8-2: The Fusion Process



[45] The 16-member Intelligence Community (IC), which includes the FBI and the Drug Enforcement Administration, has a presence in every state; however, the specific IC agencies represented in each state, and consequently each fusion center, will vary widely. States with large international ports of entry or military bases, for example, will have a greater IC presence. See www.odni.gov/who_what/061222_DNIHandbook_Final.pdf.

Is there a Role for the Private Sector?

Often overlooked, the private sector can be a rich resource of information that adds a broadened dimension to information collection. Many large corporations have sophisticated security operations that monitor global threats to their facilities, products, and personnel posed by organized crime and criminal extremists, as well as predatory criminals. This type of information is often different from that collected by law enforcement organizations and can add a unique, and more insightful, component to the body of information being analyzed by the fusion center.

Similarly, the private sector is often a legitimate consumer of law enforcement intelligence meeting the right-to-know and need-to-know information-sharing standards. Eighty-five percent of the U.S. critical infrastructure is owned by the private sector. Moreover, the private sector has a large personnel force who, if given the proper information, can significantly increase the "eyes and ears on the street" to observe individuals and behaviors that pose threats. As noted in a "Best Practices" paper produced by the DHS, "a jurisdiction's analysis and synthesis entity [such as a fusion center], should also establish processes for sharing information with the local private sector."[46]

Of course, there are information-sharing issues that need to be resolved. For example, certain types of personal identifying information may be inappropriate for law enforcement to release to the private sector. Conversely, the private sector will be reluctant to share proprietary information related to corporate products and processes. Despite these limitations, the private sector has a legitimate role in fusion centers. Just as in the case of law enforcement partners, memoranda of agreement need to be in place that include provisions on information-sharing processes and restrictions.

[46] Lessons Learned Information Sharing Best Practices. *Local Anti-Terrorism Information and Intelligence Sharing: Dissemination.* Washington, D.C.: U.S. Department of Homeland Security, 2006. https://www.llis.dhs.gov/member/secure/detail.cfm?content_id=13091 (Must register to access).

Concerns About Fusion Centers

As might be expected, centralized intelligence fusion centers have heightened the concerns of some citizens who fear that the centers will collect, retain, and disseminate information that will further erode the privacy of law-abiding citizens who express support for unpopular or controversial causes. In some cases, a dialog with the community will reduce the concerns; in other cases, it will not. It is nonetheless important to understand these points of conflict. The following discussion presents the more common concerns expressed about fusion centers followed by the law enforcement response. The intent is to provide insight and communications between fusion centers and critics.

Concern: "There is a lack of an underlying philosophy. In the absence of a common understanding about what constitutes intelligence, fusion center development and progress may be impeded."[47]

Response: The purpose of a philosophy is to establish the underlying purpose, processes, and parameters in the execution of an enterprise. The philosophy of law enforcement intelligence, and by extension intelligence fusion centers, has never been clearer than it is today. The philosophy is being molded quite effectively, with a clear articulation of roles and responsibilities as found in the *National Criminal Intelligence Sharing Plan,* with further support provided by the *Information Sharing Environment Implementation Plan* and the DHS *Target Capabilities List*. Indeed, Fusion Center Guideline 1 states, "Adhere to the *National Criminal Intelligence Sharing Plan* and perform all steps of the intelligence process."[48] The *Guidelines* established the NCISP and the standards contained therein as an unequivocal philosophy.

Concern: "…arguably, the *2006 Fusion Center Guidelines* have the following limitations: 1. They are voluntary; 2. The philosophy outlined in them is generic and does not translate theory into practice; and 3. They are oriented toward the mechanics of fusion center establishment."[49]

Response: The *Fusion Center Guidelines* cannot be viewed in isolation, but must be viewed in the context of the other national standards described above. While they are voluntary—the federal government has no authority to mandate all state and local fusion centers to follow the guidelines—the guidelines nonetheless represent accepted national professional standards that are adopted for two reasons. First, the philosophical reason is to ensure ongoing professional practice. The second, more pragmatic reason, is that adoption of the *Guidelines* represents good faith and a component of due diligence that helps protect the fusion center from civil liability. While voluntary, the *Fusion Center Guidelines* represent the de facto national standard for state, local, and tribal law enforcement.

[47] Masse and Rollins, Ibid., p. 4.

[48] Global Intelligence Working Group (2005), Ibid., p. 25.

[49] Masse and Rollins, Ibid.

With respect to the philosophy, the *Guidelines state*, "…a fusion center is defined as a collaborative effort of two or more agencies that provide resources, expertise, and/or information to the center with the goal of maximizing the ability to detect, prevent, apprehend, and respond to criminal and terrorist activity."[50] These are explicit, practical objectives, not generic ones.

Finally, the criticism that the Guidelines "…are oriented toward the mechanics of fusion center establishment" is puzzling. The philosophy has been clearly established, as described above: It is a responsible, proactive, and effective fact that national standards for the mechanics of fusion centers have been established to help ensure consistency, efficiency and effectiveness. Indeed, the Guidelines represent important control mechanisms for fusion centers to help ensure adherence to the rule of law.

Concern: "Arguments against fusion centers often center on the idea that such centers are essentially preemptive law enforcement—that intelligence gathered in the absence of a criminal predicate is unlawfully gathered intelligence."[51]

Response: The fallacy of this argument rests on erroneous or misinformed assumptions about the law enforcement intelligence function. The first is that *information* is collected; *intelligence* is the output of the analytic process. This is an important distinction.

Certainly intelligence is preemptive. The intent of intelligence is to *prevent* crime. All crime-prevention programs are a form of preemptive law enforcement. The rationale of the criticism is inherently illogical. A cornerstone of law enforcement for decades has been a preemptive approach toward crime whenever possible. Indeed, this preemptive philosophy is the reason that the National Crime Prevention Council was created. Law enforcement intelligence is simply another dimension of prevention.

With respect to the concern about "unlawfully gathering" information, law enforcement personnel at all levels of government are acutely aware of the criminal predicate standard for intelligence. They adhere to privacy and civil rights standards in the intelligence process just as they adhere to constitutional standards of criminal procedure in the course of criminal investigations. Law enforcement organizations have privacy policies, intelligence records policies, and training, all of which meet constitutional and regulatory requirements. Law enforcement understands these obligations and fulfills them.

Concern: "Ambiguous lines of authority allow for 'policy shopping'. … Fusion centers … exist in a no-man's land between the Federal Government and the states, where policy and oversight is often uncertain and open to manipulation."[52]

[50] Global Intelligence Working Group. *Fusion Center Guidelines.* Washington, D.C.: Bureau of Justice Assistance, Office of Justice Programs, U.S. Department of Justice, 2005, p. 5.

[51] Masse and Rollins, Ibid., p. 5.

[52] German, Michael and Jay Stanley. *What's Wrong with Fusion Centers?* New York American Civil Liberties Union, 2007, p. 9.

Response: All state and regional fusion centers are a part of state or local government; therefore, they have a chain of command and accountability to their parent governmental authority. All fusion centers have a policy manual that establishes, among other things, authority and responsibility. In some cases, fusion centers may be colocated with federal agencies, most notably with the FBI; however, there are clear lines of authority and responsibility for the management and accountability of the fusion center to the state or local government. Some have governing boards, others have direct lines of command to a state or local law enforcement organization or state office of homeland security. While there are different organizational configurations of fusion centers, the lines of authority are unequivocally clear. The practice of policy shopping simply does not occur.

Concern: "Private sector participation in fusion centers risks privacy and security. Fusion centers are poised to become part of a wide-ranging trend of recent years in the United States: the creation of a 'Surveillance-Industrial Complex' in which security agencies and the corporate sector join together in a frenzy of mass information gathering, tracking, and routine surveillance."[53]

Response: All nonlaw enforcement personnel in fusion centers, including public and private partners, must pass a background investigation before they are given access to information. Most have security clearances, which make them subject to federal laws governing the handling of classified and sensitive information and state and local privacy protection laws. In addition, private-sector representatives do not represent a single company, but the entire sector. The Washington Joint Analysis Center (WAJAC), for example, reached an agreement with The Boeing Company to assign a Boeing intelligence analyst to WAJAC. The analyst has a Defense Department security clearance and will represent aircraft manufacturers and their suppliers in the fusion center.

Information-collection for the intelligence process is a product of explicit procedures that are dictated by law and the scientific approach to problem solving—it is not collected in a frenzy. Indeed, mass information-gathering is avoided because it makes the intelligence process more difficult since it means that a greater mass of information would have to be sorted through to identify a threat. Indeed, the purpose of *intelligence requirements* is to identify and collect only that information which is needed for analysis.

The *National Criminal Intelligence Sharing Plan,* the *Fusion Center Guidelines,* the *Information Sharing Environment Implementation Plan,* and the DHS *Target Capabilities List* describe the importance of private-sector involvement in law enforcement intelligence.

[53] Ibid., p. 11.

Certainly there is sensitivity to the types of information to which the private sector participants have access; therefore, each fusion center has a privacy policy to which private-sector participants agree to adhere. Moreover, private-sector partners have to sign a memorandum of understanding (MOU) and a nondisclosure agreement, all of which help to protect individual privacy.

Concern: "Military participation in fusion centers violates fundamental tenets of liberty. Officials who regard American communities as battlegrounds in a 'war' can be tempted to dispense with 'inconvenient' checks and balances."[54]

Response: While the public may not be aware, both law enforcement agencies and military representatives in the law enforcement intelligence arena are hypersensitive to these issues.

Law enforcement does not have this war perspective, nor is law enforcement influenced by the military. Law enforcement agencies are acutely aware of the distinctions and simply use the military as a lawful support resource in the fusion centers just as the military has been used for years as a lawful resource in drug enforcement initiatives. Analysts, not information collectors or operational personnel, are assigned to fusion centers from the military; most typically, they are from the National Guard.

Concern: "Data fusion = data mining, which is bad for privacy and bad for security."[55]

Response: These two forms of research and analysis are *not* the same. *Data mining* (also known as Knowledge Discovery) has been defined as "the nontrivial extraction of implicit, previously unknown and potentially useful information from data".[56] It uses machine learning and statistical and visualization techniques to discover and present knowledge in a form which is easily comprehensible to humans.[57] *Data fusion* is the process of integrating information obtained from many heterogeneous sources into a single composite picture of the environment.[58]

Data mining is a proactive process using sophisticated software and mathematical models to develop new knowledge about an entity. Data fusion is an integration and analytic technique that increases the accuracy of analysis by relying on a wide array of diverse information sources. Generally speaking, law enforcement agencies and fusion centers have neither the resources nor the expertise for data mining activities; however, the inclusion of different agencies from different levels of government establishes the heterogeneous information sources characteristic of data fusion. Analysis is performed on this diverse data using the scientific approach to problem solving as is characteristic of all types of intelligence analysis.

[57] www.the-data-mine.com, *Introduction to Data Mining.*

[58] www.cas.edu.au/content.php/260.html

Concern: "Excessive secrecy undermines the mission of fusion centers."[59]

Response: Fusion centers operated by state and local law enforcement should have transparent processes; however, the content of much of their work must remain largely secret both to protect privacy and protect the integrity of inquiries. Some levels of secrecy increase when the fusion center is accredited as a Sensitive Compartmented Information Facility (SCIF).[60] In these cases, there will be more secrecy, as a matter of federal law, because the facility will contain classified information. While there are instances of excessive secrecy, the fundamental issue is that "excessive" will be interpreted differently, depending on one's position and perspective.

For many people, the past abuse of law enforcement intelligence will be the lens through which all law enforcement intelligence activities will be judged. The ongoing skepticism, while frustrating, is a reminder of the need to remain vigilant in training, supervising, and managing the intelligence process.

Similarly, critics need to realize the radical changes that have occurred in law enforcement organizations during the past 5 decades. Officers are significantly more educated, training has increased dramatically, and professional leadership has embraced modern management techniques, values, and responsibilities. This underlying fabric serves as an important foundation for the law enforcement intelligence function.

Fusion Centers and Civil Rights Issues

There is a concern among many privacy advocates that the growth of fusion centers will increase the jeopardy to citizens' civil rights and privacy. As noted in a National Governors Association best practices paper, "The risks to individuals' privacy begin when personal information of any kind is entered into criminal justice information systems."[61] Criminal intelligence records systems are certainly included in this description and warrant special attention because of the low level of proof— i.e., reasonable suspicion—required to enter personal identifying information into the system.

Complicating this issue is the fact that by not understanding the concept of the fusion process, many privacy advocates fear that the centers are the next iteration of centralized surveillance of citizens.

Perhaps the greatest concern of a fusion center in this regard is the participation of federal law enforcement agencies whose jurisdiction for information collection and retention is different from SLTLE agencies. Certainly, when an SLTLE agency is the custodian of an intelligence records' system, care must be taken to exclude information from the fusion center that does not meet the standards of 28 CFR Part 23.

Fundamentally, the privacy and civil rights issues of citizens related to fusion centers are the same as any other aspect of the intelligence process. Those relevant standards of the NCISP apply in the same manner and should be fully

[59] German and Stanley, Ibid., p. 9.

10 WAYS TO ENGAGE AND SUPPORT YOUR FUSION CENTER

- **Recognize the importance of information sharing.** Encourage the practice of sharing information with other law enforcement and public safety agencies. Use the guidelines and action steps of the NCISP to implement or enhance your organization's intelligence function.
- **Improve information flow.** Ensure that channels of communication exist to efficiently share information and intelligence, including Suspicious Activity Reports. Work with the fusion center to agree on a common lexicon and the most effective and efficient methods for the transfer of this information.
- **Support an information-sharing culture through training initiatives.** Provide training programs for everyone and explain intelligence, why it is valuable, and how it benefits the department.
- **Train new recruits.** Provide training to new recruits on the role of fusion centers, why the mission is important, what information to collect, and how to send information to the fusion center.
- **Communicate your needs to the fusion center or governing board.** Constantly communicate your information needs and requirements to the fusion center and offer definitions for actionable information. Ensure that your agency provides feedback on the value of products disseminated and offers recommendations for improvement when necessary.
- **Assign personnel to the fusion center.** Depending on the center, officers, investigators, and analysts may all be assigned and have skills and knowledge to contribute. There are many models for assignment—some agencies choose to assign personnel on a part-time basis (e.g., 1 day a week)—while others serve full-time for a 3- or 6-month rotation.
- **Establish or participate in a terrorism liaison officer (TLO) program.** For departments who cannot afford to lend personnel to a center, participate in a TLO program or intelligence liaison officer programs. Their purpose is to disseminate information distributed by the center to the "boots on the ground" and ensure that all appropriate information collected by his or her agency is effectively shared with the fusion center.
- **Educate political leaders.** Educating political leaders about fusion centers, their value, and their needs may encourage them to demonstrate commitment to the fusion concept and, thus, support your agency and that commitment through appropriate funding. Join the governing board of the fusion center, if one exists. Participating on an interagency governing board will demonstrate the importance of collaborating with the fusion center and allow for a greater understanding of the capabilities and products the center has to offer law enforcement.
- **Hire analysts, if possible.** Both intelligence and crime analysts require different skill sets than those required for patrol officers and investigators. Analysts can make officers work smarter, providing for both increased efficiency and effectiveness.

Based on: *10 Ways to Engage and Support Your Fusion Center*. Washington, D.C.: Police Executive Research Forum, 2008. https://www.llis.dhs.gov (Must register to access).

adhered to. Further, *Guideline 8* of the *Fusion Center Guidelines* states that the management of the fusion center should: "Develop, publish, and adhere to a privacy and civil rights policy."[62] Commentary on this guideline goes on to note the following:

> …one of the critical issues that could quickly stop intelligence sharing is the real or perceived violation of individuals' privacy and constitutional rights through the use of intelligence sharing systems. In order to balance law enforcement's ability to share information while ensuring that the rights of citizens are upheld, appropriate privacy policies must be in place.[63]

As a consequence, civil rights issues for fusion centers have components related to policy, training, supervision, and public information that must be addressed in the development and implementation stages.

Developing the Fusion Center

As noted previously, a fusion center's operations should be consistent with the recommendations of the *NCISP*[64] and the *Fusion Center Guidelines*[65] of the Global Intelligence Working Group. The *NCISP* provides standards for all aspects of the intelligence function to ensure best practices, effective operations, and adherence to civil rights. The *Fusion Center Guidelines* are designed to ensure the following:

> Information and intelligence sharing among states and jurisdictions will become seamless and efficient when each fusion center utilizes a common set of guidelines. The complete support of public safety leaders at all levels is critical to the successful implementation and operation of fusion centers.[66]

Adherence to established national standards will increase the quality of information sharing both within the fusion center's participants' jurisdictions, with intelligence entities outside of the region, and with the Information Sharing Environment. Further, the standards will institutionalize a consistent approach to information collection, retention, analysis, and dissemination that represent recognized and accepted processes as defined by the consensus of intelligence subject matter experts who helped design the standards.

Beyond relying on national standards, consideration must be given to defining who the center's stakeholders are and determining what it will take to get the stakeholders' buy-in to the center's operations. It is this simple: There is a direct correlation between stakeholders' (or consumers') participation in the fusion center and the success of the center. Similarly, stakeholders will not participate in the center unless the products they receive are useful.

To assist in the development and utility of fusion centers, the following common themes, and more important, common questions, should be examined:

- Do fusion centers solve the pre-9/11 information-sharing problems, and as such, make Americans safer?
- Can fusion centers work if they are not part of an integrated philosophy of intelligence and security?
- Who benefits from fusion centers?

[62] *Fusion Center Guidelines,* Ibid., p. 49.

[63] Ibid.

[64] See it.ojp.gov/documents/ncisp.

[65] See www.iir.com/global/guidelines.htm.

[66] Global Intelligence Working Group, 2005., Ibid., p. ii.

- Who should staff, fund, and oversee them?
- What role, if any, should fusion centers play in the Intelligence Community?
- What role should federal agencies play in fusion centers, including funding?
- Do fusion centers represent a shift in the security versus civil liberties pendulum?
- How active and proactive, if at all, should fusion centers be in the collection of intelligence that is not directly tied to a specific and identifiable criminal act?
- Is the current configuration of 40-plus fusion centers, in some cases several operating within one state, the most efficient organizational structure?
- Is the current approach to creating, authorizing, funding, and supporting fusion centers sustainable?
- What are the risks to the fusion center concept and how have those risks been specifically weighed and balanced against the stated goals of fusion center operations?[67]

The answers to these questions provide the foundation for shaping the guiding principles related to the creation and management of fusion centers:

1. Adhere to the tenets contained in the *NCISP*.
2. Collaboratively develop and embrace a mission statement.
3. Create a representative governance structure.
4. Use an MOU or other type of agreement, as appropriate.
5. Integrate SLTLE agencies.
6. Create an environment in which participants can seamlessly communicate.
7. Develop, publish, and adhere to a policies and procedures manual.
8. Develop, publish, and adhere to a privacy policy.
9. Ensure that appropriate security measures are in place for the facility, data, and personnel.
10. Integrate sworn and nonsworn personnel and ensure that all personnel are properly trained.
11. Leverage existing systems and databases and allow for future connectivity.
12. Offer a variety of intelligence services and monitor outputs and outcomes.[68]

[67] Masse and Rollins, Ibid., pp. 3—4.

[68] Modafferi, Peter and Kenneth Bouche. "Intelligence Sharing: Efforts to Develop Fusion Center Intelligence Standards." *The Police Chief* Vol. 7, No. 2, February 2005.

From an *operational* perspective, the experience of the North Central Texas Fusion Center has defined five guiding principles in support of the fusion center's performance:

Guiding Principle 1:	Processing tools and the aggregation of data across jurisdictions and across disciplines are required to achieve the benefits of fusion.
Guiding Principle 2:	Visualization and analysis tools are essential for "connecting the dots."
Guiding Principle 3:	The most important objective is disaster prevention, early warning, and mitigation.
Guiding Principle 4:	The more data the better.
Guiding Principle 5:	Cross-disciplinary analyst(s) need to be assigned to constantly explore the data and test hypotheses.[69]

Building on these principles, three broad phases, each with specific focal areas, are envisioned to accomplish the fusion center's development.

Phase 1. The foundation phase includes these components:

- **Reeducation.** Stakeholders must understand the contemporary role of law enforcement intelligence and the capabilities of the fusion center. Just as important, stakeholders must understand their role in making the intelligence function succeed at preventing acts of terrorism, prevent the occurrence of organized crime, and manage homeland security threats that may affect public safety. As recommended by the *NCISP* and the *Minimum Criminal Intelligence Training Standards,* personnel at all levels of the organization, from executives to line personnel, must receive awareness training as intelligence relates to their role.
- **Developing a mission, goals, and objectives.** What should the fusion center do? How will it operate? What crimes will it address? What will it produce? What is its role and relationship with its consumers? What are the priorities of the fusion center? These questions must be resolved and articulated in the mission, goals, and objectives. It is a laborious process requiring input from executives to stakeholders. It cannot be done effectively, however, until after the training component is completed because all personnel must understand the contemporary law enforcement intelligence function and ensure that their vision of the fusion center is consistent with contemporary standards.
- **What the fusion center will not do.** Just as important as what the fusion center will do, is some discussion of what the fusion center will not do. There will likely be changes in the historic intelligence activities of agencies that will not be continued in the fusion center; for example, many activities of state police intelligence units tended to be more akin to investigative support rather than intelligence activities. For the center to function most effectively, these factors must be clear. Similarly, stakeholders and consumers must understand what the fusion center will not do to avoid erroneous expectations.

[69] Stone, Kelly. *Deploying and Operating an Effective Regional Fusion System: Lessons Learned from the North Central Texas Fusion System.* Unpublished policy paper prepared by the North Central Texas Fusion System, McKinney, Texas, 2006, p. 5.

Phase 2. Proactive developmental activities that must be overtly addressed in this phase include the following:

- **Developing relationships.** Two critical elements to the success of any intelligence activity are information collection and information dissemination. Both must have detailed elements to ensure that everyone does his or her job with respect to intelligence activities. The fusion center must rely on management support from partnering agencies to support the fusion center. It must also rely on personnel to collect needed information, document it, and forward it to the fusion center. Similarly, to succeed, dissemination of information and products from the fusion center must be done in an effective manner that is easily accessible by consumers, in a format that is easy to use, and consistently contain useful information. To accomplish this, there must be overt initiatives to develop relationships among stakeholders within the fusion center and with its external constituency by developing commitments to participate in the center's activities.
- **Outputs/products.** The fusion center must identify specific outputs and products that will be produced on a regular basis. These are among the questions that need to be addressed and articulated as the fusion center's development process moves forward: Will both tactical and strategic reports be produced? Will bulletins and advisories be produced? Will summaries be produced? What is the schedule for outputs? How will responses to specific inquiries be produced? What is the process for determining *right-to-know* and *need-to-know* standards for products and outputs?

Phase 3. The third phase involves moving Phase 1 and Phase 2 activities into operational form, including everything from facilities and staffing to developing memoranda of agreement (see Chapter Annex 8-1), to the actual implementation of the fusion center's operations. This phase can consume a massive amount of time and logistics, particularly when the intelligence function is not only being revised, but reengineered, as well. Other activities in this phase include melding agencies and their data, protecting each agency's data, standardizing data for incorporation into a single system, ensuring quality control (i.e., accuracy) of data, security of the data, and establishing processes for auditing and accountability.

Outputs of the Fusion Center

The fusion center is not designed to respond to ongoing calls or inquiries about individuals or threats. While this will no doubt occur occasionally, if it happens too frequently the staff will be overwhelmed and unable to perform their analytic responsibilities. The most important output of the intelligence fusion center is actionable intelligence, meaning that the intelligence produced by the center will drive operational responses and a strategic awareness of threats.

An operational response occurs when the analysis determines that there is a threat against a specific type of target. Operationally, the law enforcement agency may then take necessary actions to harden the target or intercept the threat. Strategic awareness is broader information that provides information about threats and methodologies or indicators of terrorists and criminals.

The specific kinds of output from fusion centers are not universal. Different regions of the country, the character of targets in a region, and the unique character of threats must be taken into consideration when output is being

designed. In a given geographic region, for example, there may be a large presence of active right-wing extremists and, therefore, the fusion center would focus a significant amount of attention on their activities. Similarly, the U.S. border with Mexico would receive significant attention devoted to drug smuggling and human trafficking. Thus, while all fusion centers should have an all-crimes approach, strategic priorities within those crime categories would be appropriate.

In light of this, the fusion center's substantive outputs should be based on three basic factors:

1. Defined threats based on comprehensive and ongoing threat assessments within the jurisdiction of the fusion center.
2. Information and intelligence needs defined by stakeholders.
3. National priorities, including those of external funding, such as the National Preparedness Goal[70] or FBI intelligence requirements.

Beyond the substantive content, the format and frequency of outputs need to be identified, specifically in light of the types of analysis and products that are produced and the frequency of which they are produced. In some cases, the format of the output may be dependent on unique characteristics of the fusion center's jurisdiction. E-mail alerts, for example, may not be feasible in regions where there is limited electronic connectivity among law enforcement agencies. Similarly, intelligence alerts and bulletins that are designed as briefings and handed out at roll calls would not be feasible for rural or decentralized law enforcement agencies. Types of output may include any or all of the following:

- Summary briefs—incidents and activities, globally or locally, that may have some correlation to threats, particularly if the incidents reflect a trend.
- Threat assessment—a detailed description of threats, targets, the likelihood of an attack against a defined target, and the potential methods of attack.
- Situational awareness reports—the current status of known threats or changes in the status of known threats.
- Information bulletin—information on new or emerging threats, including threat indicators and methodologies.
- Intelligence assessments—comprehensive analysis, usually of a strategic nature, about a threat.
- Raw intelligence—information that is derived from a source deemed to be reliable but that has not been corroborated or analyzed. Typically, the threat is time-critical and potentially severe, hence the dissemination of the information.

In addition to these intelligence products, the fusion center will also produce case intelligence, which is intelligence related to specific threats, targets, and suspects. Case intelligence is produced and disseminated on a timely basis as facts warrant rather than on a fixed schedule. Dissemination is narrower and goes only to persons who have a demonstrable *right to know* and *need to know* the information.

The different intelligence outputs may use a variety of analytic techniques such as link analysis, financial analysis, association matrices, visual investigative analysis, threat profiling, and pattern analysis. Typically, a fusion center would also be

[70] www.llis.dhs.gov/member/secure/dynamicpage.cfm?pagetitle=Preparedness (Must register to access)

involved in other processes that enhance the criminal inquiries of intelligence targets, such as deconfliction, case correlation (particularly between jurisdictions), and intelligence support of investigations related to criminal enterprises and terrorism.

Conclusion

The intelligence fusion process holds a great deal of promise for effective intelligence operations. This is particularly true, given the multijurisdictional character of terrorists' operations and criminal enterprises, as well as hazards that will require public safety operations. The four greatest challenges are: 1. Develop a cooperative and committed relationship between all stakeholders; 2. Ensure privacy and protection of personal identifying information; 3. Establish policies and processes that support efficient, effective, and lawful intelligence operations; and 4. Stay on message as an analytic center.

Chapter Annex 8-1: Developing a Memorandum of Understanding[71]

Fusion centers inherently require the sharing of information and, oftentimes, resources between law enforcement agencies. In either case, there are important obligations on the part of the fusion center and each agency that enters into an agreement with the fusion center. An agreement needs to be in place to formalize and institutionalize obligations and responsibilities of all parties involved. These agreements have different names: memorandum of understanding (MOU), memorandum of agreement, letter of understanding, or statement of understanding. Regardless of the name, all refer to a written agreement between two or more parties that articulates a specific relationship.

Because the nature of the agreements will vary widely, this description focuses on the basic principles and types of content that should be included in an MOA.

Guiding Principles of an MOU:

- *The MOU Is a Statement of Commitment*—The MOU defines the actual agreements and responsibilities in the relationship. The commitment statement can set the context, quality, or sentiment behind the relationship.
- *The MOU Requires Explicit Statements of Expectations and Obligations*—Specific activities, expertise, and resources need to be articulated in the agreement with as much detail as possible.
- *The MOU Must State What Is Not Intended To Be Covered*—If there are specific activities and responsibilities that might be assumed to be covered by the MOU but are not intended to be covered by the agreement, they should be spelled out.

Contents of an MOU:

1. Introduction
    a. What is the intent, capability, or resource for which the MOU is being created?
    b. Specify the agencies that are participating in the MOU. An MOU may between two entities, such as the fusion center and a single law enforcement agency, or it may include multiple parties.
    c. Provide a statement of why the MOU necessary. This is essentially the spirit of the agreement, which can be useful if questions of interpretation later arise about certain provisions in the agreement.
    d. What agreements are set forth by this MOU?
2. Purpose
    a. To what capability does the MOU apply? When answering this question, consider these questions:
        i. What is the intended level of commitment?
        ii. What is the command structure that will make decisions about, and enforce components of, the agreement?

[71] For further information see: 1. Office for Interoperability and Compatibility. *Writing Guide for a Memorandum of Understanding (MOU).* Washington, D.C.: U.S. Department of Homeland Security, undated. www.safecomprogram.gov/SAFECOM/library/default.htm
2. *Partnering for Strength: Getting your Relationships in Print*. Collaborating Agencies Responding to Disasters (CARD), undated. www.cardcanhelp.org/resources.html.

3. Scope
    a. Who are the public safety, public service, and other governmental and nongovernmental agencies that will use the capability/resource?
    b. Are there organizations or agencies that must be excluded that would otherwise be a participant?
4. Definitions
    a. What are the technical and operational aspects of responsibilities, capabilities, and resources? Consider including definitions for each.
    b. Be certain to define/explain acronyms that may be commonly used.
5. Policy
    a. Specify the circumstances for use of fusion center resources, including special requests.
    b. Specify authorization required for contacting and use of the fusion center.
    c. Specify the operating procedures associated with the fusion center as related to the parties of the MOU.
6. User Procedure Requirements
    a. What are the training, exercise, and equipment requirements associated with participating in this MOU?
7. Financial Relations
    a. If the MOU includes a fee-for-service arrangement or other financial obligations, a method for determining financial payments should be clearly established. Any and all financial commitments should be spelled out clearly, with appropriate approvals and monitoring systems in place.
    b. Articulate any financial obligations that must be considered.
        i. What is going to be done?
        ii. Who is going to do it?
        iii. Under what conditions and when will it happen?
        iv. Who pays for what?
8. Maintenance
    a. What are the maintenance requirements associated with participating in this MOU?
    b. If any licenses are required for activities (e.g., software licensing) who will own the licenses?
    c. Who will maintain the equipment?
9. Oversight
    a. What governance structure oversees the fusion center?
    b. What is the relationship of the governance structure to the parties of the MOU?
    c. What are the participation requirements in this governance structure of agencies entering this MOU?
    d. How are issues affecting policy, recommendations, and/or subsequent change implemented by the governance structure?

10. Responsibility For Standard Operating Procedure (SOP) Compliance
    a. Who is responsible for ensuring that the SOPs associated with this capability/resource are followed and that individual agency personnel are trained appropriately?
    b. How will compliance be carried out?
11. Updates To The MOU
    a. Who has the authority to update or modify this MOU?
    b. How will this MOU be updated or modified?
    c. Will updates or modifications require this MOU to have a new signature page verifying the understanding of changes by each participating agency?
12. Separation From The MOU
    a. Under what circumstances may a signatory agency withdraw from the MOU?
    b. What are the penalties or obligations (both funding and other resources), if any, for separation prior to the termination date of the MOU?
13. Authorized Signatures and Dates
    a. All parties to the MOU must have a signature of agreement and commitment by an individual who has the authority to make such commitments.
    b. Explicit dates should be specified as to when the MOU goes into effect.

Chapter Annex 8-2: Common Terrorism Information-Sharing Standards Program

Program Manager/Information-Sharing Environment

Common Terrorism Information-Sharing Standards (CTISS) Program

The Program Manager-Information Sharing Environment released standards that state, local, and federal law enforcement officials must follow when they share information about suspicious activity that could have links to terrorism. Those standards define fusion centers as central nodes for sharing information. The role of fusion centers in collection, integration, analysis, and redistribution of incident information is envisioned to follow these processes:

1. **Observation.** A person witnesses suspicious activity and reports it to a law enforcement agency.
2. **Initial response and investigation.** A law enforcement officer collects additional information from interviews and databases.
3. **Local and regional information processing.** The reporting agency stores that information in its records management system.
4. **Creation of a Suspicious Activity Report (SAR).** A person assigned to the intelligence fusion center assesses the information using standards developed by Office of the Director of National Intelligence (ODNI). If the reported activity could have links to terrorism, the official creates an Information Sharing Environment Suspicious Activity Reporting (ISE-SAR) record.
5. **Information sharing and dissemination.** That ISE-SAR record is shared with FBI and Homeland Security Department employees who work at the fusion center. The employees enter the information into FBI and DHS databases.
6. **Information processing at the federal headquarters level.** The ISE-SAR record is combined with information from other state and local authorities to create an agency-specific national threat assessment, which is shared with agencies that participate in the ISE.
7. **National Counterterrorism Center (NCTC) analysis.** The ODNI's NCTC analyzes the data using information from the intelligence, defense, law enforcement, foreign affairs, and homeland security communities.
8. **NCTC threat alerts and warnings.** The NCTC products are shared with all appropriate federal departments and agencies and with SLT through the state or major urban area fusion centers. The sharing with state, local, and tribal entities and the private sector occurs through the federal departments or agencies that have been assigned the responsibility and have connectivity with the state or major urban area fusion centers.
9. **Focused collection.** The information has come full circle and the process begins again, informed by an NCTC or other federal organization's product and the identified information needs of state, local, and tribal entities and federal field components.

Chapter 9:

Developing Public-Private Partnerships for Law Enforcement Intelligence

Developing Public-Private Partnerships for Law Enforcement Intelligence

Conceptually, it could be argued that the idea for public-private partnerships in law enforcement goes back to one of the most fundamental principles of policing articulated by Sir Robert Peel in 1829 in the United Kingdom. Peel noted that the government alone could not perform all policing duties—assistance was needed by members of the public and, by extension, the private business sector, to help keep communities safe from crime. Indeed, Peel argued that in a democratic society, the police derived its authority from the public; hence, the public had an obligation to assist the police on matters of public safety. His principle, "The police are the public and the public are the police" infers a reciprocal responsibility.[1] In the 21st century, this can be inferred to include two-way information sharing and joint public safety initiatives—responsibilities that both law enforcement and the private sector should embrace.

Reinforcing this notion was an observation reported in a study by the Vera Institute of Justice, which concluded:

> The police depend on citizens to assist in almost every aspect of crime prevention and investigation. Mobilizing that public support is essential to the core mission.[2]

Traditionally, the relationship between law enforcement and the private sector concerning crime control and community safety initiatives has been relatively superficial. Typically, such initiatives have been related to crime issues that were largely idiosyncratic to a given community. In some cases, the law enforcement-private sector relationship has even been contentious. For example, alarm companies and law enforcement have often had problems related to responses to false alarms just as law enforcement and private investigators or security guards have been at professional odds, often with law enforcement viewing these two groups despairingly as "police wannabes."

In other cases, new law enforcement-private sector relationships have been derailed by legitimate obstacles such as civil rights and privacy concerns by law enforcement or the potential to undermine profit and investments by private entities. While not insurmountable, resolution of these issues requires creativity and innovation, both of which are often labor-intensive. All too often the initiative has dwindled away, with both groups saying "we tried" rather than forging forward to resolve the barriers. In some cases, it was perceived that the potential outcomes were not worth the time and resource investment needed to make the initiative work. These perspectives are beginning to be reshaped in the post-9/11 era, albeit slowly.

[1] Carter, David L. *Police and the Community.* 7th ed. Englewood Cliffs, New Jersey: Prentice Hall, Inc., 2000.

[2] Bhanu, Chitra and Christopher Stone. *Public-Private Partnerships for Police Reform.* New York: Vera Institute of Justice, 2004, p. 3.

Working cooperatively with the private sector to accomplish functional goals can be highly productive. As observed by the Vera Institute:

> Perhaps the most promising but least studied source of external support for police reform is the private business community. Not only do private sector companies command political attention, they hold talent, dynamism, creativity, and a wealth of resources that can be useful to reformers within police agencies.[3]

Similarly, a study by the RAND Corporation found the following:

> Private organizations also have proved to be a good source of information for local police. Private security officers, reservation and store clerks, and baggage handlers are good examples of private sources with helpful information; they are much more likely than an officer to see or sense something suspicious. Some agencies are trying to develop such relationships by creating seminars to teach businesses about the kinds of information that are most helpful. These seminars have the twofold objective of easing the anxiety of participants while enhancing the likelihood that they will call the police with information.[4]

As law enforcement reengineers its intelligence initiatives for homeland security, it has become obvious that the need for effective public-private partnerships is more important than ever. Moreover, the partnerships need to be configured in an array of different models depending on the threat picture within a region. The obstacles still remain; however, increasingly it is understood that the value derived from such relationships is indeed worth the investment of time and resources. While there are many programmatic approaches related to the private sector associated with prevention, disaster preparedness, incident management, and response, the current discussion will be limited to public-private partnerships for intelligence (P3I).

Background and Perspective

Much of the current thought on public-private partnerships has been shaped by initiatives related to the development of the European Union. A brief look at this history provides some perspective.

As a means to increase their economic strength on a global basis, 13 Western European countries developed an agreement that was originally known as the European Economic Commonwealth. It evolved into the European Community and, as it is known today, the European Union.[5] One of the foundations of developing a viable and economically strong union of diverse, multilingual governments was to embrace public-private partnerships. The conceptual framework developed by the European Union has broad applicability to the U.S.

> A public-private partnership is an agreement of cooperation between autonomous private and public parties working together to achieve joint objectives, on the basis of a clear division of responsibilities, tasks and authority, and with no hierarchy amongst the parties. The most important preconditions for the success of a public-private partnership are mutual trust and recognition of the possibilities for the future.[6]

[3] Bhanu and Stone. Ibid., p. 1.

[4] Riley, K. Jack, Gregory Treverton, Jeremy Wilson, and Lois Davis. *State and Local Intelligence in the War on Terrorism.* Santa Monica, California: RAND Corporation, 2005, p. 40.

[5] The current European Union membership is 27 countries, with three candidate countries awaiting admission. The history of the European Union is too complex and unnecessary for the current discussion. A good history, including milestone events, can be found at europa.eu/abc/history/index_en.htm.

[6] European Commission. *Report of the Seminar on Public Private Partnerships.* The Hague, Netherlands: 2003, www.theccv.eu/binaries/English_documents/Crime_prevention/seminar_ppp.pdf, p. 6.

In expanding the concept of public-private partnerships to public safety and security issues, the European Commission report stated the following:

Security—or safety—is a fundamental right, … meaning that the State bears responsibility for the preservation of this right. Four notions are important in this respect:

1. The State cannot solve the security problems in society alone.
2. When there is a specific risk, the people in charge must take the necessary measures.
3. Repression is not the only solution; there is a need to develop prevention.
4. The problems on a local level must be tackled by a common endorsement of all the participants [public and private alike].[7]

Three conditions for effective partnerships were articulated for public-private partnerships to be functional:

1. Effective cooperation, which includes the willingness to listen, to get to know each other, to respect each other, to recognize the limits of each partner, to share useful information, leading to discretion, confidentiality and the willingness to share information.
2. Working methodically: which means not to wait for a crisis before working together, to meet regularly, to plan processes of meeting, to use tools agreed on by all the partners to collect information.
3. Strengthening and a territorial disposition adapted to the history of the [community] and to its administrative and social reality.[8]

On the last point, for P3I in the U.S., this would include consideration of civil rights and privacy issues, protection of corporate proprietary information, adherence to national standards for security of sensitive information, and participation in the Information Sharing Environment (ISE).

U.S. National Standards and Recommendations for Public-Private Partnerships

In the U.S., the need to proactively incorporate the private sector as a functional partner in the information/intelligence-sharing process has been consistently recognized by a wide range of inquiries. The *9/11 Commission Final Report* noted this:

> The mandate of the Department of Homeland Security does not end with the government; the department is also responsible for working with the private sector to ensure preparedness. This is entirely appropriate, for the private sector controls 85% of the critical infrastructure in the nation. Indeed, unless a terrorist's target is a military or other secure governmental facility, the "first" responders will almost certainly be civilians. Homeland security and national preparedness therefore often begins with the private sector.[9]

[7] European Commission. (2003). Op. cit., p. 15.

[8] European Commission. (2003). Op. cit., p. 15\6.

[9] National Commission on Terrorist Attacks upon the United States. *9/11 Commission Final Report.* Washington, D.C.: 2004, 397–398.

There is no more critical need for information-sharing with the private sector than to develop intelligence to prevent terrorists' attacks from touching U.S. soil. The 9/11 Commission goes on to observe the following on the matter of public-private information sharing:

> The necessary technology already exists. What does not [already exist] are the rules for acquiring, accessing, sharing, and using the vast stores of public and private data that may be available. When information sharing works, it is a powerful tool.[10]

In examining the successes of government information-sharing, the Government Accountability Office made the following observation:

> One of the challenges in securing our homeland is ensuring that critical information collected and analyzed by the Department of Homeland Security (DHS) and Department of Justice (DOJ) is shared in a timely and secure manner with a variety of parties within federal, state, and local governments, as well as the private sector.[11]

To deal with these issues, the *National Strategy for Homeland Security* stated, "Government at the federal, state, and local level must actively collaborate and partner with the private sector…". [12] Similarly, the *National Strategy for Information Sharing* observed, "Private sector information represents a crucial element in both understanding the current threat environment and protecting our nation's critical infrastructure from targeted attacks."[13]

The Global Intelligence Working Group recommended that law enforcement include the private sector in the law enforcement intelligence mission. Recommendation 7 of the *National Criminal Intelligence Sharing Plan,* for example, states the following:

> Local, state, tribal, and federal law enforcement agencies must recognize and partner with the public and private sectors in order to detect and prevent attacks to the nation's critical infrastructures. Steps should be taken to establish regular communications and methods of information exchange.[14]

Similarly, the *Fusion Center Guidelines* observed:

> The public safety and private sector components are integral in the fusion process because they provide fusion centers with crime-related information, including risk and threat assessments, and subject.

As evidence by the various reports cited thus far, it is clear that public-private information-sharing is critical for homeland security. It is recommended in virtually every inquiry and assessment of intelligence effectiveness, yet in the years since the 9/11 attacks, accomplishments have not reached the magnitude that was envisioned. As noted by a 2005 Bureau of Justice Assistance report exclusively devoted to public-private relationships in homeland security, "Barriers to information sharing between law enforcement and private security clearly exist."[15] The report goes on to conclude:

[10] Ibid., p 419.

[15] Morabito, Andrew and Sheldon Greenberg. *Engaging the Private Sector to Promote Homeland Security: Law Enforcement-Private Security Partnerships.* Washington, D.C.: Bureau of Justice Assistance, 2005, p. 4.

[16] Ibid., p. 7.

> The lifeblood of any policing agency is information; thus, information sharing (and its analyzed counterpart, intelligence sharing) should be a central component of any law enforcement-private security partnership.[16]

Not only has the DOJ noted the importance of public-private information sharing, a recent array of DHS inquiries has also emphasized the importance of this relationship. For example, one of the objectives of the DHS Intelligence Enterprise Strategic Plan is as follows:

> Objective 1.4: Reporting: Manage Homeland Security intelligence-related information reporting, seamlessly linking all levels of government and the private sector.[17]

Similarly, one of the DHS Lessons Learned/Best Practices papers, states:

> A jurisdiction's analysis and synthesis entity should also establish processes for sharing information with the local private sector. Private businesses and public safety agencies can provide each other with valuable threat and vulnerability information. However, public and private entities often have restrictions on information sharing with each other because of concerns over the release of sensitive or proprietary information.[18]

Yet another DHS Lessons Learned/Best Practices document recommends: "Local businesses and industries should also be incorporated into any local information sharing network".[19] One of the caveats, however, is that, "Public safety and private security officials should cooperatively establish guidelines that strike a balance between the need to inform the private sector of potential threats and the need to ensure that proprietary information is not improperly disseminated".[20] Another report addressed this issue, noting:

> Currently, no formal process exists for state, local, tribal, and private sector entities to task federal agencies with specific intelligence requirements. Failing to understand these entities' requirements inhibits the federal government's ability to understand the threats facing the Nation, much less provide actionable, timely, preferably UNCLASSIFIED, and frequently updated homeland security information and intelligence to those on the front lines of the domestic War on Terrorism.[21]

It is clear from these recommendations and assessments that the private sector must be integrated into information-sharing partnerships. Despite this plethora of recommendations, integration has been surprisingly limited. Moreover, the economic lifeblood of many communities lies in the corporate sector. Many corporations and industries—beyond those that are part of the critical infrastructure—have been identified as targets of terrorist attacks. Information-sharing between public and private entities simply has not evolved as recommended and expected. It is incumbent upon law enforcement leaders to develop a process and training to remedy that problem.

P3I and the Intelligence Process

The current model of intelligence, related particularly to homeland security, addresses "all crimes, all hazards and all threats." From this perspective, state, local, and tribal law enforcement agencies are concerned with two types of intelligence: law enforcement and homeland security.

As a brief review, law enforcement intelligence is the analytic output of raw information that describes threats to a community that have a nexus with crime. This traditional form of intelligence focuses on criminal behaviors such as those related to terrorism or criminal enterprises. The less-traditional homeland security intelligence is the analytic output of raw information that describes noncriminal threats to the critical infrastructure, public health, or community safety for which a law enforcement agency will have some type of public order, public safety, and/or order-maintenance responsibility. If a pandemic flu strikes a community, for example, law enforcement agencies will likely have to assist with victims, aid in quarantines, and assist in expediting and protecting medical supplies. As another illustration, homeland security intelligence may determine that, as a result of new industry, larger barges will travel a major waterway near a community which, in turn, increases the likelihood of a barge striking a major bridge. As a result, law enforcement strategic planning would have to deal with rescue and recovery plans, traffic control plans, and security of the accident scene.

Linking both types of intelligence into a targeted capability outcome, the DHS *Target Capability List* states the following:

> Effective and timely sharing of information and intelligence occurs across Federal, State, local, tribal, territorial, regional, and private sector entities to achieve coordinated awareness of, prevention of, protection against, and response to a threatened or actual domestic terrorist attack, major disaster, or other emergency.[22]

Some challenges for P3I may occur for health professionals with unique types of personal identifying information (such as information on public health and the Health Insurance Portability and Accountability Act of 2006).[23] Plans and processes for lawfully dealing with sharing this type of information and avoiding barriers should a public health tragedy emerge are much easier to resolve before a crisis than during a crisis. If a public health emergency occurs, it would be essential for health care professionals to identify individuals to law enforcement who pose a risk or who are at risk. If processes are put in place with both law enforcement and public health professionals trained, conflict resolution and service delivery will be expedited.

The intent of this discussion has been to place some basic definitions and concepts in context to provide perspective for the P3I. A transitional issue is the relationship of public-private partnerships to the ISE from the context of state, local, and tribal law enforcement agencies.

[22] National Preparedness Directorate. *Targeted Capabilities List.* Washington, D.C.: U.S. Department of Homeland Security, 2007, p. 69.

[23] See the Office of Civil Rights, U.S. Department of Health and Human Services, www.hhs.gov/ocr/hipaa, for more information.

The Information-Sharing Environment and the Private Sector

A new challenge for both law enforcement and the private sector results from the creation of the ISE. The ISE is a formal set of guidelines and processes to enhance the sharing of intelligence across five critical sectors: 1. The Intelligence Community; 2. Federal law enforcement; 3. State, local, and tribal law enforcement; 4. The private sector; and 5. Foreign partners.

> Recognizing the need to go beyond individual solutions to create an environment—the aggregation of legal, policy, cultural, organizational, and technological conditions—for improving information sharing, Congress passed and the President signed the landmark Intelligence Reform and Terrorism Prevention Act of 2004 (IRTPA). The Act requires the President to establish an Information Sharing Environment (ISE), "for the sharing of terrorism information in a manner consistent with national security and with applicable legal standards relating to privacy and civil liberties."[24]

Based on this legislative mandate, the program manager for the ISE guided the development of an implementation plan to provide the mechanism by which the ISE would accomplish its legislative mandate. A critical starting point was defining a vision that has essentially become the ISE's ultimate goal:

> We envision a future ISE that represents a *trusted partnership among all levels of government in the United States, the private sector, and our foreign partners, to detect, prevent, disrupt, preempt, and mitigate the effects of terrorism against the territory, people, and interests of the United States of America.*[25] (Emphasis in original.)

Key to realizing this vision was to create a culture of information sharing among the Intelligence Community, law enforcement agencies, and the private sector. This ambitious plan includes developing the willingness among all entities to be involved proactively in two-way information sharing, increasing technological connectivity between the entities to appropriately and lawfully share information and to develop a common lexicon to increase the quality of information while maintaining security.

As part of this challenge, the *ISE Implementation Plan* stated that the private sector should be part of "… a coordinated [information sharing] source … for access to terrorism information, alerts, warnings, and situational awareness".[26] The *Implementation Plan* went on to note that private-sector information represents a crucial element in both understanding the current threat environment and preventing the nation's critical infrastructure from being the target of attacks.

> Protecting the interconnected and interdependent U.S. infrastructure also requires a robust public-private partnership that provides the private sector with information on incidents, threats, and vulnerabilities, as well as protects private-sector information in such a way that the private sector is willing to share it with government partners.[27]

[27] Ibid., p. 19.

While going beyond the needs of the intelligence process, the primary conduits for sharing terrorism information currently are the Sector Coordinating Councils (SCC) and sector-specific Information Sharing and Analysis Centers established by the *National Infrastructure Protection Plan* (NIPP) and the National Infrastructure Coordination Center. To date, however, sharing through these mechanisms has yielded mixed results. One of the reasons stems from the ambiguity inherent in the public-private relationship. Another important factor is that the private-sector participants report the demand from federal, state, and local governments for critical infrastructure and other information since 9/11 has multiplied many times over, imposing more demands on industry to collect information and report it. Added to the complexity of these factors is that requests for private-sector information are rarely coordinated or consistent, resulting in duplicative requests.[28] If P3I is going to be successful, a consistent collection plan needs to be established. The NIPP[29] articulated six objectives that can serve as guideposts for the collection plan:

1. Sharing information to manage risks to business enterprises and in a manner that protects the information privacy and other legal rights of Americans.
2. Creating a national framework and culture for sharing information that rationalizes requests for terrorism information to the private sector and that adequately protects the risks and proprietary interests of corporations.
3. Creating an integrated, trusted environment in which information can be shared, maintained, and protected.
4. Ensuring access to the integration and analysis of data from multiple sources to provide industry with indicators of impending threats or current attacks.
5. Receiving actionable alerts and warnings concerning specific industries that improve their situational awareness of terrorist threats and enable them to prioritize risks and security investments, and shape the development of plans to ensure the security, continuity, and resiliency of infrastructure operations.
6. Implementing policies and mechanisms that provide liability and antitrust protections to the private sector in connection with sharing information in good faith.[30]

One initiative that is intended to help facilitate these initiatives is the United States Public Private Partnership (USP3). USP3 was designed to serve as a coordination conduit for private and public outreach programs creating a national cross-sector membership. Members in USP3 are involved in information sharing among the partnership.[31] While the concept is sound and there has been good support for the initiative, notably by the DHS, the project has had limited participation. Nonetheless, USP3 should be monitored and supported by local law enforcement as a foundation for developing solid partnerships with the private sector.

The challenge is to understand the complete character of P3I, defining the critical issues that must be resolved, and achieving these objectives in a manner that protects the critical interests of both private entities and law enforcement organizations. These are often competing interests; however, some principles can be relied on to guide both types of organizations through this largely uncharted territory.

Fundamental Principles of Public-Private Partnerships for Intelligence

The P3I is intended to prevent or mitigate criminal and homeland security threats to a community through a two-way flow of raw information and intelligence. In its Homeland Security Policy Statement, the National Governors Association observed that:

> …private sector partners play a key role in providing experts, technology, and infrastructure resources to establish and maintain our nation's security. The role of the business community and the impact on the economic viability of a community when faced with [the prospect of] a terrorist attack must be considered.[32]

One perspective of understanding private-sector targets within a community is to use the framework on which the DHS relies for identifying critical infrastructures and key resources. Certain national infrastructures are so vital that their incapacity or destruction would have a debilitating impact on the defense or economic security of the United States.

- Telecommunications
- Electrical power systems
- Gas and oil storage and transportation
- Banking and finance
- Transportation
- Water supply systems
- Emergency services (including medical, police, fire, and rescue)
- Continuity of government.[33]

These elements of the critical infrastructure affect every community in the United States and, therefore, are of primary national concern.

The term "key resources" means publicly or privately controlled resources essential to the minimal operations of the economy and government.[34] A key resource can vary between communities. Hallmark Cards, for example, is not part of the U.S. critical infrastructure; however, the company employs more than 4,000 competitively paid workers at its Kansas City, Missouri, headquarters and, therefore, is a key resource for the economy of Kansas City. A key resource may also go beyond a single business and include an entire sector within a community. For example, the beef cattle industry in Dodge City, Kansas, includes cattle feed lots owned by a wide array of individuals and businesses, a cattle auction house, and multiple beef processing companies. Collectively, these businesses are the economic engine, hence key resources, for southwestern Kansas. (See Chapter Annex 9-1 for a public-private case study of this in Dodge City.)

As noted previously, while there are many roles the private sector may fulfill in homeland security, the current discussion is focusing solely on the intelligence role for prevention. As such, both private critical infrastructures and knowledge resources should be identified by their likelihood of becoming a target in light of the reasonable threats within the region.

[32] National Governors Association. "Section 5.5 – Coordination with the Private Sector." *Policy Position: EC-05.* Homeland Security Policy. Washington, D.C.: National Governors Association, 2007.

[33] *Executive Order No. 13010. Critical Infrastructure Protection.* See 42 U.S.C. 5195c(e).

[34] Homeland Security Act of 2002 codified as 6 U.S.C. 101(9).

One might also consider the nonlaw enforcement public sector within the same framework as private because much of its information processing and roles are more like the private sector than law enforcement. Moreover, these organizations will have access to unique types of information; for example, public health, agriculture and veterinary medicine, mass transportation, and aviation departments possess a significant amount of information that could provide value to both law enforcement and homeland security intelligence.

Intelligence relies on raw information. From this perspective, an important element to consider is that the private sector has access to raw information not readily available to law enforcement that can be important for responding to intelligence requirements related to threats within a community or a region. This information may come from independent sources (domestically or internationally) that a corporate security organization has developed through its own sources. These are some examples:

- An automobile manufacturer's corporate security division learns through an investigation of trans-shipment thefts from an overseas parts supplier that the same criminals are smuggling explosive components to a person within the U.S.
- Corporate security of a multinational banking firm learns of suspicious financial transactions originating in your city that involve transferring funds to a bank in Iran suspected of hosting bank accounts of persons suspected of terrorism.
- Corporate security of a large retail company discovers that drugs being smuggled from Thailand to your community are hidden in legitimate shipments of merchandise.

Information from the private sector may also be developed as the result of a request from law enforcement to be on the look out (BOLO) for certain terrorism or criminal indicators. Examples:

- Law enforcement intelligence provides training on criminal indicators to freight or package delivery companies and asks their delivery persons to report suspicious activities based on those indicators.
- Law enforcement intelligence asks retailers to notify it if certain commodities known to be used in terrorism financing or part of another type of criminal enterprise are being sold in, or stolen from, their stores (e.g., Enfamil infant formula[35]).
- Law enforcement intelligence asks a representative of large corporate retailers of certain chemicals to report unusual purchases of selected products that could be used to commit a terrorist attack.

"Business leaders often ask what—other than extra funds—they can contribute to effective police reform. One answer is skills."[36] The private sector has expertise not readily available in law enforcement. This can range from unique technologies, international audio and video communications, abilities to assess hazardous materials, and access to a wide array of equipment ranging from chemical detectors to satellites.

[36] Bhanu and Stone, Op. cit., p. 3.

Types of Partnerships

Partnerships may be developed in different forms according to resources, threats, and information needs. They will be determined by such factors as the nature of threats within a community; the types of critical infrastructures and key resources in a region and their vulnerability; and the willingness of public and private organizational leaders to enter into an information-sharing partnership.

Full Partnerships through Personnel Assignment

Full partnerships occur when a person from the private sector is assigned full-time to a fusion center or intelligence unit. Typically, the individual will represent a business sector, not just the company where he or she is employed. The Boeing Corporation, for example, has assigned an intelligence analyst (who has a Department of Defense security clearance) full-time to the Washington Joint Analysis Center (WAJAC). The Boeing employee represents the entire aircraft manufacturing industry (including suppliers), not just the Boeing Corporation. The criterion for a private sector representative to be assigned to WAJAC is stipulated in its operations manual:

> "Private Entities: WAJAC shall consider the assignment of personnel from privately owned corporations who have a stake in homeland security and meet the approval of the WAJAC Advisory Board." (p. A-4).

Having a private-sector employee represent an entire sector, with the approval of the WAJAC Advisory Board, avoids allegations of playing favorites to any specific company. Moreover, it is simply more efficient and effective to have one sector representative rather than multiple representatives from one sector. Of course, a challenge is to ensure that the sector representative has an agreement with other members of the sector to share needed information.

A full partnership assignment should include, at the minimum: 1. A background investigation of the person being assigned; 2. A memorandum of agreement (MOA) between the public and private entities that spells out duties, responsibilities, and processes of both parties as related to the employee's assignment; and 3. A signed nondisclosure agreement.

The law enforcement intelligence entity needs to assess the sectors in its region to determine the most critical to have represented in the fusion center or unit. Of course, those which have major installations in the region are the most likely candidates. Table 9-1 lists the range of sectors that may provide value to an intelligence unit.

Table: 9-1: Sectors of Private Industry

• Agriculture, food, water, environment • Banking and finance • Chemical industry and hazardous materials • Criminal justice (nonlaw enforcement) • Education • Emergency services (nonlaw enforcement) • Energy • Government • Health and public health • Hospitality and lodging • Information and telecommunications • Military facilities and defense industrial base	• Postal and shipping • Private security • Public works • Real estate • Retail • Transportation – Aviation (all commercial) • Transportation – Aviation (general) • Transportation – Buses and light rail • Transportation – Maritime • Transportation – Rail • Transportation – Roads and bridges

Full-time Information-Sharing Partnership

Under a full-time arrangement there is two-way information sharing between law enforcement and private sector partners that occurs on an ongoing basis, just as the agency does with law enforcement partners. The distinction between this and the full partnership is that in the current case a person is not assigned to a fusion center or intelligence unit—he or she remains at his or her place of employment. This is particularly valuable when standing intelligence requirements are related to the private sector. The most common model where this is used is when an intelligence liaison officer[37] (ILO) program has been established.

The ILO concept establishes a formal relationship with the private-sector organization designating an individual who will be the contact point on all two-way information-sharing. Typically, the ILO is vetted for security purposes; receives training along with law enforcement officers on intelligence, counterterrorism, and homeland security intelligence issues; is given defined areas of responsibility for information-sharing; and is often given access to a secure e-mail system, such

[37] This concept is used in a variety of different agencies and has different names: Terrorism liaison officer (TLO) and industry liaison officer (ILO) are common examples. Regardless of the name of the program, the concept is the same. Similarly, the concept is not limited to the private sector. A state fusion center, for example, may designate an ILO from different law enforcement agencies throughout the state.

as the Automated Trusted Information Exchange (ATIX). ILOs should also meet regularly with the intelligence group to discuss issues and processes in order to maximize effectiveness as well as to maintain a strong relationship that is essential for sustaining the ILO program. As was the case with the full partnership, all participating organizations should sign an MOA and the ILO should sign a nondisclosure agreement.

Since the ILO will physically remain at his or her place of employment, information security becomes a greater issue for both parties. Information security processes, therefore, should be outlined in the MOA.

The ILO program is a functional option when the private sector does not have sufficient personnel to assign a person to the law enforcement agency, yet its information is critical for community safety.

The ILO fulfills a number of important roles which include, but are not limited to these:[38]

- Collect, report, retrieve, and share training materials related to threats faced by the sector.
- Serve as a source person for internal and external inquiries from the fusion center or intelligence unit.
- Collect, report, retrieve, and share information and intelligence related to potential threats to the sector.
- Identify, communicate, and serve as a liaison with stakeholders in the sector.
- Serve as the contact person for persons in the sector who have questions about, or information to share about, a threat.
- Conduct, coordinate, and/or facilitate training regarding threats in the sector. The training should be for law enforcement and/or the sector.
- Serve as the designated sector representative for meetings, associations, task forces, or any other entity related to sector threats.
- Monitor and share information with the fusion center or intelligence unit about the existence and/or changes of sector critical infrastructure and key resources.
- Conduct and maintain threat and vulnerability assessments for the sector.
- Keep up to date on terrorist and criminal threats to the sector by monitoring all sources, including open sources.
- Familiar with all law and national standards related to the intelligence function.
- Serve as a sector subject matter expert on all technical and industry-specific language, equipment, and processes for the sector.

Ad Hoc Partnerships

The ad hoc partnership is used on an as-needed basis. This is a particularly viable alternative when no standing intelligence requirements are needed from a particular industry in the private sector. When threat circumstances arise relating to the sector or organization, a mechanism is in place for rapid information-sharing. In extreme cases, a private-sector representative may be placed on a

[38] Based on the Arizona Counterterrorism Information Center bulletin on the terrorism liaison officer program.

temporary duty assignment to the law enforcement agency. Similar vetting processes should be used as in the case of the ILO as well as the memorandum of understanding (MOU) and nondisclosure agreement.

Obstacles to Law Enforcement-Private Partnerships

The inherent nature of P3I requires the open two-way exchange of threat-based information and intelligence between law enforcement agencies and the private sector for both law enforcement and homeland security purposes. As such, processes need to ensure that the exchange is open and that both law enforcement and the private sector receive the information they need. Unfortunately, this is not easy. In exploring the law enforcement-private sector relationship, the Bureau of Justice Assistance (BJA) identified three key obstacles that must be overcome when establishing effective partnerships.[39]

Obstacle 1: Barriers to Information-Sharing. A number of information-sharing barriers must be overcome by both law enforcement and the private sector if effective information sharing is to take place.

The barriers emanating from a law enforcement agency to the private sector include the following:

- Uncertainty about what types of information may be shared with the private sector because of privacy and civil rights concerns.
- Uncertainty about how to share information designated for law enforcement distribution only. In this regard, one question to resolve is whether the assignment of a private-sector representative in a formal arrangement under the authority of an MOU establishes that person as an agent for the law enforcement organization. In many cases, this will be largely influenced by state law.
- Determination of an acceptable method to share sensitive information and intelligence. (Once again, ATIX may provide the best answer.)

Conversely, private-sector barriers to law enforcement include these:

- The reluctance to share proprietary information even if related to a potential threat.
- Foreign-owned companies are reticent to share any information with the government in the U.S.
- As a rule, the private sector does not want to risk information becoming public that could harm profits.

While these information-sharing barriers are not insurmountable, they require nontraditional and creative resolution to address legal controls, information security concerns, and legitimate corporate interests.

Obstacle 2: Lack of Trust. Surveys by the Justice Department[40] have consistently found that the level of trust between law enforcement and private sector security is quite low. The two sectors often view each other as having separate goals and different constituencies. The law enforcement agency's constituency is the community it serves, whereas the constituency of the private sector includes

[39] Morabito, Andrew, and Shelton Greenberg. *Engaging the Private Sector to Promote Homeland Security: Law Enforcement-Private Security Partnerships.* Washington, D.C.: Office of Justice Assistance, U.S. Department of Justice, 2005, p. 4.

[40] Ibid.

not only a broader community but also its investors who go far beyond the local community. There is also an often unstated belief by both law enforcement and the private sector that if one cooperates, the other may not reciprocate. Contributing to the distrust is that, in some instances, private security is seen as not being equal to sworn law enforcement. Of course, private security capability is quite broad, ranging from security guards to sophisticated investigators and analysts.

BJA noted that to develop trust, law enforcement executives and their staffs must do the following:

- Create a vision and passion that brings workers together.
- Deliver what is promised.
- Ensure consistency. Constant change or change that is not understood destroys credibility.
- Communicate.
- Draw out and address past suspicions and concerns.
- Pay attention to detail.
- Train law enforcement personnel and private-sector partners together.
- Ensure equity and equality. Both sides must produce their share of work and be recognized for it.
- Reinforce the importance of the partnership (with an emphasis on sharing the credit for successes).
- Admit mistakes and learn from them. Both sides will make errors.

Obstacle 3: Misinformation and Misunderstanding. Among the major causes of lack of trust are misinformation and misunderstanding. Often, neither law enforcement nor the private sector has a complete understanding of what the other does or can do. Collectively, these have often been viewed as insurmountable by both parties. Successful partnerships demonstrate that the barriers can be overcome, but it requires leadership, commitment, and work to resolve the barriers.

How can these obstacles be overcome? BJA recommends use of the "4 C's":[41]

- Communication—Goals, plans, the types of information to be shared, and concerns should be clearly and unequivocally stated by both parties.
- Cooperation—Overt efforts must be made to reach out to the other. Each party will have wins and losses. The need to develop creative ways to share information should be paramount to establishing a trusting relationship.
- Coordination—Be certain that the actions and responsibilities of each party are clearly articulated to ensure there is no duplication and that all activities mesh well in a seamless public-private Information Sharing Environment.
- Collaboration—Not only work together, but plan together. Each should rely on the expertise and strengths of the other.

[41] Morabito and Greenberg, Ibid., p. 5.

Summary of Critical Elements when Establishing P3I

- Documentation and Agreements
  - » Operational plan to integrate private sector in intelligence operations
  - » Memorandum of agreement for activities, obligations, and services
  - » Nondisclosure agreements by both parties
  - » Liability waiver
- Processes
  - » Application review process
  - » Vetting of private-sector applicants
  - » Training
  - » Access to secure communications (consider ATIX)

Two Critical Issues to Resolve: Sharing Criminal Information and Private Proprietary Information

Sharing criminal information with a private partner has concerns and restrictions that are related to civil rights, state law, criminal intelligence records regulations and policy, and operational security. Most issues can be resolved but they will require carefully crafted policies, MOU provisions, and training. A critical issue for law enforcement is the sharing of information when individuals or organizations are identified: this is the point where constitutional protections attach.

Perhaps the easiest issue is how to share information related to criminal intelligence when individuals and organizations are *not* identified. This may be information about threat conditions, threat indicators, and advisories related to unspecified threats. In these cases, the information-sharing restrictions essentially focus on the right-to-know and need-to-know requirements. The MOA between both parties should be written in such a manner as to make the private-sector representative an agent of the law enforcement entity, thereby giving him or her the right to know. The need to know is determined on a case-by-case basis, just as it should be for law enforcement personnel.

The greater challenge is how to lawfully share information with private-sector partners that identifies individuals and organizations. When a person or organization is identified, constitutional rights and more stringent restrictions attach to the information and information-sharing process. The ability to share this information with private-sector personnel hinges on two important concerns. The first is how state law deals with privacy issues and, in particular, whether a private-sector partner is deemed to be an agent of the law enforcement agency. The second issue is the right-to-know and need-to-know standards that apply in the same manner as described above. Essential to success is the careful crafting of the MOA, training for all parties, and a secure information-sharing process.

Just as there are legal and operational restrictions on sharing criminal information, there are corporate restrictions on sharing proprietary information that belongs to private entities.

Essential Questions to Ask

- Do you know the private-sector entities in your jurisdiction that should be involved?
- Do you have an established contact with any of these private-sector entities?
- Have representatives of these entities been vetted?
- Do you have an MOA with any of these entities?
- Have the entities with which you have a relationship signed a nondisclosure agreement?

Proprietary information is information that is patented, copyrighted, and/or trademarked, and describes a product, process, design and/or formula that was developed or purchased by a private organization and is part of that organization's business processes. It includes, but is not limited to: financial information; data or statements; trade secrets; product research and development; existing and future product designs and performance specifications; marketing plans or techniques; schematics; client lists; computer programs; processes; and know-how that have been clearly identified and properly marked by the company as proprietary information, trade secrets, or company confidential information

To be proprietary, the information must have been developed by the private entity and is not available to the government or to the public without restriction from another source. The formula for a soft drink, software code, the business plan of a company, a business marketing list ,or the components of a computing device are examples of proprietary information. The nature of proprietary information can range on a very broad spectrum. Essentially, every product and every business in the world conceivably has some form of proprietary information that typically is not shared because of concern over aiding competitors or undermining one's success in the marketplace.

In some cases, proprietary information may be relevant to the prevention or mitigation of a criminal incident or emergency; for example, the design of a production or shipping facility, the location of storage and backup sites, the compounds in a chemical product, or the process to disable some type of device. In such a circumstance, it is hoped that the private entity would share proprietary information with law enforcement. To accomplish this, the law enforcement agency must recognize the magnitude that such a request holds. The disclosure of the information could undermine the success of the company. While the law enforcement agency sees the value of learning such information, it must also be cognizant of the risk that it poses to the private-sector partner. It is good practice to have a procedure for the release of proprietary information and a statement of release and nondisclosure that is signed by both parties. Examples of components of such a document are listed in Table 9-2.

Table 9-2: Sample Components of a Release and Nondisclosure Agreement Regarding Proprietary Information

- Identify the specific type of proprietary information needed.
- Provide a clear state of justification of why the information is needed to prevent or mitigate terrorism or criminal offense or the public safety need for such information.
- Define the conditions under which the private-sector entity would release the information.
- Articulate any unique stipulations to the distribution of the information.
- Define the information security requirements for protecting the proprietary information.
- Describe the time frame, if any, for which the information release is authorized.
- Describe how the information is to be handled after the threat requiring the information has passed.
- Stipulate sanctions, processes, or other remedies to impose should the information be inappropriately disclosed or disseminated.
- Signed and dated by both the public sector and private sector authorizing agents.

Developing the Message to Private-Sector Partners

- There should be a consistent message to private-sector partners, but recognize the following:
- Different types of substantive information may be disseminated to the different partners.
  - » Somewhat different information will be sought from the different partners.
- The message should emphasize their responsibility to contribute to community safety.
  - » This is somewhat of a parallel to Neighborhood Watch or Business Watch.
- Key components of the message:
  - » We need your help to protect our community by reporting suspicious activity that you observe.
  - » We will provide information on what to look for.
  - » We will provide you with details on the reporting process.
  - » The process is designed to protect the rights of innocent persons.
- Goal: To convey to partners their obligation to community safety through a structured process that protects citizens civil rights.

Developing a Successful Public-Private Partnership for Intelligence

Successes in P3I require a collaborative effort and an effective plan. In its study of public-private relationships, the Bureau of Justice Assistance identified 12 essential components to develop. These components can be used as a road map for creating a public-private partnership. To begin, the law enforcement agency must articulate its vision and responsibilities for each of the factors listed

below (See Figure 9-1). The response to each factor is reviewed and refined by those responsible for establishing and managing the partnership. The final implementation plan, including commitments of personnel and resources, is reviewed, refined (as necessary), and affirmed by the chief executive. The critical factors to be addressed in this process are the following:

- Negotiate and develop common goals.
- Identify and develop common tasks for both law enforcement and private-sector personnel.
- Develop knowledge of the capabilities and goals of participating agencies and businesses.
- Articulate well-defined projected outcomes.
- Establish a reasonable timetable for implementation.
- Provide training on the concepts, purpose, and tasks for all involved.
- Clearly identify the tangible purposes of the partnership.
- Clearly identify leaders and those responsible for tasks and goals.
- Create an operational guide on how the partnership will function after it is implemented.
- Secure an agreement by all partners about how the partnership will proceed, including resources and responsibilities.
- Articulate a mutual commitment to providing necessary resources.
- Establish an assessment and reporting process.[42]

Denver Police Department Public-Private Partnership (DP3)
The acronym DP3 stands for Denver Public-Private Partnership. DP3 represents the Denver Police Department's effort at forming a partnership with private security professionals in the City and County of Denver.

The centerpiece of DP3 is a broadcast alert communication network whereby DP3 members receive up-to-the-minute information regarding security threats, crime trends and incidents-in-progress, upcoming major events, BOLO announcements, and the like.

Additionally, DP3's web site will post crime-prevention information and have links to partner organizations' web sites. These sites have many valuable resources relating to security, domestic preparedness, and major incident planning.

Benefits of Membership
The DP3 homepage will post public information and links, but members will have additional privileges. DP3 members, after a limited background and records check, will receive e-mail or text messages and alerts. Members will also have access to the DP3 archives of past alerts and the document library.

Who Should Join
Eligibility for membership in DP3 is limited to security directors and supervisors having an established proprietary or contractual security force within the City and County of Denver. They may also designate members of their staff as being eligible for membership. Access to the DP3 site, however, is open. A brief e-mail to DP3@ci.denver.co.us expressing interest in membership is all that is required, and you will be contacted with instructions and an application. Applicants will undergo a brief computer records and background check as part of the application and approval process.

www.denvergov.org/DP3

---

[42] Adapted from: Morabito and Greenberg, Ibid, pp. 5–6.

Following this process provides a solid foundation and a clear purpose for the partnership with a demonstration of support and commitment by the chief executive. Collectively, this represents an explicit development plan that may be submitted to potential private-sector partners. If the partnership is going to move forward, the private sector must review, refine, and agree to its responsibilities associated with the above factors. There may need to be a negotiation process on certain elements of the plan, which the law enforcement agency must reasonably consider. In the end, each party must agree to its responsibilities and commitments before the partnership is finalized. The development and implementation plan should then move into a joint operational plan with a signed MOA, as appropriate (see Figure 9-1 again).

It is a recipe for failure if either the law enforcement agency or private entity attempts to implement critical factors without input from the other party. Remember that in many cases, the private partner will often have to sell the partnership to a larger corporate structure. As such, demonstrating substantive input into the partnership development process by the private entity can be an important factor in securing corporate commitments.

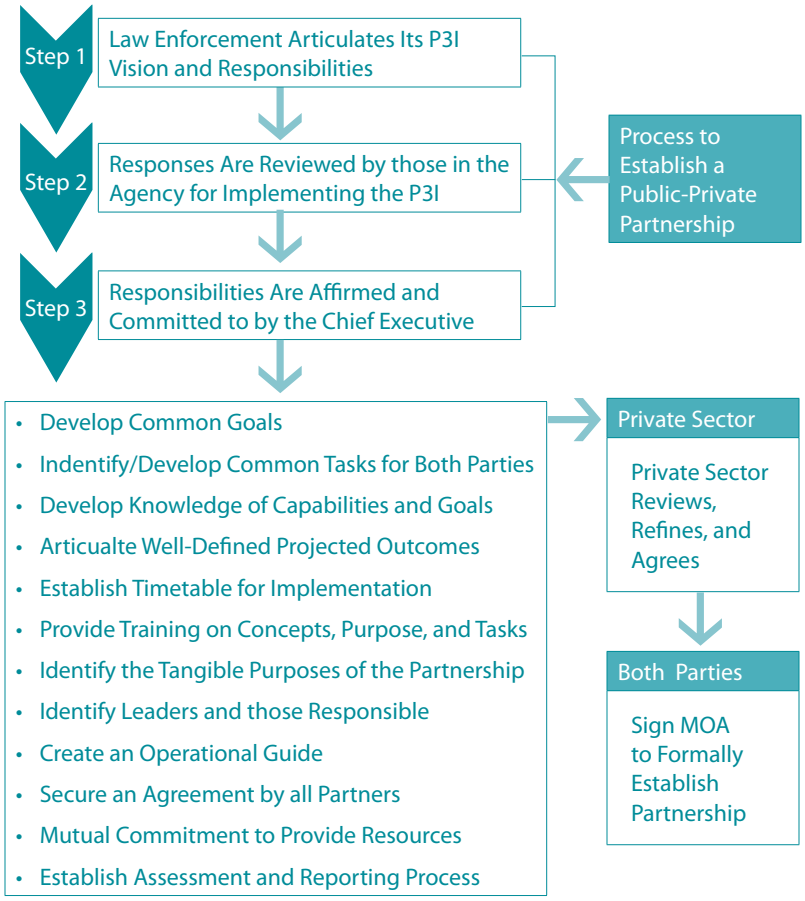
In developing a public-private partnership in support of the intelligence function, Matthew Simeone of the Nassau County, New York, Police Department identified several key factors executives should consider:

- First who, then what: Make sure the right people were in the right positions in the organization before they decide on strategy.
- Tipping Point Leadership: Within every organization there are people, acts, and activities that exert a disproportionate amount of influence on performance. Consequently, focusing efforts on identifying and then leveraging these factors can enable great change.
- Instilling a Need for Change: An initiative involving the private sector and information sharing is likely to bring about debate within the agency regarding the type of information that will be shared. Preparing an internal campaign that addresses the anticipated concerns of officers and the value they will receive from the partnership is essential for the partnership to be effective.
- Committing the Resource: As has been discussed on previous issues, the failure to commit resources to the partnership is essentially condemning the partnership to failure.
- Leveraging the Natural Leaders: The person responsible for developing and implementing the public-private partnership must believe in the concept, understand the concept, have the interpersonal and intellectual skills to move the partnership forward, and be respected within the agency as an informal leader.
- Be Open to Innovation: Agencies should be open to user innovation and should encourage creativity and sharing within the agreed-on guidelines. Just because something has not been done before does not mean it is a bad idea or that it will not work.
- Build on Established Experiences: While public-private partnerships for intelligence may be new, the agency may have previous public-private experiences related to crime prevention or community policing that can serve as a springboard for the intelligence initiative.[43]

Some examples of different law enforcement-private partnership models will provide additional insight.

[43] Adapted from: Simeone, Matthew J. *The Integration of Virtual Public-Private Partnerships in Law Enforcement to Achieve Enhanced Intelligence-Led Policing.* Monterey, California: A thesis prepared for the Naval Postgraduate School, 2007, 103–108.

Figure 9-1: Establishing a Public-Private Partnership for Intelligence



InfraGard[44]

In the 1990s, with the rapid growth of computer networking and reliance on computerization for managing many aspects of government and commerce, it was recognized that the U.S. cyber infrastructure responsible for sustaining the fundamental elements of American life was increasingly vulnerable to terrorist attacks, criminal incursions, and natural disasters. To address this issue, a new initiative in critical infrastructure protection was developed by the Federal Bureau of Investigation (FBI) with the expressed purpose of understanding potential threats and developing ways to prevent or mitigate threats. The greatest emphasis was focused on cyber threats and cyber security.

As this initiative developed, it became apparent that a significant portion of the critical infrastructure was owned by the private sector. As such, it was concluded that critical infrastructure could be adequately protected only by developing a two-way information-sharing partnership between the government and the private sector. It was in this environment that InfraGard was developed.

InfraGard is an information-sharing and analysis effort serving the interests and combining the knowledge base of a wide range of members. At its most basic level, InfraGard is a partnership between the FBI and the private sector. It is an

[44] For more information about InfraGard see www.infragard.net/about.php?mn=1&sm=1-0.

association of businesses, academic institutions, state and local law enforcement agencies, and other participants dedicated to sharing information and intelligence to prevent hostile acts against the United States. InfraGard chapters are geographically linked with FBI Field Office territories, with an FBI special agent coordinator assigned to it. The FBI coordinator works closely with program managers in the Cyber Division at FBI Headquarters.

In its early development, InfraGard was under the direction of the National Infrastructure Protection Center (NIPC) with its focus on cyber infrastructure protection. After September 11, 2001, NIPC expanded its efforts to include physical as well as cyber threats to critical infrastructures. InfraGard's mission expanded accordingly.

In March 2003, the NIPC was transferred to the DHS, which now has responsibility for Critical Infrastructure Protection (CIP) matters. The FBI retained InfraGard as an FBI-sponsored program and works with DHS in support of its CIP mission, facilitating InfraGard's continuing role in CIP activities. In addition, the FBI has further developed InfraGard's ability to support the FBI's investigative mission, especially as it pertains to counterterrorism and cyber crimes.

The goal of InfraGard is to have ongoing, two-way, substantive information sharing between the FBI and its private-sector critical infrastructure partners. InfraGard members gain access to information that enables them to protect their assets and, in turn, give information to the government that facilitates its responsibilities to prevent and address terrorism and other crimes. This information exchange occurs at both the national and local levels for a more comprehensive approach to infrastructure protection.

To accomplish its goal, the FBI established the following objectives:

- Increase the level of information and reporting between InfraGard members and the FBI on matters related to counterterrorism, cyber crime, and other major crime programs.
- Increase interaction and information-sharing among InfraGard members and the FBI regarding threats to the critical infrastructures, vulnerabilities, and interdependencies.
- Provide members with value-added threat advisories, alerts, and warnings.
- Promote effective liaison with local, state, and federal agencies including the DHS.
- Provide members with a forum for education and training on counterterrorism, counterintelligence cyber crime, and other matters relevant to informed reporting of potential crimes and attacks on the nation and U.S. interests.

InfraGard is a solidly conceived and developed program. As might be expected, more substantive information exchanges tend to occur at the local level, while the national level initiatives are important for setting the tone for the public-private partnership. Critical to the success is having a special agent coordinator who fully understands the concept and its value and immerses himself or herself in the partnership to ensure that it is a productive relationship.

Security/Police Information Network: Nassau County, New York

The Nassau County Security/Police Information Network (SPIN) is a dynamic, multidimensional crime-prevention partnership between the Nassau County Police Department and the private sector that seeks to increase public safety through the sharing of important and timely information. This program is designed to promote homeland security initiatives and business continuity, as well as to foster the exchange of information that is critical to the success of protecting Nassau County residents and businesses.

The goals of SPIN are to share information, identify and discuss crime trends and solutions, and work together toward the common goal of protecting persons and assets. SPIN enables the police department or any other county agency to send information to the general distribution group or to a specific sector (i.e., colleges/universities, hospitals, schools, malls/retail, utilities, petroleum, technology, hotels/motels, financial institutions, corporate security, and civic leaders). In addition, SPIN connects local, state, and federal law enforcement agencies operating in Nassau County, as well as public transportation and other government agencies. As a result, SPIN's multitiered approach allows messages to be tailored to law enforcement, vetted security directors, or chambers of commerce and civic organizations.

SPIN members are contacted by e-mail of unfolding situations as they occur. Messages include notifications of bank robberies, major road closings, disruptions in public transportation, major fires or explosions, civil disturbance, public health or weather-related emergencies, or any other situations involving public safety or affecting continuity of business. In addition, Sex Offender Registry notifications are sent to vulnerable entities using SPIN. Members can use SPIN to share information or inquire about safety matters or concerns.

The establishment of such a comprehensive network has applications that are far-reaching in scope, such as: aiding in the capture of felony suspects; notifying participants of the latest crime trends; helping the continuity of business through traffic delay notifications; and facilitating the large-scale exchange of information. The network also provides the police department with the ability to provide training materials to participants that will enhance the safety of all who live and work in Nassau County. Informational meetings are held as necessary to discuss timely security-related issues. Meeting topics have included domestic terrorism, the Republican National Convention, gang awareness, and the *National Response Plan*.

Recognizing the vast amount of knowledge, expertise, and resources in the private sector, SPIN recently expanded the scope of its public-private partnership with the formation of a Security Advisory Council. Utilizing the expertise of security professionals and police officers, the Council is focused on the establishment of guidelines promoting homeland security, crime-prevention and crime-reduction techniques, as well as working toward a coordinated response to critical incidents. The Security Advisory Council's first project, *Digital Video*

Surveillance Guidelines, was recently completed. The guidelines were presented at a SPIN meeting and then posted to the departmental web site.

SPIN, in partnership with the Nassau County Office of Emergency Management, has the ability to send out information to the entire SPIN membership, or to any specific sector of private industry, which are sorted into their own e-mail distribution groups.

The design of SPIN (see Figure 9-2) is not only logical; it is easily adaptable and scalable to meet the needs of agencies of diverse sizes.

Surrounding its law enforcement core are nonlaw enforcement government agencies and responsibilities that are among the easiest with which to establish a partnership, as well as to meet and communicate on a regular basis.

Relying on e-mail and a web portal, SPIN has been comparatively inexpensive to implement, it is less labor-intensive than face-to-face initiatives, it is fast, and it is easier for many private-sector entities, particularly those with a small workforce, to participate. Yet, it has empirically been demonstrated to be highly effective.[45]

Jani-King Janitorial Services Terrorism Awareness Program
Dallas-based Jani-King International, Inc., the world's largest commercial cleaning franchisor, has announced a training program for its franchisees and employees to provide an additional level of security to the more than 50,000 buildings that Jani-King cleans. Some 10,000 franchisees will be trained to assess potential building and workplace security threats and report them to authorities.

Jani-King believes that an aggressive and proactive approach to terrorism prevention is critical and of benefit to everyone. "The key word here is prevention," says Jani-King President Jerry Crawford. "We want to create a security force multiplier to help reduce the risk of terror threats."

"Jani-King is one of the only businesses where banking institutions, major corporations, educational facilities, nuclear power plants, and utilities literally hand over the keys to their buildings and provide access to secure areas," says Crawford. "We feel an obligation to put into action additional measures to help keep these buildings safe."

Crawford explained that Jani-King's training program would specifically educate employees and franchisees on three key areas that are important to terror prevention: awareness, identification, and reporting. "The training will consist of awareness of potential security threats, recognition skills, and proper reporting channels," says Crawford. "Franchise owners will not be trained to confront suspicious persons." Crawford gave an example. "Our crews clean the same buildings night after night. We see the normal activity. We want our employees to understand how to spot suspicious activity and then how to report it."

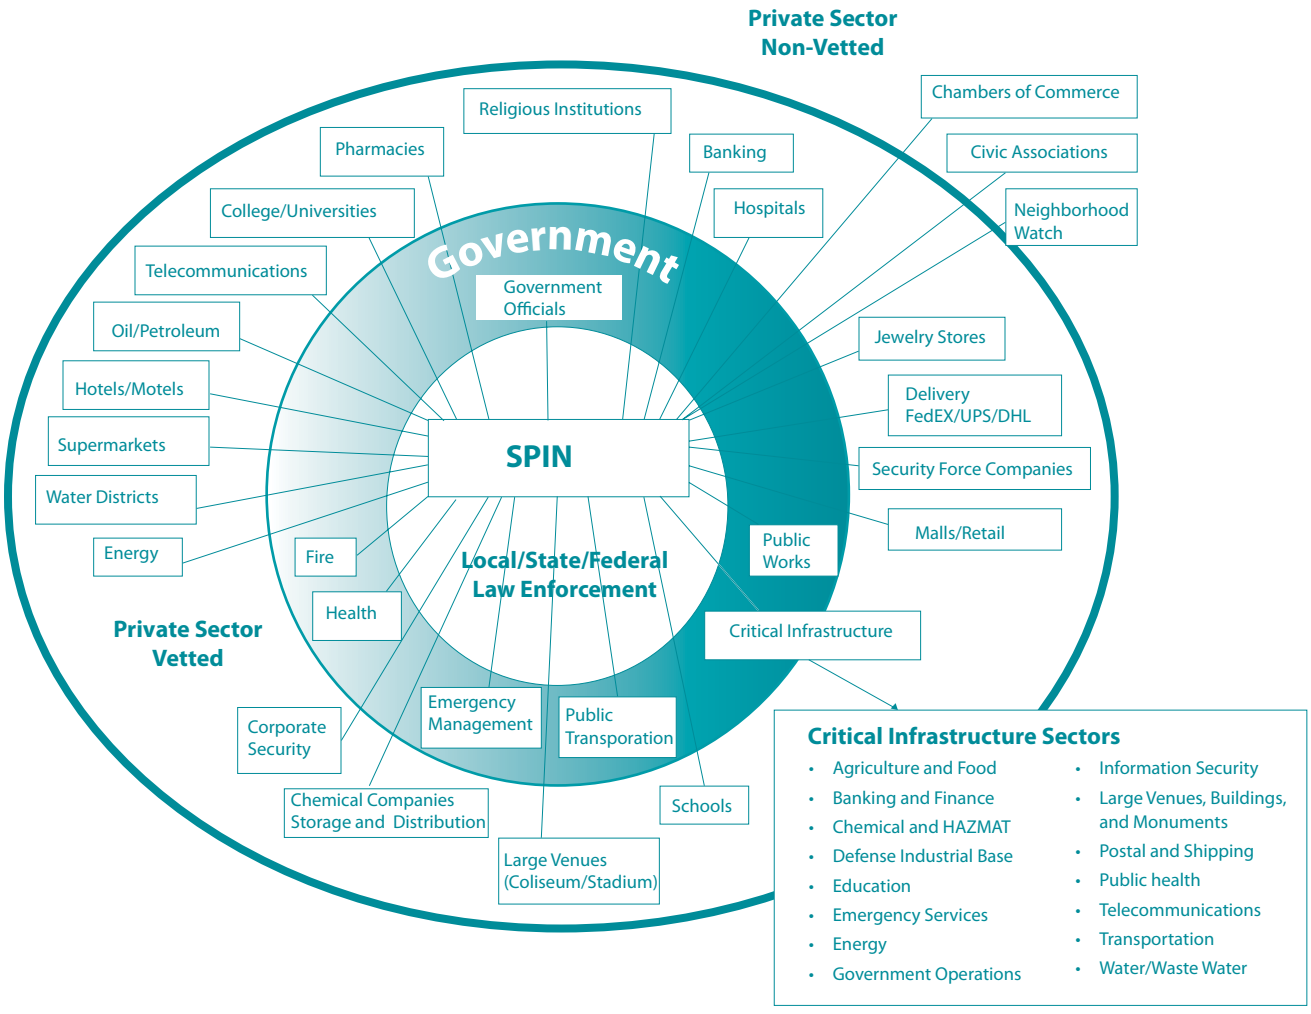
[45] For a comprehensive discussion of SPIN, see: Simeone, 2007, Op. cit.

Homeland Security, Information-Sharing, and the Private Sector

While there is an important role in all aspects of the intelligence process for public-private partnerships, it has been most comprehensively structured through initiatives of the DHS. Directed by legislation, Executive Orders, and Homeland Security Presidential Directives, DHS has developed a comprehensive structure for information sharing. Each holds potential for the intelligence process.

The DHS model has established different formal mechanisms to address its relationship with the private sector. These mechanism are intended to reach beyond the intelligence process and include the diverse elements of the *National Strategy for Homeland Security,* that include processes "to protect, prevent, respond to and recover from" terrorism and other man-made or natural threats to the homeland. The focus of the current discussion is to examine these processes from an intelligence perspective.

Figure 9-2: Nassau County (New York) Police Department SPIN Project Diagram



Critical Infrastructure Sector Partnership[46]

Critical infrastructure protection is a shared responsibility among federal, state, local, and tribal governments and the owners and operators of the nation's critical infrastructure and knowledge resources. Partnership between the public and private sectors is essential for three interactive reasons:

1. The private sector owns and operates approximately 85 percent of the nation's critical infrastructure.
2. Government agencies have access to important information about threats that may disable or destroy the critical infrastructure.
3. Both the private sector and the government control security programs, research and development, and other resources that may be more effective if discussed and shared, as appropriate, in a partnership setting.

Many factors inhibit information sharing for critical infrastructure protection, ranging from limitations by the government for sharing certain types of sensitive information to reservations by the private sector about making business processes available to persons outside of the corporate structure. Because of the important, yet tentative, understanding by both parties, mechanisms had to be put in place to enhance the sharing of important information, yet protect the responsibilities of each. *Homeland Security Presidential Directive 7* and the *NIPP* provide the overarching framework for a structured partnership between government and the private sector for protection of the CI and KRs. This sector partnership structure encourages formation of Sector Coordinating Councils and Government Coordinating Councils to facilitate communications and enhance information-sharing policies and practices.

Sector Coordinating Councils. A "sector" refers to businesses that share a common or closely related product or service. Often, members of a sector are business competitors—such as Delta Airlines and United Airlines in the aviation sector—yet they also share common risk and security problems. In the case of homeland security, sectors are identified as they relate to the protection of U.S. sovereignty and citizens, ranging from the provision of important services to the continuity of both government and the economy. The Sector Coordinating Councils (SCC) foster and facilitate the coordination of sector-wide activities and initiatives designed to improve the security of the nation's critical infrastructure. They are self-organized, self-led, broadly representative of owners and operators (and their associations) within the sector, and are focused on homeland security and critical infrastructure protection. The DHS has a strong preference that each SCC be chaired by an owner and/or operator. Government agencies may suggest the inclusion of various parts of a sector, but it is the responsibility of each SCC to identify the sector's boundaries, establish the criteria for membership, seek broad participation and representation of the diversity of the sector, and establish the governance, business case, and work processes of the sector's SCC.

Government Coordinating Councils. The Government Coordinating Councils (GCC) bring together diverse federal, state, local, and tribal interests to identify and develop collaborative strategies that advance the protection of critical infrastructures. GCCs serve as a counterpart to the SCC for each critical

[46] www.dhs.gov/xprevprot/partnerships/editorial_0206.shtm

infrastructure and key resource sector. They provide interagency coordination around CI and KR strategies and activities, policy, and communication across government and between government and the sector to support the nation's homeland security mission. GCCs coordinate with, and support the efforts of, the SCCs to plan, implement, and execute sufficient and necessary sector-wide security to support the CI and KR sector. GCCs can leverage complementary resources within government and between government and CI and KR owners and operators.

Critical Infrastructure Partnership Advisory Council

The DHS established the Critical Infrastructure Partnership Advisory Council (CIPAC) to facilitate the effective defense of our nation's critical infrastructure by coordinating federal infrastructure protection programs with the infrastructure protection activities of the private sector and of state, local, territorial, and tribal governments.

CIPAC membership encompasses CI and KR owner/operator institutions and their designated trade or equivalent organizations identified as members of existing SCCs. The GCC members of CIPAC are representatives of federal, state, local, and tribal government entities.

CIPAC provides the framework for members of SCCs and GCCs to engage in intragovernment and public-private cooperation, information sharing, and engagement across the entire range of critical infrastructure protection activities. It enables them to interact freely and share sensitive information and advice about threats, vulnerabilities, protective measures, mutual actions, and lessons learned. CIPAC, therefore is exempt from the requirements of the Federal Advisory Committee Act that require public disclosure of an advisory committee's activities.

CIPAC consists of Joint Sector Committees in which GCC and SCC members participate. The Food and Agriculture Joint Sector Committee, for example, comprises food and agriculture GCC and SCC members. The CIPAC also includes one Joint Cross-Sector Committee consisting of the designated private-sector and agency leads from each Joint Sector Committee. The 16 sectors and 7 subsectors of CIPAC are as follows:

- Chemical Sector
- Commercial Facilities Sector
- Communications Sector
- Dams Sector
- Defense Industrial Base Sector
- Emergency Services Sector
- Energy Sector
    - Electricity Subsector
    - Oil and Natural Gas Subsector
- Financial Services Sector
- Food and Agriculture Sector

- Health Care and Public Health Sector
- Information Technology Sector
- Nuclear Sector
- Postal and Shipping Sector
- State, Local, Tribal, and Territorial Government Coordinating Council
- Transportation Sector
  - Aviation Modal Subsector
  - Highway and Motor Carrier Modal Subsector
  - Maritime Modal Subsector
  - Mass Transit Modal Subsector
  - Railroad Modal Subsector
- Water Sector

Special Note: Terrorism Early Warning Group

While the structure and processes of the Terrorism Early Warning (TEW) groups concept go far beyond both private-sector and intelligence issues, it is important to note the private-sector role.[47] TEW groups include analysts from local, state, and federal agencies as well as input from the private sector and the nonlaw enforcement public sector to produce a range of intelligence products at all phases of response (pre-, trans-, and post-attack) specifically tailored to the user's operational role and requirements. TEW groups seek to identify emerging threats and provide early warning by integrating inputs and analysis from multidisciplinary, interagency teams. Using all-source/all-phase fusion, where intelligence is derived from all potential sources (classified, sensitive but unclassified, and open sources), provides information and decision support at all phases of a threat or response to a threat.[48]

In many ways, a TEW epitomizes the concept of thinking globally, acting locally because it seeks to identify global-distributed threats and achieve an understanding of their impact on a local community. This requires more than simple information sharing: it demands collaborative information fusion and the production of intelligence among cooperative nodes that are distributed among locations where terrorists operate, plan, or seek to attack.[49] As a result, there is a need to develop a diverse array of intelligence in a collaborative and integrated process that encompasses multiple sources, including the private sector.

The TEW concept and approach are based on the recognition that local and regional agencies are producers as well as users of intelligence. The following precepts form a foundation for both individual TEWs and the need to link these TEWs into a national network.

- Intelligence for domestic civil protection (homeland security) is not solely a top-down, federally-driven process.
- Intelligence must move top-down, bottom-up, and laterally. There is also a need for bilateral police information sharing and cooperation, independent of federal agencies.

[47] The "Lessons Learned Information Sharing" web site operated by the DHS has extensive resources on all aspects of the TEW. For more information search "TEW" at www.llis.gov.

[48] TEW Information based on: Sullivan, John P. *Terrorism Early Warning and Co-Production of Counterterrorism Intelligence.* Paper presented at the Canadian Association for Security and Intelligence Studies, Montreal, Quebec, Canada, 2005.

[49] Ibid.

- Local police and public safety and health agencies may be first to observe indicators.
- The need for local responsibility to protect public and craft response.
- There is a need for accountability, structure, and guidelines (i.e., doctrine) for access to national intelligence products.
- Regional entities (such as TEW groups) are partners in processing and disseminating intelligence (including providing local context and analyzing products). Local knowledge adds significant value.

Further, while an emphasis on prevention and deterrence is a critical aspect to TEW operations, the domestic intelligence effort is not exclusively related to supporting criminal investigations or pre-attack, pre-event prevention. Intelligence sharing and access to a wide range of intelligence products is needed during attacks in order to develop effective consequence management efforts.[50]

Anecdotal evidence suggests the TEW is an effective process for managing complex diverse information, particularly in large, multijurisdictional areas. As mentioned previously, the TEW concept encompasses far more than the intelligence process. As such, it requires greater degrees of collaboration among partners. Nonetheless, it is an initiative that should be explored when considering any aspect of public-private partnerships for counterterrorism.

Conclusion

The intent of this discussion was to emphasize the importance of P3I and the value such partnerships can bring to the intelligence process. Processes were described on how to develop and implement a public-private partnership as well as challenges that will be encountered. Even with the value of P3I, such partnerships nonetheless require creativity, collaboration, and flexibility by all parties to be developed effectively. There will be challenges which lack clear direction to resolve and new relationships that alter the status quo. Nonetheless, the value gained can be of significant importance for the protection of our communities.

Chapter Annex 9-1: Public-Private Partnership Exercise

Sudden Impact: Threat Planning for Infectious Disease in Cattle

Communicable Cattle Disease Exercise
Dodge City, Ford County, Kansas
(Funded by the National Institute of Justice)

Intelligence Case Study

The following is an actual case study from Ford County (Dodge City) Kansas. Ford County is one of the largest cattle production areas in the U.S. Tens of thousands head of cattle are raised and processed here every year. Because of the critical role cattle play in the American food supply as well as the economic impact of the cattle industry in Kansas, the Kansas Bureau of Investigation (KBI) and the Ford County Sheriff's Office developed a program, with funding support from the National Institute of Justice, to determine how public safety organizations could best work with the private-sector cattle farms, sale barns, and processing plants in case an infectious disease was introduced either intentionally or through natural causes.

Particular challenges:

- Information sharing
  - Would the cattle producers provide sufficient critical information, including proprietary information, to public safety officials related to the identification or discovery of an infectious disease and the status of cattle from feedlots to processing to shipping?
  - What kind of information could the public safety sector provide to the cattle industry regarding threats, particularly concerning sensitive information and with consideration of privacy issues?
  - What kind of public health information would be needed and how could it be shared, particularly related to health privacy laws (notably the Health Insurance Portability and Accountability Act)?
- Interruption of operations
  - How would the cattle industry respond to public safety requests to reduce or stop operations should an emergency occur?
  - What authority does public safety agencies have to mandate the closure of private-sector operations in such an emergency?
  - At what point is the public safety threat sufficient to warrant a halt in cattle production operations?
  - What effect would such actions have on the local economy and to what extent should such factors be considered in halting operations?

While there were many other aspects, particularly related to emergency responses, these emerged as the most critical for the current illustration. Following a comprehensive simulation exercise, it was apparent that the private-sector businesses and public safety officials had distinctively different perspectives on

these issues, despite the fact that extensive meetings and agreements had taken place prior to the simulation.

Some of the issues that emerged:

- Law enforcement tended to take an aggressive stance and gave orders rather than working cooperatively.
- Law enforcement was reluctant to share certain types of information about threats, suspects, and associated facts under the assumption it was improper to share this information with the private sector.
- The private companies tended to withhold certain types of critical information under the assumption it would not be understood by public safety officials.
- Private companies resisted shutting down all operations because of the economic impact of such actions.
- Private companies argued against stop orders of cattle that were already in shipment because of the economic impact. Conversely, law enforcement tended to dismiss the economic variables.

The lesson learned from this exercise was that despite extensive planning by a wide variety of people who had the intent to find the best method to handle an emergency, additional planning was necessary. Both groups viewed the issues from significantly different perspectives.

Public-private partnerships are necessary and can be effective, but they are not easy. The stress and disagreement that arose from an exercise would be magnified under the conditions of an actual threat. Hence, the need for extensive planning, communications, training, and exercising is essential.

Chapter 10:

Managing Information: A Closer Look at Suspicious Activity Reports, Intelligence Requirements, Collection, Analysis, and Products

Managing Information: A Closer Look at Suspicious Activity Reports, Intelligence Requirements, Collection, Analysis, and Products

It is all about the information. Raw information is the fuel that drives the intelligence process. The information flow should be constant, bidirectional, and originate from a diverse array of sources. Managing this information relies on a number of processes that have been introduced in previous chapters. The intent of this chapter is to build on the discussions of these processes with more detail, providing insight into current intelligence applications for information management. Because of the rapid evolution of law enforcement intelligence—particularly as influenced by fusion center development, Intelligence-Led Policing (ILP) and the Information Sharing Environment (ISE)—there is value in a closer examination of these integrated processes as tools for both the information collector and the intelligence consumer.

Suspicious Activity Reporting

Law enforcement intelligence has long used information, both solicited and unsolicited, to learn about criminal threats. Traditionally referred to as "tips and leads," this information was most commonly provided to the intelligence function by officers, informants, and sometimes by the community. In some cases, intelligence personnel would disseminate specific types of information that was needed to answer specific questions about national threats; i.e., intelligence requirements. While criminal investigators and patrol officers rely on the public as a source of information, through Neighborhood Watch or Crime Stoppers, this practice is not as common for the intelligence function.

As the philosophy and processes of intelligence have changed, so have the processes related to tips and leads. It has been recognized that there is value in a proactive approach to generate more of this type of information for the intelligence function. Beyond simply capturing more information, a more structured process was needed to capture, evaluate, store, and share this information. The process is evolving with coordinated development by the Global Intelligence Working Group (GIWG) on behalf of the Department of Justice (DOJ), the Program Manager's Office for the Information Sharing Environment (PM-ISE), and the Intelligence and Analysis Directorate (I&A) of the Department of Homeland Security (DHS). These new initiatives collectively refer to the management of suspicious behaviors through the use of Suspicious Activity Reports (SAR).[1]

[1] There are two types of SARs: one type deals specifically with financial transactions where financial institutions must report large cash transactions as suspicious activity. For more information about the financial SAR see www.fincen.gov/reg_sar.html. Another type of SAR pertains to criminal behavior.

Suspicious Activity Reporting for a Law Enforcement Agency

A further description of suspicious activity reporting gives perspective as described in a project by the Major Cities Chiefs Association:

> The Suspicious Activity Report (SAR) process,… focuses on what law enforcement agencies have been doing for years—gathering information regarding behaviors and incidents associated with crime—and establishing a process whereby information can be shared to detect and prevent criminal activity, including that associated with domestic and international terrorism.[2]

Suspicious activity reporting is a formalized process to *document* and *share* observed behaviors which are indicative of criminal activity. Information—including "tips and leads"—may come from law enforcement personnel, private-sector partners, or citizens. This information should be placed in written form and processed through the agency in order to have the SAR integrated into the analytic process of the intelligence function.

There are three types of Suspicious Activity Reports. The first is the *financial* SAR. This was mandated by the Bank Secrecy Act wherein a wide range of financial institutions must report certain types of transactions to the Treasury Department. The suspicious activity most commonly associated with financial SARs is money laundering or trafficking in unlawful commodities.

The second is the *all-crimes* SAR. This is simply the documentation and reporting of suspicious activity related to any crime. The activity may be observed by a law enforcement officer or reported to an officer. This is similar to what many law enforcement agencies have used, traditionally known by various names such as a Field Intelligence Report, Field Interview Report or Miscellaneous Investigation Report.

The third type is the *Information Sharing Environment Suspicious Activity Report* (ISE-SAR). This is the documentation of suspicious activity specifically related to terrorism or crimes that support or facilitate terrorist planning and acts. As will be described later, an all-crimes SAR and an ISE-SAR are handled differently.

At a law enforcement agency, the form and processes for line officers are typically the same for both the all-crimes and ISE-SARs; however, when the SAR is processed through the intelligence unit or fusion center, the ISE-SAR is processed and shared differently. The reason for the different processing is based on the responsibility of the ISE to deal with terrorism and crimes supporting terrorism.

The first step for a law enforcement agency is to have an intelligence policy to manage suspicious activity reporting. Several organization components need to be in place to have an effective suspicious activity reporting process. Included are:

1. *An agency-wide process for documenting suspicious activity.* A policy guiding the format, use of case numbers, and processing of the SAR must be a formal part of the agency's records system.
2. *An agency-wide process of sharing SARs with other components of the agency and shared externally with other agencies— such as a fusion center—as appropriate.* A report of suspicious activity is of little value if it is just recorded, but not shared.

[2] *Suspicious Activity Report Support and Implementation Project. Final Report.* Washington, D.C.: Major Cities Chiefs Association; U.S. Department of Justice and U.S. Department of Homeland Security, 2008, p 1.

3. *Training personnel on the indicators of the crimes of concern.* Indicators are the signs, symbols, material, and behaviors that are known to be linked to crimes. For example, certain symbols are known to be linked expressly to right-wing extremist groups just like the possession of certain precursor chemicals are known to be associated with "cooking" methamphetamine. Virtually any type of crime will have some type of indicators. As a result, personnel must be trained to recognize these indicators to support suspicious activity reporting. Important, training should include the fact that activities should be viewed as suspicious in light of the "totality of the circumstances," not just on the observation of an indicator alone.
4. *A SAR review and purge process.* Not all activities that initially appear suspicious are criminal. Consequently, the SAR policy should have a process to review the SAR, and ensure there is a reasonable criminal nexus. If not, the SAR should be purged. Important, the agency's privacy policy should be a key component in the review and purge process

---

Financial SAR

To assist law enforcement agencies in its efforts to combat money laundering, terrorist financing, and other financial crimes, the Bank Secrecy Act (BSA) requires financial institutions to file SARs to inform the federal government of transactions related to possible violations of law or regulation. The financial SAR was created replace multiple reports required by different financial regulatory agencies to report, and subsequently investigate, financial transactions that may have a criminal nexus. To further increase efficacy of criminal financial investigations, all financial SARs are filed through the Financial Crimes Enforcement Network (FinCEN).

While it is the financial institutions' responsibility to file the financial SAR, law enforcement intelligence units deal with these reports extensively in the course of identifying illegal activity, identifying offenders, developing cases against continuing criminal enterprises and identifying emerging threats based on trend and pattern analysis of reported financial irregularities.

The financial SAR can be an important resource for the intelligence process because virtually every criminal enterprise has to have a financial network. The SAR is an important tool for tool for intelligence analysis because it reaches into a wide variety of financial institutions and processes, including:"

- Depository institutions, e.g., banks, credit unions, and thrifts
- Brokers or dealers in securities and/or futures
- Money services businesses, e.g., sellers of money orders and travelers' checks; check cashers and currency exchangers
- Casinos and card clubs
- Insurance companies
- Mutual funds
- Individual(s) transporting more than $10,000 in currency or other monetary instruments into/out of the U.S.
- Shippers/receivers of more than $10,000 in currency or other monetary instruments into/out of the U.S.

SARs are a critical source of information for the intelligence cycle. Oftentimes, the reports identify behavior related to previously unknown threats. In other cases, the SAR provides information about an inquiry that helps more clearly understand a known threat or new dimensions of a known threat. The SAR also aids in defining new intelligence requirements. While the SAR is certainly not the only source of new information for the intelligence cycle, it fulfills a critical role, particularly when supported by officers who are comprehensively trained on terrorism and crime indicators and who consistently report that suspicious activity.

Suspicious Activity Reporting Processes

An important part of the suspicious activity reporting process is the underlying assumption that many people observe suspicious activity in their daily lives but either do not recognize it or think the suspicious behavior is not of sufficient consequence to report. As will be seen, a goal is to generate increased reporting of suspicious activity with the belief that as these reports increase, the probability of gaining critical threat information will also increase. The keys to success are the following:

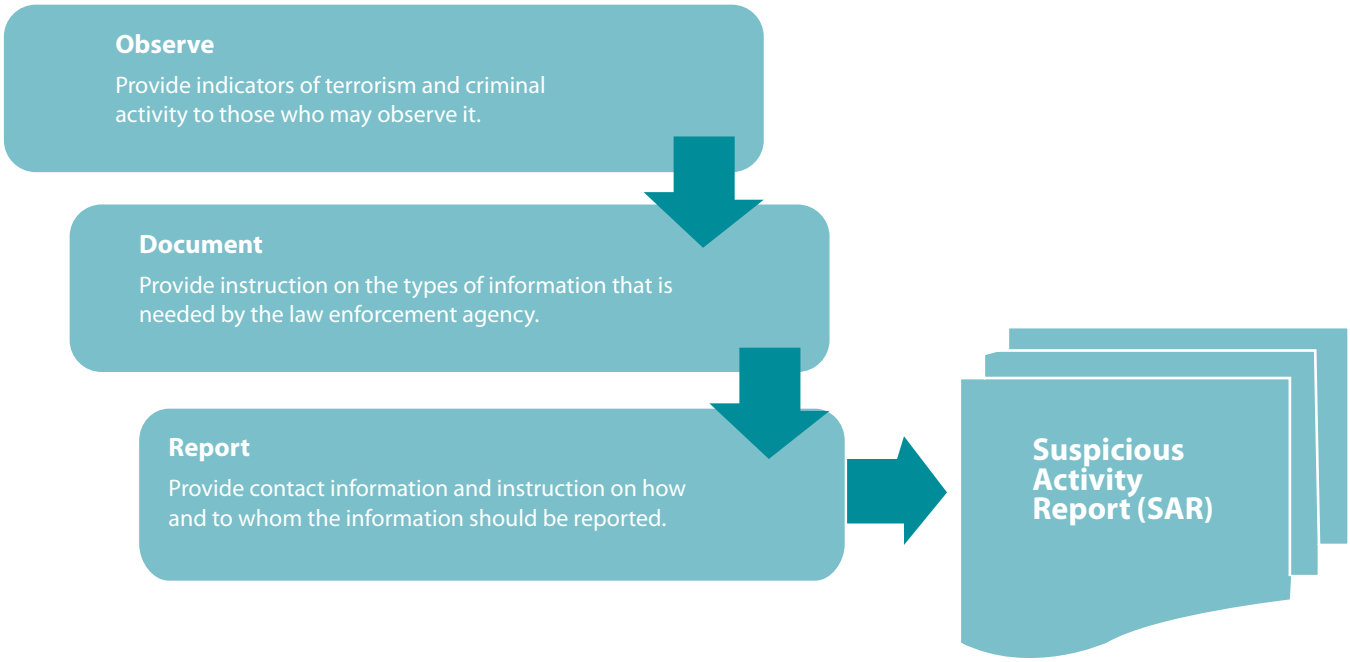
- Recognize "focused" suspicious activity
- Capture substantive information about suspicious activity
- Ensure that all activity is reported through the proper internal intelligence channels or external channels, such as a fusion center (instead of simply being recorded in a law enforcement agency's records management system)
- Review and analyze the information and, if creditable, share it or store it in a searchable database.

This new vision of suspicious activity reporting has two integrated dimensions. The first dimension is development of a model for refining suspicious activity processes. The second dimension is broadening the scope of persons who are encouraged to report suspicious activity, such as community members and private-sector partners.

With the first dimension, "suspicious activity" can encompass a broad array of behavior. Moreover, what a person defines as suspicious will vary, depending on a person's life experiences, values, and other social factors. Direction must be given so that suspicious activity is defined (and viewed) in the context of the types of information that is needed for the intelligence process. To accomplish this, a three-part model can be used: Observe, Document, and Report (see Figure 10-1).[3]

[3] This model is based on a community training model for counterterrorism developed by the Regional Community Policing Training Institute at Wichita State University, Dr. Andra Katz-Bannister, Director.

Figure 10-1: Suspicious Activity Reporting Model



Observe

People must be observant, but observations need to be targeted. Awareness training is needed to ensure that the behavior that is observed has a potential criminal nexus. Often, training includes providing information about "indicators"—behaviors that are reasonably linked to potentially criminal activities. There are two critical components of indicators: First, the focus must be on *behavior*— not the attributes of an individual. Moreover, there must be a reasonable likelihood that the behavior could be related to a crime; that the behavior is not just "odd" or "unusual." "Attributes of an individual" would include perceived[4] race, ethnicity, gender, religion, and so forth. That is, a person *should not* be deemed "suspicious" simply because he or she possesses these attributes—suspicion must be based on *behavior*. If suspicious behaviors are observed and documented as they relate to the preparation or commission of a crime, then the attributes can be properly used as part of the description of the suspicious person. Of course, these guidelines are general and must be applied in light of circumstances and other information the observer has.

The second critical component is for the observer to understand the *types of behaviors and symbols* (e.g., gang markings, tattoos, slogans of criminal extremists, etc.) that are particularly indicative of criminal activity. This means that observers can benefit from some type of training or information about suspicious activities.

For law enforcement officers, training programs are available, both in class and online, that can provide important contemporary information about threat indicators. One such program has been the *State and Local Anti-Terrorism Training (SLATT)* program funded by the U.S. Bureau of Justice Assistance (BJA). SLATT training provides detailed information to officers on indicators of both international and domestic terrorism/criminal extremism from the perspective

[4] The word "perceived" is used here because often an observer sees a characteristic that is mistaken for an attribute. For example, an untrained observer may see a person that the observer concludes is from the Middle East when, in fact, the person is of a different ethnicity.

of how patrol officers, for example, may encounter and observe such behaviors during their regular work shift.[5]

> Communities Against Terrorism (CAT), also funded by the BJA, is a program directed toward the nonlaw enforcement community to provide suspicious activity indicators The CAT program assists law enforcement in the development of partnerships with community members because when community members are aware of potential indicators of terrorism activities, they may provide law enforcement with valuable information. To assist law enforcement in the outreach effort, the CAT offers has templates of flyers containing potential indicators that law enforcement can distribute to specific industries.[6]

Document

When suspicious activity is observed, the value of the SAR is increased if the observer provides explicit information about the suspicious persons and the specific nature of the suspicious activity. While law enforcement officers are trained to collect such information, the public, which reports a significant amount of suspicious activity, typically does not have this knowledge. Public education programs need to inform community members of the kinds of information that are most valuable: Detailed descriptions of the suspicious persons and their vehicles, location of the activity, the actions that appeared suspicious, and any objects the person might have that added to the suspicious activity are all types of information that must be documented. Once again, the CAT program provides the details that are specific to different kinds of businesses.

Report

For law enforcement officers, new processes—described later as the Nationwide SAR Initiative—are being developed to establish common standards for capturing and reporting SARs that will enhance SAR information-sharing. At the outset, the process has a particular focus on terrorism because it is being driven by the ISE.[7] However, since the standards are being prepared with support from the GIWG and the Criminal Intelligence Coordinating Council (CICC), the framework for suspicious activity reporting is envisioned to eventually apply to "all crimes and all threats". A goal is to have the reporting of suspicious activities become more standardized, with officers using a consistent reporting process.

Reporting suspicious activities has been more problematic for community members. In many cases, information has not been reported because the community simply did not know how or to whom to report this information. Law enforcement agencies have been improving their capacity to assist citizen reporting; for example, increasing numbers of law enforcement agencies have developed SAR web sites, special telephone numbers, and initiatives related to agencies' community-based programming.

[5] See www.slatt.org. The web site not only provides training schedules but also online training and a wide range of resource materials. For full access to the web site, one must register with employment verification that the user has a bona fide need for access to the site. Because the program is funded by BJA, there is no charge for the training.

[6] CAT brochures may be downloaded by registered users of slatt.org at www.slatt.org/secured/cat.aspx.

[7] See www.ise.gov/pages/ctiss.html for more information on the ISE initiatives and standards related to SARs.

The goal is to educate and encourage people to be aware of behavior that is likely to be criminal, capture critical facts about the behavior, and submit the information to a law enforcement agency. In many cases, the information can provide important missing puzzle pieces to the intelligence analyst. In other cases, the information may inform the law enforcement agency about potential criminal activity about which the agency was previously unaware.

As initiatives are developed to encourage people to report suspicious behavior, law enforcement is more likely to identify and mitigate threats. A significant element of this process is to ensure that suspicions are based *on behavior* and that the observer captures as much accurate information as possible to report the suspicious activity. Once this information is in the hands of the intelligence function, it must be integrated to learn what else is known about the suspicious activity and to define future information needs to clearly understand if a threat exists and, if so, how it can be stopped.

SARs and Personal Identifying Information

An important issue related to SARs is whether the report contains Personal Identifying Information (PII). PII may be defined as any information or data from which a reasonable person may identify a specific individual. When PII is collected, civil rights protections and privacy standards must be applied.

A PII-SAR is a report that names an individual or provides sufficiently specific information where identity could reasonably be established, such as the physical description of an individual and the address where the person lives. In these cases, retention, security, and dissemination guidelines must be restrictive, with the safest approach of using information management standards that are consistent with the 28 CFR Part 23 guidelines.[8] It should be stressed that SARS typically are not defined as criminal intelligence and the 28 CFR Part 23 guidelines are not required for SARs. However, the guidelines serve as a good model to use for protecting privacy and civil rights. In addition, several agencies are developing SAR-specific guidelines to ensure the protection of privacy and civil liberties. A non-PII-SAR is a report that describes suspicious circumstances, indicators, and/or behaviors of unknown persons. If PII is not included in the report, then the law enforcement agency has significant latitude for retaining and disseminating the information.

Regardless of the SAR model used by a law enforcement agency, distinct policies with respect to the handling of SARs that have PII and those that do not should be made.

Establishing Controls on Suspicious Activity Reports/ Information

Information contained in SARs is sensitive for several reasons: The basis or motivation for reporting the information and the inherent accuracy of the information is often unknown. As such, law enforcement must determine whether lawful activity was misperceived as being criminal and whether the information was reported accurately. Despite these potentially limiting factors, when suspicious activity is reported to law enforcement, the agency has a public

[8] The reader is reminded that 28 CFR Part 23 applies only to criminal intelligence information. Even if the SAR is not retained as part of the criminal intelligence records system, the guidelines afford recognized civil rights and privacy standards to demonstrate that the law enforcement agency is doing due diligence in protecting individuals' rights. Actual policies should be reviewed by counsel with specific reference to the laws of each state.

safety responsibility to determine if there is a reasonable suspicion that a crime is being planned or has been committed. If so, the information should be retained and serve as the basis for a further criminal inquiry and operational planning to protect the public.

Because of this sensitivity, the Global Justice Information Sharing Initiative's Privacy Committee identified six critical factors, or points in the SAR process, wherein information management controls should be implemented to ensure the security and privacy of PII while at the same time permitting the agency to further its inquiry into the behavior. These controls are based on the same principles of information management used to protect information in a criminal intelligence records system. With some modification from the Privacy Committee's report, the six controls include the following:

1. Receipt/Collection. At the time of receipt or collection, suspicious activity information should be assessed and reviewed for sensitivity and confidentiality using corroborative information, if possible. Every effort should be made to validate or refute the information in order to resolve as quickly as possible whether there is a criminal predicate or whether the SAR is unfounded. Collecting information that is purely expressive activity protected by the First Amendment should be prohibited.
2. Storage. Storage of suspicious activity information should be handled similarly to data that rise to the level of reasonable suspicion. Those requirements should include an audit and inspection process, supporting documentation, and logical separation or labeling of the unconfirmed SAR from other information.
3. Access. Because of uncertainty about the information's credibility and/or accuracy, access to suspicious activity information should be handled similarly to access to information that rises to the level of reasonable suspicion. Access should be allowed only where there is a right to know and a need to know the information in the performance of a law enforcement, homeland security, or public safety activity.
4. Dissemination. Suspicious activity information, if systematically collected and stored for interagency distribution, should be disseminated primarily in response to an inquiry, and only for law enforcement, homeland security, and public safety purposes. Uncorroborated suspicious activity with PII should not be regularly disseminated in bulletins or other similar products, but it may be included in secure information databases and disseminated to relevant law enforcement, homeland security, and public safety agencies that have the right to know and need to know the information for public safety purposes.
5. Retention. The retention period for suspicious activity information should be established by policy and be of sufficient time to determine the veracity of the information in light of the agency's expertise and resources. Suspicious activity records should have a "disposition" label, such as "undetermined/unresolved" or "cleared/unfounded," to clearly notify the user of the information's status. Agencies should also consider the need for maintaining some type of suspicious activity data for purposes of statistical reporting and performance measurement when setting retention and purge procedures.
6. Security. Physical and electronic security measures should be similar to those used for information that is rising to the level of reasonable suspicion.[9]

[9] These factors are based on the following document with some modification: Global Intelligence Working Group. *Privacy Committee Report: Tips and Leads Issues Paper.* Washington, D.C.:, Global Justice Information Sharing Initiative, U.S. Department of Justice, 2007, pp. 7–8.

Permeating each factor in this process should be constant attention to privacy, accuracy, and corroborating the information in the SAR, as reinforced by a report to Congress by the PM-ISE:

> Protecting the information privacy and legal rights of Americans is a top priority: At the local level, SARs will be incorporated into existing processes and systems used to manage other crime-related information and criminal intelligence so as to leverage existing policies and protocols utilized to protect the information privacy, civil liberties, and other legal rights of the general public. Multiple levels of review and vetting will be established to ensure that information is legally gathered and managed, and reports containing personally identifiable information that are unfounded, or that cannot be reasonably associated with criminal activity, will not be shared beyond the originating entity.[10]

Complicating these processes among many law enforcement officers is that all information may be useful sometime in the unknown future. This belief produces a great reluctance to destroy any information or reports. Iit must be remembered that SARs are largely unsolicited tips and leads from sources that have a wide range of credibility. If the follow-up shows that the allegation in the SAR is unfounded, there is no reason to retain any PII.

Policy Recommendations for Developing and Managing a Suspicious Activity Reporting System

As has been evident in this discussion, law enforcement agencies are increasingly developing a more comprehensive system to stimulate the reporting of suspicious activity as well as to have a more structured process to manage SAR records. The Major Cities Chiefs Association and the Global Justice Information Sharing Initiative approached this task with support from the Department of Justice (DOJ) and the Department of Homeland Security (DHS). A number of substantive recommendations were made from this project including, in part, the following:

- Agencies should educate and gain the support of policymakers about issues and processes related to suspicious activity reporting.
- All privacy and civil liberties policies and training should be reviewed to verify that they are consistent with current law and national standards.
- Information management of the SARs process should be integrated with existing processes and systems that manage criminal investigative information and criminal intelligence, thereby leveraging existing policies and protocols to protect privacy and civil rights.
- The SAR policy should be communicated to the public because transparency is the key to acceptance.
- Gathering, processing, reporting, analyzing, and sharing suspicious activity information is critical to preventing crimes, including those associated with domestic and international terrorism. The SAR process should have an all-crimes orientation.
- The SARs process should use criminal information management processes, applying SARs to the appropriate criminal records management system or criminal intelligence records system.

[10] McNamara, Thomas E. *Annual Report to the Congress on the Information Sharing Environment.* Washington, D.C.: Program Manager–Information Sharing Environment, 2008, p. 29.

- Suspicious activity submissions should not bypass the local law enforcement agency or agency of original jurisdiction and the standard 911 reporting systems.
- When an agency receives information that affects another jurisdiction, it is the responsibility of the receiving agency to immediately notify the affected agency and discuss coordination, deconfliction, investigation, and vetting procedures with the affected agency. Once vetted, further dissemination of the information would be the responsibility of the affected agency.
- A process should be established to ensure that SARs are made available to fusion centers and local Joint Terrorism Task Forces (JTTF) in a timely manner.
- An ongoing emphasis should be placed on defining and communicating trends in terrorism activity, geographically-specific threat reporting, dangers to critical infrastructure, and general situational awareness.
- There is a need for a common national methodology, including common data codes, for sharing suspicious activity data in order to discern patterns across the country.
- Training is a key component of the SAR process. All relevant agency personnel must be trained to recognize behavior and incidents indicative of criminal activity associated with international and domestic terrorism.
- Incorporating outreach to the public, law enforcement, and the private sector in the collection process is important to the success of the program.
- Develop a common national methodology to horizontally and vertically share SAR data in a timely manner that is consistent with privacy and civil liberty guarantees.
- Develop a standardized training program to provide consistent nationwide SAR training.[11]

The intent of these recommendations is to maximize the utility of suspicious activity information while at the same time protecting civil liberties. While these recommendations are intended to bring about standardization of the SAR process, the report notes that every jurisdiction will have to develop policies and procedures that take into account the unique circumstances and relationships within that community.[12]

The Nationwide Suspicious Activity Reporting Initiative

The Nationwide Suspicious Activity Reporting (SAR) Initiative (NSI) directly supports efforts to protect local communities from terrorism and other violent crime while at the same time protecting the privacy and civil liberties of Americans. An outgrowth of a number of separate but related activities during the last several years, the NSI responds directly to the mandate to establish unified, standardized, and integrated process to gather, document, process, analyze, and share information regarding circumstances potentially associated with terrorism-related criminal activity in a manner that rigorously protects the privacy and civil liberties of Americans, as called for in the National Strategy for Information Sharing (NSIS). The NSI process is a cycle of 12 interrelated operational activities that address the requirements outlined in the NSIS. The NSI long-term

[11] *Suspicious Activity Report Support and Implementation Project,* Op. cit., 2008, pp 2–5.

[12] Ibid., p. 6.

goal is that most federal, state, local, and tribal law enforcement organizations will participate in a standardized, integrated approach to gathering, documenting, processing, analyzing, and sharing information about suspicious activity.

Suspicious activity is defined as "observed behavior reasonably indicative of pre-operational planning related to terrorism or other criminal activity."[13] Although the Nationwide SAR Cycle was developed to enhance our abilities to identify, document and share terrorism-related suspicious activity, the process and technological concepts can be applied to address any emerging crime problem. The NSI cycle intentionally used this approach because individuals and groups involved in terrorism may engage in broad range of criminal activity as they plan, prepare for, and carry out a terrorist attack.

The Challenge. The lack of unified operational processes and a standardized technological approach for gathering, handling, and sharing terrorism-related suspicious activities has impeded the use of locally generated information to identify and mitigate emerging crime trends, including those potentially related to terrorism. Furthermore, the lack of standardized privacy and civil liberty rules can lead to the inappropriate collection and retention of data, and potentially infringe on the privacy and civil liberties of Americans.

The Solution. The NSI builds on what law enforcement and other agencies have been doing for years—gathering information regarding the behaviors and incidents reasonably indicative of criminal activity. As part of this standardized process, frontline and analytic personnel are trained to identify and distinguish between legal and illegal behaviors. Furthermore, through the establishment of clearly defined business rules, potential SARs are reviewed and vetted before they are made available to other analytic and investigative personnel. The use of common data and technical architecture standards enable terrorism-related SARs to be accessed by fusion centers, authorized federal, state, local, and tribal law enforcement agencies, DHS Headquarters, and the FBI's JTTFs and Field Intelligence Groups, thereby enabling the discovery of patterns and trends by analyzing information at a broader level than typically recognized within a single jurisdiction, state, or territory.

The NSI cycle (Figure 10-2) accommodates the specific risks and threats of local, state, and tribal law enforcement agencies. The first part of the cycle encourages jurisdictions to conduct risk assessments and use that information to identify and document priority information needs for that jurisdiction. Those information needs are guide the training provided to frontline law enforcement officers and analysts regarding those behaviors and incidents reasonably indicative of pre-operational planning related to criminal activity—including those potentially related to terrorism. So whether the identified risk is related to illegal drugs, violent gang activity, terrorism or other crime—the NSI process and technological concepts can be applied to address any emerging crime problem.

[13] *Information Sharing Environment, Functional Standard, Suspicious Activity Reporting*. ISE-FS-200, Version 1.5, 2009, Section 5, h. See www.ise.gov/docs/ctiss/ISE-FS-200_ISE-SAR_Functional_Standard_V1_5_Issued.pdf.

The Benefit. Better recognition by law enforcement of behaviors and incidents indicative of criminal activity in a manner that more effectively protects privacy and civil liberties. Investigators, analysts, and homeland security professionals have improved access to critical information, enabling more rapid identification of emerging threats facing our local communities. Preliminary results have already proven value to local counterterrorism efforts. For example, in one jurisdiction during a 12-month period, 1,500 SAR were documented, and of those 1,500 more than 65 have been referred to the JTTF, resulting in 21 prosecutions and convictions in state court for terrorism-related offenses.

While there is widespread recognition of the importance of identifying and reporting suspicious activities, the initiative is not without its critics. The American Civil Liberties Union made the following comment about suspicious activity reporting:

> This overbroad reporting authority gives law enforcement officers justification to harass practically anyone they choose, to collect personal information, and to pass such information along to the intelligence community. Suspicious activity report (SAR) policing opens the door to racial profiling and other improper police behavior, and exposes law-abiding people to government prying into their private affairs without just cause.[14]

Because of these concerns, training is essential. It must be emphasized that the focus is on collecting information about behaviors that represent pre-operational indicators of criminal activity. Unusual or odd behavior or circumstances would not be included unless there is some articulable relationship between that behavior and a potential crime. Beyond training, it is essential to have ongoing supervision and a substantive assessment mechanism to document the effectiveness of the process.

Summary

Suspicious activity reporting is being embraced as a key element in the contemporary intelligence process. With appropriate methods and systems in place, it serves as a valuable tool for gaining critical raw information. The reader is cautioned that the processes are still in development. Moreover, SARs are sensitive from a civil rights perspective and require careful development and controls. While noteworthy progress has been made, challenges remain. The PM-ISE has noted the following:

> Fostering an information-sharing culture may be the most formidable challenge confronting the ISE. In the post-9/11 world, a predisposition to share the right information with those who need it is not merely an option but a fundamental principle firmly grounded in law and regulation. The goal is clear, but achieving it will take dedicated effort. The NSIS states "We will…change government culture to one in which information is regularly and responsibly shared and only withheld by exception." ISE cultural change initiatives aim to ensure that this principle is clearly understood and that managers are held accountable for driving change in their agencies.[15]

10 WAYS TO INTEGRATE SUSPICIOUS ACTIVITY REPORTING INTO YOUR AGENCY'S OPERATIONS

1. RECOGNIZE the importance of SAR, understand your role in the SAR process, and know that your involvement makes a difference. Strong leadership is an essential element. Gain support from personnel, leadership, and policymakers both internally and externally.

2. DEVELOP a data-collection process and secure standardized reporting format for sharing suspicious activity. Define and communicate trends in terrorism-related activity, geographically specific threat reporting, dangers to critical infrastructure, and general situational awareness.

3. LEVERAGE and adopt the use of common national standards to enhance the capability to quickly and accurately analyze suspicious activity data such as the ISE Functional Standard for Suspicious Activity Reporting, the State and Local Agency Information Exchange Package Document (IEPD) for SAR Reporting, the National Information Exchange Model (NIEM), and the Records Management System (RMS) and Computer Aided Dispatch (CAD) functional standards.

4. INCORPORATE appropriate guidelines and concepts into your operations, such as Intelligence-Led Policing, the *National Criminal Intelligence Sharing Plan, the Fusion Center Guidelines, the Findings and Recommendations of the Suspicious Activity Report (SAR) Support and Implementation Project,* and privacy and civil liberties templates. Use the IEPD for the *SAR for Local and State Entities* to establish and integrate the SAR process.

5. IMPLEMENT and adhere to your agency's privacy policy and ensure that the privacy and civil liberties of citizens are protected. Evaluate and update, if necessary, your privacy and civil liberties policy to ensure that the gathering, documenting, processing, and sharing of information regarding terrorism-related criminal activity is specifically addressed. Communicate the policy to the public.

6. TRAIN personnel and institutionalize the SAR process within your agency. Ensure that law enforcement and public safety personnel understand the SAR process and what internal policies or protocols exist to share appropriate information. Learn about available training to increase or enhance abilities, such as the State and Local Anti-Terrorism Training (SLATT) Program.

7. INSTITUTIONALIZE the gathering of suspicious activity information at the street level and standardize the reporting of such data so that it may be shared with other appropriate public safety partners, such as your criminal intelligence unit, state or regional fusion center, Joint Terrorism Task Force (JTTF), and other law enforcement and public safety partners.

8. EDUCATE citizens, businesses, and partners on suspicious activity reporting and how to report activity to appropriate officials. Integrate programs such as the Communities Against Terrorism (CAT) program in your community. Develop outreach materials to educate the public on recognizing and reporting behaviors and incidents indicative of criminal activity associated with international and domestic terrorism.

9. PARTNER with other law enforcement, public safety, private sector, and state or major urban area fusion centers. Foster interagency collaborations to maximize each other's resources and create an effective and efficient information sharing environment.

10. CONNECT to a major information sharing network, such as the Regional Information Sharing Systems (RISS), the Federal Bureau of Investigation's Law Enforcement Online (LEO), and the U.S. Department of Homeland Security's Homeland Security Information Network (HSIN). Leverage proven and trusted technology to share information, communicate, and access additional resources.

From: *10 Ways to Integrate Suspicious Activity Reporting into Your Agency's Operations.* Washington, D.C.: Bureau of Justice Assistance, U.S. Department of Justice, 2008. (Brochure)

Figure 10-2: Nationwide Suspicious Activity Reporting Cycle

Intelligence Requirements

With the growth of the ISE and fusion centers, law enforcement is increasingly relying on the use of intelligence requirements as a method for defining the types of raw information that are needed to develop a more robust analysis of threats. An "intelligence gap" is missing information that is needed for effective intelligence analysis. An "intelligence requirement" is the information needed to fill the gap. When managing information, both the gaps and requirements must be identified and defined.

To illustrate requirements, a statement by former Secretary of Defense Donald Rumsfeld, which was panned by many pundits as being nonsense, demonstrates the concept when dissected. Secretary Rumsfeld stated the following:

> "There are known knowns. There are things we know that we know. There are known unknowns. That is to say, there are things that we now know we don't know. But there are also unknown unknowns. There are things we do not know we don't know."[16]

Table 10-1 illustrates Secretary Rumsfeld's statement as applied to different intelligence challenges—international terrorism (such as al-Qaeda) and violent crime within a community—followed by a statement of the intelligence action related to requirements which must be taken.

Table 10-1: Interpretation and Illustration of the Rumsfeld Quote

	Al-Qaeda Example	Violent Crime Example	Intelligence Action
There are known knowns	We know that al-Qaeda's intent is to commit more terrorist attacks against the U.S. and U.S. interests.	We know there is an increase in violent crime using guns within a community.	The information we know must be consistently monitored and verified (i.e., "standing requirements") to determine any changes in the status of the information we know.
There are known unknowns	We know that al-Qaeda has plans for future terrorist attacks, but the timing, method, and locations are unknown.	We know there is an increase in black market guns, but it is unknown who the supplier is, where the guns come from, or how the transactions are made.	We know that we have intelligence gaps. Intelligence requirements, sources, and methods must be defined so that we may learn the currently unknown information.
There are unknown unknowns	If al-Qaeda has developed new alliances or new methods to commit attacks, these are unknown to us.	There are factors driving the increase in violence beyond the availability of guns; however, these other factors are unknown to us at the time.	Information must be collected from all sources and analyzed in an attempt to identify new threat information.

[16] Department of Defense News Briefing, February 12, 2002. See www.slate.com/id/2081042.

The intelligence analyst must integrate currently held information to determine what we know about a threat: these are the "known knowns." Because the threat environment is dynamic, these known factors must be constantly monitored to verify the threat and determine if a change is occurring to the threat picture. In many instances, while we know that a general threat exists, the specific character of the threat—the method of attack, specific target of attack, and when the attack may be attempted—is unknown. These are "known unknowns." Finally, there are threats which may be developing, either by a known suspect or a suspect completely unknown to us, that we are simply unaware of—these are the "unknown unknowns." The goal is to continually monitor suspicious activities and collect information from diverse sources that may give us an indicator of a new threat. When these new indicators are learned, requirements are defined to better identify the threat and those who pose the threat.

One can understand how the layman may interpret Secretary Rumsfeld's statement as nonsense, but he was essentially describing intelligence gaps and intelligence requirements.

The use of intelligence requirements is a concept that is largely new to law enforcement intelligence, although it has long been used in national security intelligence to specify information needs about threats. It is a holistic approach to collecting and analyzing information so that the most comprehensive picture of a threat emerges, as well as alternatives for countering the threat. The use of requirements also increases the efficacy of the intelligence process by expressly focusing on information needs rather than using a broad dragnet approach to information collection or simply awaiting the serendipitous discovery of critical data.

To use an analogy, the job of an intelligence analyst is akin to putting together a jigsaw puzzle without knowing what the final picture in the puzzle looks like. Each piece of information is like a puzzle piece and the analyst must see where it fits to create a discernable image. The missing pieces are information gaps; the intelligence requirements are to identify and collect the missing pieces, filling gaps, to make the picture more complete. As more pieces are identified, new requirements often emerge. Once sufficient information has been collected, the picture becomes clear and the threat is more clearly understood. Of course, in practice it is not that simple; therefore, there is the need to elaborate on the issues and processes related to requirements-driven intelligence.

Filling Gaps/Fulfilling Requirements

The information-collection process has to be focused so that specific information needs are fulfilled. This increases the efficiency of the process and ensures that the right information needs are being targeted. Historically, law enforcement used an approach that was based largely on intuition of what was suspicious. Often it was mere suspicion based on statements or behaviors that seemed out of the norm, extreme, or unusual. This process was neither objective nor scientific and was often influenced by bias (typically, unintended bias) imposed by the officer's attitudes, values, and beliefs. This process collected volumes of

diverse raw information that was forwarded to analysts and investigators who could examine the information in hopes of discovering that substantive threat information may emerge. As illustrated in Table 10-2, there are a number of differences between this tradition-driven approach and the requirements-driven approach to information collection. In essence, the requirements-driven approach is more scientific and, therefore, more objective, more focused, more efficacious, and less problematic on matters related to civil rights. On this last point, given that intelligence requirements are often the product of an ongoing criminal inquiry, the criminal predicate is more easily articulated.

Essentially, the tradition-driven approach is like throwing out a net, seeking to collect as much information as possible under the assumption that threat information and evidence of crime will emerge from the vast body of information. It is less efficient, less effective, and more likely to lead to civil rights liability. Requirements-driven intelligence is more laser-like. It focuses specifically on the types of information we need to give us an understanding about a narrowly defined area of threat.

Table 10- 2: Traditional Collection versus Requirements-Driven Collection

Tradition-Driven	Requirements-Driven
• Data-driven	• Analysis-driven
• Exploratory	• Specifically focused
• Emphasizes amassing data	• Emphasizes a focused, selective approach to information collection and analysis
• Assumes collected information will identify criminals	• Analytic inference of criminal suspects from collected information
• An aggregate approach to information collection (dragnet); even mere suspicion	• Targeting/specificity on information regarding reasonable suspicion of crimes
• Explores all general inferences about potential criminality	• Selectively explores crime and threat leads based on priorities and evidence
• Explores collected information to see if there are questions to answer	• Answers questions by collecting and analyzing specifically collected information
• Develops intelligence records for contingency needs, (i.e., just in case information is needed)	• Develops intelligence records in support of active threats and criminal enterprises

Applying the Concept to Law Enforcement

As part of the FBI Intelligence Directorate's reengineering process, former Executive Assistant Director Maureen Baginski used requirements-driven intelligence. This concept is epitomized by the statement frequently made by Baginski, and previously referenced in Chapter 4's discussion of the intelligence process, "The absence of evidence is not the absence of a threat."

This is an insightful observation for understanding why requirements-driven intelligence is important. Let us say that a law enforcement executive asks the Regional Intelligence Fusion Center if there is a terrorism threat within the agency's region. The response may be, "There is no evidence to suggest a terrorist threat within the region." However, there may be an unknown threat in the community for which no evidence has been discovered (e.g., "unknown unknowns"). One such unknown threat in the community was Timothy McVeigh who placed the bomb at the Murrah Federal Building in Oklahoma City. Another unknown threat was Muhammad Atta, who had a base of operations within U.S. communities to aid in planning the attacks of September 11, 2001. These were both clear threats to their communities but the evidence of these threats had not been discovered.

We must have a means of identifying these unknown threats, assessing the danger posed, and taking appropriate action to prevent or mitigate the threat. The process is not easy, especially for a state, local, or tribal law enforcement (SLTLE) agency that may have limited information-collection and analytic capabilities. Identifying evidence of such threats is both labor-intensive and resource-intensive, requiring good information-sharing, effective linkages with intelligence networks, constant monitoring and exchange of information, and ongoing information collection, assessment, and analysis within an agency's jurisdiction. These needs reinforce the value of fusion centers, which will have all of these characteristics, and the need for agencies to be a fusion center partner. The fusion process is particularly structured to use the intelligence requirements model effectively.

While requirements-driven intelligence will work well for a law enforcement agency, it requires a commitment of time and resources to accomplish its goals. At the very least, a law enforcement agency needs a minimalist intelligence capacity to contribute to the process at a state or regional level, particularly to be an effective intelligence fusion center partner.

Comparing Intelligence Requirements and Crime Analysis

Intelligence requirements may be conceptualized as information that is needed to make decisions on how to best protect a community from threats posed by organized crime and terrorism. When requirements are filled, executives and managers have sufficient reliable information to direct an operational response to a threat.

As an illustration, SLTLE agencies often make operational decisions related to incidents of predatory crime based on crime analysis requirements. Indeed, this is the fuel of the CompStat process. Specifically, as a result of the timely analysis of reported crime, certain types of crime trends emerge. Relying on information derived from that analysis such as type of crime, modus operandi, time and geographic factors, suspect descriptions, etc., response strategies are developed to deal with the crimes that have occurred and the likely forecast (i.e., future) of crime that will occur if the crime series is left unchecked. The agency may use saturation patrol, undercover officers, decoys, surveillance, or a combination of strategies to capture these repeat offenders. Without the information from the crime analysis output, the most effective operational decisions cannot be made.

Of course, crime analysis requirements are much easier to provide than intelligence requirements because of the inherent differences between criminal investigation and criminal intelligence. Essentially, investigations are crime-driven while intelligence is threat-driven. Thus, investigations are reactive, responding to crimes that have occurred and a known quantifiable universe of data that have been identified through the investigation. Conversely, intelligence is proactive by intervening when a threat is identified. Essentially, intelligence is pre-crime and far more probabilistic—factors that pose both operational challenges and civil rights issues.

Requirements and Strategic Priorities

Intelligence activities should be based on the mission of the unit or fusion center; for example, the mission of a High Intensity Drug Trafficking Area intelligence center would be focused on the production and distribution of illegal drugs. Similarly, intelligence activities of the Immigration and Customs Enforcement service of the DHS are focused on smuggling humans and contraband across U.S. borders. Most state, local, and tribal intelligence activities, however, have adopted an all-crimes, all-threats, all-hazards approach. In reality, all-crimes for intelligence purposes is somewhat of a misnomer. Because this encompasses a wide breadth of crime types, pragmatically, even an all-crimes intelligence operation must prioritize the types of crime that will be the focus of intelligence activities. As noted in the Chapter 6 discussion of strategic priorities, this priority will be based on geography, criminal history of the region, and special issues that help facilitate organized crime and terror threats, such as the presence of seaports, international airports, or unique commercial industries, such as critical infrastructure or key resources.

Intelligence requirements should also be mission-related. Known as *priority intelligence requirements,* the intent is to maintain focus on crime and threats that have been assessed as having the impact of greatest concern in the jurisdiction. We know, however, that crimes and threats change over time. In the case of drugs, for example, trends change in different geographic areas of the country quite frequently. In some areas, methamphetamines are a major problem, in another region the drug problem may be crack cocaine. In both cases, the primary drug problem will evolve. As a result of such changes in crime problems, reprioritizing intelligence targets should be part of the reevaluation component of the intelligence process, as well as of strategic intelligence analysis.

Typologies of Requirements

There are various ways to describe intelligence requirements, meaning that there is no uniform standard for describing the different types of requirements used by law enforcement agencies. This discussion seeks to take the different models and terms currently used and not only explain them, but also illustrate their relationships.

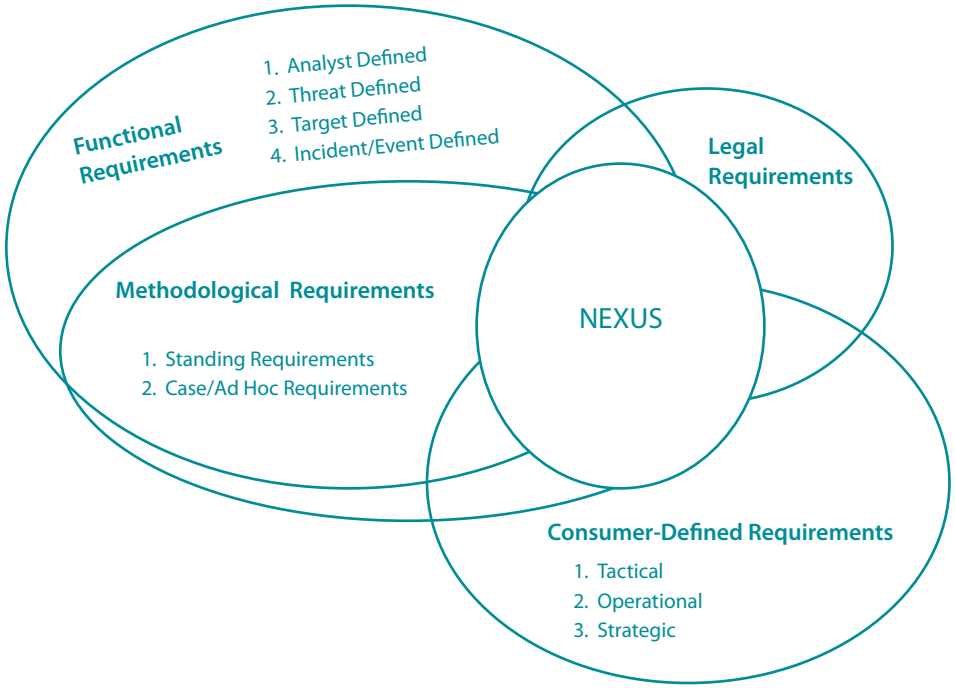
Requirements may be characterized in different ways based on their role. These different characterizations are not mutually exclusive. Indeed, as illustrated in the Venn diagram of Figure 10-3, there is a nexus among the different types, with the various characterizations fundamentally relating to their purposes.

Functional requirements are defined by the intelligence unit or fusion center for the purpose of learning about different dimensions of a threat. Information is collected through SARs and the collection plan associated with ongoing inquiries to help the analyst understand the functional evolution of threats. This is often a systemic process wherein as more information is received and analyzed, a better understanding of the threat emerges which, in turn, helps define additional requirements. This is an iterative process that continues to refine the threat picture until the threat is compromised or until it dissipates.

There are four types of functional requirements:

1. Analyst defined. During the course of the analysis the intelligence analyst discovers a gap in the information that needs to be filled for a comprehensive and accurate analysis to be completed. An analyst has three SARs that suggest an interrelationship among the three as preparation to commit a crime. The intelligence requirements are information that is needed to confirm this linkage.
2. Threat defined. Known threats within the jurisdiction that are monitored on a consistent basis to continually assess the threat. For example, if a jurisdiction has a known white supremacist group that has made criminal threats, monitoring that group to understand changes in its structure, membership, and/or activities can help identify imminent threats.
3. Target defined. Based on the nature of known threats, targets are monitored to assess vulnerability and risk. The Earth Liberation Front threatens to burn down houses and destroy construction equipment in a new subdivision that it says is in an environmentally sensitive area. The requirements would be to collect information on the vulnerability of the targets for a threat assessment.
4. Incident/event defined. If an event is planned or an incident occurs, requirements will be defined to determine potential threats associated with the event or future implications of the incident. For example, if the president of the World Bank is invited to give the commencement address at a local university, there is a high likelihood that anarchists will attend the commencement to demonstrate their disdain for the World Bank. Some anarchists will lawfully demonstrate while others are likely to commit property crimes and disrupt the event. The intelligence requirements are derived from the fact that the event was scheduled.

Figure 10-3: Characterizations of Law Enforcement Intelligence Requirements



For each type of functional requirement, there are critical information needs to enable an understanding of all dimensions of a threat. Threat requirements apply to both law enforcement and homeland security/all-hazards intelligence. As the name implies, these are information needs that help an analyst define a threat with as much precision as possible. Whether the threat is from a terrorist group or from pandemic flu, the analyst needs a wide array of valid information from reliable sources that can provide as much insight as possible about the threat picture.

The method by which the information is solicited is referred to as the methodological requirements. Generally speaking, there are two types:

1. Standing requirements. Information that needs to be collected on an ongoing basis to monitor known and consistently present threats within a community.
2. Case (or ad hoc) requirements. Information that is needed by analysts to determine the existence and character of a threat that is based on unsolicited tips, leads, suspicious activity reports, and/or other information developed through the intelligence process.

Another dimension of requirements is based on an analysis request by intelligence consumers; for example, a partner agency in a fusion center may request a certain type of analysis for its jurisdiction. This request, therefore, will drive the requirements process. These are the types of requirements:

1. Tactical. What information is needed to prevent or mitigate an imminent or short-term threat?

2. Operational. What information is needed to prevent or mitigate a developing or long-term threat?
3. Strategic. What changes in the threat picture exist in the coming months or years that can have an impact on operational planning and resource allocation?

Overlapping these is a type of requirement that is unique to law enforcement: *legal requirements.* Recall that the sole authority for law enforcement agencies to have an intelligence function is their statutory authority to enforce the criminal law. As a result, conceptually all information collected must be viewed as if it may eventually result in a criminal prosecution. Consequently, information is needed, at the least, to aid in establishing the criminal predicate and eventually sufficient evidence to establish the burden of proof in a trial. Requirements will need to be defined that help establish the corpus delecti or the elements of a specific crime as it relates to the intelligence targets.

Requirements and Criminal Evidence

This issue warrants special attention because it is unique to law enforcement intelligence. In the national security intelligence community, requirements serve as information to help make decisions about threat prevention, policy development, and strategic responses. In law enforcement intelligence, however, while many of these same needs are fulfilled, there is the added dimension that information collected from requirements may also be used as criminal evidence. Given the civil rights responsibilities that law enforcement officers must uphold, intelligence requirements for a law enforcement agency must also ensure that information collected during the requirements process follows the law of criminal procedure.

This can be a challenging process for law enforcement because there is a constant balancing process. In some cases, information collected about an individual must be balanced and documented with the threat to public safety. In other cases, the officers may be following up on a SAR to determine the veracity of the lead and establish both a criminal predicate and determination of a threat. There are many scenarios where decisions are made about information collection and retention that are in the arena of uncertainty. Relying on a cautious perspective, some fundamental guidelines should help guide the information collection process for legal requirements:

- Follow the law of criminal evidence and procedure.
- Always act in good faith with documented evidence and rationale that are the basis for information-collection and retention.
- If there is a threat to community safety, document the evidence and rationale associated with that threat and corroborate it to the extent possible.

Summary

Information is needed to make decisions: the higher the quality and the more comprehensive the information, the more sound the decision. Similarly, information that answers a specific question is more useful than information that is general. If an executive is going to make a decision about implementing a new program, he or she needs information about the specific costs, benefits, and risks of the program as well as the more difficult dimension of what benefits will be lost if the program is not implemented. Typically, the information sought is not conclusive, but based on probability, the experience of others, experimentation, logic or, sometimes, an educated guess. Not having sufficient reliable information makes the decision process more difficult and risky.

The same process applies to the operational environment of criminal intelligence. To adequately assess the threats from a terrorist group or criminal enterprise, information is needed for a comprehensive analysis. Often during the course of the analytic process, critical information is missing that prevents a complete and accurate assessment of the issue. The collection process focuses on collecting the specific information identified in the requirement in order to answer questions related to criminal or terrorist threats.[17] The fulfillment of the intelligence requirement provides critical information for making strategic or operational decisions about how to respond to the threat.

The intent of this discussion was to provide some perspective of intelligence requirements as specifically related to law enforcement intelligence. Once those information needs are identified, the next step is to collect them.

Collection

Collection of information has been discussed in the context of the intelligence process (Chapter 4) and information needs for ILP (Chapter 6). The current discussion builds on the previous by looking at information from a broader perspective. Collection refers to information that is brought into the intelligence process for analysis. It is the generation of raw data and, as will be seen, it is not always an overt action by the law enforcement agency to reach out and gather information.

Essentially, information enters the intelligence process in one of three ways:

1. It is deliberately sought out and collected—tasked collection.
2. It is collected as a result of another law enforcement activity—routine collection.
3. It is given to law enforcement—volunteered information.

Tasked collection is in response to intelligence requirements and is typically gathered as a result of a collection plan, defined as follows:

> A plan for gathering information from all available sources to meet an intelligence requirement. Specifically, a logical plan for transforming the essential elements of information into orders or requests to sources within a required time limit.[18]

[17] FBI Office of Intelligence. *The FBI Intelligence Cycle: Answering the Questions. A Desk Reference Guide for Law Enforcement.* (Pamphlet), July 2004.

[18] www.acpo.police.uk/asp/policies/Data/nim2005.pdf

The collection plan, previously referred to in Chapter 6, typically will be determined by an analyst, sometimes with input from a supervisor, to determine what types of information are needed, where (sources) the information may be obtained, and how (methods) the information will be gathered. The analyst will have an array of options from which to choose, ranging from open sources (discussed in detail in Chapter 11) to restricted databases,[19] to interviewing people, and more. The key lies in the question: "Where might I find this information and how will I get it?" The collection plan is the road map to answering this question.

In some cases, the assistance of operational units will be needed. In these circumstances, intelligence personnel should coordinate with operational managers or supervisors to explain what information is needed, why it is needed, and the role of the operational units in collecting the information. Even in cases where the "why" must remain confidential, a general description of the "why" will help in gaining cooperation and commitment.

When operational units assist in collection, explicit descriptions of the types of information needed should be provided. Similarly, time constraints for when the information is needed should be established. Operational units should also be provided with precautions, if any, during the collection process. In some cases, precautions may be related to officer safety; in other cases, the precaution may be to collect the information in a subtle manner so as not to tip off an inquiry. The key, of course, is effective communications between intelligence personnel and operational personnel.

The second method, *routine collection,* refers to the collection of information as part of routine operational and law enforcement activity. It focuses on the standing intelligence requirements or other issues of intelligence significance that are known and require a constant input of raw information. Information collected in this way usually is submitted as an information/intelligence report, but it may also be recorded elsewhere such as information within or from the following:

- Crime reporting
- Criminal investigations, including stand-alone proactive or reactive operational databases/case management systems
- Firearms licensing to monitor trends and to flag names of known offenders
- Community and partnership activities and meetings
- Custody records.

Routine collection can take many forms. As one example, the intelligence commander in one state has configured e-mail notification from the Open Source Center[20] (OSC) so that whenever any kind of information naming his or her state is entered into the OSC, the commander routinely receives an e-mail about the entry. In many cases, the information would have limited or no value from a criminal intelligence perspective, but where there is value, the information may have been missed without routine collection.

[19] Chapters 12 and 13 will discuss these in detail.

[20] OSC is an information system operated by the Office of the Director of National Intelligence. Open source information is the topic of the following chapter.

Volunteered information is offered to law enforcement by the general public, community contacts, and private partners. Its collection is focused (but not exclusively based) on the intelligence requirement. Information obtained usually is recorded and submitted on a SAR or some form of information report, depending on the nature of the information.

Collecting Information from Corrections Agencies

Correctional agencies are an often overlooked source of information in the collection process. Increasingly, corrections departments are creating and using a Security Intelligence Threat Group, an intelligence-based approach to information collection and analysis to determine threats that reside in prison facilities.

Despite common misperceptions, many inmates retain strong connections with criminal groups on the outside during their incarceration. There is ample evidence that gangs and drug traffickers as well as radical ideological groups (such as the Aryan Brotherhood or Islamic extremists) have outside connections and tend to know, and sometimes have influence on, the criminal organization's activities. Corrections agencies have greater breadth for information collection and can be an important data source for the intelligence process.

> Significant elements of nontraditional information and intelligence resides within corrections IT systems. In fact, corrections is uniquely positioned to gather information that other law enforcement entities are not able to gather. Information like inmate visitor data, criminal associate data, and telephone record data are but a few of the intelligence sources that have the potential to provide valuable insight to law enforcement and homeland security agents seeking to develop a framework for social networking to better determine the synergistic relationship between the criminal enterprise and the terrorist network(s) that threaten our country.[21]

The types of information that correctional agencies are able to collect and retain are invaluable. While the information has often been successfully exploited for dealing with gangs, such initiatives need to be broadened. The National Institute of Justice has established the Corrections/Law Enforcement Intelligence Gathering and Sharing Project[22] as a means of enhancing threat identification. Beyond working with corrections agencies within a law enforcement agency's region, monitoring projects such as this can provide additional value for developing information-sharing.

Summary

Regardless of the method that is used to collect information, it is important to remember for law enforcement intelligence that there is a different standard for information that is collected for use in a criminal intelligence records system between information that identifies individuals and groups and information that contains no identifying information. (These differences are discussed in detail in Chapter 7.)

Analysis

Without analysis, there is no intelligence. No single methodology is used for intelligence analysis; rather, various approaches and analytic tools are used, depending on the type of data/information that are available and the type of analysis (tactical or strategic) that is being performed.

The intent of this discussion is not to teach analytic methods, but to provide the consumer of analysis with insights into the process. Such insights should make the end-user a more enlightened consumer. Moreover, with a better understanding of analysis, a law enforcement officer will have better insights when responding to intelligence requirements.

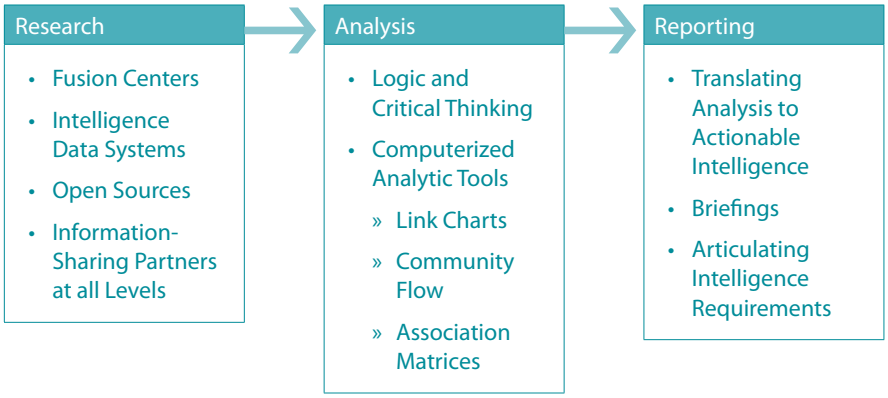
Intelligence analysis is often referred to as a unidimensional activity that is the central step in the intelligence process. When examining the analysis function more closely, one finds that it is a process that requires three broad skill sets. (See Figure 10-4) As such, the development of knowledge, skills, and abilities (KSA) must correlate with these skill sets.

The first skill, *research,* involves collecting diverse pieces of information and assessing the value (validity and reliability), as well as the relevancy and materiality to the assessment. Research is somewhat different from collection. Research involves gaining information that clarifies issues and provides perspectives on an issue of interest. Examples: searching the web blogs of anarchists to learn more about their beliefs and train of thought; reviewing research on the characteristics and common processes of human smuggling; reviewing reports and articles on a specific issue, such as the behavioral characteristics of a person planning a suicide attack; or any other type of data collection that provides insight—as opposed to evidence— about a targeted issue. Certainly there could be an overlap between research and collection; however, the roles are more complementary than duplicative. Analysts' KSAs must include both research and assessment methodologies. The analyst must be aware of the diverse sources of information—both open source information and law enforcement proprietary information—and know how to gain access to them. While collection of information will occur from a wide array of sources beyond the analyst, the need for research skills to be able to drill down into the information is essential.

The intelligence analyst must be more than a recipient of information. The analyst must be proactive in two methods: The first is to define and disseminate intelligence requirements to fill gaps in the information in order to have a more comprehensive and robust analysis of a threat, individual, or target. The second method is to elicit information from diverse sources. Whether this is a data base, a fusion center, a private partner, or an investigator, the analyst must proactively seek the information. Information-sharing systems and practices have increased dramatically as a result of post-9/11 intelligence reengineering. Nonetheless, no system or process can ensure that all the needed information will reach the analyst's desk. Proactive efforts by the analyst will add redundancy to the collection process to ensure that it is as comprehensive as possible. This is reinforced by the *Law Enforcement Analytic Standard #11–Collection Follow-Up Standard:*

In the course of collection by investigators and others, analysts shall evaluate the progress of the collection to determine if the collection plan/requirements are being met and shall identify additional sources of information, as well as identify information that may be useful to other cases or activities. Where possible, analysts shall relay that information to an appropriate body for follow-up.[23]

Figure 10-4: The Analytic Process



An important part of this process is that policies and procedures must give analysts the authority to seek needed information and have some type of accountability mechanism to ensure that the information is being provided. An unfortunate reality in many law enforcement organizations is that the intelligence analyst is often viewed as having a lower professional status than a sworn officer, sometimes making it difficult for analysts to give direction to investigators. While this artifact of organizational culture is slowly changing as analysts are increasingly viewed as practicing professionals, remnants of this perspective remain. Consequently, it is important for the intelligence process to ensure that analysts have the organizational authority to gain the information they need.

The second skill set, *analysis,* is essentially the scientific approach to problem solving. It relies on inductive and deductive reasoning; a balanced assessment of raw data; objectivity in the interpretation of facts; hypothesis testing; critical thinking; and decision making based on evidence. The late Carl Sagan, a world-renowned astrophysicist, explained the scientific process this way:

> Science is a way of thinking much more than it is a body of knowledge. Its goal is to find out how the world works, to seek what regularities there may be, to penetrate to the connection of things—from subnuclear particles, … to living organisms, the human social community, and thence to the cosmos as a whole. Our intuition is by no means an infallible guide. Our perceptions may be distorted by training and prejudice or merely because of the limitations of our sense organs, … Science is based on experiment, on a willingness to challenge old dogma, on an openness to see the universe as it really is. Accordingly, science requires courage—at the very least the courage to question the conventional wisdom. … [T]he scientific cast of mind examines

[23] Global Justice Information Sharing Initiative and the International Association of Law Enforcement Intelligence Analysts, Inc. *Law Enforcement Analytic Standards.* Washington, D.C.: Global Justice Information Sharing Initiative, 2004.

> the world critically as if many alternative worlds might exist. … If you spend any time spinning hypotheses, checking to see whether they make sense, whether they conform to what else we know, thinking of tests you can pose to substantiate or deflate your hypotheses, you will find yourself doing science.[24]

This process described by Sagan is essentially what intelligence analysts do when attempting to derive meaning from a diverse array of facts. Sagan noted that science seeks to determine "…what regularities there may be…". In law enforcement, we seek to identify criminals' modus operandi because these regularities in criminal processes are important for forecasting crime and determining prevention strategies. Similarly, Sagan observed that science seeks "…to penetrate to the connection of things." Law enforcement intelligence analysts seek to find the connection between criminal conspirators (e.g., via link analysis), between different types of evidence (e.g., via association matrices) and between criminal transactions (e.g., via commodity flow diagrams).

Intelligence analysis is an intellectual exercise that has pragmatic applications. For most people, it does not come easily. It requires *structure*, *critical thinking*, *self-discipline*, and *strong substantive knowledge of the target*. "Structure" refers to the ability to be organized and follow accepted analytical methods without taking shortcuts and ensuring that all information and evidence is included in the analysis. "Critical thinking" means that the analyst will follow the rules of logical reasoning, not intuition. It also means that the analyst will draw conclusions based on the known evidence, not assumed evidence. "Self discipline" is essential for the analyst to remain objective and not be influenced by emotion or external pressures. This objectivity also means that the evidence is considered with respect to its "weight" (reliability, validity, and corroboration). Beyond having the analytic KSAs, the analyst needs to have "substantive knowledge" of the targeted crime(s). Whether the target is a Jihadist network, drug trafficking cartel, or money laundering network, the analyst needs to understand the terminology, beliefs, and mechanics associated with the criminal enterprise.

Training, programs, continuing education, and self-directed education are valuable for developing the substantive knowledge needed for effective analysis; however, the thinking skills, which must be integrated with the substantive knowledge, are more challenging. A person can be taught the processes and tools of analysis, but critical thinking is most effectively produced through "mental calisthenics" and experience. Mental calisthenics refers to series of written exercises or problems that challenge a person to find a solution. There may be multiple solutions, of which the next challenge is to find the best or most probable solution. This process is frequently used in Problem-Based Learning, which is a strategy that builds a curriculum around a central question. The question may force the student to either solve a problem or make a decision.[25] The analytic skill set is the most difficult to effectively develop in an analyst; it is also the most critical.

The third skill set is *reporting*. Throughout the analytic process, there are stages where the findings must be reported to decision-makers and investigators.

[24] Sagan, Carl. *Broca's Brain: Reflections on the Romance of Science*. New York: The Ballantine Publishing Group, 1979.

[25] Friedman, Robert S. and Fadi Peek, "Problem-Based Learning and Problem-Solving Tools: Synthesis and Direction for Distributed Education Environments," *Journal of Interactive Learning Research* 13,(3)(2002): 239–257.

Reporting is translating the analytic output into descriptive status reports or actionable intelligence. A descriptive status report essentially describes the character and process of an intelligence target, probable effects, and probable future activities. The report may also include evidence currently possessed, intelligence requirements, and unexplained crime-related phenomena that need closer assessment. Typically, these reports are designed to assist in planning and directing an inquiry, allocating resources, assessing risk to potential victims, gaining insights about threat timetables, planning for intervention and mitigation strategies. In contemporary intelligence, the reporting process is when the analyst develops "intelligence products." This will be discussed in detail in the next section of this chapter.

Suggested Software Needed for Effective Analysis

- Word processing program
- Spreadsheet program
- Relational database
- Presentation software
- Flowcharting software
- Link analysis software
- Database reporting/visualization software
- Mapping software
- Photo enhancement software
- Telephone analysis software
- Portable Document Format (PDF) creation software
- Security software (virus, adware, spyware software; firewall and Virtual Private Network [VPN] security)
- Publication software
- Statistical analysis software
- Text mining software

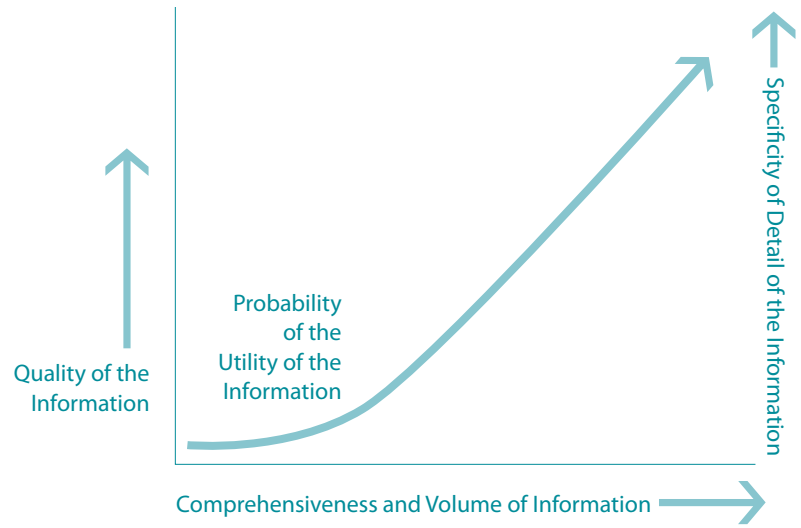
Resource: *The Analyst Toolbox,* Global Intelligence Working Group. it.ojp.gov/documents/analyst_toolbox.pdf

---

With actionable intelligence, a law enforcement agency has sufficient information to develop an operational response to threats. Within this framework, three factors contribute to effective analysis:

1. The overall quality of the information used to make a decision. Accuracy of information is essential. When information is analyzed, conclusions are drawn based on the facts that the analyst has. If the information is wrong or biased, this will inherently affect the quality of the analysis.
2. An increased body of information to make the information more comprehensive; hence, corroborating other facts. As the volume of high-quality information increases, the more accurate the analysis. Raw information is clarified and the quality of analysis will increase as volume increases. The key is to ensure that the quantity of information is accurate and relevant, a factor that is at the heart of the fusion process.
3. Increased specificity of the information. The more detailed the raw information, the greater the likelihood of identifying subtle factors about a threat.

Figure 10-5: Critical Characteristics of Information Quality



As illustrated in Figure 10-5, as each factor increases, the value of the analysis increases. Regardless of the skill of the analyst and the analytic tools available, the character of the raw information is fundamental to actionable analysis.

Analytic Tools

A number of analytic tools are available to the intelligence analyst. "Tools" essentially refers to methodological techniques that help *organize*, *integrate*, *compare*, *correlate*, and *illustrate* a body of raw information. None of the analyst tools will produce actionable intelligence alone; each adds a component of new knowledge—or at least new insight—about the data which, collectively, contribute to the analysis and/or lead to the definition of new intelligence requirements.

The actual analysis relies on the critical thinking skills of the analyst along with his or her ability to integrate the output of these diverse methodologies into a cohesive, actionable intelligence product. These products may include portions of the analytic tools output to illustrate complex relationships, such as an illicit commodity flow chart or a link analysis chart showing the relationships and hierarchy of people involved in a criminal enterprise.

While the intelligence consumer does not need to know how to perform these various types of analyses, there is value in understanding the different analytic tools available and the types of information they provide. While not an exhaustive list, the more common tools[26] an intelligence consumer may encounter include the following:

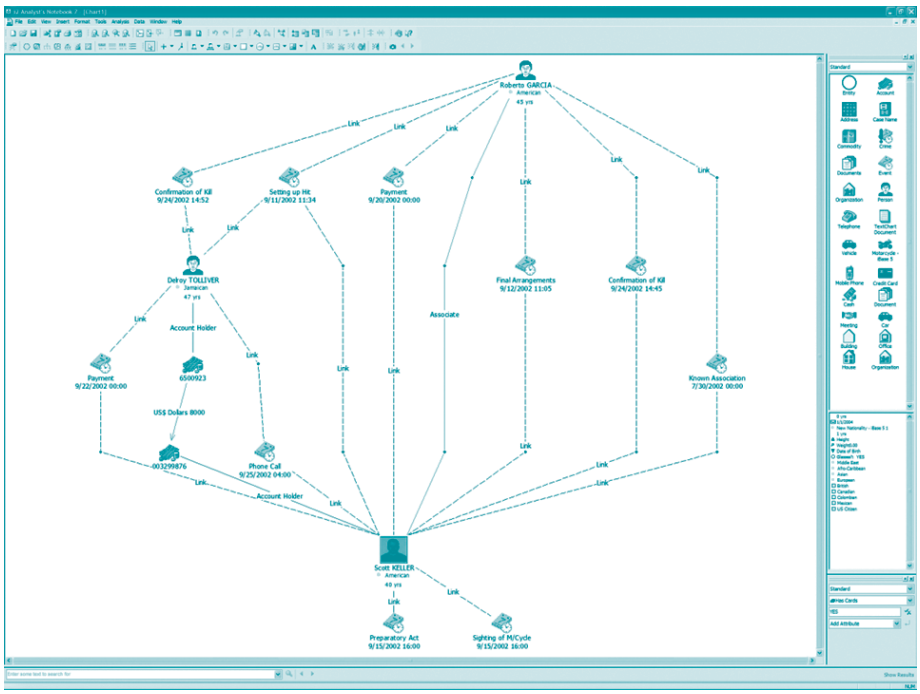
- Activity flow. Similar to a modus operandi or method of operation, the activity flow shows the steps a criminal enterprise uses, indicating exact incidents, dates, and a description of the activities that occurred. The incidents are linked in a flow chart to help understand the progression of the enterprise. The activity flow pieces together a complex criminal organization and may be used for intervention in the enterprise as well as to determine where gaps exist. If gaps are identified, intelligence requirements will be used to fill the gaps so that the activity of the enterprise can be fully mapped to aid in prevention and in prosecution.
- Association matrix. This matrix seeks to correlate two or more factors in a criminal enterprise, documenting the frequencies with which certain factors (e.g., persons, organizations, phone numbers, addresses, and similar variables) occur at the same time in order to isolate the correlating factors that are instrumental in the criminal enterprise operations and eliminate factors that have no correlation. The factors may be alike, such as correlating a series of telephone numbers. The factors may also be inherently independent but provide insight when they are correlated, such as charting the travel patterns of two intelligence targets when a telephone call or bank transaction precedes the travel.
- Commodity flow/visual investigative analysis. A diagram that illustrates how an unlawful commodity is moved through a criminal enterprise and the transactions that are made in the commodity movement. For example, the commodity flow of Afghan heroin would show each transaction and method of smuggling, along with the transaction costs, from Afghanistan to a city in Middle America.
- Communications traffic analysis. Important information can be gained from a traffic analysis of telephones, text messaging, and e-mail. By identifying with whom intelligence targets are communicating, the frequency of the communications, their origins and destinations, length of the communications, and whether there were attachments to e-mails, an analysis can provide significant corroboration and evidence of criminality. While the content of communications, obviously, will provide important information, an analysis of communications traffic can also be valuable.
- Crime pattern analysis. A generic term for a number of related disciplines such as crime or incident series identification, crime trend analysis, hot spot analysis, and general profile analysis and can include mapping.
- Criminal business profiles. Such profiles contain detailed analyses of how criminal operations or techniques work, in the same way that a legitimate business might be explained.
- Demographic/social trends analysis. An analytic method centered on demographic changes and their impact on criminality. It also analyzes social factors such as unemployment and homelessness, and considers the significance of population shifts, attitudes, and activities as they may affect crime.

[26] Many of these analytic tools are illustrated in: Peterson, Marilyn, et al. *Successful Law Enforcement Using Analytic Methods.* South Florida, Florida: International Association of Law Enforcement Intelligence Analysts, Inc., 1996.

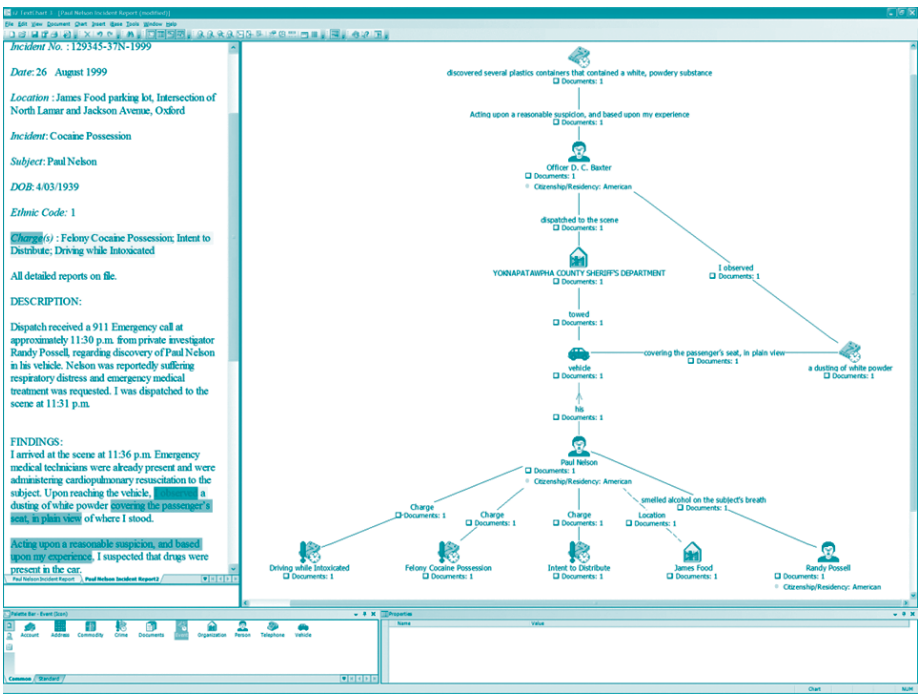
- Event flow analysis. Charts that provide a visual depiction of a series of important occurrences or incidents (such as a criminal transaction) and the sequential relationship of these occurrences, such as travel of a criminal participant, monetary transactions, or other events that are critical in facilitating the crime.
- Financial analysis. There are a variety of financial analysis techniques that collectively seek to correlate diverse financial transactions including the nature of the transactions; parties involved; origin, intermediary, and destinations of transactions; and comparative analysis of income and expenditures. Collectively, the intent is to document transaction trends of intelligence targets (both individuals and organizations) and identify discrepancies or suspicious financial activities. Given that virtually all crimes have some form of financial element, financial analysis is an important tool.
- Hypothesis testing. The analyst will make a hypothesis about the linkages of people and organizations in the criminal enterprise, necessary transactions for the enterprise to operate, and critical commodities or resources necessary for the enterprise to be successful. Unlike the previous items in this list, which are visual depictions of various elements of the enterprise, hypothesis testing uses the depictions to determine if all the elements in the enterprise have been identified that can be used to prevent the enterprise from continuing and, ideally, determining the criminal liability of participants.
- Link Analysis. A chart that identifies all confirmed and suspected persons and organizations in the criminal enterprise and illustrates their relationship to each other.
- Market profiles. The profiles are assessments that survey the criminal market around a particular commodity in an area, such as drugs or stolen vehicles, or of a service, such as prostitution. They are continually reviewed and updated.
- Network analysis. This analysis not only describes the links between people who form criminal networks, but also the significance of the links, the roles played by individuals, and the strengths and weaknesses of a criminal organization.
- Operational intelligence assessment. Such an assessment evaluates incoming intelligence to maintain the focus of an operation on previously agreed objectives, particularly in the case of a sizeable intelligence collection plan or other large-scale operation.
- Results analysis. An analysis that evaluates the effectiveness of law enforcement activities; for example, the effectiveness of patrol strategies, crime-reduction initiatives, or a particular method of investigation.
- Risk analysis. An analysis that assesses the scale of risks posed by individual offenders or organizations to individual potential victims, the general public, and to law enforcement agencies.
- Target profile analysis. An analysis that embraces a range of analytical techniques to describe criminals, their criminal activity, lifestyle, associations, the risk they pose, and their strengths and weaknesses to give focus to the investigation targeting them. Profiles may also focus on victims and vulnerable persons.

Each of these techniques is used to better understand raw information and its relationships and to illustrate a criminal phenomenon. Figure 10-6 presents examples of two kinds of analytical charting.

Figure 10-6: Illustrations of Analytical Charting[27]



Link Analysis Chart



Text Analysis Chart

Predictive Analysis

Predictive analysis has become increasingly popular as a tool for intelligence analysis; therefore, a brief description of the concept can be of value to the intelligence consumer. Predictive analysis is borrowed largely from the private sector where econometric models are used to forecast market changes. By analyzing economic factors in a current market, buoyed by analysis of known trend data—such as changes in a sector's economics during different times of the year—a manufacturing firm may alter its production, workforce size, and supply chain to enable it to continue profitable operations while meeting supply demands throughout varying conditions. In that situation, the analysis provides strategic direction for both management and operations to make decisions about alternative futures that will help them avoid unnecessary profit losses while still fully serving customer needs.

Can such a quantitative-based approach work in the largely qualitative world of law enforcement intelligence analysis? While predictive analysis has important applications to intelligence analysis, it will not provide an analysis as robust as in more quantitative fields that have more predictable change cycles, such as in the business world. Nonetheless, it has important applications to intelligence, but will require a diverse and often labor-intensive research effort; a multifaceted analytic methodology, and a broadened method of reporting that offers differential outcomes based on the evolution of social and political trends. As time passes, these trends can be monitored by the intelligence analyst to refine the status and threat implications of the trends being observed.

Predictive analysis is a critical-thinking methodology that integrates known quantitative and qualitative variables—including incidents, events, and political and social dynamics—into a logical forecast of threat parameters. In many ways, the label "predictive" is misleading because it is virtually impossible to truly predict events that are based on human behavior and the infinite number of variables that can influence that behavior. The process is a probabilistic analytic exercise that gathers diverse data, constantly monitors changes in the data, and refines the forecast based on the new inputs. Just like the intelligence process itself, predictive analysis is reiterative, constantly seeking new inputs of information to refine the forecast.

The reiterative nature of predictive analysis complements requirements-driven intelligence. This process continuously seeks to identify information to fill intelligence gaps or voids in our knowledge base about threats, and then identify, collectand analyze information to fill those gaps. Intelligence requirements—the information that is required to fill a gap—provides constant input into the intelligence cycle to help ensure that there is a base of knowledge that is as comprehensive as possible.

Predictive analysis in law enforcement can have the greatest impact on strategic intelligence, although it can also have an application to aid in defining standing intelligence requirements. This analytic technique will not forecast threats, per se, but it can forecast changes in the environment that may alter conditions that contribute to threats.

Critical Variables for the Analysis of a Threat

Critical to analytic techniques that seek to help us understand any kind of threat, is the ability to collect information about a series of key variables related to the intelligence target(s). Once again, each variable has significant implications for intelligence requirements.

- Intent. What is the stated intent of the intelligence target? Has it changed? How might any of the current events or activities influence the stated intent of the target?
- History. What has the intelligence target or group done in the past? Often, history can provide insight into future behaviors, methods, and targets. This includes identifying and assessing triggering events from previous attacks or violent behaviors of the intelligence target.
- Capability. What capabilities does the target or group have? Have they been trained to execute terrorist attacks or crimes? Do they have critical assets available, including people, munitions, money, documents, and travel to commit the crime?
- Opportunity. Are there any unusual or unique opportunities arising that will help facilitate an attack? If so, what kind of access to that opportunity will the intelligence target have? Is there evidence to suggest that planning for an attack or crime to coincide with an opportunity has occurred?
- Resolve. Does the intelligence target or group actually have the commitment to execute the attack? Is the intelligence target simply making a threat or does the target actually pose a threat? Are there insights into how the resolve to commit an attack may be mitigated? Particularly in the case of ideological groups, a critical variable related to "resolve" is learning the characteristics of the leader. If the group has a charismatic leader, then the likelihood increases that the group will act on its intent.

Intelligence requirements and analysis are inherently related to threat assessments. The interrelationship is systemic: a change in one component will affect the others.

> Intelligence analysis is a complex task involving the examination and assessment of information to draw conclusions about a particular topic. It is not an academic exercise because it does not involve philosophical theories. Instead, intelligence analysis is a function heavily dependent on realism and requires an objective approach to thinking. It is predominantly process driven, and it requires continuous exhaustive research using information from a variety of classified and nonclassified sources. Analysis also involves the collation of information to identify relationships, expose indicators and filter factual evidence. This is a process that forces the questioning of information to confirm truths and probabilities. The next process is to scrutinize the information to recognize trends that will lead to an event or pattern. Once a conclusion about the information has been formed, an assessment is made which is then presented to customers so they can make well-informed decisions based on our findings.[28]

[28] Australia's Defence Intelligence Organisation, www.defence.gov.au/dio/analysis.html.

Summary

Intelligence analysis is both the development of cognition and a cognitive process. It is a cognitive process because the analyst is learning as he or she conducts the analysis. But it is also the development of cognition because the output of the analysis— conclusions, estimates, and forecasts—is new knowledge that will be shared with others in reports and briefings. Effective analysis, therefore, should serve the law enforcement agency in the following ways:

- Identifying points of opportunity for intervention that might change the state of affairs in some way, especially before a conflict occurs
- Helping states attain a comparative advantage in decision-making, thus the term "actionable intelligence"
- Protecting the state and its citizens to maximize security
- Optimizing resources
- Integrating information to enhance understanding of threat environments.

Analysis is a critical factor in information management because it provides the intelligence that describes criminal threats and the alternatives to manage those threats. This information must be expressed in the form of intelligence products.

Intelligence Outputs and Products

The output of analysis, that is, intelligence, must be placed in a reporting format that maximizes the consumption and use of the information. This is referred to as the intelligence product. In describing the relationship of analysis to products, Ratcliffe, in *Integrated Intelligence and Crime Analysis,* observed the following:

> …criminal intelligence is the creation of an intelligence knowledge product that supports decision-making in the areas of law enforcement, crime reduction, and crime prevention. In this context, an intelligence knowledge product is a product that can influence the thinking of a decision-maker. It is the result of a criminal intelligence analysis and could be a written bulletin, a presentation, a verbal report, or some combination of these in a briefing. An intelligence knowledge product could even be a brief telephone conversation if the intelligence is timely and has an effect on the decision-making of the recipient of the intelligence.[29]

Typically, different types of products are developed to meet the needs of different consumers and different types of analysis. A tactical analytic product will differ from a strategic analytic product. The product developed for a comprehensive assessment of a targeted criminal enterprise will differ from a product intended to make officers aware of criminal indicators. An executive briefing of a criminal threat will differ from a patrol briefing of a criminal threat. Regardless of the type of product, all should contain five fundamental elements in the context of the product's intent:

1. Identify the targeted consumer of the information (patrol officers, administrators, private sector, others).
2. Convey clearly the critical information needed by the intended consumer.

[29] Ratcliffe, Jerry H. *Integrated Intelligence and Crime Analysis: Enhanced Information Management for Law Enforcement Leaders.* Washington, D.C.: Office of Community Oriented Policing Services, U.S. Department of Justice, 2007, p. 8.

3. Identify time parameters wherein the intelligence is actionable.
4. Define additional intelligence requirements, if needed.
5. Provide operational recommendations in light of the analysis.

Ideally, products are a series of regularly produced intelligence reports that have a specific format and type of message to convey. They are most useful when each product has a specific purpose; is in a consistent, clear, and aesthetic format; and contain all critical information the consumer needs with no superfluous information. As a general rule, at least three types of products should be developed by an intelligence unit or fusion center:

1. Products directed toward the prevention of known threats.
2. Products that provide threat advisories which provide indicators of threatening behaviors and threatened targets.
3. Products that describe changes of the terrorist or criminal threat picture to a jurisdiction.

While most law enforcement officers are very familiar with investigative reports and records, they are less familiar with intelligence products. As indicated in Table 10-3, there are notable differences that are important for the consumer to understand. With a clear understanding of the distinction, there will be greater use of the products.

Table 10-3: Differences between Investigation and Intelligence Reports

Criminal Investigation Reports and Records	Law Enforcement Intelligence Reports, Records, and Products
• Primary goal is prosecution • Report is documentation of a criminal incident that occurred • Report is an official record and is evidentiary • Motive is irrelevant as a legal element of the crime • Evidence is documented to prove the corpus delicti	• Primary goal is threat-based prevention • Report focuses on suspected criminal threats • Report documents information associated with a threat inquiry • Motive is an important tool for forecasting • Information is documented to build hypotheses about criminal threats

Two broad distinctions in law enforcement intelligence outputs are characterized in Table 10-4. The first is "case intelligence." A critical characteristic of case intelligence is that it identifies individuals or organizations. Conceptually, its ultimate goal is arrest and prosecution of particularly-described persons as a means of preventing a threat from reaching fruition.[30] An important factor to note is that with case intelligence, civil rights attach to individuals who have been identified in any type of intelligence report. The second type, "intelligence advisory products," describes (i.e., advises) general indicators of crime and threats for which officers must be aware. The goal is for law enforcement personnel to be

[30] It should be remembered that the only authority for law enforcement agencies to be in the "intelligence business" is based on their statutory authority to enforce the criminal law; therefore, development of a criminal case is a sound model to follow.

aware of the indicators and, if observed, take appropriate action to ensure public safety and prevent a criminal incident from occurring. As a general rule, there are no explicit civil rights issues of advisory products until a person or organization is identified as related to the criminal indicators.

Table 10-4: Case Intelligence versus Intelligence Products

Case Intelligence	Intelligence Advisory Products
• Individuals are identified • Specific offenses are identified • Intelligence develops evidence of criminal liability • The goal is to develop a criminal case for prosecution	• Trends in crime and/or their methodologies are identified • A change in criminal trends is forecast • Indicators of the new crime types are identified for awareness by law enforcement personnel • The goal is to prevent the crime from occurring

Any intelligence unit or fusion center can determine the type of products it needs to develop based on the administrative mandate of the unit. Some are designed to meet unique jurisdictional needs, such as a transit law enforcement agency. As a general rule, law enforcement intelligence reports may be in a typology with two broad components: 1. The nature of the report and 2. The nature of the analysis.

Nature of the Intelligence Report

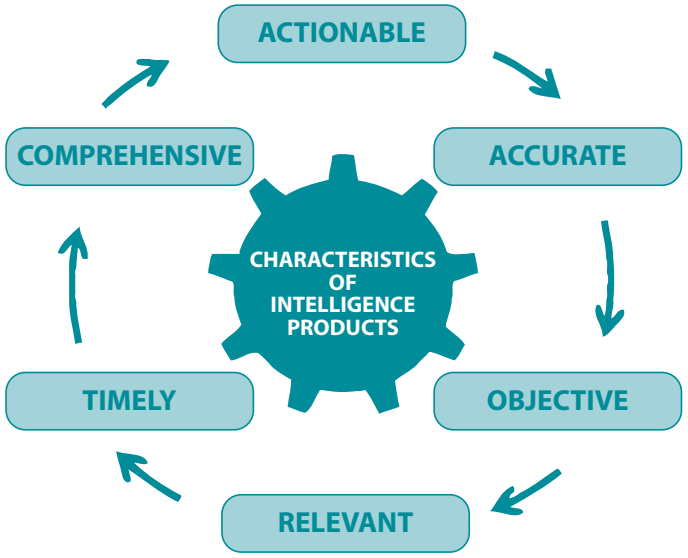
Different kinds of intelligence reports are created to meet the needs of specific audiences. An "Intelligence Alert" may be a short report giving the basic facts about indicators or persons related to a threat that is time-critical. An "Intelligence Bulletin" may provide more detailed information about indicators or threats that are not imminent but those which personnel may encounter. An "Intelligence Assessment" typically provides a historical perspective of a threat and how the current status of the threat has changed. At this point there are no uniform classifications of intelligence reports across all agency types and levels of government; rather each agency or fusion center produces reports that tend to meet these general guidelines. Law enforcement personnel should receive training on the types of products that are used in their jurisdictions and the intent of each report type.

Nature of the Analysis

Perhaps adding confusion to the universe of intelligence reporting is that some terminology has different meaning to the intelligence community, the military, and federal law enforcement when compared to state, local, and tribal law enforcement. The current discussion is directed toward the latter. Previously, the differences between tactical analysis and strategic analysis were described from the law enforcement perspective. Again, while there are no uniform categories of specific report types based on the kinds of analysis that was performed, suffice it to note that intelligence consumers should be aware that some report outputs will describe threats in need of an operational response (tactical) while other reports will describes changes in the threat picture (strategic).

Other report types exist or will emerge. Intelligence briefings are oral summaries of analyses that require yet a different approach to reporting that pay homage to the often repeated comment of Sgt. Joe Friday in the old television series Dragnet: "I want the facts, just the facts." We are increasingly seeing new report types emerging that are based on technology and range from text messaging to Podcasts. Regardless of the method of reporting, it is essential that each report type contains the information that is needed for the intended consumer to be effective in fulfilling his or her responsibilities.

Figure 10-7: Characteristics of Intelligence Products



As illustrated in Figure 10-7 and discussed below, regardless of the type of product, each should reflect six core characteristics.

1. Actionable. The product should provide sufficiently definitive information that some kind of operational activity or response may be developed from the intelligence.
2. Accurate. The nature of the analytic process is often probabilistic; therefore, concrete conclusions and forecasts can rarely be made. Despite this, every effort should be made to be as accurate as possible, with weaknesses in the conclusions clearly documented.
3. Objective. Intelligence products should be free of bias. All information should be provided in a balanced manner clearly articulating knowns and unknowns as well as strengths and weaknesses in the analysis.
4. Relevant. The analysis, and the products, should focus on threats that are part of the strategic priorities and/or emerging threats that could have a significant effect on public safety in the region.
5. Timely. Timeliness has two components. First, the intelligence product should be of a threat that is of current concern. Second, when practicable, the product should be made available to maximize the time permitted for operational units to develop a response and put it in place.
6. Comprehensive. The intelligence product should provide as much information as possible about all dimensions of the threat.

Practices to Avoid with Intelligence Products

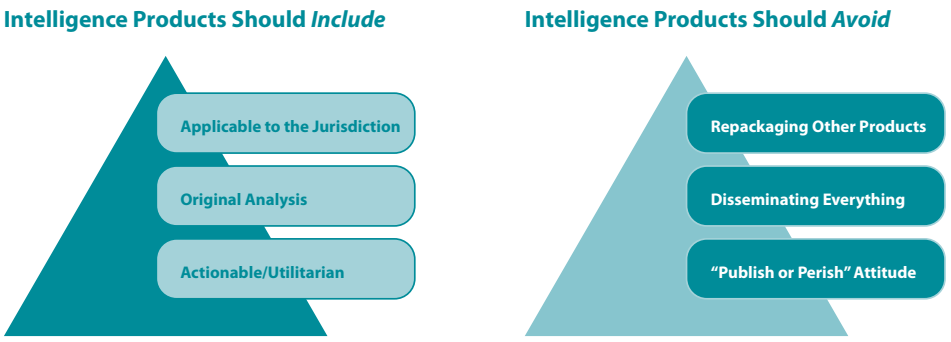
In the post-9/11 environment where the critical phrase is "information sharing," some practices related to intelligence products have emerged that create more problems than solutions. Information should be "targeted," that is, useful information needs to be shared with people who can use it. Unfortunately, this axiom has gone unheeded too frequently.

Three fundamental practices related to analysis and intelligence products should be avoided. They might be expressed as the "three don'ts of information sharing."

1. Don't repackage the intelligence products of another organization. Most agencies will have received the original product; hence, repackaging it is duplicative and can be confusing. A repackaged product adds little value and may have a misleading effect if the same information is distributed as the product of two different agencies. Further, if another agency's product is simply repackaged, the agency will not be able to provide any follow-up detail should inquiries be made.
2. Don't disseminate everything to everybody. Receiving too much information can be just as ineffective as receiving no information. If personnel are inundated with a cascade of information that has little value to them, they tend to pay little attention to any information. The intelligence function, not the consumer, must separate the wheat from the chaff. Targeted dissemination of information to people who need it is critical.
3. Don't develop a "publish or perish" attitude. This can be a systemic problem. Managers want to see productivity by intelligence analysts; however, productivity is difficult to quantify in the intelligence function. One activity which can be easily counted is the production of intelligence products and some intelligence units and fusion centers have used "products" as a measure of effectiveness. While it is understandable how this has evolved, the publication of products alone is not a measure of success. Even if the product is "interesting" it provides little value unless it is actionable. It is not the quantity of products that should be measured, but their *quality* and *utility*. Of course, this is difficult and somewhat subjective. The evaluation process is often difficult to perform effectively.

Figure 10-8 summarizes what intelligence products should and should not contain.

Figure 10-8: Attributes of Intelligence Products



To avoid the problems embodied in the "don'ts" of intelligence products, those responsible for the intelligence function should answer these questions affirmatively as they relate to intelligence products:

1. Tactical and Operational Intelligence. Does the intelligence product provide sufficient detail about a threat within your region or service area so that operational personnel can develop tactical plans or activities to prevent or mitigate an identified threat?
2. Strategic Intelligence. Does the intelligence product describe the characteristics, modus operandi, or change in the threat picture in sufficient detail as related to your region or service area so that effective decisions can be made about strategic priorities and resource allocation?
3. Actionable Dissemination. In light of the nature of the threat and content of the intelligence product, who within your region or service area has the right to know and need to know this information for threat prevention, mitigation, and/or planning?

Summary

Intelligence products are the means by which critical threat information reaches the street. The importance of developing the kinds of products of greatest use to an intelligence unit or fusion center's consumer and placing the right product in the hands of the people who need it is a critical process.

Conclusion

As specified in the *National Strategy for Information Sharing* (NSIS), two fundamental objectives are related to SLTLE agencies with respect to sharing information from the federal government:[31]

1. Ensuring that the Federal Government provides information in ways that better meet the needs of SLT partners through the establishment of an Interagency Threat Assessment and Coordination Group (ITACG) within the National Counterterrorism Center (NCTC). This integrated approach allows Federal agencies to work together to disseminate a federally-validated perspective on available threat information.[32]
2. Supporting improved collaboration at the State and local levels by designating fusion centers "as the primary focal points within the State and local environment for the receipt and sharing of terrorism-related information" and by establishing and sustaining a national integrated network of these centers.[33]

In July 2007, Congress passed the 9/11 Commission Act of 2007 that statutorily created the ITACG and designated the PM-ISE "to monitor and assess" the ITACG's efficacy.[34] The Act also called for a DHS State, Local, and Regional Fusion Center Initiative which, among other requirements, must "support efforts to include state, local, and regional fusion centers into efforts to establish an information sharing environment."[35] The NSIS further advanced these initiatives by providing a detailed description of the role of the ITACG and the roles and responsibilities of Federal and SLTLE agencies. Significant advances have been made in implementing the NSIS objectives[36] at all levels of government; however, there is variability of successes around the U.S. at the state, local, and tribal levels.

[31] National Strategy for Information Sharing, 2007, p. 30.

[32] NSIS, p. 18.

[33] NSIS, p. 20.

[34] 9/11 Commission Act of 2007 (P.L. 110-53), §521(c), The ITACG was established as part of the ISE Implementation Plan and Guideline 2, but the statute strengthened several of its functions and provided for additional oversight.

[35] 9/11 Commission Act of 2007, Op cit. §511(b)(2).

[36] McNamara, *Annual Report to the Congress on the Information Sharing Environment,* 2008, Op cit., p. 24.

For effective information management in the intelligence process there must be a common foundation and ideological thread permeating the law enforcement organization. To meet the needs of contemporary law enforcement intelligence, including newly established national standards, the management of information requires the following:

1. Reengineering some of the organization's structure and information processes. SLTLE agencies should examine their current intelligence processes, if any, to determine if they are consistent with the NCISP and currently accepted national standards for law enforcement intelligence. If not, adjustments should be made to the organization and/or processes. This consistency is important so that there is a common understanding and acceptance of information validity, reliability, and consistency with civil rights standards. A common perspective of the intelligence process and a body of policies and procedures, all of which meet the same national standards, greatly enhances two-way information-sharing—an essential element of requirements-driven intelligence.
2. Developing a shared vision of the terrorist or criminal threat. All agencies at all levels of government must define and understand the threats that face them. This does not mean that all communities are threatened in the same way, but that all agencies understand the common enemies. This includes a common understanding of threats and general agreement on the types of threats facing America. Important strides have occurred as cooperative initiatives and information sharing have taken place: for example, the growth of the Intelligence Fusion Centers, and initiatives such as the Global Intelligence Working Group, Criminal Intelligence Coordinating Committee, the Information sharing Environment, and the Counterterrorism Training Coordination Working Group. With diverse membership from law enforcement agencies at all levels of government, the common lexicon is growing and communication is increasing.
3. A commitment to participate and follow through with threat information. Effective information sharing can exist only if there is a true commitment by an agency to participate, not just lip service to intelligence initiatives. To enhance output of these different national initiatives, an executive must ensure that personnel are trained in the intelligence process and that policies are in place for effective, lawful, and reliable information collection and sharing (in accordance with standards in the NCISP). Commitment also means that the chain of command reinforces the need for employee information collection and sharing processes. Too often the policies that are in place are irregularly applied. When this occurs, the intelligence process breaks down and the ability to connect the dots is jeopardized.
4. The commitment of an agency's resources, time, and energy to the intelligence function. A commitment to participate necessarily requires a commitment of resources. Intelligence is prevention-oriented. Often, it is difficult to see what has been prevented. Similarly, a great deal of information that is collected and shared leads to nothing—a fact of life in the intelligence enterprise—but the critical few pieces of information that lead to the prevention of a terrorist attack are well worth the investment. The intelligence function should be a budget line in the agency's regular budget, not an activity that is relegated to soft money or piggy-backed on other agency activities. The lack of a budget line for intelligence is tantamount to the lack of full commitment.

5. Proactive people using creative thought to identify what we don't know about terrorism and organized crime. Requirements-driven intelligence seeks to fully understand the environment of a community and how changes in that environment may influence threats or crime. Creativity requires viewing community conditions and potential threats through a lens that seeks to interpret information in different ways. Terrorists and criminals have shown they can be creative in the planning and execution of their crimes. Law enforcement must be similarly creative to identify changes in the threat environment and develop proactive operational initiatives to prevent threats from reaching fruition.
6. A law enforcement agency to think globally and act locally. Most people view issues in life from a provincial perspective. This is normal because our greatest concerns are those that affect us in the most direct manner. Unfortunately, the provincial view does not always serve us well when we view events around the globe with the mistaken belief that they won't affect us. Global events in terrorism and crime can affect us on local basis just as global economic events have an influence in our communities. As a simple example, terrorist events, war, economic markets, and political conflicts in OPEC will have an effect on the prices we pay at our local gas pumps. We must recognize that international planning, financing, and logistical support of terrorism, and criminal incidents can have an impact on our communities. Thus, local intelligence analysts must consider the extended effect of global incidents, such as the conflict between Israel and Hezbollah, and how that can be translated to local and regional reactions to those who support Islamic extremism. If the analyst does not have this information, then these are intelligence gaps that must be filled and applied locally.

Chapter 11:

Open Source Information and Intelligence: A Perspective for State, Local, and Tribal Law Enforcement Agencies

Open Source Information and Intelligence: A Perspective for State, Local, and Tribal Law Enforcement Agencies[1]

When considering the collection of information for the intelligence process, a historically undervalued resource has been open sources of information.[2] In many ways, open source information holds some of the greatest value for intelligence because of the vast array of diverse, reliable information available for analysis. This is particularly true with the rapid growth of networking. A great deal has been written about open source information,[3] particularly as it is used in business intelligence, and increasingly for its use in national security intelligence. The current discussion will provide perspective for open source application in the law enforcement community, including important limitations that may be imposed on the retention of certain types of open source information.

It should go without saying: The growth of technology has radically changed the character of open source information. To provide perspective, as the public embraced the World Wide Web en mass beginning in the mid-to-late 1990s, the Internet emerged as the primary source to search for all types of information. As computer memory and processing speeds increased, more information was being stored and processed, including audio and video files. The integration of computing into nearly every aspect of daily life, spurred by the prevalence of wireless computing has caused the development of faster, more discriminating search software. Similarly, content providers have increased the type and mass of content available. Collectively, technological development and the willingness of the public to embrace this technology have contributed dramatically to the ease and value of open source information.

There is a caveat, however: Quantity of information does not equal quality of information. Open source users must take care by assuring that the information collected from open sources for use in decision-making is accurate and dependable. Information absent quality control is of little value. The challenge, particularly when massive amounts of information are at one's fingertips, is to make good end-user decisions about what information should be kept and which information should be discarded.

Understanding "Open Source"

The concept of open source information and intelligence is in a state of renewed interest, particularly as applied to the intelligence community and law enforcement. A brief discussion on the concept and its application in the current context will provide perspective.

Why Is there Value in Open Source Information?

Open source information has often held a second-class status in the intelligence world because of the erroneous assumption that people, movements, and conditions that pose threats would not have information that is available about their intent, characteristics, or behavior in the open.

[1] For an effective discussion of open source information, certain topics are most effectively illustrated using examples from commercial services and web sites. Attempts were made to be objective in the illustrations and where possible use multiple sources. References to businesses and web sites are for illustration purposes only and should not be construed as an endorsement in any form.

[2] Best, Richard and Alfred Cumming. *Open Source Intelligence (OSINT): Issues for Congress.* Washington, D.C.: Congressional Research Service, 2007, p. 4.

[3] For example, see www.oss.net/extra/document/?module_instance=3 and www.firstmonday.org/issues/issue76/stalder.

This assumption is erroneous for six fundamental reasons.

- First, individuals and groups who pose threats because they have an extremist ideology—even those who support violence to fulfill their ideological goal—and typically want to share their beliefs and goals, usually with the intent of persuading others to adopt their beliefs. They often post such information on web sites, in print, in broadcast media that are sympathetic to their cause, and via shortwave broadcasts.[4]
- Second, criminals use the web as a largely anonymous instrumentality to traffic in contraband. Offenders can easily reach a U.S. market from overseas and use techniques to make them difficult to track, both of which add to the lure.[5]
- Third, certain types of information that are useful for the intelligence process, including information that identifies individuals, are openly available because policy, regulation, or law permits the custodian of such information to make it publicly available in some states; for example, public databases contain information about motor vehicle licenses, property ownership, voter registration, sex offenders, salaries of public employees, and a wide array of other information for which an individual has little, if any, control over its public release.[6]
- Fourth, people want selected information to be public. This can occur for a multitude of reasons: telephone numbers, business names and addresses, various reports of research, and marketing are but a few examples. Not only do the individual pieces of information provide insight, surprising amounts of new knowledge can be gained when such information is analyzed in the aggregate.[7]
- Fifth, nonlaw enforcement entities, such as the news media or advocacy groups, may conduct inquiries that become open sources. These sources may provide personal information, descriptions of behavior, personal relationships, activities of a given group, and descriptions of an incident to satisfy the purpose of their business or cause.[8]
- Finally, information often becomes openly available because of an individual's carelessness. A politician making an embarrassing statement in the presence of an open microphone in a public venue or a person writing incriminating information in a blog are examples. In these cases, valuable information that may be used in the intelligence process is often available through open sources.[9]

[4] For example, see media files supporting the World Jihad at www.memri.org.

[5] For example, see the Drug Enforcement Administration's Operation Cyber-Chase arrests of illegal web-based pharmacies at www.usdoj.gov/dea/pubs/pressrel/pr042005.html.

[6] For example, see the Michigan Internet Criminal History Access Tool (ICHAT) at apps.michigan.gov/ICHAT/Home.aspx.

[7] For example, see the aggregated data base to locate people and businesses at www.switchboard.com.

[8] For example, NBC's news stories on pedophiles – see www.msnbc.msn.com/id/6083442.

[9] One source for inadvertently released information, among a wide array of other information, is www.cryptome.org.

[10] *Intelligence Community Directive, Number 301.* National Open Source Enterprise. Section F(3), July 11, 2006.

Definitions and Categories

Open source information is any type of lawfully and ethically obtainable information that describes persons, behaviors, locations, groups, events, or trends. The Office of the Director of National Intelligence (ODNI) simply defines open source information as follows:

> Publicly available information that anyone can lawfully obtain by request, purchase, or observation.[10]

As can be seen by either of these definitions, the array of information that falls within the open source arena is very broad. From a law enforcement perspective, one of the values of open source information is that it can be searched for and collected without legal process. As will be described later, civil rights issues emerge related to the retention of open source information for the intelligence process.

As one should assume, when raw open source information is evaluated, integrated, and analyzed it provides new insight about intelligence targets and trends—this is open source intelligence.

Open source information is wide-ranging. To provide perspective, examples of categories of open source information include these:

- All types of media.[11]
- Shortwave broadcasts and conversations.[12]
- Publicly available databases.[13]
- Directories.[14]
- Databases of people, places, and events.[15]
- Open discussions, whether in forums, classes, presentations, online discussions on blogs, or general conversations.
- Government reports and documents.[16]
- Scientific research and reports.[17]
- Statistical databases.[18]
- Commercial vendors of information.[19]
- Web sites that are open to the general public even if there is an access fee or a registration requirement.[20]
- Search engines of Internet site contents.[21]

The main qualifier that classifies information as open source is that no legal process or clandestine collection techniques are required to obtain the data. While open source data has virtually always existed, networking has increased its accessibility significantly. For example, if an analyst was preparing a strategic intelligence report on trends in international terrorism, he or she may go to the U.S. Department of State Counterterrorism Office[22] web site, the FBI terrorism reports[23] web site, the Department of Homeland Security-funded terrorism database,[24] and the Israeli Defense Forces terrorism statistics center web site[25] to download the various reports and data. If the analyst was preparing a report on right-wing extremists, he or she may visit the Southern Poverty Law Center[26] web site to download reports or go to a white supremacy web site, such as Stormfront,[27] to read materials and then conduct further research by following hyperlinks to gain more raw data to prepare an independent report.

Source of First Resort

Open sources are increasingly referred to as the source of first resort. This means that analysts and information collectors should exploit open sources of information as the first step in the information-collection process. Particularly when intelligence gaps, whether tactical or strategic, are identified, open sources can provide important insights which may give functional direction to a line of inquiry.

If a unique crime trend emerges within a community, for example, an open source search of newspapers nationwide can identify other locations where crimes with similar modus operandi have occurred.[28] Similarly, unknown graffiti or a unique

[23] www.fbi.gov/terrorism/terrorism.htm

[24] www.start.umd.edu.

[25] dover.idf.il/IDF/English

[26] www.splcenter.org

[27] www.stormfront.org

tattoo may be searched via image files.[29] A blog search can provide unique insights about virtually any extremist group just as information may be obtained about a unique problem.[30] Similarly, insightful information about Hezbollah[31] can be found on YouTube and information about the MS-13 gangs[32] can be found on MySpace.

Similarly, because of the threat posed by jihadists, there is value in knowing the beliefs, language, arguments, and perspectives of jihadists to:

> …improve strategic understanding of the of the jihadist threat by more effectively mining the Internet and other open sources for information. Such an effort, it is suggested, also will enable … a better tactical understanding of how jihadists use the Internet's web-television capabilities, chat rooms, and "news" sites, to train forces and raise money. Ultimately, these observers suggest, the United States must develop the capability to understand and influence foreign populations — "not in their council of states but in their villages and slums" — if it is to effectively counter the threat posed by jihadists. In such circumstances, it is argued, the information that should matter most to policymakers can be derived from open sources.[33]

The value of open sources as the first resort is multifold. When an issue or threat emerges, open sources can often provide an efficient, effective, and fast insight into the issue that may often validate the need for further inquiry. Similarly, open sources can provide a broad view of a person or threat as a means of establishing context and perspective. Moreover, open sources can often provide insights and relationships that may be missed by the inherent nature of many closed sources.

> Allen Dulles estimated in 1947 that over eighty percent of the "information required for guidance of our national policy" was available in open sources. George Kennan revised the estimate to upwards of ninety-five percent in a 1997 *New York Times interview*.[34]

With this estimated amount of valuable information available through open sources, it is only reasonable to use these sources as a starting point in a line of inquiry. The application to law enforcement is just as valid as it is for national security. The below scenarios, all of which are based on actual cases, illustrate this point:

- A land developer reports that he has received a threat from an obscure radical environmental group saying that if he does not stop construction of condominiums at an environmentally sensitive location, "he will pay the price". A quick search of news stories identifies the presence of the environmental group in other locations, its past activities and attacks, and the methods of attack. This can be an important element for defining specific intelligence requirements and methods of prevention in the current case.
- A tip is provided to law enforcement that a radical Islamic cleric who preaches violence is going to be in its community to speak to a local group. An open source search provides information about the individual's past speeches, the content of the speeches and any public safety issues that emerged associated with the speech.

[28] For example, one such source is library.pressdisplay.com which can be accessed at no charge through www.opensource.gov.

[29] All major web search engines include an image search capability. In addition, there are specialized image search engines such as www.picsearch.com and www.thrall.org/proimage.html.

[30] For example, if protestors from the Westboro Baptist church are anticipated at a funeral for an American service veteran, information about tactics, can be found at www.godhatesamerica.com and their protest schedule can be found at www.godhatesfags.com.

[31] See youtube.com/watch?v=P28KJvu46DY .

[32] See profile.myspace.com/index.cfm?fuseaction=user.viewprofile&friendid=91546354.

[33] Ibid., Best and Cumming, 2007, p. 2.

[34] Office of the Director of National Intelligence. *National Open Source Enterprise.* Washington, D.C.: Office of the Director of National Intelligence, 2007, p. 3.

- The manager of a nursery reports that a man driving a rental van just purchased an unusually large quantity of fertilizer. While a criminal history check was negative, an open source search of a commercial integrated database identified the individual's address and persons known to use the same address. An Internet search engine identifies some of the man's associates on a right-wing extremist web site.
- A confidential informant states that members of a violent gang are slowly moving into the region. An intelligence analyst conducts an open source search to learn more about the gang, identify gang characteristics, and locates samples of the gang's graffiti and tattoos and distributes the information to patrol officers so they can record the presence of gang symbols in the community.
- A group of anarchists announce that they are going to demonstrate against the president of the World Bank who is speaking at the commencement exercise at a local university. A search of anarchist blogs finds a discussion of plans by the anarchists to cause major disruption during the protests by destroying targeted property and resisting arrest.

In each case, the initial tip or lead was followed by a quick open source search to gather more information. Not only did the open source information provide more insight about the threat, the information aided analysts in defining explicit intelligence requirements to help in fully articulating the threat picture.

As a source of first resort, open sources are not only fast; they also represent a minimal intrusion on civil liberties. Furthermore, open sources are less expensive than traditional law enforcement information-collection methods.

National Initiatives: The National Open Source Enterprise

The Office of the Director of National Intelligence (ODNI) was created by the Intelligence Reform and Terrorism Prevention Act (IRTPA) of 2004. Among the mandates for the ODNI was the development of a comprehensive National Intelligence Strategy; including development of an Information Sharing Environment (ISE) that maximizes intelligence and information sharing among the Intelligence Community, law enforcement, the private sector, and foreign partners. The ISE includes development of a consistent intelligence lexicon and standardized information-sharing and security standards. To maximize efficient, effective, and comprehensive information collection in support of the intelligence process, one strategy of the ODNI was to create the National Open Source Enterprise (NOSE).[35]

In the development of this enterprise, the ODNI notes:

> Given the challenges and threats the United States faces in the 21st century, it is essential our decision-makers, war-fighters, law enforcement, and homeland security authorities receive accurate, actionable and timely intelligence support. … Part of this new approach to intelligence is the collection of national intelligence via an integrated collection enterprise, fundamental to which is a robust, distributed, open source exploitation capability, known as the National Open Source Enterprise (NOSE).[36]

[35] See *Intelligence Community Directive, No. 301, National Open Source Enterprise* (July 11, 2006).

[36] Office of the Director of National Intelligence, p. 3.

The NOSE builds on observations from *The Commission on the Intelligence Capabilities of the United States Regarding Weapons of Mass Destruction* (2005) which observed:

> The need for exploiting open-source material is greater now than ever before…The ever-shifting nature of our intelligence needs compels the Intelligence Community to quickly and easily understand a wide range of foreign countries and cultures…information often detailed in open sources…"[37]

Based on *Intelligence Community Directive 301*, which created NOSE, the following are among the new responsibilities of Intelligence Community members:

- Conduct acquisition, analysis, and dissemination of open source materials.
- Make all open source information, products, and services available across the Intelligence Community (unless expressly prohibited by law).
- Coordinate all open source resources and activities through the Assistant Deputy Director of National Intelligence for Open Source.
- Designate a primary open source coordinator in each department or agency.
- Support staffing requirements of the Director of National Intelligence's (DNI) Open Source Center.
- Make full use of open source information, expertise, and capabilities to conduct analysis and inform collection strategies.
- Use a formal intelligence requirements mechanism for open sources.[38]

These responsibilities represent a major commitment to open source activities. A significant initiative in this regard was creation of the OSC,[39] formerly the Foreign Broadcast Information Service of which the CIA serves as the Executive Agent.

> OSC offers extensive coverage of open source intelligence information monitored worldwide on topics such as military affairs, politics, the environment, societal issues, economics, and science and technology. The information is obtained from radio, television, press, periodicals, books and other sources of unrestricted information such as databases and gray literature (open source information not available by subscription).

The web site has a massive amount of information, in both text and multimedia, and is accessible through a standard Internet connection. State, local, and tribal law enforcement (SLTLE) personnel can gain access to the web site by registering, which includes verification of employment (i.e., right to know) and that the requester has the need to know sensitive homeland security information. While there is a great deal of information at the OSC that will be of interest, although marginally relevant to many SLTLE agencies, the greatest value of the OSC to law enforcement is the free access to many commercial databases.

The direction of these and additional open source activities demonstrate the importance and value that are being committed to the development of a new open source capability. Moreover, in light of the implementation of the ISE, the goals of information sharing across the Intelligence Community and with SLTLE and the private sector,[41] the NOSE takes on even greater meaning.

Open Source and Law Enforcement Intelligence (Tradecraft)

"Tradecraft" is a collective term used by the Intelligence Community to refer to the methods used in the Intelligence Process, particularly collection and analysis, on both broad and specific scales. While the term is rarely used in law enforcement, it is useful to understand its meaning in light of developments in the ISE.

Therefore, open source tradecraft has two meanings for law enforcement. At the macro level, it broadly refers to how open sources can be used in the Intelligence Process. At the micro level, it means the explicit procedures in conducting open source searches as well as capturing and interpreting raw open source information. The remaining discussions deal with open source tradecraft for law enforcement at both levels.

The fact that information is collected from an open source should not dissuade a law enforcement officer or analyst from using it. Indeed, there is often high-quality, insightful evidence available from open sources. So much so, that the 9/11 Commission's Final Report recommended that a new "Open Source Agency" be added to the U.S. intelligence structure.[42] This is essentially being implemented with NOSE. However, like virtually every other aspect of intelligence issues, the use of open sources in law enforcement intelligence has unique applications and parameters that vary somewhat from open source exploitation by Intelligence Community agencies. Fundamentally, the distinction lies in the fact that the SLTLE agency should be collecting and retaining only open source information identifying individuals and/or organizations where there is a criminal nexus. As will be described below, a great deal of open source applications for law enforcement intelligence should be incorporated as standard protocol in the intelligence process.

Criminals Also Use Open Source

A 15-year-old Sierra Vista High School student who was shot October 13, 2007 in front of his southwest Las Vegas home was a key witness in a 2006 Crips gang-related double slaying in Riverside County. Prosecutors in California think another teen shot Demontre Carroll in the back to silence him. The teen, who had relocated to Las Vegas from Southern California because of threats on his life, was located by the assailant using the victim's MySpace page.

Law Enforcement Applications of Open Source

There are both tactical and strategic applications of open source for law enforcement intelligence, such as the following:

- *Identifying and verifying facts.* Perhaps one of the most common uses of open sources in law enforcement is to identify and verify a wide range of facts. Personal identity information, addresses and phone numbers, e-mail addresses, vehicles known to have been used, property records, are among a wide variety of other facts can easily be identified through open source public and commercial databases and directories.
- *Social networking.* Social networking sites such as MySpace, provide a wealth of information about individuals and persons with whom they interact. Social networking web sites contain identity information of the user and his or her friends, often with photographs, as well as private messages and statements about beliefs and behavior. Likes and dislikes are often enumerated, ranging from entertainment to politics to people, as well as contact information. While some information, such as a private message, is subject to legal process, a great deal of information is available as an open source.
- *Identifying criminal offenders.* In a surprising number of cases, people will make incriminating statements in open sources. It has occurred in media reports but most commonly in either social networking sites or on web sites devoted to a particular deviant or unlawful behavior. Sexual predators, drug traffickers, persons trafficking in stolen property, and criminal extremists are all examples that have been found in the "deep web." While incriminating statements alone will not meet the burden of proof for conviction, they clearly establish a criminal predicate and basis for further inquiry.
- *Understanding and interpreting ideologies*. An important element of analysis that aids in defining and forecasting threats is to understand the motivation or rationale of individuals involved in criminal behavior. Particularly in the case of ideological extremists, web sites can be a valuable source. Extremist web sites typically articulate their beliefs as well as what behaviors or changes their movement will cause. Moreover, drilling down and reading blogs can provide more information about individuals' beliefs and behaviors, including incriminating statements.
- *Identifying criminal methodologies.* Collecting information from media sources, web sites, and/or blogs can provide important insight into methods and targets of criminal acts. The modus operandi of violent serial offenders, criminal extremists, and criminal enterprises can be identified readily in many cases. This can be valuable information for developing preventive strategies; for example, a technique used by anarchists is the "black bloc" that includes property destruction and other activities that could be criminal. The tactics can be learned through various open sources.[43]
- *Identifying emerging crime issues and trends.* Just as criminal methodologies can be learned from open sources, so can new and emerging crime trends. In many cases, certain types of crime will disperse geographically in a consistent pattern. Drug trafficking and gang activity serve as good

[43] flag.blackened.net/revolt/rbr/rbr6/black.html

examples. Monitoring new and emerging crimes or changes in crimes on a broad geographic basis can often provide insight about crime problems that are on the horizon for a community. Methamphetamine hydrochloride, for example, first emerged in urban areas on both coasts of the United States. Its movement to rural areas and to the midwest was on a fairly definable path permitting forecasting. Much of the information was easily identifiable through media reports.

An Example of "Pushed" Open Source Information

In March 2008 there was a series of direct action demonstrations in San Francisco. Predominantly focused on the war in Iraq, other issues were also being expressed by demonstrators including opposition to the U.S. policy toward Israel, economic issues, and global warming. Some demonstrators stated on "direct action" web sites they would be involved in civil disobedience and arrests were anticipated.

To learn more about the protests and the plans, the author searched several direct action web sites related to the demonstration. One web site provided cell phone text messages on plans and events throughout the day. The author signed up for the text service and had information on the demonstration "pushed" to his cell phone, therefore not only monitoring the events, but arriving at locations where civil disobedience was planned prior to most demonstrators.

The texts were open sources in near real time and it illustrates that with technology, open source information can take diverse forms.

An important word of caution: Just as law enforcement seeks information that provides insights into criminal behavior, individuals who are involved in criminal behavior may also attempt to provide disinformation on their web sites in an attempt to mislead law enforcement authorities. This is of particular concern regarding ideological groups who may seek to either induce law enforcement into some form of unjustified action or to simply distract law enforcement away from the heart of a group's real activities. This reinforces the need to verify sources and content.

Open Sources and Civil Rights

Unlike Intelligence Community agencies and the private sector, SLTLE agencies must be vigilant in the management of open source information because of unique rules that apply to information retention in a criminal intelligence records system.

Raw information obtained from open sources tends to fall into two categories that have important significance for an SLTLE agency: 1. Information about individuals and organizations and 2. Aggregate nonidentifying information. As a general rule, when a law enforcement agency conducts an open source search for information, the agency should assumed that civil rights protections attach to any information that identifies individuals or organizations, no matter how innocuous that individual piece of information appears to be. Conversely, as a general rule, no civil rights attach to aggregate information or descriptions of issues, trends, ideologies, and so forth that does not identify an individual or organization.

Of particular importance is when the information involves expressive activity that is protected by the First Amendment. It is easy to find information posted on blogs and web sites that express extreme statements about a diverse array of behavior, such as support for international terrorism, advocacy of legalization of drugs, vehement opposition to policies of government officials, advocacy of pedophilia, racist beliefs, and so forth. The difficulty is to distinguish between extreme expressive beliefs and statements that have a criminal nexus.

The statements in Table 11-1 illustrate expressive beliefs (left column) and statements with a likely criminal nexus (right column). Assume that the statements are made by a person who has been identified by an SLTLE officer.

Table 11-1: Comparison of Expressive Statements and Statements with a Criminal Nexus

Expressive Statement	Statement with Criminal Nexus
• "All politicians are corrupt and ought to be shot."	• "The only way to stop this war is for us to kill the President."
• "Doctors who perform abortions are committing murder and must be stopped."	• "The only way to stop that doctor from performing abortions is for us to blow up his clinic."
• "Everyone should smoke marijuana."	• "I can get you some marijuana to smoke."
• "Violence is the only message they understand."	• "I urge you to kill our oppressors."

The differences are often subtle. The expressive statements, while extreme, are less explicit. Moreover, even in these illustrations, additional facts and circumstances would be needed to establish a criminal predicate.

It is good practice to assume that any information identifying individuals or organizations collected from open sources must be 28 CFR Part 23-compliant.[44] Thus, there must be evidence establishing a reasonable suspicion that there is a nexus between the person or organization identified in the open source and a crime; that is, the "criminal predicate test." The essential principle is not the source of the information, but *what information is being retained* by a law enforcement agency in its criminal intelligence records system. Illustrations of open source applications include the following:

- If information is being collected from open sources as part of the criminal investigation of a crime that has already occurred, the criminal predicate test for intelligence records typically does not apply. Information from a criminal investigation would be placed in the law enforcement agency's Records Management System, rather than the criminal intelligence records system.
- If a group plans a protest or demonstration in a jurisdiction, open source information may be used to determine how past protests or demonstrations have been conducted, tactics used in other protests and demonstrations, outcomes and behaviors of the protesters and demonstrators with no criminal predicate required.

[44] The reader is reminded that 28 CFR Part 23 applies only to information that is placed in a criminal intelligence records system.

- While there is some debate, the general rule is that an open source inquiry identifies people who have been arrested during a protest or demonstration; this information may be retained without a separate criminal predicate being established. If a person has been arrested, probable cause has been established, which is a higher standard than the "reasonable suspicion" required for the criminal predicate.
- If the law enforcement agency receives a Suspicious Activity Report that an identified person may commit a crime during the course of the protest or demonstration, that information may be retained in a temporary criminal intelligence file in order to collect further information to verify the veracity of the suspicious activity information. In these cases, the law enforcement agency's criminal intelligence records policy should be followed.

• Descriptive information about extremist ideological beliefs, behaviors of those supporting those beliefs, changes and trends in extremists beliefs or collective behavior, methods advocated for accomplishing the goals of the extremist ideology, and potential targets of the extremists' actions may all be collected, analyzed and retained by a law enforcement agency without a criminal predicate as long as specific individuals or organizations are not identified.

Creating intelligence dossiers on persons who are merely suspicious is both tempting and easy using open source data. Similarly, exploring a social networking site through its search utility to determine if something interesting is located about a person is similarly easy. Nevertheless, law enforcement personnel must follow 28 CFR Part 23-compliant procedures for collecting and retaining open source information in a criminal intelligence records system just as it would for any other form of criminal intelligence information. It warrants repeating: The issue is not whether the information is from an open source, but whether a law enforcement agency can properly keep the information. Decisions must focus on the reason for which information is being retained, not the source of the information.

An important point to remember is that laws vary by state and locality, whether it is intelligence records laws, open records legislation, a state freedom of information act, or state privacy act. There is sufficient variability among the states to warrant a careful review of state law as it relates to criminal intelligence records.

Working with Internet Service Providers and Web-Based Companies

Often, open source searches will lead to the need to use the legal process to gain further information about an inquiry. Of course, when a law enforcement agency seeks information about the specific behaviors of an individual who is a customer or client of a private company, significant privacy concerns arise.

While this process moves beyond open sources, it should be noted that Internet service providers and companies that operate social networking web sites typically have a published policy and guide to work specifically with law enforcement agencies. While it is important for the reader to be aware of this,

since legal process has to be used and information is being sought that is not openly available, it is not open source information when the process goes beyond information that is openly available on the Internet.

Attribution and Copyrighted Materials in the Intelligence Process and Reports

Much of the open source information acquired through the intelligence process is in the public domain, that is, information for which no copyright is claimed. In other cases, as with certain commercial databases, rights to the information have been obtained by contract in accordance with usual government procurement procedures. In many other cases, however, agencies acquire copyright information without the authorization of the copyright holder.[45]

Too often products from law enforcement agencies, ranging from intelligence products to training materials, contain information that is drawn from other sources; however, there is no attribution to the original source. Attribution is important for four basic reasons:

1. It gives corroboration and support for the line of logic, inference, or conclusion that is presented in the report.
2. It permits the consumer to go to the original source for further information on the subject as well as giving the consumer the opportunity to independently evaluate the original source.
3. Attribution will typically meet the standards of law for copyrighted materials.
4. Attribution is the ethical and correct method of operation by giving appropriate recognition to the thoughts, ideas, creativity and work of others.

The importance for attribution has been reinforced by the ODNI through Intelligence Community Directive (ICD) 206, *Sourcing Requirements for Disseminated Analytic Products.*[47] The Directive states:

> Source reference citations shall be included as endnotes in disseminated analytic products. These endnotes shall be provided for all significant, substantive reporting or other information upon which the product's analytic judgments, assessments, estimates, alternative hypotheses and views, or confidence levels depend.[47]

The importance of attributing information to the original source is based on the following notion:

> Thorough and consistent documentation enhances the credibility and transparency of intelligence analysis and enables consumers to better understand the quantity and quality of information underlying the analysis.[48]

Of course, not all attributed material is copyrighted work, particularly in the case of public records. Most public documents and information that have been originally collected by the law enforcement agency are not copyrighted. In these cases, attribution is important for validity purposes.

Beyond public records there is information that should be attributed, particularly if it is from a copyrighted source. For example, information in a strategic

[46] www.fas.org/irp/dni/icd/index.html

[47] Office of the Director of National Intelligence. ICD 206. *Sourcing Requirements for Disseminated Analytic Requirements.* Paragraph D.2, October 17, 2007, p. 2.

[48] Ibid., Paragraph B., p. 1.

intelligence product is drawn from a book on terrorism, a video from a television network that is used to illustrate terrorist attack methods, or the original concept and ideas of a consultant that is used in an intelligence report. All should be considered as copyrighted materials and attributable to the original source.

A copyright is a form of protection provided by the laws of the United States[49] to the authors of original works, including not only written materials, both published and unpublished, but also video and audio materials. Under the protection of federal copyright law,[50] the owner of copyright has the exclusive right of use, distribution, limitation to distribution, and to authorize others to reproduce copies; use the copyrighted material; prepare derivative works based on the original; and rent, sell or transfer the copyright.

Law enforcement agencies are obliged to follow copyright law just as any other individual or organization. While it is important to understand and respect copyrighted works, the "fair use" exemption permits use of the materials without seeking permission of the copyright owner.[51]

> The fair use of a copyrighted work, including such use by reproduction in copies or phonorecords[52] or by any other means specified by that section, for purposes such as criticism, comment, news reporting, teaching (including multiple copies for classroom use), scholarship, or research, is not an infringement of copyright. In determining whether the use made of a work in any particular case is a fair use the factors to be considered shall include:
>
> 1. The purpose and character of the use, including whether such use is of a commercial nature or is for nonprofit educational purposes.
> 2. The nature of the copyrighted work.
> 3. The amount and substantiality of the portion used in relation to the copyrighted work as a whole.
> 4. The effect of the use upon the potential market for or value of the copyrighted work.
>
> The fact that a work is unpublished shall not itself bar a finding of fair use if such finding is made upon consideration of all the above factors.[53]

With specific reference to copyright law and open source intelligence, a Congressional Research Service report stated:

> In using such copyrighted information, intelligence agencies, like other users of public information, are governed by the doctrine of "fair use" (based on common law and codified in the Copyright Act of 1976 (17 USC 107)).[54]

Clearly, law enforcement agencies are also obliged to conform to copyright law. Beyond the legal requirements, it is simply good practice to offer attribution of information where applicable.

Copyright and attribution issues are complicated when law enforcement agencies use the services of a commercial vendor whose work product has copyright protection. Care must be taken to ensure that users of the information understand the copyright implications in the service contract.

[49] United States Code, Title 17.

[50] United States Code, Title 17, Section 106 with reference the Copyright Act of 1976.

[51] Ibid., Section 107.

[52] "Phonorecords" is language from the 1976 law and has been interpreted to include all forms of audio and video media that meet the other standards for copyright protection. Similarly, digital materials such as web pages are also included.

[53] www.copyright.gov/title17/92chap1.html#107

[54] Weimer (2005), Ibid.

In the process of collecting information and preparing intelligence reports, law enforcement personnel should always include copyrighted material in their searches, be certain to provide proper sourcing[55] of the information, and be aware of the proper procedures in the fair use exemption.[56]

Metrics for Open Source Use

A great deal of information has been discussed about the effectiveness of open source information; however, the only true measure of effectiveness is to ensure that it is designed and evaluated to specifically meet the needs of the intelligence environment in which it is being used. A challenge, however, is the absence of widely accepted measurements or metrics related to open source intelligence. Responsible managers must develop outcome measures for intelligence practices to ensure they are accomplishing their intended goals (i.e., effectiveness) and are doing so in a manner that does not waste resources (i.e., efficiency).

Simple open source metrics may include the following:

- A count of open sources attributed in intelligence reports
- The proportion of all analysis where open sources are used
- Proportion of time when open sources are the source of first resort for intelligence requirements
- Time requirements for locating needed information in the open source environment versus the closed source environment.

While somewhat superficial, these metrics represent more than is currently used. Moreover, inasmuch as open source information is used by all-source analysts in connection with information from closed sources, it is difficult to measure how much open source information contributes to a specific intelligence product.

> It is anticipated that open source information will increasingly be relied upon given its greater availability, the nature of issues that today's analysts must cover, and the heavier emphasis placed on it by senior intelligence leaders.[57]

The ultimate open source metric is the qualitative contribution open sources make to the analysis. While this is difficult to measure, long-term evaluative assessments should be developed in order to focus the type of open sources and the methodology of their inclusion in the intelligence process which is most productive.

Open Source Content for the Intelligence Process

While open sources include information beyond the web, it is apparent that information about virtually any topic can be found on the Internet. Indeed, the quantity of information can be overwhelming. Having some perspective about different kinds of open source content that have particular value for law enforcement intelligence can begin to make the navigation and collection process more manageable.

[55] *Intelligence Community Directive 206* provides a significant amount of detail of information that should be included in the attribution.

[56] The United States Copyright Office web site, www.copyright.gov is very comprehensive and should provide answers to most copyright questions, including the fair use doctrine.

[57] Ibid. Best and Cumming, 2007, p. 17.

Open Source Information Identifying People and Organizations from Subscription Services and the Media

Two open sources that frequently identify people and organizations that warrant special attention are subscription database services and media reports. These are often subject to question about the propriety of their use. Both may be used properly and can be of great value to law enforcement intelligence. Just as in the case of any open source, the nature of the sources must be understood and the regulations concerning retention in criminal intelligence records systems must be applied in the same manner as any other information.

Searching media sources[58] can also provide a significant amount of information about individuals, organizations, trends in crime, movements, and criminal extremist ideologies. News services have global networks of sophisticated communications and informants with trained staff to conduct research and investigate virtually all issues that would be of interest to a consuming public. As a general rule, responsible news organizations also have editorial policies to ensure that the information used in news stories is valid, reliable, and corroborated (i.e., "well-sourced"). Crime and criminal extremism are important news; hence, journalists often seek to learn as much as possible about these incidents. The depth of information frequently includes details that are useful in the intelligence process. The news media can openly identify individuals and organizations involved in criminal incidents and often link similar individuals and incidents in diverse geographic locales. A search of news stories can provide both important leads and important undiscovered detail about a line of inquiry. A word of caution, however: not all media sources adhere to the same high standards. The practices and reputation of the media source must be evaluated just as any other source.

A number of companies have developed systems that permit a search for information from public and commercial databases using proprietary data integration software. Examples of the types of data that may be obtained are listed in Table 11-2. Companies such as AutoTrack,[59] Accurint,[60] Lexis-Nexis,[61] and RiverGlass[62] permit the development of extraordinarily detailed information about people into a summary report. Even though a fee is charged for these services, they are still open source because anyone can purchase the data and neither a legal process nor surreptitious collection methods are used.

Since both subscription services and media sources can provide a significant amount of detail about individuals and organizations, it is important to repeat once again that the criminal predicate rule is still applicable for information placed in law enforcement intelligence records.

National Media Exploitation Center

On a related point, initiatives by the Intelligence Community related to media information are worthy of note. Because of the vast amount of information that is available and easily accessible from the global news media, the National Media Exploitation Center (NMEC) was established in late 2001 at the Central Intelligence Agency[63] (CIA). NMEC's role is to coordinate FBI, CIA, the Defense Intelligence

[58] Such as News Directory www.newsdirectory.com or World: News, Media and Communications www.geocities.com/albaruthenia/AW/news.html.

[60] www.accurint.com

[61] www.lexisnexis.com

[62] www.riverglassinc.com

[63] Don Cryer, Special Assistant to the Director of Central Intelligence for Diversity Management. (November 5, 2003). *Prepared Statement, Hearing before the Permanent Select Committee on Intelligence, 108th Congress.*

Agency, and National Security Agency efforts to analyze and disseminate information gleaned from millions of pages of paper documents, electronic media, videotapes, audiotapes, and electronic equipment.[64]

Table 11-2: Examples of Information Obtainable from Subscription Database Services

- Full names
- Date of birth
- Place of birth
- Parents, spouses, siblings, and children
- Known associates
- Known addresses associated with all the names
- Social security numbers
- Mortgage and lien information
- Credit report
- Credit cards and credit card usage
- Professional affiliations
- Occupations and employers
- Licenses of all types
- Vehicle, watercraft, and aircraft registrations

In this venue, exploitation refers to the collection of open source information relevant to defined requirements, integrating it with other known information and deriving new knowledge from this process; that is, developing open source intelligence. The NMEC has a great deal of expertise and resources. SLTLE agencies may take advantage of the NMEC through federal partners—typically the FBI or DHS—at the primary state fusion center.

The Social Networking Concept and Issues for Open Source

A social network is a linked, interactive structure of people consisting of "nodes" that may be either an individual or group. The basis of the linkage is a shared interest of virtually any definable character—music, occupation, personal philosophy, political affiliation, sexual orientation, hobbies, and so forth. Each node may have multiple connections based on the different variables. For example, one person (i.e., a node) may be a member of multiple social networks. A person who is an accountant may also be a motorcycle enthusiast, enjoy country music, and be an avid fantasy football player. Each variable could represent membership in different social networks. Similar social network models can be defined for people who support extremist ideologies, are gang members, or are involved in illegal activities, such as drug use or pedophilia.

While social networks have existed in some form since the dawn of humankind, the growth of the Internet has resulted in new social networks that are virtual, notably represented by web sites such as MySpace,[65] FaceBook,[66] Bebo,[67] Twitter,[68]

[64] Federal Bureau of Investigation. "The FBI's Counterterrorism Program Since September 2001." *A Report to the National Commission on Terrorists Attacks Upon the United States.* Washington, D.C.: Federal Bureau of Investigation, undated, p. 16.

[65] www.myspace.com

[66] www.facebook.com

[67] www.bebo.com

[68] www.twitter.com

and SocialGrid.[69] Other social networking web sites not as sophisticated or widely known also represent diverse interests. Ironically, social network members will frequently post information that is incriminating or, at the least, sufficiently strong to establish a criminal predicate as related to their behavior. While in some cases one may find gang members or supporters of the Earth Liberation Front on popular web sites such as MySpace, there are many more underground web sites that will have postings indicating criminal behaviors. That is why creative search strategies become important. Typically, intuitive search criteria will not produce the results being sought; rather, use of terms and phrases unique to the social structure are required. As a result, background research to understand a social network becomes an important starting point.

A different form of social networking is found in YouTube.[70] As most readers will know, individuals may post videos on this web site for public viewing. The videos range from humor to personal statements about all kinds of issues. Included are videos related to Hamas,[71] Hezbollah,[72] MS-13[73] and others. In some cases, the videos are critical while in other cases, they are supportive of the cause. Reviewing the videos can provide unique insights and images, including signs and symbols of the group being examined.

To be most successful in searching a social network, the user must create an identity and become a member of the network. For purposes of intelligence inquiries, a false identity and e-mail address should be created by the law enforcement user.[74] Important, there are certain ethical and legal limits that should be fully explored before going forward. Of particular concern is the need to be certain that statements and actions by a law enforcement employee do not induce a person to commit an act that the person would not have otherwise done without the inducement. That is entrapment. A law enforcement agency should develop a policy and procedures to guide the use of creating a false identity and using that identity for intelligence inquiries including social networking.[75] Despite the caveat, the value of using the search engine of each social networking web site should not be underestimated.

Newsletters and Blogs

Monitoring a variety of variables related to a threat is an important part of strategic intelligence. Essentially, these are standing intelligence requirements. Open source materials that are particularly useful for this purpose are newsletters and blogs. While newsletters exist in both printed and electronic form, the latter is increasingly prevalent because they are more timely and frequently provide hyperlinks leading the reader to sources that will provide greater detail about the subject.

Newsletters are designed to highlight issues, trends, and developments within a specific topic area. Blogs are web-based opinion discussions also typically focused on a specific topic area where writers and readers express opinions, perspectives, and beliefs. In many cases, a single source will have both a newsletter and a blog; for example, a particularly useful newsletter and blog for intelligence issues is *Secrecy News*[76] from the Federation of American Scientists.[77]

[69] www.socialgrid.com

[70] www.youtube.com

[71] www.youtube.com/watch?v=TrieBhaGgHM

[72] www.youtube.com/watch?v=P28KJvu46DY

[73] www.youtube.com/watch?v=MDUIxJJbP00

[74] The processes and "lessons learned in the creation of a false identity for law enforcement inquiries will not be discussed because this is a publicly available document.

[75] As a technical point, searching a social networking site is an open source. Establishing a false identity on the site to lure an individual into making incriminating statements is surreptitious and, therefore, not an open source.

[76] See www.fas.org/sgp/news/secrecy and www.fas.org/blog/secrecy, respectively.

[77] The Federation of American Scientists web site contains a great deal of interesting and useful information related to intelligence issues, including downloadable documents, many of which are often difficult to gain access to. See www.fas.org.

Generally speaking, there are four broad categories of newsletters and blogs:

1. *Professional/academic and government.* These sources tend to be among the most objective, although never rule out the ideological influence, even if unintentional, of an author or editor. Despite this caveat, these sources are most likely to make statements based on corroborated information and use an approach to analysis and conclusion based on logic and the scientific method rather than emotional arguments. Typically, these sources report facts and data more objectively and most commonly include attribution of facts and data.
2. *Commercial sources.* As the name implies, these are profit-driven sources often intended to provide information that supports the sale of products or services. Despite the fact that the motive of the source is to make a profit, the sources can nonetheless be very reliable. Indeed, the reliability of these sources is often an important selling point for the business. While the information is typically accurate, information about alternatives is not likely to be included.
3. *Advocacy groups.* These sources are agenda-driven based on the ideology and goals of the source. A newsletter from a right-wing extremist source will reflect information that supports that ideology. Similarly, discussions in a blog on environmental extremism will support the goals of that group. The reader should recognize where they are coming from and factor that into one's analysis. Using this approach, these sources can be quite insightful for understanding an ideology or advocacy position.
4. *Pundits.* A wide range of individuals blog on the web as critics and commentators on virtually every subject. Pundits work for a wide variety of organizations—news, entertainment media, professional organizations, etc.—and some are independent commentators working only for themselves, oftentimes not as a source of income, but as a means to discuss an interest or belief. What is important to recognize is that pundits typically do not seek to be objective, but to comment on a topic of interest from their particular ideology or perspective. This is also true for pundits who blog for news organizations. Often their arguments and observations are persuasive and useful, but typically they are not objective. Pundits tend to be news and policy wonks; hence, their research will often identify issues and sources of information that might otherwise be easily missed. As such, they are often good sources of raw information that can be corroborated through objective sources.

Subscribing to newsletters and monitoring blogs on a consistent basis can provide a wealth of information about trends, issues, and anomalies. When a new issue of concern begins to emerge on a consistent basis, and particularly if it is reflected in multiple sources, the issue should be proactively explored through other information sources to determine its reliability and validity and to assess the probable impact on one's area of responsibility.

The number of blogs and newsletters on the web is unknown; moreover, they are dynamic in both their presence and content; as a result, there is value in relying on web sites that aggregate blogs, newsletters, and news. These sites typically organize their content into broad categories and have search engines that limit queries to the site's contents. Both factors aid in narrowing the breadth of a search. Two such sites that are comprehensive in their aggregation are

BlogRunner[78] and TalkDigger.[79] Each uses a slightly different approach, thereby providing a more comprehensive search methodology.

Wikis

A wiki is software that allows users to easily create, edit, and link pages. Wikis are often used to create collaborative web sites and to power community web sites, often also referred to as wikis. These collaborations are increasingly being used by businesses to provide affordable and effective Intranets and for knowledge management.[80] More specifically, the collective business knowledge of all members of an organization can be documented, refined, and shared in a dynamic virtual environment.

Wikis generally are designed with the philosophy of making it easy to correct mistakes, rather than making it difficult to make them. Thus, while wikis are open, they provide a means to verify the validity of recent additions to the body of pages. The most prominent, on almost every wiki, is the "Recent Changes" page—a specific list numbering recent edits, or a list of all the edits made within a given time frame.

Critics of publicly-editable wiki systems argue that these systems could be easily tampered with, while proponents argue that the community of users can catch malicious content and correct it. The safe lesson on a public wiki is to use it as a pointer system and corroborate the content of interest.

Perhaps the best known wiki is the online encyclopedia *Wikipedia*;[81] however, there are many types of wikis, some with a very specific focus.[82] For example, the ODNI OSC provides access to a wiki that is specifically focused on intelligence called *Intellipedia*.[83] While primarily focused on the Intelligence Community, it contains information that is also useful to SLTLE. Wikis can be a valuable source when dealing with a topic or issue about which the information collector has limited information. Most wikis include external references to materials which helps in the corroboration process.

From an intelligence perspective, the wiki can provide subject matter knowledge on an issue as well as direction to more information.[84]

RSS Feeds

RSS (Really Simple Syndication) is a family of web feed formats used to publish frequently updated content including, but not limited to, blog entries, news headlines, and podcasts. An RSS document (which is called a feed, web feed, or channel) contains either a summary of content from an associated web site or the full text. RSS makes it possible for people to keep up with web sites in an automated manner that can be sent to the subscriber.[85]

From an open source perspective, the value of RSS feeds, when available on a web site, is that any new information or changes in content are sent to those registered for the service without the need to check each site. It increases both the efficiency and timeliness of information for the user.[86]

[78] www.blogrunner.com

[79] www.talkdigger.com

[80] en.wikipedia.org/wiki/Wiki

[81] en.wikipedia.org/wiki/Main_Page

[82] A wide variety of wikis can be searched through www.wiki.com.

[83] www.opensource.gov/providers/intelinku/wiki/Main_Page (access only)

[84] For example, see the crime wiki at unclesam.pbwiki.com/Crime.

[85] en.wikipedia.org/wiki/RSS_(file_format)

[86] As an example, see the terrorism news and analysis RSS feeds at www.2rss.com/rss_5352.html.

Gray Literature

Gray literature is open source information that typically is not published but made openly available, usually to a specific audience. While it is open, the information is often not easily identified or retrieved. The American Library Association observes:

> The greatest challenges involved with [gray literature is] the process of identification, since there is limited indexing, and acquisition, since availability is usually marred with uncertainty. Added to this is the absence of editorial control, raising questions about authenticity and reliability.[87]

Traditionally, gray literature was defined as any documentary material that is not commercially published and is typically composed of technical reports, working papers, business documents, and conference proceedings. More of these types of documents are becoming available online, but often are not discovered by traditional search engines.

This author views the concept of gray literature more broadly, particularly as applied to the law enforcement intelligence process. The basic idea of gray literature has three components: 1. Documents of interest that exist; 2. The information is open; and 3. The information is not widely distributed and therefore difficult to locate. The concept of gray literature, therefore, should not be limited to academic or scientific works, but applied to any documents characterized by these three elements.

Brochures printed by a right-wing extremist are handed out a local gun show or fliers printed by anarchists and distributed at a demonstration could also be considered gray. In both cases, the documents are not commercially published but are intended to be disseminated openly and as broadly as possible (the limitation often being a budgetary one). The limited supply of these unpublished materials makes them difficult to identify or locate. Collecting gray literature is a challenge and must be explored in light of the types of potential literature that exist and where they might be located, most likely by a human collector rather than by networking.

The Deep Web

The web is a complex entity that contains widely diverse information in a variety of formats. Most people tend to view the web in the context of web sites with a combination of fixed and dynamic content. The fixed content tends to have minimal change and is the most common content found in standard searches. The dynamic content on many web sites is far larger than the fixed documents and is more likely to be missed in standard searching, with the exception of file names and file extensions.

[87] www.ala.org/ala/mgrps/divs/acrl/publications/crlnews/2004/mar/graglit.cfm

The deep web or invisible web refers to the following:

> …the vast repository of information that search engines and directories don't have direct access to, like databases. Unlike pages on the visible Web (that is, the Web that you can access from search engines and directories), information in databases is generally inaccessible to the software spiders and crawlers that create search engine indexes.[88]

Common estimates suggest that the deep web contains 500 times the content that is found in the visible web. Five broad types of content[89] constitute the invisible web:

1. *The content of web-based databases.* Information stored in databases is accessible only by query to the database and are not picked up by the web crawlers used by search engines. This is distinct from static, fixed web pages, which contain documents that can be accessed directly. A significant amount of valuable information on the web can be generated from databases.
2. *Nontextual files.* These include multimedia files, graphics files, software, and documents in formats such as Portable Document Format (PDF). Web crawling has a limitation in searching the content of these types of files. Web crawlers can identify file names and extensions (e.g., .jpg, .wmv, .pdf, etc.) of such files, but cannot identify the content of these files during the web crawling process. Essentially, they are files that are not in HTML[90] format, therefore, a great deal of information and data are not picked up from these files by traditional searches.
3. *Script-based web pages.* These are web pages that are written in script coding, other than HTML and/or those with URLs[91] that contain a "?".
4. *Content available on sites protected by passwords or other restrictions.* The content of web sites protected by some degree of access through rigorous password protection or a Virtual Private Network (VPN) will not be identified by search engines. There is a continuum of identifiable and nonidentifiable information from these types of web sites depending on what types of information the site owners elect to be publicly accessible (often for marketing purposes) as well as the degree of security applied to the site (in some instances the web site's security is limited and some data can be identified). Suffice it to note, a significant amount of information from these sites is not identifiable through traditional search engines.
5. *Pages deliberately excluded by their owners.* A web page creator who does not want his or her page captured in search engines can insert special meta tags that will cause most search engines' crawlers to avoid the page.

Obviously, a great deal of open source information from the deep web could be valuable to the intelligence process if it could be identified and retrieved. The deep web is searchable, but not using standard search techniques. The goal is to find tools that can locate valuable open source deep web information.[92] The most effective ways to search the deep web is to use search utilities that are designed to explore specific databases. While this still reaches only a portion of the deep web, the information gained from these databases can be extremely valuable, although not necessarily convenient. Deep web searching of databases typically requires accessing a variety of web sites to search for the desired information.

Language Distribution on the Internet

According to one web-based study, languages were distributed among web pages in these percentages:

English	56.4%
German	7.7%
French	5.6%
Japanese	4.9%
Spanish	3.4%
Chinese	2.4%
Italian	2.0%
Other	17.6%

If an information collector is searching only in English, then the search has immediately eliminated 43.6 percent of the visible web.

[89] See www.internettutorials.net/deepweb.asp.

[90] HTML is Hypertext Markup Language.

[91] A URL is Uniform Resource Locater, which is the web address.

[92] For a guide to assist your search strategy, see: www.lib.berkeley.edu/TeachingLib/Guides/Internet/Strategies.html.

Both as a resource and as a means to illustrate the breadth of databases in the deep web, the following is a list of deep web/database search utilities. It is not a comprehensive list; rather, the sites are among those most likely to have some form of utility for law enforcement intelligence.

1. Clusty[93]—A metasearch engine that combines the results of several top search engines.
2. Intute[94]—A searchable database of trusted web sites reviewed and monitored by subject specialists.
3. Infomine[95]—A virtual library of Internet resources relevant to university students and faculty. Built by librarians from the University of California, California State University, the University of Detroit–Mercy, and Wake Forest University.
4. Librarians Internet Index[96]—A search engine listing sites deemed trustworthy by human librarians, not just an Internet bot.
5. Internet Archive[97]—A database of tens of thousands of movies, live music, audio, texts, and home of the Wayback Machine that allows you to find old versions of web pages, more than 55 billion.
6. Direct Search[98]—A list of hundreds of specialty databases and search engines. No longer maintained, but still perhaps the most complete list of the deep web.
7. Scitopia.org [99]—A federated search engine that consists of a real time search through a disparate group of databases. The user enters a set of query parameters, which are broadcast to the selected databases; the results are collated and presented back to the user in a unified format.
8. Science.gov [100]—A search engine for government science information and research results. Launched in February 2002, it is in its fourth generation, providing a search of more than 50 million pages of science information with just one query, and is a gateway to more than 1,800 scientific web sites.
9. Pipl[101]—As an alternative method to search for people, Pipl searches databases for names of individuals rather than names that are simply incorporated on web pages.
10. StumbleUpon[102]—Using the technique of web harvesting, this deep web search engine relies on a combination of human opinions and machine learning to immediately deliver relevant content.
11. GPO's Catalog of U.S. Government Publications[103]—A searchable database of federal publications, with links to those available online.
12. Smithsonian Institution Libraries[104] —A collection of 20 libraries from the world's largest museum complex.
13. The National Archives[105]—A list of all National Archives research tools and databases.
14. HighWire Press[106] —A searchable catalog of the largest repository of free full-text, peer-reviewed content, from more than 900 journals.
15. Education Resources Information Center (ERIC) [107]—A catalog of more than 1.2 million bibliographic records, providing links to the full text where available. Sponsored by the U.S. Department of Education and the Institute of Education Sciences.
16. Encyclopedia Britannica[108]—The authoritative encyclopedia searchable with full text online.

17. Topix.net [109]—A news search engine.
18. Internet Public Library[110]—The Internet's public library, which is fully searchable.
19. The Online Books Page[111]—A searchable database of more than 25,000 English works with full text available free online.
20. ebrary[112]—A searchable database of more than 20,000 full-text books.
21. Hoover's[113]—A searchable database of businesses.
22. ThomasNet[114]—An industrial product search directory.
23. GuideStar.org[115]—A searchable database of nonprofit organizations.
24. American FactFinder[116]—A repository of aggregate census bureau data searchable by city, county, or ZIP Code.
25. FedStats[117]—A gateway to statistics from more than 100 U.S. federal agencies.
26. United States Government Printing Office (GPO)[118]—A search engine for multiple government databases, including U.S. budgets, campaign reform hearings, code of federal regulations, congressional bills, unified agendas, and more.
27. CIA Electronic Reading Room[119]—A searchable database of declassified CIA documents.
28. International Data Base (IDB)[120]—A computerized data bank of statistical tables and demographic information for 228 countries and areas.
29. FIRST[121]—A database of military aggression and weapons holdings.
30. CIA Factbook[122]—A reference material published by the CIA, containing information on every country in the world.
31. THOMAS (Library of Congress)[123]—A searchable database of legislative information from the Library of Congress.
32. Law Library of Congress[124]—The largest collection of legal materials in the world, containing more than 2 million volumes.
33. Global Legal Information Network[125]—A searchable public database of laws, regulations, judicial decisions, and other legal sources.
34. FindLaw[126]—A free legal database with searchable collections of cases and codes, legal news, and an online career center.
35. Bureau of Justice Statistics[127]—A directory of legal and judicial statistics, ranging from crime to law enforcement, to courts and sentencing.
36. Library of Congress[128]—A searchable catalog of the world's largest library, containing more than 130 million items.
37. Library of Congress Digital Collections[129]—A searchable database of Library of Congress items that have been digitized and fully available online.
38. Library of Congress Prints and Photographs Reading Room[130]—A searchable catalog of Library of Congress prints and photographs including thumbnail reproductions of the items.
39. National Institutes of Health[131]—A searchable encyclopedia of health topics.
40. FAA Flight Delay Information[132]—A map of the United States with flight delay information from the nation's largest airports.
41. National Highway Traffic Safety Administration[133]—A database of car and car part defects, searchable by item number or car make and model.

Beyond these diverse resources, a number of fee-based deep web search utilities are available. The advantage to these search utilities is that they identify and seek information from multiple databases without the need to make separate inquiries, and proactively search for data in non-HTML formats (beyond databases). The following are among the most comprehensive::

1. Xrefer[134] —A searchable database of 236 titles and more than 2.8 million entries.

2. LexisNexis[135]—The world's largest collection of public records, unpublished opinions, forms, legal, news, and business information. More than 35,000 sources are searchable with full-text available online.

3. Forrester Research[136]—An independent technology and market research company publishing in-depth research reports on a variety of subjects.

4. Factiva[137] —A searchable collection of more than 10,000 individual sources.

5. Copernic[138]—Provides indexing, searching, and tracking of databases and deep web resources by using software that seeks and identifies web resources beyond those in HTML.

6. BrightPlanet[139]—Searches, harvests, consolidates, indexes, merges, analyzes, and categorizes documents and associated metadata in any format and language, from visible and deep sources on the web and from inside and outside the firewall.

   Both the BrightPlanet and Copernic utilities are particularly comprehensive deep web search tools that go beyond databases that are useful for law enforcement intelligence.

What should be apparent is that much of the deep web is not hidden in a surreptitious manner. Rather, it is hidden because it contains information in formats or architectures that are not readily identifiable by standard search engine technologies. As a result, it takes specially designed search utilities and greater effort by the user to identify and capture deep web information.

The Underground Web

The underground web is a cultural dynamic that has evolved on the Internet, just as it has in the physical society. An article in *Business Week* described it this way:

> Warning: You are about to enter the dark side of the Internet. It's a place where crime is rampant and every twisted urge can be satisfied. Thousands of virtual streets are lined with casinos, porn shops, and drug dealers. Scam artists and terrorists skulk behind seemingly lawful Web sites. And cops wander through once in a while, mostly looking lost.[140]

Many visible web sites reflect the underground culture where transactions constantly traverse the line between lawful and unlawful behavior. While they are virtually impossible to police, these visible sites—whether trafficking in illegal commodities or purveying any other kind of illegal activity—are often relatively

[139] www.brightplanet.com and www.completeplanet.com

[140] www.businessweek.com/magazine/content/02_35/b3797001.htm

easy to find through diligent standard search techniques. Often operated offshore, the sites' owners do not want to be overly visible drawing attention to their activities, but they need to be found with relative ease to make a profit for their operations.

Other types of underground deep web sites exist with the intent to keep their activities as secret as possible from the visible web world. Nonetheless, they must be accessible for their clientele, with URLs often passed between individual referrals by those who are participants in the underground activities. Identity thieves selling stolen credit card information, pedophiles exchanging photographs, traffickers unlawfully selling controlled substances, and criminal extremists planning an event are examples of open source information that exist in the underground deep web.

While this kind of information is of great interest to law enforcement intelligence, it is difficult and time-consuming to locate. Painstaking searches of the deep web and labor-intensive reading of deep web content and blogs can produce evidence and leads for a criminal inquiry. Nonetheless, this process will be faster and more effective in identifying criminal threats than traditional methods of inquiry.

There is some optimism that this process could become easier. In mid-2006 the Symantec Corporation beta-tested new software called Dark Vision that mines underground web sites and chat rooms for sensitive information that is being sold.[141] The original plan was to target carder web sites—deep underground web sites where identity thieves sell stolen credit card information. While Symantec is uncertain when or if the software will be rolled out, it nonetheless represents a breakthrough that could be applied to other criminal activity.

A vast amount of open source incriminating information is available in the deep underground web. The challenge is to develop the searching expertise and investing the time to find this critical information.

A Broadened Perspective of Open Source for Law Enforcement

The value of many web resources, such as directories, extremist web sites, and social networking sites, for law enforcement intelligence is evident; however, there is a wide array of data that have value for the intelligence process that are less intuitively evident, for example:

- Information about a possible threat that includes the name of an unknown geographic feature.
- Information about the demographic characteristics in a geographic area that is needed in a strategic intelligence assessment.
- Information from a foreign source about money, distance, weight, temperatures or the size of clothing (among other things) that needs to be converted to U.S. standards.
- Real time information to track either a commercial flight or private aircraft.
- Legal description of the GPS coordinates and/or image of a house in question.
- A satellite image of a given location.
- The need to convert a digital video so it can be viewed on a law enforcement computer.
- The need to identify relatives of an intelligence target.

[141] www.infoworld.com/article/07/07/31/Symantec-Dark-Vision-mines-sites_1.html

These requirements, and much more, can be found in an eclectic array of web-based open sources. (See Chapter Annex 11-1 for the descriptions and locations of these web sites.)

The point of note is simple: One of the important values of online open sources is easy access to information that is unique yet critical to a comprehensive analysis.

Homeland Security Intelligence and Open Sources

Beyond enforcing the criminal law, America's law enforcement agencies have a wide range of well-established responsibilities related to public safety and order maintenance. Whenever there is a natural disaster, such as a flood, tornado, or hurricane, law enforcement has the responsibility to aid in the rescue and recovery of victims, protect unharmed citizens from injury and protect property. Similarly, in a catastrophe, such as the crash of an airliner or the collapse of a building or a public health emergency, law enforcement agencies have historically had significant responsibilities for public safety and order maintenance.

With the creation of new national initiatives related to homeland security after 9/11, many of these public safety responsibilities have become more structured. Particularly with the growth of intelligence fusion centers that have an operating philosophy of all crimes, all hazards and all threats, a new form of noncriminal intelligence has emerged: homeland security intelligence.

It should be reinforced that intelligence is based on prevention and is inherently a pre-incident function; whether that incident is criminal or all hazards/noncriminal. To reiterate, homeland security intelligence may be defined as "the analytic output of raw information that describes noncriminal threats to critical infrastructure, public health or community safety." Law enforcement needs to obtain a wide range of information to effectively prepare for homeland security threats identified through analysis. Open sources can be particularly valuable to aid in the intelligence process and to understand the characteristics and threats posed by pandemic flu, hazardous materials, or other direct or incidental threats posed by a homeland security emergency.

A wide range of information related to hazardous materials may be found at Environmental Chemistry;[142] information on threats to public health can be obtained from the Centers for Disease Control;[143] and a wide range of diverse useful information is available from a collection of online searchable databases provided by the National Center for Biotechnology Information of the National Institutes of Health.[144]

The broad range of homeland security threats is too exhaustive for a comprehensive discussion. The point to note is essentially this: Since the responsibility for homeland security intelligence has become a part of the law enforcement intelligence process, particularly at the state fusion center level, analysts and information collectors should aggressively use open sources as the first step in collecting this critical information.

[143] www.cdc.gov

[144] www.ncbi.nlm.nih.gov/sites/gquery

Open Source Processes and Protocols

A number of tools and techniques may be relied on to make the open source collection process more productive as well as to enhance the quality of information. The following discussion is a primer for insights into the process.

Using an Open Source Collection Plan

As anyone knows who has browsed the Internet, the ability to search diverse information and travel down an unanticipated path of hyperlinks can easily draw one away from their original line of inquiry into an area of often interesting but frequently irrelevant information. From an intelligence perspective, this is unproductive and risks the collection of unneeded and sometimes distracting information. The user is urged to develop an open source collection plan when using networking to seek open source information.

A collection plan is essentially a research methodology that seeks to focus the open source information collection process. Rather than relying on a dragnet approach, the collection plan focuses on source searching that is defined by specifically identified agenda items, such as the following:

- Intelligence requirements
- Research an identified emerging threat issue
- Identifying information in support of tips and leads that have been received
- Research information about a known local threat to determine its presence and effects in other geographical areas
- Research diverse and creative tactics for managing threats
- Gain a body of information about a specific intelligence target
- Gain knowledge about the current and changing nature of threat conditions in your region.

The plan should include the following:

- Specific types of information needed (i.e., names, locations, characteristics, or indicators of the threat or criminal behavior, signs and symbols of the threat, effects of the threat).
- Identification of the sources where the specified information is most likely to reside.
- Critical information associated with a given threat (e.g., methods, geography, modus operandi, and so forth).
- Logistical information associated with threats.
- Materiel used in the commission of a crime or terrorist act and how that materiel is used.
- Unique characteristics related to the intelligence target (i.e., important dates, times, symbolism, and so forth).

The significant point to note is that open source information collection through networking can be of the greatest utility when it has a specifically directed agenda.[145]

[145] See Chapter Annex 11-1 for a series of questions and methodology to help form a precise search plan.

Techniques and Tools

Perhaps the most important foundation skill to develop for any type of networking environment is to become adept at searching. The most common approach is to open one's search engine of choice and use the default search utility for the information that is needed. Some successes are achieved with this method, but the results often can provide a large quantity of related information that often lacks the specificity needed. Narrowing the search can be more productive in seeking the information that is needed. The first step is to develop a pre-search plan to focus on search requirements (See Chapter Annex 11-2). Beyond this plan, here are some tips for narrowing the search:

- Understand the culture of the intelligence target to both identify and accurately interpret relevant information. With a clear understanding of the culture of the target or the information that is being sought, a wider array of search terms and phrases can be developed. Moreover, narrowing the terms may assist in defining the sources or search engine to use.
- Based on the cultural assessment, carefully define the types of information that is being sought. To do this, rely on the concept of being collectively exhaustive; that is, make an attempt to search all derivative terms that describe the data or phenomenon being sought in the search.
- Once the information is defined, dissect it to develop alternative terms, synonyms, jargon, symbols, abbreviations, and alternative spellings.
- Examine different formats of the information being sought. For example, if searching for the name John Alexander Doe, the search should take several forms, such as:
  - John Doe
  - J Alexander Doe
  - J. Doe
  - J. Doe
  - Johnny Doe
  - Alexander Doe
  - J.A. Doe
  - J. "Alex" Doe

This is particularly important for deep web searches.

- Specialty search engines[146] can help focus a search by limiting searches to explicitly defined areas. Using a search engine that focuses only on news web sites[147] can pick up useful information from trends in terrorism or crime to the names of individuals or organizations that may be associated with threats. Moreover, news web sites often make an assessment of the quality of information easier than many other sites.
- Language translation from multiple languages to English is increasingly available at no charge online. These sites typically will permit the entry of text for translation or entry of a web site address to translate the information contained in the URL.

National Virtual Translation Center

Building on this last point, when foreign language translations are necessary, the National Virtual Translation Center[148] (NVTC) may be an additional resource to explore. Established by Congress in 2003, the NVTC role is to provide timely and accurate translations of diverse raw information for all elements of the Intelligence Community. A virtual workplace, NVTC personnel and linguists are located throughout the United States and connect through various networks with the NVTC program office in Washington, D.C. As a member of the Intelligence Community, the NVTC is part of the ISE and, therefore, may become a resource

[146] A wide variety of general and specialty Internet search engines can be found at www.searchengineguide.com/searchengines.html.

[147] An example is NewsDirectory at www.newsdirectory.com.

[148] www.nvtc.gov

for SLTLE, and particularly fusion centers, on inquiries that may coincide with Intelligence Community concerns. SLTLE agencies should work with their FBI or DHS fusion center partners to secure assistance with the fee-based NVTC.

The Need to Determine Accuracy, Reliability, and Validity

As is the case with any information collected for the Intelligence Process, it is essential to evaluate the accuracy of facts, the reliability of the source of information and validity of the information's content. These concepts are the same as for any type of information in the Intelligence Process:

- *Accuracy:* The information is true and may be corroborated.
- *Source Reliability:* The source of the information is dependable for providing accurate information.
- *Information Validity:* The information actually depicts or portrays what it purports.

A good method for measuring these standards in open sources is to seek multisource reporting of information for validity. It is important to ensure that multisource reporting is not merely repetitive reporting; for example, *USAToday*, CNN, Fox News, and MSNBC may report the same news story. If all of these news outlets are simply reporting the same facts derived solely from an Associated Press story, then this is not multisource validity. This is referred to as the echo chamber, which is described as follows:

> …a group of media outlets that tend to parrot each other's uncritical reports on the views of a single source, or that otherwise relies on unquestioning repetition of official sources.[149]

In the example above, if each network reports the Associated Press story and independently confirms it relying on its own reporters, then this is multisource validation. A useful tool for assessing validity and reliability can also be found online through web sites such as Truth or Fiction,[150] About.com: Urban Legends,[151] or Snopes.[152] These web sites contain surprisingly comprehensive and well-sourced information about rumors, legends, and information that has been quoted as fact. The web sites typically describe the veracity of the story, with some form of explanation.

Web content is bursting with hyperbole, innuendo, and false information. One must be diligent to ensure that collected information is accurate, reliable, and valid.[153]

[149] www.sourcewatch.org/index.php?title=Echo_chamber

[150] www.truthorfiction.com

[151] urbanlegends.about.com

[152] www.snopes.com

[153] For a comprehensive discussion of reliability, particularly as related to the web and open source information, see sourcesandmethods.blogspot.com/2008/10/how-to-determining-source-reliability.html.

Avoiding Traffic Analysis: Becoming Anonymous on the Web

Online intelligence and investigation procedures should mask the Internet Protocol (IP) address of the computer being used. This can easily be accomplished in two ways. One way is simply to have a stand-alone computer that is generically registered using a false identity with an Internet Service Provider (ISP).[154] The computer should not be connected to any other network and not used for personal activities, such as accessing accounts requiring a user name and password.

Another method is to use a proxy server that will mask the IP address of the computer being used.[155] There are commercial enterprises that will provide this service for a fee, such as Anonymizer[156] or The Cloak.[157] There are also free methods such as using a free proxy web site as found on Proxify[158] or ProxyIndex.[159] Another method is to identify anonymous server IP addresses and insert the IP number and port number into the proxy server option in your web browser. The process is actually quite simple. First go to a web site that lists proxy servers, such as Public Proxy Servers,[160] and select a server from the list. In your Internet browser, go to the proxy settings dialog box. In Microsoft Internet Explorer[161] (IE), the path is usually the following:

Tools > Internet Options > Connections > LAN Settings

In LAN settings, check the proxy server box and enter the IP address and port number (both will be on the proxy server list). Figure 11-1 illustrates how a proxy server from the Russian Federation (highlighted at the bottom of the image) was entered into the proxy server option in Microsoft IE.

The reason that the IP address should be masked is because tools are available on the Internet to trace domain names, IP addresses, connection routes, e-mail addresses, general geographic locations of the computer, and other electronic transaction information. These tools can also be used effectively by law enforcement and can be found at such web sites as DomainTools,[162] Better-WhoIs,[163] and Geektools.[164] It should be noted that different WhoIs web sites will have different databases to search and multiple sources may need to be used. If, however, the IP being searched for has been cleaned through a proxy server, the WhoIs search will not be fruitful.

Finally, the computer's cookies and Internet cache should be cleaned regularly. This will help ensure anonymity, particularly in light of the inevitable fact that someone will use the computer for personal business. While cookies and the cache can be cleaned manually, the most effective way is to use software designed for that purpose.[165]

[154] This is sometimes referred to as a "hello computer" much like and generically registered "hello telephone" used in law enforcement undercover operations.

[155] To maximize safety, use a proxy server even on a hello computer.

[156] www.anonymizer.com

[157] www.the-cloak.com/pay-terms

[158] www.proxify.com

[159] www.proxyindex.com

[160] www.publicproxyservers.com

[161] The path to LAN settings may differ somewhat between versions of IE. Other Internet browsers such as Netscape and Firefox, will have a similar ability to create a proxy server.

[162] whois.domaintools.com

[163] www.betterwhois.com

Information That Can Be Learned From Your Computer's Internet Protocol Address
Information that is useful to law enforcement is also useful to those persons monitoring visitors to their web sites. If a computer's Internet Protocol (IP) address is not made anonymous, the types of information that can be gained from the IP alone include:

- City and state where the computer is accessing the Internet
- Area code
- Longitude and latitude
- ISP
- Last web site visited

See for yourself. Visit these web sites:

- www.zabasearch.com/zabainfo
- www.ip-address.com

The Investment in Critical Thought and Time

Despite the ease and speed of the Internet, two of the most important open source tools are critical thought and time. Both are needed to define search terms and phrases, develop the collection plan, identify critical information needed in an inquiry verify the information, and interpret it. Often, this information will lead to other sources and critical thought is needed to dissect the additional source alternatives, weighing the value of each, and moving the search and collection processes forward.

The process can be laborious, particularly as one sifts through diverse blogs. Reading, consuming, interpreting, and collecting important information from the overwhelming quantity of information is labor-intensive, but valuable for discovering information that can be essential in identifying and preventing threats.

Information collectors and analysts must have the wherewithal to push the process forward, particularly during searches that seem to be unproductive. Managers and administrators must develop the patience to understand these unique performance characteristics when evaluating personnel.

Conclusion

This discussion was an overview of the open source concept, the current philosophy and application of open source information as part of the National Open Source Enterprise, the role of open sources in law enforcement intelligence, and a primer on the use of open source techniques and tools for the intelligence process. The web sites listed in this discussion are intended to serve as illustrations and are not meant to be a comprehensive list nor an endorsement of any particular commercial or open application. They were accurate at the time of publication of this *Guide*.

As the source of first resort, open source information and intelligence provides tremendous potential for law enforcement that should be exploited to increase the efficiency and effectiveness of the intelligence function.

Chapter Annex 11-1: Eclectic Web Sites Sometimes Found Useful for Intelligence

The Intelligence Process sometimes needs information that intuitively would not seem to be part of a law enforcement inquiry. The sites can be accessed at no charge.

- According to the National Counterterrorism Center definition, terrorism occurs when groups or individuals acting on political motivation deliberately or recklessly attack civilians/noncombatants or their property and the attack does not fall into another special category of political violence, such as crime, rioting, or tribal violence. The incidents may be tracked on the Worldwide Incidents Tracking System: wits.nctc.gov.
- The Geographic Names Information System (GNIS), developed by the U.S. Geological Survey in cooperation with the U.S. Board on Geographic Names, contains information about physical and cultural geographic features in the United States and associated areas, both current and historical (not including roads and highways). The database holds the federally recognized name of each feature and defines the location of the feature by state, county, USGS topographic map, and geographic coordinates: nhd.usgs.gov/gnis.html.
- The National Geospatial-Intelligence Agency (NGA) GEOnet Names Server (GNS) provides access to the National Geospatial-Intelligence Agency's (NGA) and the U.S. Board on Geographic Names' (US BGN) database of foreign geographic feature names. The database is the official repository of foreign place-name decisions approved by the US BGN: earth-info.nga.mil/gns/html/index.html.
- The Statistical Abstract of the United States is the authoritative and comprehensive summary of statistics on the social, political, and economic organization of the United States. Sources of data include the Census Bureau, Bureau of Labor Statistics, Bureau of Economic Analysis, and many other federal agencies and private organizations: www.census.gov/compendia/statab.
- The U.S. Census Bureau FactFinder user can obtain comprehensive population, housing, economic, and geographic data in the form of maps, tables, and reports from a variety of Census Bureau sources: factfinder.census.gov.
- Sometimes simple information is needed:
  - The geographic location of an area code: www.areadecoder.com.
  - Social Security numbering scheme: www.ssa.gov/history/ssn/geocard.html.
  - Geographic, social, and economic information about a ZIP Code: www.zipskinny.com.
  - The definition of a word: thesaurus.reference.com.
- A Librarians Internet Index is comprehensive portal of links to web sites on virtually every topic. The unique aspect of this portal is that the web sites which have direct links have been reviewed as being trustworthy sites: www.lii.org.
- The How Stuff Works web site covers a very wide array of topics and explains the components and processes that make the topic functional: www.howstuffworks.com.

- Significant weather events always hold the potential for law enforcement activity. Two good and slightly different sources for weather are:
  - National Weather Service www.nws.noaa.gov.
  - The Weather Channel www.weather.com.
- At times there is a need to convert U.S. dollars to a foreign currency or vice versa. To do this easily at current rates, use the FX Currency Converter: www.oanda.com/convert/classic.
- The need to convert information in a variety of ways often becomes essential, but difficult. Online Conversion has made it simply by providing conversion calculators for length, temperature, speed, volume, weight, cooking, area, fuel economy, clothing, area, angles, frequency, distance, and much more: www.onlineconversion.com.
- Real time tracking of both commercial and private flights: www.flightware.com.
- Scalable satellite imagery can be used to see the layout of a target location (different sites will provide slightly different satellite images):
  - TerraServer www.terraserver.com.
  - Google Maps maps.google.com.
  - Digital Globe www.digitalglobe.com.
- Cyberhomes provides images and/or aerial views and maps of property throughout the U.S., GPS location, legal description of the property, and other information: www.cyberhomes.com.
- Genealogy web sites have become very popular as people seek to learn more about their family tree. Many of these web sites have a surprisingly wide range of information useful for law enforcement: www.ancestry.com.
- In some instances, information such as images, audio, video, word processing, etc., that are in a different format that cannot be opened on the law enforcement computer. These files can be converted online to a different format so they can be opened on your computer at: www.media-convert.com.
- Voicemail menus can often be frustrating, particularly when one needs to talk with a person. The Get Human web site identifies the shortcut codes in a large number of voicemail systems to avoid voice mail prompts and to reach a person: www.gethuman.com.
- A wide range of unique information searches: www.blackbookonline.info.
- Junk science is faulty scientific data and analysis used to advance special and, often, hidden agendas. Junk science is debunked at: www.junkscience.com.
- A guide to medical quackery and health fraud: www.quackwatch.com.

Chapter Annex 11-2: The Pre-Search Development Plan

The Pre-Search Development Plan[154]

1. What unique words, distinctive names, abbreviations, or acronyms are associated with your topic?

   The value of starting with these search elements is that they help define your search parameters. Be certain to include synonyms and professional terminology.

2. Can you think of societies, organizations, or groups that might have information on your subject on their pages?

   Search these as a "phrase in quotes," looking for a home page that might contain links to other pages, journals, discussion groups, or databases on your subject. You may require the phrase in quotes to be in the documents' titles by preceding it by title:[no space]

3. What other words are likely to be in any web documents on your topic?

   You may want to require these by joining them with AND or preceding each by +[no space].

4. Do any of the words in 1, 2, or 3 belong in phrases or strings, together in a certain order, like a cliché?

   Search these as a "phrase in quotes". (e.g., "world jihad" or "Aryan nation").

5. For any of the terms in #4, can you think of synonyms, variant spellings, or equivalent terms you would also accept in relevant documents?

   You may want to allow these terms by joining them by OR and including each set of equivalent terms in ( ). As an example of synonyms: "terrorists" and "jihadis". As an example of alternate spellings: "Osama" and "Usama".

6. Can you think of any extraneous or irrelevant documents these words might pick up?

   You may want to exclude terms or phrases with -[no space] before each term, or and not

7. What broader terms could your topic be covered by?

   When browsing subject categories or searching sites of webliographies or databases on your topic, try broader categories.

Chapter 12:

Federal and National Law Enforcement Intelligence Resources, Networks, and Systems

Federal and National Law Enforcement Intelligence Resources, Networks, and Systems

Legislation, mission-related responsibilities of federal agencies, and the need to develop programs and products that have interstate utility have led a wide variety of federal agencies to develop resources and systems that support law enforcement intelligence at the state, local, and tribal levels. Some resources are designed to meet specific needs, such as financial crimes investigations, while others are intended to support broad law enforcement needs, such as the FBI's Law Enforcement Online (LEO). Although in most cases, the resources are provided by a federal agency, some resources are national, but are provided by an entity other than the federal government. The value of these diverse resources and systems to state, local, and tribal law enforcement (SLTLE) will vary according to agency size, geographic location in the U.S., and unique crime problems facing a jurisdiction.

This chapter identifies the various resources, giving the greatest attention to those that have the most value for the broadest range of law enforcement agencies. Unlike previous chapters which sought to provide a discussion of integrated issues surrounding the chapter's topical theme, this chapter is more like a catalog. The goal is to identify the most relevant resources for SLTLE and provide insight into what the resources or systems can provide to a law enforcement agency.

Many resources are also available at the state and local levels, but there was no attempt to document them because of their limited national applicability and the volume of information involved. In some instances, the chapter discusses specific state resources for the purpose of illustration. Information about law enforcement intelligence resources within each state can be found at these sources:

1. *National Criminal Intelligence Resource Center* (NCIRC) operated by the Bureau of Justice Assistance, U.S. Department of Justice.[1]
2. Fusion Center Technical Assistance Program of the Lessons Learned Information Sharing (LLIS) online information system operated by the U.S. Department of Homeland Security (DHS).[2]

As will be seen, there is some overlap between resources and systems; nonetheless, exploring the materials in the following pages should provide valuable direction for the law enforcement intelligence consumer.

[1] The public side of this resource is at www.ncirc.gov. The public NCIRC site has a limited amount of information; however, it provides access to the Criminal Intelligence Master Training Calendar. The greatest value of this site is on the secure side of NCIRC that is accessible through the RISS.NET portal and LEO.

[2] Users must first register for access to this web site at www.llis.dhs.gov. After registering, the user must e-mail a request for access to the Fusion Center Technical Assistance Program channel on LLIS.

What Is Needed to Start?

From a basic perspective, certain fundamental elements need to be in place to enable access to, and use many of, these resources and systems.

- Access to the Internet through a security controlled computer(s) designated exclusively for law enforcement use (excluding undercover computers).
- The computer should have a firewall and virus and spyware protections.
- A privacy policy must be in place that is consistent with the federal privacy guidelines.[3]
- A security policy should be in place that is consistent with the Global Justice Information-Sharing Initiative security policy.[4]
- An additional fair use operating policy for the agency's law enforcement computers may be implemented describing both accepted and prohibited use of the law enforcement agency's computers.
- Supervisory accountability should be in place to monitor and supervise access to systems and resources.

Most systems that a user will access will have additional requirements, but they are simply the minimum requirements needed before gaining access to systems and resources.

Federal and National Law Enforcement Intelligence Resources

Many federal agencies have reengineered their intelligence function since 9/11 to make their intelligence products more accessible and useful to SLTLE. Intelligence products have been redesigned or new products developed, dissemination methods have been revised, greater attention has been given to providing critical information that is unclassified for wide consumption by SLTLE, and new offices and initiatives have been developed. More information is being produced and disseminated more widely than in the history of law enforcement. Among the challenges that law enforcement now faces is accessing the needed information and using it with efficacy.

Many federal intelligence resources are in a dynamic state responding to changes in threats as well as changes in policy. It is virtually impossible to provide an exhaustive discussion of them all. This discussion, therefore, will identify the federal intelligence resources that are of greatest use to SLTLE, their intelligence products, and the agencies' contact or access information. In addition, a broader discussion of the FBI than of other agencies will be provided because of the comparatively more frequent interaction on intelligence matters between SLTLE and the FBI.

While federal agencies have attempted to provide more unclassified information to America's law enforcement agencies, a significant amount of classified information remains relating to terrorism. The FBI and the DHS, therefore, have made a commitment to increase security clearances for SLTLE officers. Despite this, controversies and questions remain. Dealing with the issue of classified and sensitive information is the first place to start when discussing federal information sharing.

[3] it.ojp.gov/default.aspx?area=globalJustice&page=1151

[4] it.ojp.gov/global

Terms and Concepts Related to Classified Information

When dealing with classified information, the following terms and concepts are often used as related to SLTLE:

Tear Line or Tear Line Report: The place on an intelligence report (usually denoted by a series of dashes) at which the sanitized version of a more highly classified and/or controlled report begins. The sanitized information below the tear line should contain the substance of the information above the tear line, but without identifying the sensitive sources and methods. This will permit wider dissemination of the information below the tear line, in accordance with the right-to-know and need-to-know principles.

Write for Release (Write for the Consumer): Preparing intelligence reports and products at the unclassified level to the greatest extent possible or using tear line reporting to facilitate the dissemination of releasable information to individuals who do not have a clearance.

Markings. Classified Information and information that has been declassified have an explicit set of comprehensive rules for the proper marking of documents to ensure notice is given about classification and safeguarding. The extensive set of markings guidelines are available from the Office of the Director of National Intelligence in the document entitled *Authorized Classification and Control Markings Register* (available on the Office of the Director of National Intelligence (ODNI) web site in the "Electronic Reading Room" at www.dni.gov/electronic_reading_room.htm).

Sources and Methods: This refers to how information was obtained. "Sources" refers to from whom or where the information was collected (for example, a confidential informant) and "methods" refers to the means used to collect the information (for example, an electronic intercept).

Classified Information

A mystique often surrounds classified information, leading most people to ask, "That's it?" after seeing a collection of classified documents. While a number of explicit elements are required for information to be classified, often the distinction between classified and unclassified information with respect to the law enforcement community is that the classified information contains information about the sources and methods used in the collection of information. Extensive rules and processes are associated with all aspects of classified information. The following discussion addresses only the fundamental issues of classification that are most pertinent to enabling law enforcement intelligence personnel to understand the process.

Some of the rules governing classified information are unique to the specific mission of some federal agencies, their responsibilities, and the types of information they collect and retain. The current discussion is limited to issues and questions that typically arise about classified information specifically related to how SLTLE agencies will most typically interact with the classified information environment.

Table 12-1: Information Categories for Classified Information[5]

Information To Be Classified Must Fall within One or More of the Following Prescribed Categories:
• Military plans, weapons systems, or operations
• Foreign government information
• Intelligence activities (including special activities), intelligence sources or methods, or cryptology
• Foreign relations or foreign activities of the United States, including confidential sources
• Scientific, technological, or economic matters relating to the national security, which includes defense against transnational terrorism
• United States Government programs for safeguarding nuclear materials or facilities
• Vulnerabilities or capabilities of systems, installations, infrastructures, projects, plans, or protection services relating to the national security, which includes defense against transnational terrorism
• Weapons of mass destruction.

The federal agency responsible for managing the classified information environment is the Information Security Oversight Office[6] (ISOO) of the National Archives and Records Administration (NARA). The ISOO is responsible to the President for policy and oversight of the government-wide security classification system and the National Industrial Security Program. The ISOO receives its authority from *Executive Order 12958, Classified National Security Information*[7] and *Executive Order 12829, National Industrial Security Program*.[8]

The classified information environment is highly controlled. Certain explicit categories of information are subject to classification (see Table 12-1), while other categories of information are subject to prohibitions or limitations concerning classification (see Table 12-2). Despite these regulations, antisecrecy advocates,[9] law enforcement officials, and members of Congress,[10] among others, have expressed concerns that the federal government tends to over classify too much information. Suffice it to note for the current discussion that the debate on over-classification between federal law enforcement and SLTLE is often heated.

[5] www.archives.gov/isoo/pdf/appropriate-classification.pdf

[6] www.archives.gov/isoo

[7] www.archives.gov/isoo/policy-documents/eo-12958-amendment.html

[8] www.archives.gov/isoo/policy-documents/eo-12829.html

[9] See, for example, www.fas.org/blog/secrecy/2007/12/classification_reform_bill_int.html.

[10] For example, in the 110th Session of the United States Congress, Rep. Jane Harmon introduced H.R. 4806 "To require the Secretary of Homeland Security to develop a strategy to prevent the over-classification of homeland security and other information and to promote the sharing of unclassified homeland security and other information, and for other purposes."

Table 12-2: Information Categories Prohibited or Limited for Classification[11]

Information That Is Subject to Prohibitions or Limitations with Respect to Classification:
• Is the information classified to conceal violations of law, inefficiency, or administrative error? • Is the information classified to prevent embarrassment to a person, organization, or agency? • Is the information classified to restrain competition? • Is the information classified to prevent or delay the release of information that does not require protection in the interest of national security? • Does the information relate to basic scientific research not clearly related to national security? • If the information had been declassified, released to the public under proper authority, and then reclassified: » Was the reclassification action taken under the personal authority of the agency head or deputy agency head based on his or her determination that the reclassification was necessary in the interest of the national security? » Was that official's determination in writing? » Was the information reasonably recoverable? » Was the Director of the Information Security Oversight Office notified of the reclassification action? • If the information had not previously been disclosed to the public under proper authority but was classified or reclassified after receipt of an access request: » Does the classification meet the requirements of this order (to include the other elements of this methodology)? » Was it accomplished on a document-by-document basis with the personal participation or under the direction of the agency head, the deputy agency head, or the senior agency official? • If the classification decision addresses items of information that are individually unclassified but have been classified by compilation or aggregation: » Does the compilation reveal an additional association or relationship that meets the standards for classification under this order? » Was such a determination made by an Original Classification Authority in accordance with the other elements of this methodology? » Is the additional association or relationship not otherwise revealed in the individual items of information?

[11] www.archives.gov/isoo/policy-documents/eo-12829.html

According to Executive Order 12958,[12] information at the federal level may be classified at one of three levels:

1. "Top Secret" shall be applied to information, the unauthorized disclosure of which reasonably could be expected to cause exceptionally grave damage to the national security that the original classification authority is able to identify or describe.
2. "Secret" shall be applied to information, the unauthorized disclosure of which reasonably could be expected to cause serious damage to the national security that the original classification authority is able to identify or describe.
3. "Confidential" shall be applied to information, the unauthorized disclosure of which reasonably could be expected to cause damage to the national security that the original classification authority is able to identify or describe.

Classified information, including computers that contain classified information or are connected to a classified information system, must be located in a Sensitive Compartmented Information Facility (SCIF). A SCIF is an accredited area, room, group of rooms, or installation where Sensitive Compartmented Information (SCI) may be stored, used, discussed, and/or electronically processed. SCIF procedural and physical measures, which are explicitly stipulated in federal government regulations, prevent free access to persons unless they have been authorized with an appropriate security clearance.

Security Clearances for SLTLE Personnel

Before an individual is given access to classified information, he or she must have the appropriate clearance level. Beyond the clearance levels of Top Secret, Secret, and Confidential, "highly sensitive programs" require a clearance addendum to the Top Secret clearance, such as SCI, Special Access Programs, Q Clearances, and other similar programs. Beyond the clearance levels and special conditions that establish a person's right to know, an individual must also have the need to know the classified information. Just because a law enforcement employee has a security clearance does not mean that he or she will be given broad access to classified information.

Beyond access to classified information, security clearances are also often required for access to certain facilities. Employees working in a SCIF must have at least a Secret clearance. Similarly, certain intelligence training programs require people to have clearance before attending the training, either because of the location for the training (i.e., in a secured facility) or content of the training.

A number of federal agencies can authorize clearances. The process begins with the applicant completing a comprehensive questionnaire—Form SF-86 Questionnaire for National Security Positions[13]—wherein he or she must provide extensive information about his or her personal background. The information is used by the federal agency to conduct a comprehensive personal security investigation. Fingerprints must also be submitted and privacy waivers signed. Following the investigation, the findings are adjudicated by a separate body that determines whether to issue a clearance. The adjudication process is an administrative examination of a sufficient period of a person's life to make an

[12] www.archives.gov/isoo/policy-documents/eo-12958-amendment.html amends a previous Executive Order on classified information.

[13] Form SF-86 is available as a form which may be filled out on the computer from the General Services Administration at www.opm.gov/Forms/pdf_fill/sf86.pdf. Applicants should check with the agency from which they are seeking the clearance for special instructions; for example, the SF-86 asks for the applicant's employment history during the past 7 years, while other agencies request the employment history for the past 10 years.

affirmative determination that the individual, based on his or her past behavior and associations, is eligible for a security clearance. The process is the careful weighing of a number of variables. In particular, a person's conduct is reviewed to make a determination that he or she has high integrity and is reliable and trustworthy. When questionable conduct is identified, the adjudication will consider the following factors:

- The nature, extent, and seriousness of the conduct
- The circumstances surrounding the conduct, including knowledgeable participation
- The frequency and how recent the conduct occurred
- The individual's age and maturity at the time of the conduct
- The voluntariness of participation
- The presence or absence of rehabilitation and other pertinent behavioral changes
- The motivation for the conduct
- The potential for pressure, coercion, exploitation, or duress
- The likelihood that the conduct will continue or recur.

The factors are balanced to determine if the clearance should be granted. Once a clearance is issued, the applicant must be briefed on the regulations associated with the clearance and sign a nondisclosure agreement.[14]

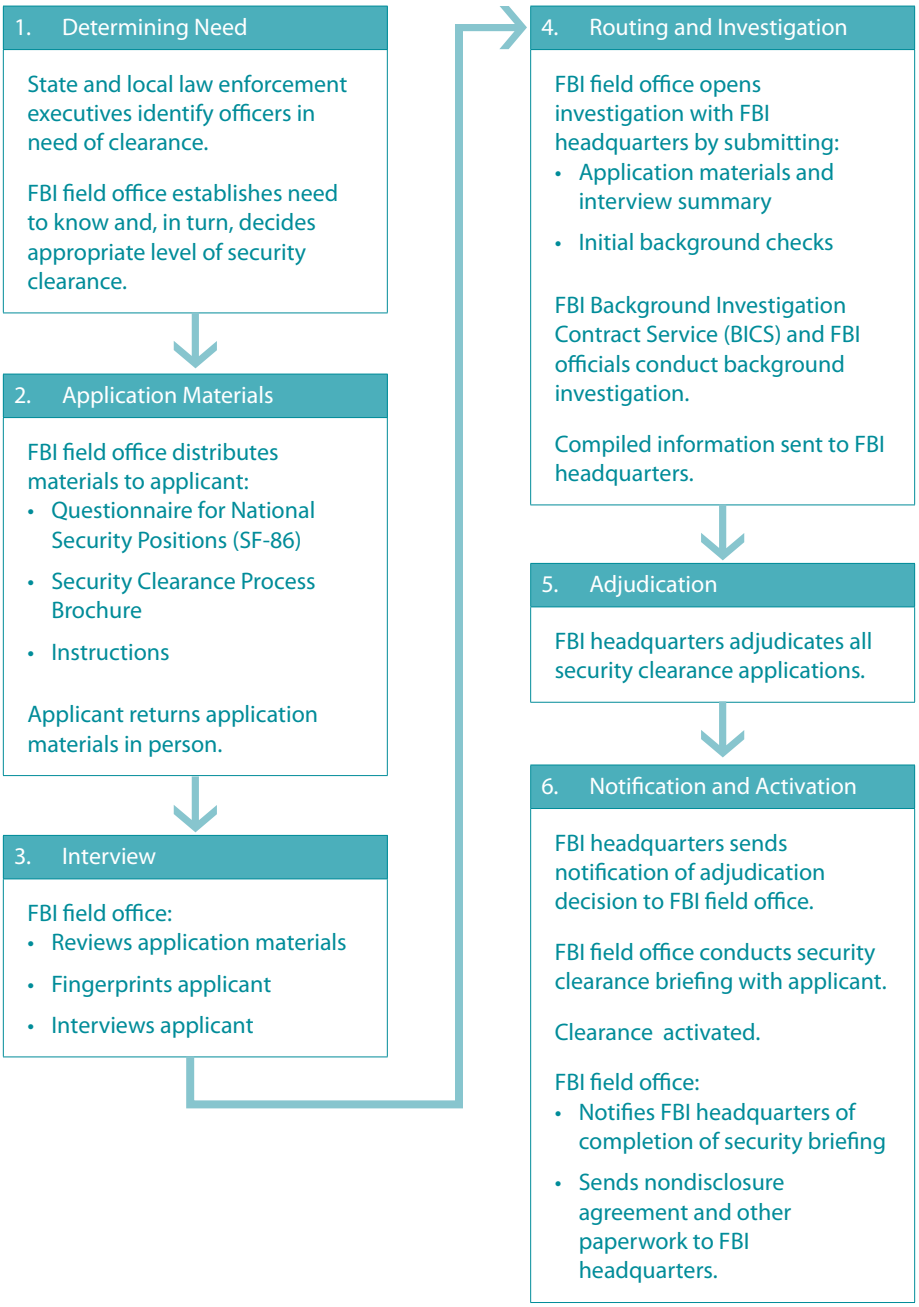
As noted previously, different agencies issue clearances, with some variability in processes. The most common clearances for SLTLE are from the FBI and the DHS. The clearance process is labor-intensive and expensive. For these reasons, as well as some operations security concerns, there must be a substantial reason for issuing a clearance to an SLTLE employee. Moreover, conducting an excess number of clearance investigations slows the process, thereby taking longer to process clearances for those persons who may be in more critical positions. Not all SLTLE requests for clearances will be honored by the federal agency.

In most cases, the FBI will begin consideration of a clearance investigation for an SLTLE officer by examining local issues on a case-by-case basis[15] (See Figure 12-1 for the steps in the FBI process.). For those who seek to apply for a security clearance, the appropriate forms and fingerprint cards can be obtained from the local FBI Field Office.

[14] The general nondisclosure agreement can be found at contacts.gsa.gov/webforms.nsf/0/03A78F16A522716785256A69004E23F6/$file/SF312.pdf.

[15] The FBI provides the following guidance: Most information needed by state or local law enforcement can be shared at an unclassified level. In those instances where it is necessary to share classified information, it can usually be accomplished at the Secret level. Local FBI Field Offices can help determine whether a security clearance is needed, and if so, what level is appropriate.

Figure 12-1: Steps in the FBI Security Clearance Process for SLTLE Personnel[16]



Sensitive but Unclassified and Controlled Unclassified Information

Dissemination refers to the types of information about threats, suspects, and indicators of criminality that a law enforcement agency or government entity wants to purposely share. Because of the sensitivity of the information, controls are put in place to protect the information and prevent inadvertent information sharing with persons who do not have the right to know and need to know.

[16] From: U.S. General Accounting Office. *Security Clearances.* GAO-04-596. Washington, D.C.: U.S. General Accounting Office, 2004, p. 8.

The management of information that is deemed sensitive but does not meet the requirements for classification is going through a significant change process at this writing. The changes are predicated on new initiatives of the Information Sharing Environment (ISE) to be compliant with provisions of the Intelligence Reform and Terrorism Prevention Act of 2004. Because a multiyear transition process is in place transitioning Sensitive But Unclassified (SBU) to Controlled Unclassified Information (CUI), this chapter discuss both.

Sensitive but Unclassified Information

It is not feasible for every law enforcement officer to have a security clearance and not all information meets the standards for classification. A mechanism exists to get critical information into the hands of officers that does not involve the classified information framework. The traditional approach has been to use markings designating the information as SBU. A wide variety of SBU labels are placed on intelligence products and other information by the originator of the information to indicate that the information should not be shared broadly and that dissemination should be limited only to those indicated by the SBU label.

There are no national standards or guidelines for SBU information; rather, each agency has developed its own policies and procedures to identify and safeguard SBU information. Generally, this unclassified information is withheld from the public for a variety of reasons, but has to be accessible to law enforcement, private security, or other persons who have a responsibility to safeguard the public. Agencies have discretion to define SBU in ways that serve their particular needs to safeguard information. Since there is no uniformity in implementing rules throughout the federal government on the use of SBU, the specific meanings of the markings are often unclear.[17] There have been even fewer efforts to define and safeguard the information at the state, local, and tribal levels. There is an intuitive understanding, but no formal process to control the information. Some guidance has been provided by the DHS, which issued a directive in 2004 on "For Official Use Only" information.

For Official Use Only Information

The For Official Use Only (FOUO) label is used within the DHS "…to identify unclassified information of a sensitive nature, not otherwise categorized by statute or regulation, the unauthorized disclosure of which could have an adverse impact on a person's privacy or welfare, the conduct of a federal program, or other programs or operations essential to the national interest."[18] FOUO is not classified information, but information that should be distributed only to persons who need to know the information to be aware of conditions that will help keep the United States and local communities secure. Within DHS, the caveat For Official Use Only will be used to identify SBU information that is not otherwise governed by statue or regulation. In sum, FOUO information may be shared with anyone who has the right to know and need to know the information in the report or product.

Law Enforcement Sensitive Information

The second most common SBU label is Law Enforcement Sensitive (LES). It is more restrictive than FOUO because it limited dissemination to anyone in the

[17] For a detailed review of the SBU meaning and how it is defined and used by different statutes and regulations, see: Knezo, Genevieve J. "*Sensitive But Unclassified" and Other Controls: Policy and Options for Scientific and Technical Information.* Washington, D.C.: Congressional Research Service, 2006.

[18] U.S. Department of Homeland Security, Management Directive System, MD Number: 11042, *Safeguarding Sensitive But Unclassified (For Official Use Only) Information.* May 11, 2004.

law enforcement community who had the right to know and need to know the information. The additional qualifier was that the recipient had to be a law enforcement employee. One of the reasons for the distinction was because some information that contained Personal Identifying Information (PII) had to stay within the law enforcement community for reasons relating to civil rights and privacy.

While these definitions reflect the intent of the FOUO and LES labels—and because there are no national standards or national policies for the explicit types of information of information that is deemed SBU, agencies at all levels of government began making their own rules and adaptations of rules as they labeled SBU information. It is increasingly common to see a document with both the FOUO and LES dissemination labels, which basically eliminates the original distinctions between the labels.

Agencies provide different interpretations to any given SBU label because there are so few uniform national SBU guidelines. There are no sanctions if SBU information is widely distributed, including to the media, and no guidelines to ensure that the information is secured. Nevertheless, and in many ways, particularly for SLTLE agencies, SBU markings reflected a professional agreement to limit the dissemination of certain types of information.

Many of the problems with SBU dissemination labels and procedures are being remedied during a transition away from SBU and into the new method of marking unclassified sensitive data: Controlled Unclassified Information (CUI).

Controlled Unclassified Information

Among the mandates of the Intelligence Reform and Terrorism Prevention Act of 2004 was the development of policies and practices that would enhance the ability of rapid information sharing among the Intelligence Community, law enforcement, the private sector, and foreign partners. One of the information-sharing obstacles, though, was the lack of consistency in policies regulating SBU/CUI. At the federal level alone, the Program Manager for the Information Sharing Environment observed the following:

> Among the twenty departments and agencies we have surveyed, there are at least 107 unique markings and more than 131 different labeling or handling processes and procedures for SBU/CUI. Even when SBU information carries the same label marking (e.g., For Official Use Only), storage and dissemination are inconsistent across Federal agencies and departments. Because such markings are agency-specific, recipients of SBU information in a different agency must understand the processes and procedures of the originating Federal agency for handling the information, even if their agency uses the same marking. The result is an unmanageable collection of policies that leave both the producers and users of SBU information unable to know how a piece of information will be controlled as it moves through the Federal government and therefore reducing information sharing.[19]

[19] McNamara, Ted. *Statement for the Record before the Subcommittee on Intelligence, Information Sharing and Terrorism Risk Assessment of the House Committee on Homeland Security*, April 26, 2007.

These problems were the basis for establishing a common framework for sharing the information under the new label of Controlled Unclassified Information (CUI). After nearly 4 years of work on developing the new framework, the President issued a memorandum to the heads of all executive departments and agencies in the United States Government to implement the CUI framework:

> The global nature of the threats facing the United States requires that (a) our Nation's entire network of defenders be able to share information more rapidly so those who must act have the information they need, and (b) the United States Government protect sensitive information, information privacy, and other legal rights of Americans. A uniform and more standardized government-wide framework for what has previously been known as SBU/CUI information is essential for the ISE to succeed. Accordingly, this memorandum establishes a standardized framework designed to facilitate and enhance the sharing of Controlled Unclassified Information.[20]

The policies set forth in the Presidential Memorandum for the designation, marking, safeguarding, and disseminating of CUI are mandatory for all CUI originated by the Executive Branch of the federal government and shared within the ISE, regardless of the medium used for its display, storage, or transmittal.

It is important to note that the Presidential Memorandum also encourages the adoption of the CUI Framework by state, local, tribal, and private-sector entities. Frequent consultations with individuals and organizations from these entities during the development of this Framework suggest that there is some support for moving in the direction of a common, or mostly common, CUI Framework. As necessary, departments and agencies may agree with foreign partners to ensure that they protect shared CUI in "a like manner," similar to what is now done for sharing classified information. Of course, this provision applies only to the federal government, not to SLTLE. Presidential Guideline 4 activities address foreign government sharing, including sharing of CUI.[21] Additionally, sharing CUI with the private sector will most likely require some change to an agency's contractual policy, which may include mandating the use of the CUI Framework.

The term Controlled Unclassified Information or CUI is a *categorical designation that refers to unclassified information that does not meet the standards for National Security Classification under Executive Order 12958, as amended, but is (i) pertinent to the national interests of the United States or to the important interests of entities outside the Federal Government, and (ii) under law or policy requires protection from unauthorized disclosure, special handling safeguards, or prescribed limits on exchange or dissemination. Henceforth, the designation CUI replaces Sensitive But Unclassified.*[22] (Emphasis in original.)

[20] www.fas.org/sgp/bush/cui.html

[21] The full text of Presidential Guideline 4 can be found at www.ise.gov/docs/guidance/guideline%204%20-%20sharing%20with%20foreign%20partners.pdf.

[22] Background on the *Controlled Unclassified Information Framework.* (Unpublished background paper.) Washington, D.C.: Executive Office of the President, May 9, 2008, pp. 4–7.

The CUI Executive Agent, based in the National Archives and Records Administration, is responsible for administering all policies and regulations associated with the CUI framework. Among the regulations established thus far are the following:

1. Information shall be designated as CUI if:
    a. A statute so requires or authorizes; or
    b. The head of the originating department or agency, through regulations, directives, or other specific guidance to the agency, determines that the information is CUI. Such determination should be based on mission requirements, business prudence, legal privilege, the protection of personal or commercial rights, or safety or security. Such department or agency directives, regulations, or guidance shall be provided to the CUI Executive Agent for his review.
2. Notwithstanding the above, information shall not be designated as CUI:
    a. To: 1. conceal violations of law, inefficiency, or administrative error; 2. prevent embarrassment to the U.S. Government, any U.S. official, organization, or agency; 3. improperly or unlawfully interfere with competition; or 4. prevent or delay the release of information that does not require such protection;
    b. If it is required by statute or Executive Order to be made available to the public; or
    c. If it has been released to the public under proper authority.[23]

CUI Markings

Marking material as CUI signals that it contains sensitive information and that safeguarding and dissemination controls apply. All CUI will carry one of three markings (See Figure 12-2 for examples).

1. *Controlled with Standard Dissemination:* Information is subject to safeguarding measures that reduce the risks of unauthorized or inadvertent disclosure. Dissemination is permitted to the extent that it is reasonably believed that it would further the execution of a lawful or official purpose.
2. *Controlled with Specified Dissemination:* Information is subject to safeguarding measures that reduce the risks of unauthorized or inadvertent disclosure. Material contains additional instructions on what dissemination is permitted.
3. *Controlled Enhanced with Specified Dissemination:* Information is subject to enhanced safeguarding measures more stringent than those normally required because inadvertent or unauthorized disclosure would create a risk of substantial harm. Material contains additional instructions on what dissemination is permitted.

Standard Dissemination
DEPARTMENT OF HOMELAND SECURITY
WASHINGTON D.C. 20220
MEMORANDUM FOR Law Enforcement
DATE: March 6, 2009
FROM: Security
SUBJECT: CUI Markings
This memorandum reflects the proper marking of a CUI document.
Text Text Text

CUI Safeguarding

The CUI background memorandum stated that the marking *Controlled* means that the information is subject to standard CUI safeguarding procedures to reduce the risks of unauthorized or inadvertent disclosure. The marking *Controlled Enhanced* means that enhanced safeguarding is required because inadvertent or unauthorized disclosure would create the risk of substantial harm.

Reasonable safeguarding measures are required for all CUI to protect it from unauthorized or inadvertent release. These measures to will manage the risks associated with the communication, processing, storage, and life cycle of CUI. Defined safeguarding standards will be published in a CUI Framework Standards Registry maintained by the CUI Executive Agents. The guiding principle for these standards is risk management.

The federal government recognizes that it may take some time for state, local, tribal, and private-sector recipients of CUI to implement these safeguarding requirements, particularly the requirements for encryption of CUI during electronic storage and transmission. Because of the importance of promptly sharing CUI, the federal government recommends a phased approach to implementation, which provides the necessary flexibility for transitioning to the new CUI Framework. During this phased approach, federal departments and agencies should be willing to share CUI with state, local, tribal, and private-sector partners that have not fully implemented the encryption aspects of the safeguarding requirements.[24] While encryption may be a challenge for some agencies, access to encrypted e-mail is available through RISS.net, LEO, and HSIN.

Finally, for law enforcement agencies to receive CUI information from a federal agency, they must have a privacy policy in place that meets the ISE *Privacy Guidelines*.[25] Fortunately, creating a privacy policy meeting these standards can be accomplished fairly easily by following the *Privacy Policy Development Guide* that was prepared by the Global Privacy and Information Quality Working Group of the Global Justice Information Sharing Initiative.[26]

Once fully implemented, the framework is intended to end confusion about proper access, handling, and control of unclassified information that needs protection. Moreover, the new system will instill confidence that identical rules apply to everyone using the CUI markings and will provide clear guidance to SLTLE partners who are confused by SBU markings.[27]

Summary

At the time of this writing, the transition from SBU to CUI was just beginning[28] and many legacy markings, for example, LES and FOUO, will continue to be used until new policies are put in place. SLTLE agencies should strongly consider adopting the CUI framework for their own products to aid in simplifying the sharing of sensitive information. Agencies should also monitor the CUI office of the National Archives and Records Administration[29] for changes and developments.

SLTLE agencies will encounter these labels when receiving federal intelligence products and it will be useful to know the framework from which they arise. At a practical level, the rule is for law enforcement officers to use good judgment

[28] The Office of the CUI Executive Agent in the National Archives and Records Administration is located on the Internet at www.archives.gov/cui.

[29] At the time of this writing, a specific web site for the CUI Executive Agent had not been established. Information can be obtained by going to www.archives.gov and using the site's search utility for CUI.

when handling such materials. This does not mean that SLTLE officers may not disseminate this information further unless prohibited from doing so as indicated on the report; rather, the officer should use the information in a manner that meets community safety needs, including disseminating portions of the information to those segments of the community that would benefit from the data contained in the report.

Federal and National Intelligence Resources and Products

A wide range of information systems is available to law enforcement agencies to aid their intelligence function. Some systems are specifically for intelligence purposes while other systems have a much broader customer base but have applications for intelligence. Some systems are classified, allowing limited access to SLTLE, while other systems are designed specifically for wide use by law enforcement officers. Information systems were designed for diverse purposes; therefore, a brief understanding of these purposes can provide insight into their use and applicability.

Some of the resources described in the following discussion are information systems; others are offices or programs that use or provide services through different information systems. Some resources are federal, meaning that they are provided as part of the mission of a federal agency, and still other resources are national, which means they provide services and resources on a nationwide basis although the organization is not a federal agency and in most cases it receives federal funding to provide its service. Because of rapid growth of many of these resources, poor communication, and different perspectives of what is needed, the reader will find there is some duplication of effort.

As a place to begin, resources and systems may be described in six broad categories. Information actually found in some of the categories will overlap a resource in another category. This typology will help provide a perspective of the different types of resources and systems that are available for SLTLE.[30]

1. *Situational Awareness.* Documents and technologies that provide information on threats, incidents, indicators, and other short-term or real-time information needed for planning or operational responses.
2. *Public Records.* Depending on statutes and policies, various types of information collected or recorded by diverse public agencies may be available. Land transactions, driving records, registered sexual offenders, addresses, telephone numbers, and all types of licenses are illustrations.
3. *Criminal Justice.* Whenever anyone has an encounter with the criminal justice system it is going to be in a record. Computer-aided dispatch calls, arrest records, field interview reports, court records, probation and parole records, and institutional corrections records are examples.
4. *Intelligence.* Any records system or network that is explicitly designated to handle intelligence, such as RISS.net, LEO, and the Homeland Security Data Network. (While many of the networks are not exclusively for intelligence, all contain intelligence products.)

[30] Based on: Shaw, Larry. (Inspector, Florida Department of Law Enforcement Information Systems and Technologies. *Presentation at the Bureau of Justice Assistance-Funded Intelligence Commanders' Course,* Norwalk, California, July 2008.

5. *Resource and Communications Systems.* A number of systems have emerged post-9/11 that are explicitly designed to provide diverse types of intelligence resources and/or provide secure e-mail communications for SLTLE. Examples are the NCIRC, the Automated Trusted Information Exchange, and the Federal Protective Service (FPS) information portal.
6. *Open Sources.* The previous chapter addressed open source information as publicly available information that anyone can lawfully obtain by request, purchase, or observation.

Although many information systems can provide support to the law enforcement intelligence function, it is not feasible to include all of them here. This is particularly true when one considers state and local systems that are in use. Rather, the goal is to provide a snapshot of the systems that SLTLE officers across the United States are most likely to encounter, as well as a brief listing of other federal intelligence information systems that they may encounter occasionally. This discussion will help readers acquire an awareness of the different systems available on a national basis so that law enforcement agencies may develop the access they need to best fulfill their intelligence function.

In most cases, the information from the resources and systems in the following discussions will not be classified, but will be SBU/CUI. In all cases, the sensitivity of the information and appropriate safeguarding of the information will be clearly marked.

Department of Justice— Law Enforcement Information Sharing Program[31]

The L*aw Enforcement Information Sharing Program* (LEISP) is not an information system. It is a program that addresses barriers to information sharing and creates a forum for collaboration on how existing and planned systems will be coordinated and unified for information-sharing purposes. LEISP delineates guiding principles, a policy framework, and functional requirements that are necessary to facilitate multijurisdictional law enforcement information sharing. LEISP establishes the DOJ's commitment to move from a culture of need to know toward a culture of need to share in which information is shared as a matter of standard operating procedure. Through the strategy, the DOJ also commits to participate as a partner to help bring together the law enforcement community in the common cause of achieving multijurisdictional information sharing.

LEISP sets in motion three implementation tracks: Track I is the DOJ's internal reform initiative, OneDOJ, which will closely coordinate information-sharing efforts within the Department, facilitate sharing of DOJ-held information with law enforcement agencies outside the Department, provide connectivity for sharing of information with the DHS, and allow the DOJ to present a single face to its information-sharing partners. Track II will first incorporate quick hits to leverage existing sharing-technology capabilities and then center on building out the services and technology platforms that will enable the Department to share its information seamlessly. In Track III, the Department will work cooperatively

[31] The information in this section is based largely on: *LEISP: United States Department of Justice Law Enforcement Information Sharing Program.* Washington, D.C.: October 2005. Unpublished report available at www.usdoj.gov/jmd/ocio/onedoj_strategy.pdf.

with its federal, state, local, and tribal law enforcement partners to enhance interconnectivity that allows standard, routine information sharing across all jurisdictions on a national basis.

Currently, the LEISP has five major initiatives:

1. OneDOJ System (formerly the Regional Data Exchange – R-DEx).
2. Law Enforcement National Data Exchange (N-DEx).
3. Joint Automated Booking System (JABS).
4. National Virtual Pointer System (NVPS).
5. Federated Identity Management (FIDM) Pilot Program.

The LEISP plans to implement policies, practices, and technologies to ensure that each component of the DOJ shares information as a matter of routine across the entire spectrum of the law enforcement community at all levels of government. The intent of the program is to ensure that law enforcement information-sharing practices in the DOJ are consistent with the national standards and ensure the protection of privacy and civil rights in all systems that contain PII. Moreover, the program should significantly enhance the amount and quality of intelligence that is shared with SLTLE agencies.

One DOJ (formerly the Regional Data Exchange: R-DEx)

The R-DEx system was developed to ensure that DOJ criminal law enforcement information was available for users at all levels of government so that they can more effectively investigate, disrupt, and deter criminal activity, including terrorism, and protect the national security. R-DEx furthered this purpose by consolidating certain law enforcement information from other DOJ systems, as well as certain state and local law enforcement information, so that it may more readily be available for sharing with other law enforcement entities.[32]

Information in R-DEx includes information about individuals who were referred by the Federal Bureau of Prisons (BOP), the United States Marshals Service (USMS), the Bureau of Alcohol, Tobacco, Firearms and Explosives (ATF), the Drug Enforcement Administration (DEA), the Federal Bureau of Investigation (FBI), as well as individuals referred by certain state and local law enforcement agencies that participate in the R-DEx system. All SLTLE agencies participating in R-DEx had to sign a memorandum of understanding (MOU) with the Department of Justice.

Relying on the basic concepts of R-DEx, including its database, the system has evolved into OneDOJ as the current operational information-sharing system for DOJ. It is hosted at the FBI's Criminal Justice Information Services (CJIS) data center and used to achieve the goals of OneDOJ. The OneDOJ system enables DOJ to meet its internal requirements for effective information sharing across its law enforcement agencies; only DOJ users have direct access to the OneDOJ system. External sharing is accomplished through bilateral partnerships with designated regional, state, or federal sharing initiatives. These partnerships allow non-DOJ users to access OneDOJ data from within their own systems and vice-versa.[33]

[32] *Federal Register,* Volume 72, Number 20, January 31, 2007, pp. 4532–4533, edocket.access.gpo.gov/2007/E7-1567.htm.

[33] www.usdoj.gov/jmd/ocio/leisp/initiatives.htm

The system has two primary operational objectives:

1. To serve as DOJ's system for sharing criminal law enforcement information internally across investigative components.
2. To provide regional criminal law enforcement connectivity for authorized users to conduct federated searches of OneDOJ information. This connectivity will also provide authorized DOJ users with the means to query partner law enforcement information as governed by the respective MOU.

OneDOJ is a DOJ repository for law enforcement information shared with other federal, state, local, and tribal law enforcement agencies through connections with regional information-sharing systems. All DOJ law enforcement components— ATF, BOP, DEA, FBI, and USMS—are sharing information under consistent policy and technical standards. Information shared includes open and closed case documents, investigative reports, witness interviews, criminal event data, criminal history and incarceration information, and identifying information about individual offenders.

Information sharing through OneDOJ with law enforcement outside of DOJ is achieved by interconnecting with regional systems to access DOJ information relevant to their users. As one example, the LInX-NW and ARJIS systems are connected with OneDOJ. This allows, for instance, LInX users in Washington state to access shared DEA case files of the Seattle field office from the LInX user interface. Additionally, the bidirectional nature of the connection allows DOJ users to access state and local information in the regional systems from the OneDOJ user interface.

Interconnection with OneDOJ is accomplished through an open, XML-based, NIEM-compliant standard developed by the DOJ LEISP and its partners. The standard, called LEXS-SR (LEISP Exchange Specification–Search and Retrieval), defines the interface between OneDOJ and regional sharing systems.[34]

Law Enforcement National Data Exchange

The Law Enforcement National Data Exchange (N-DEx) system provides SLTLE agencies with a system for collecting, processing, and disseminating criminal and investigative data for use as a pointer system for nationwide information sharing. Data fields within N-DEx include methods of criminal operation, arrestee/indicator information, victim information, suspect information, and other ongoing criminal and investigative information. The system has adopted the National Information Exchange Model to maximize compatibility for information-sharing. At the heart of success for N-DEx is participation by SLTLE agencies in providing data for the system. Federal agencies may also contribute investigative event data.

> All information shared through N-DEx originates from data supplied by data sources from numerous local, state, tribal, and federal systems such as incident reports, arrest reports, case files, booking reports, incarceration records, and criminal histories. These records contain information about entities (people, locations, and items such as weapons and vehicles) and may specify relationships among the entities they contain (e.g., a person lives at a certain address or owns a certain vehicle).[35]

[34] www.usdoj.gov/jmd/ocio/leisp/onedoj.htm

[35] www.fbi.gov/hq/cjisd/ndex/ndex_concept.htm

N-DEx information services correlate data received from data suppliers and apply an analytic process that will proactively notify specific users if certain relationships are discovered. N-DEx data processes will analyze and categorize all information that is entered into the system to address the who, what, when, where, why, and how of law enforcement information nationwide."[36] It will also provide users with a single point of discovery to connect the dots through the N-DEx analytic capabilities. The system's processes will constantly correlate data, even similar data from diverse sources, to provide an ongoing linkage among all known suspects, events, and indicators. When a user conducts a search for a name, for example, the system will automatically link and make available to the user correlations between people, places, and things that he or she did not know.

System development will interconnect the information technology resources housed within the Criminal Justice Information Services (CJIS) Division of the FBI, including the National Crime Information Center (NCIC), Integrated Automated Fingerprint Identification System (IAFIS), and the National Instant Criminal Background Check System's Denial Decision Extract File. It will also define, develop, and connect Federal Crime Reporting data into the N-DEx matrix of information. The system will provide a search capability that will provide law enforcement with a method for querying these repositories in order to link and

Requirements for N-DEx Participation

Who can participate?
- Any law enforcement agency can participate.

What are the requirements?
- Agencies must adhere to national standards for efficient sharing of data.
  - » National Information Exchange Model (NIEM)
  - » Law Enforcement Information Sharing Program (LEISP) Exchange Specification (LEXS)

When can I start?
- Contact the N-DEx program office to develop a strategy for participation. Telephone: 202.324.7126, Fax: 202.324.0920.

How do I start?
- Agencies will:
  - » Sign an operational MOU.
  - » Identify and map incident/case data to the N-DEx Information Exchange Package Documentation (IEPD).
  - » Obtain network connectivity through an existing CJIS wide area network (WAN) or connect over the Law Enforcement Online (LEO.

Why are participation requirements important?
- To provide criminal justice agencies with data standards and suggestions for participation in the N-DEx Program.

Where do I begin?
- The N-DEx IEPD can be downloaded at it.ojp.gov/iepd.

[36] Ibid.

solve crimes as well as the ability to develop crime trend analysis and predictive crime modeling. Connection to the N-DEx System will be accomplished through one of two methods: CJIS WAN or the Law Enforcement Online/Regional Information Sharing System (LEO/RISS).

Joint Automated Booking System

The Joint Automated Booking System (JABS) is an information-sharing initiative for strengthening law enforcement and homeland security activities. The initiative automates the federal booking process and provides a mechanism for rapidly and positively identifying an individual using a fingerprint submission to the FBI's IAFIS. The JABS program is not restricted to DOJ users, but includes other user groups from within the DOJ, DHS, Department of Defense, and the Department of Health and Human Services. JABS added an interagency booking service to provide automated submission of booking packages for federal law enforcement agencies that routinely bring their suspects in for booking. This initiative expanded JABS services to agencies in 11 federal departments outside of DOJ (DHS, Agriculture, Education, Interior, Labor, State, Transportation, Treasury, Veterans Affairs, Housing and Urban Development, and the General Services Administration), as well as the U.S. Postal Service. These agencies can now utilize JABS without having to actually deploy an automated booking station in their offices.[37]

National Virtual Pointer System[36]

For many years, state and local law enforcement envisioned a drug pointer system that would allow them to determine if other law enforcement organizations were investigating the same drug suspect. The DEA was designated by the Office of National Drug Control Policy in 1992 to take the lead in developing a national drug pointer system to assist federal, state, and local law enforcement agencies investigating drug trafficking organizations and to enhance officer safety by preventing duplicate investigations. The DEA drew from the experience of state and local agencies to make certain that their concerns were addressed and that they had extensive input and involvement in the development of the system.

The National Drug Pointer Index (NDPIX) became operational across the United States in October 1997. The National Law Enforcement Telecommunications System (NLETS)—a familiar, fast, and effective network that reaches into almost every police entity in the United States—is the backbone of the NDPIX. Participating agencies are required to submit active case-targeting information to NDPIX to receive pointer information from the NDPIX. The greater the number of data elements entered, the greater the likelihood of identifying possible matches. Designed to be a true pointer system, the NDPIX merely serves as a switchboard that provides a vehicle for timely notification of common investigative targets. The actual case information is shared only when telephonic contact is made between the officers or agents who have been linked by their entries into the NDPIX.

[37] www.usdoj.gov/jmd/ocio/leisp/initiatives.htm

[38] See www.dea.gov/programs/ndpix.htm.

NDPIX was developed for five reasons: 1. To promote information sharing; 2. To facilitate drug-related investigations; 3. To prevent duplicate investigations; 4. To increase coordination among federal, state, and local law enforcement agencies; and 5. To enhance the personal safety of law enforcement officers.

NDPIX has been transitioned and upgraded to the National Virtual Pointer System (NVPS). A steering committee—which included DEA, HIDTA, RISS, the National Drug Intelligence Center (NDIC), the National Institute of Justice, ,the National Sheriffs' Association, the International Association of Chiefs of Police (IACP), and the National Alliance of State Drug Enforcement Agencies—developed the specifications for the system and is overseeing its testing and transition.

Characteristics of the NVPS will include the following:

- Covers all crimes, not just drugs.
- Accepts only targets of open investigations with assigned case numbers.
- Transaction format contains an identifying field for the NVPS Identifier.
- Uses a secure telecommunications network.
- Uses the NDPIX "Mandatory" data elements.
- Single sign-on from any participant allows access to all participating pointer databases.
- Each system provides a user ID and password to its respective users.
- Each system maintains its own data.
- Uniform Crime Reporting or the National Incident-Based Reporting System codes are used to identify type of crime.
- Targets deconfliction for all crimes.
- Will rely on web-based communications.
- Has links with HIDTA and RISS.

This upgrade of the system to the NVPS represents an important development for a comprehensive national pointer system.

Federated Identity Management Pilot

The Federated Identity Management (FIDM) pilot, sometimes known as a single sign-on, now in its second year, is an SBU/CUI initiative funded by the Program Manager's Office of the Information Sharing Environment. The objective is to provide and test an agreed-on standard for authenticating users and remove impediments they may experience while accessing mission-critical data. Benefits include a simpler, more reliable authentication process, thereby providing users with quicker access to data. The U.S. Department of Justice is validating this concept and supporting technologies as they relate to the law enforcement environment and testing specific architecture of the federation believed to be the most appropriate for the LEISP mission.[39]

SLTLE agencies, notably through the Criminal Intelligence Coordinating Council, have been urging adoption of this model. Not only does having an array of different user names and passwords slow the process of seeking information from

[39] www.usdoj.gov/jmd/ocio/leisp/initiatives.htm

different systems, but also users are more likely to use only one or two systems, rather than all that are available because of the cumbersome multiple logons. If users are not fully accessing all available systems, valuable information related to an intelligence inquiry or criminal investigation may not be discovered. While the technology and architecture are in place with the FIDM project, the biggest challenge that remains is related to policy; that is, governing boards of the different systems appear to be reluctant to embrace FIDM as a means of accessing their systems.

Federal Bureau of Investigation Intelligence Initiatives[40]

The Federal Bureau of Investigation (FBI) has stated that to meet its security mission it must gather information and share intelligence with both the domestic law enforcement community and the Intelligence Community concerning all threats, whether from gangs, organized crime, or al Qaeda. As a means to enhance the effectiveness of this responsibility, the FBI developed the Strategic Execution Team (SET).

Through the SET, the FBI is establishing new baseline capabilities for its intelligence process to improve overall performance. The new field intelligence structures and processes have at their foundation the recognition that working seamlessly with SLTLE is essential to protecting America. Law enforcement partners are key customers for FBI intelligence products and the goal is to ensure that those products respond to customer needs.

Integrating Intelligence into the Criminal Programs

After the attacks of September 11, 2001, the FBI shifted resources away from its criminal programs to focus on counterterrorism. During the past few years, as the FBI's counterterrorism capabilities improved and the Bureau grew in size, some resources have been restored to the criminal programs to deal with ongoing threats posed by these groups. During the change process, the FBI recognized the need to develop a capacity to be more predictive and preventive for all crimes within its jurisdiction; that is, in addition to investigating crimes after the fact for prosecution, the Bureau must collect and act on intelligence to detect, disrupt, and dismantle criminal enterprises that pose the greatest threat to society.

While a great deal of progress has been made since 9/11 in developing the FBI's intelligence capabilities, these efforts have focused largely on the national security programs. For many agents working criminal matters, intelligence has been perceived as something done by the other side of the house. A key goal of SET is to change this dynamic to fully integrate intelligence into the criminal programs, to strengthen those programs by making them more intelligence-driven, and ultimately to be one coordinated FBI with a single unified process for intelligence that cuts across all programs.

Impact on Law Enforcement Partners:

- The FBI will provide a more intelligence-driven national and regional approach to criminal investigations.
- There will be an increase in FBI intelligence reports about criminal matters.

[40] The information in this section is based on an internal FBI Report entitled *Implementation of New Field Intelligence Operations: Executive Summary.* April 30, 2008.

Standardize Field Office Structure and Responsibilities

All field offices will be required to have a centralized strategic coordinating component in its Field Intelligence Group (FIG) that will: 1. Help the office fully understand the key threats in their domains and what resources the FBI has to bring to bear on each threat; 2. Ensure that the FBI fully capitalizes on collection capabilities to meet intelligence requirements; and 3. Develop a collection plan to address any gaps.

All field offices will also have a dedicated chief reports officer who will ensure that the office disseminates timely, relevant, and high-quality intelligence to outside partners.

Impact on Law Enforcement Partners:

- There will be uniform structures, positions, and processes across all FBI field offices, making it easier to work with the FBI.

Develop a Domain Management Process

A dedicated Domain Management team on the FIG will pull together information from inside and outside the field office to develop a thorough understanding of the office's territory and the threats and vulnerabilities within. The team will produce the Domain Assessment, a product that takes the synthesized data, adds perspective and context, and recommends specific courses of action. It will answer the fundamental question, "What can we do about it?" The team will also produce a Common Operational Picture, a map representation of the territory, combining open source data on the territory's infrastructure and demographics, and field office data on case subjects, sources, and vulnerabilities.

After creating the initial baseline Domain Assessment and the Common Operational Picture (COP), the team will continuously improve them by identifying what is not known but should be known, i.e., intelligence gaps, and taking action to address them. Domain Management will help FBI managers guide the office's activities and also inform national domain management efforts. It will improve the Bureau's ability to proactively identify threats, manage current investigative activities strategically, and identify new opportunities for information collection and for prosecution.

Impact on Law Enforcement Partners:

- As the FBI develops local, regional, and national pictures of particular threats, particularly criminal threats, the Bureau has committed to share these assessments with law enforcement partners.
- As the domain awareness is developed and continuously improved, the FBI will have better strategic intelligence to share with SLTLE about criminal and national security threats that require attention. If there is the presence of a particular gang or domestic terrorist group, for example, it would benefit local law enforcement to know what trends the FBI is seeing with those groups across the country. It would help local law enforcement know how they are financed, how they recruit, and what their leadership structure looks like. The FBI will develop and share with SLTLE such crime-related assessments.

Develop a Collection Management Process

Collection Management is a formal business process through which the field office's identified intelligence gaps and needs are prioritized into requirements that feed into a comprehensive plan. Elements of that plan are assigned to various squads (and ultimately sources) for resolution. The results are monitored and retasked, as required. Through Collection Management, the FIG will help the field office manage competing demands for intelligence collection, including the need to collect information to further case investigations, to follow threat leads, to conduct liaison and build partnerships, to help meet intelligence requirements from the law enforcement and Intelligence Communities, to complete the COP, to improve the FBI's understanding of a particular issue, and to support regional and national efforts. These requirements will be consolidated and prioritized through a careful balancing of factors, including an analysis of each case, to determine the level of threat represented, national and regional priorities, vulnerabilities and knowledge gaps in the territory and prioritized requirements, and specific requests from SLTLE.

Impact on Law Enforcement Partners:

- Local law enforcement will have a standardized, routine process for submitting, prioritizing, and resolving intelligence requirements.

Enhance Collection

The vast majority of the FBI's intelligence collection occurs in its operational squads. To fully leverage the Bureau's existing source base, the SET plan includes training and information technology tools to increase agents' awareness of priority requirements. Where staffing levels permit, operational squads will be assigned embedded intelligence analysts who will ensure that information collected during the squad's normal course of duties is analyzed and appropriately forwarded to the FIG for dissemination, domain awareness, and/or gap identification.

To further strengthen FBI collection capabilities, all field offices must also have a dedicated team of intelligence special agents assigned to the FIG. These agents will use the full range of appropriate human intelligence (HUMINT) tradecraft and operational skills to develop, recruit, and exploit sources, and leverage relationships with external partners in order to collect information about the most critical gaps. The intelligence special agents will not work on cases for prosecution, but will provide cross-program support, collecting information about counterterrorism, counterintelligence, cyber, and criminal program requirements.

Impact on Law Enforcement Partners:

- Improved information flow between operational squads and the FIG will result in dissemination of more raw intelligence from those squads. The greatest change will be in the criminal programs that historically have not focused on requirements-based intelligence collection.

Enhance Liaison

Recognizing that SLTLE agencies are key eyes and ears in the community, the FBI aslo recognizes that enhanced liaison is a vital component establishing a proactive posture against threats to the U.S. Under the SET plan, the FIG HUMINT squad will

serve as the coordinating hub of all field office liaison activities. It will not absorb relationships established in other squads or programs, but these relationships will be centrally coordinated to ensure common messaging and deconfliction of multiple requests for information from the same entity. Some agents assigned to the FIG will serve in an official liaison role and will coordinate with (and in some cases embed themselves with) federal, state, and local law enforcement agencies. They will work to better understand the intelligence needs of SLTLE, leverage non-FBI sources capable of collecting critical information, and make it easier for SLTLE to leverage FBI resources across the entire FBI and the U.S. Intelligence Community.

Impact on Law Enforcement Partners:

- The standardized liaison program will facilitate the two-way flow of intelligence, allowing the FBI and SLTLE to better leverage each other's domain knowledge, liaison contacts, and sources. Local law enforcement will have a single point of contact that will enable each agency to more easily tap into the FBI knowledge base of criminal and terrorist threats.
- Collectively, the FBI will be better positioned to use mechanisms—without duplication or conflict—that provide early warning on the most critical threats.
- The FBI will continue a high level of participation in fusion centers. The intelligence that is gathered will be shared through these fusion centers, as appropriate.

Improve Production and Dissemination

Field offices will improve the quality of their intelligence products through formal training, including basic and advanced training for reports officers. The chief reports officer will provide the necessary technical expertise and oversight to address content and other measures of quality such as technical tradecraft, standardization, and substantive accuracy.

The timeliness of FBI intelligence products will be improved by streamlining the production and approval process, removing duplicative steps and approvals, and enabling direct dissemination from field offices, where appropriate.

To ensure that intelligence products are relevant to FBI customers' needs, Intelligence Information Reports (IIR) will be tied to specific intelligence requirements from the beginning of the production process. Strong mechanisms for receiving feedback will be implemented. New metrics will also assess each field office's throughput, the ratio of IIRs actually disseminated to the Intelligence Community to the total number of IIRs submitted to FBI headquarters.

Impact on Law Enforcement Partners:

- SLTLE will see improvements in the quality of FBI intelligence products. FBI products from across the field will have a uniform look and feel.
- SLTLE will receive raw intelligence reports more quickly.
- More intelligence will be directly responsive to SLTLE requirements.
- SLTLE will see more intelligence reporting originating from criminal squads.

Terrorist Screening Center[41]

The Terrorist Screen Center (TSC) was created to ensure that government investigators, screeners, agents, and state and local law enforcement officers have ready access to the information and expertise they need to respond quickly when a suspected terrorist is screened or stopped. The TSC consolidates access to terrorist watch lists from multiple agencies and provides 24/7 operational support for thousands of federal screeners and state and local law enforcement officers across the country and around the world. The intent of the TSC is to ensure that federal, state, and local officials are working off the same unified, comprehensive set of antiterrorist information.

Since its implementation on December 1, 2003, the TSC has provided the following:

- A single coordination point for terrorist screening data
- A consolidated 24/7 call center for encounter identification assistance
- A coordinated law enforcement response to federal, state, and local law enforcement
- A formal process for tracking encounters and ensuring that feedback is supplied to the appropriate entities.

The TSC created the terrorist screening database (TSDB), a single, comprehensive source of known or appropriately suspected international and domestic terrorists. These data are available to local, state, and federal law enforcement officers through the NCIC. When a police officer queries the NCIC, he or she may receive a notification that the query resulted in the potential match of a record within the TSDB and directs the officer to contact the TSC to determine if it is an actual match. If it is, the TSC transfers the call to the FBI's CT Watch to provide operational guidance to the officer.

Consolidated Terrorist Screening Database

The TSC receives international and domestic terrorist identity records and maintains them in its consolidated TSDB. The TSC reviews each record to determine which are eligible for entry into the NCIC's Violent Gang and Terrorist Organization File (VGTOF) and once the record is entered into the NCIC, it is accessible by state, local, and federal law enforcement officers. If a query by a law enforcement officer matches a name in the NCIC, the officer will be requested, through the NCIC printout, to contact the TSC. The printout also provides the officer with instructions for arresting, detaining, questioning, or releasing the subject. If the TSC determines that the person encountered by the officer is a match with a person in the NCIC/VGTOF file, the officer is immediately connected to the FBI's CT Watch for operational guidance. Depending on the situation, the CT Watch may dispatch a local Joint Terrorism Task Force (JTTF) agent to assist the law enforcement officer. Information that the officer obtained through the encounter is then sent back to the originating agency.

An example will illustrate the TSC's processes. On August 20, 2004, as two off-duty police officers were traveling across the Chesapeake Bay Bridge between

[41] Information for this section was gained from interviews and reviews of various courses, including testimony and press releases at www.fbi.gov/congress/congress04/bucella012604.htm, www.fbi.gov/pressrel/pressrel03/tscfactsheet091603.htm, and www.cia.gov/news-information/speeches-testimony/2003/wiley-speech-62262003.html.

southeastern Virginia and the Delmarva Peninsula, they observed individuals filming the structure of the bridge. The officers reported the suspicious activity to the Maryland Transportation Authority (MTA) who conducted a traffic stop of the vehicle. The MTA officers ran an NCIC check on one of the occupants of the car and learned that the individual may have a record within the TSDB. At the NCIC's request, the officers contacted the TSC and learned that the individual was the subject of the TSDB record. The TSC transferred the call to the FBI's CT Watch who informed the MTA that the individual was an alleged co-conspirator in a significant terrorism case. The FBI arrested the subject on a material witness warrant, and a search warrant executed at the subject's residence turned up valuable evidence. This new level of information-sharing and cooperation among state, local, and federal law enforcement agencies enhances our ability to prevent a terrorist attack within the United States.

Law Enforcement Online[42]

Law Enforcement Online (LEO) is an online service operated by the FBI for law enforcement, first responders, and criminal justice officials. Law enforcement personnel interested in signing up for LEO simply have to fill out a LEO application and submit it to their local FBI office for approval. The LEO site contains the following resources"

- *Topical Focus Area.* Custom web-type pages that provide a secure community area for general information related to the law enforcement profession using text, graphics, audio, and video.
- *Law Enforcement Special-Interest Groups.* Segmented areas with multilevel controlled access for specialized law enforcement groups that have their own members.
- *E-mail.* Provides the capability to send and receive secure e-mail/messages electronically between LEO users and RISS users.
- *Chat*. The ability to have a real-time discussion among users (through a keyboard) on three levels; one-to-one, groups, and the Electronic Academy for presentations or question-and-answer sessions.
- *Feedback*. The capability to survey users for input on various topics.
- *Electronic Calendar.* Provides national, state, and special-interest calendars for posting upcoming dates of interest for conferences, meetings, training courses, seminars, and other important dates.
- *Topical Electronic Library.* An easily accessed repository of a broad range of publications, documents, studies, research, technical bulletins, and reports of interest to the law enforcement community. The library will provide indexed and full-text retrieval capability. Material for this component is expected to come from the entire law enforcement and education communities.
- *Distance Learning.* Online topical learning modules that can be used any time of the day or night at the user's own pace with instructional feedback

In addition, *FBI Intelligence Assessments, FBI Intelligence Bulletins, and FBI Intelligence Information Reports* are available on the LEO web site, as well as other items of interest related to the FBI intelligence program. To obtain access to LEO, contact the training coordinator at the local FBI field office.[43]

[42] The LEO web page is www.fbi.gov/hq/cjisd/leo.htm.

[43] www.fbi.gov/contact/fo/fo.htm

Guardian and eGuardian

The FBI's Guardian system is a federal classified system restricted for FBI use. The system records suspicious activity that is pre-investigation, pre-case, nonintelligence data with a nexus to terrorism.[44] Because Executive Order 13388 requires federal sharing of terrorist threat information with local law enforcement, the FBI is making portions of the Guardian database visible to law enforcement through LEO. The initiative to allow local law enforcement to have access to the system is called eGuardian. Eventually, the eGuardian project will also include a way for state and local agencies to report suspicious activity in addition to reviewing information gathered by FBI agents.

eGuardian utilizes the existing system and its capabilities by filtering classified information. It facilitates the sharing of critical unclassified data stored within the system and enhances interagency threat assessment and coordination, thereby enabling federal, state, local, and tribal law enforcement to obtain, share, integrate, and use the unclassified threat and incident data from Guardian. It also provides incident capture, searching, reporting, and trend analysis capabilities for these agencies.

eGuardian has a robust incident management system, allowing users to create, update, and search incidents. Any number of people, places, vehicles, weapons, or other pieces of information can be added to an incident. Additionally, the system allows users to attach any kind of file to an incident, including documents, images, videos, and audio clips. In addition to incident management, eGuardian offers other capabilities for data analysis, data optimization, and data segmentation as well as a search capacity similar to that of Internet search engines.

Department of Homeland Security Intelligence and Analysis Directorate

The mission of DHS Office of Intelligence and Analysis (I&A) is to provide homeland security intelligence to the Secretary, the operating components, and headquarters offices as well as to our state, local, tribal, and private-sector partners. I&A, a member of the Intelligence Community, ensures that any information related to protecting the homeland is collected, processed, analyzed, and disseminated to the full spectrum of domestic customers. It provides threat warning, estimative, and alternative analysis. In addition, it also provides intelligence support to infrastructure protection and vulnerability studies. I&A works closely with DHS component intelligence organizations (such as Immigration and Customs Enforcement, Customs and Border Protection [CBP], and others) to ensure that nontraditional streams of domestic information are fused with traditional sources of information from other members of the Intelligence Community to give a complete picture of potential threats to the nation.[45]

DHS has a lead role in providing threat information, situational awareness, and context about nuclear threats to SLTLE as well as private-sector partners. Given the technical nature of nuclear devices and the broad customer base, DHS is providing baseline information on how a field officer might identify components of a nuclear device, differentiate radiological from nuclear devices, training on the

[44] Coleman, Gerry, "Next Generation: CJIS?", *Time System Newsletter* (Wisconsin Department of Justice Crime Information Bureau) 2006-1 (March 2006): p. 1.

[45] Allen, Charles E. *Testimony of the Under Secretary for Intelligence and Analysis before the Senate Committee on Homeland Security and Governmental Affairs: Assessing the Nuclear Attack Threat,* April 2, 2008.

potential effects of a nuclear device, and ensuring that our partners understand the range of effects from a nuclear device. DHS provides this information through unclassified and classified products, as well as secure video teleconferences and in-person threat briefings at state and local fusion centers.

Part of the DHS effort to enhance information-sharing with SLTLE agencies was creation of the Fusion Process Technical Assistance Program Resource Center as a joint initiative between I&A and the DHS Preparedness Directorate. In addition, the program works closely with intelligence and counterterrorism initiatives of the U.S. Bureau of Justice Assistance. The online program serves as a directory of all fusion centers as well as a resource for intelligence-related documents ranging from model policies to lessons learned. It is a dynamic resource available to SLTLE who are registered users of the DHS LLIS web site.[46]

DHS I&A has aggressively developed an intelligence capacity that is consistent with established processes and principles used in the Intelligence Community. Beyond that, I&A has developed new initiatives to increase two-way information-sharing with SLTLE agencies:

- DHS I&A has deployed analysts to many fusion centers at the state and local level across the country. The goal is to have a DHS analyst in all primary state fusion centers. As of this writing, about 35 intelligence analysts had been assigned.
- Trained intelligence reports officers deployed to DHS components provide *Homeland Intelligence Reports* to the rest of the Intelligence Community containing information gleaned from contacts at the borders. I&A has issued nearly 3,000 such reports in the past year, sharing valuable information about transnational threats from the Caribbean and Latin America, sensitive information from ports of entry, and data from people who are given secondary screening or who are denied entry into the United States.
- I&A has raised its visibility with the Intelligence Community, sitting as a full participant in Intelligence Community forums and working hand-in-hand with partners at the Director of National Intelligence, the FBI, and National Counterterrorism Center (NCTC).
    - The I&A has formed the Interagency Threat Assessment and Coordination Group (ITACG) with the FBI, NCTC, and SLTLE. It is located in the NCTC, under NCTC management, but with DHS and FBI senior officers leading it. ITACG officers monitor sensitive databases each day to determine what can be sanitized and sent to state and local partners.
    - I&A contributes to the daily *National Terrorism Bulletin* and *President's Daily Brief* and disseminates joint advisories with the FBI, mostly at the SBU/CUI level, to ensure maximum reach to state, local, and private-sector partners.
    - I&A is establishing a National Applications Office that will use satellite imagery, not only for civil applications, but to support homeland security efforts.[47]

Homeland Security Information Network[48]

The Homeland Security Information Network (HSIN) is a secure, Internet-based system of integrated communication networks designed to facilitate information-sharing between DHS and other federal, state, county, local, tribal, private-sector commercial, and other nongovernmental organizations involved in identifying

[46] Users must first register at www.llis.dhs.gov. Once the user is given access to LLIS, he or she e-mails a request to have access to the Fusion Process Technical Assistance Program Resource Center. www.llis.dhs.gov/channel/channel.do?id=90287.

[47] Allen, Charles E. DHS Under Secretary for Intelligence and Analysis. *Charles E. Allen Address to the Washington Institute for Near East Policy,* Washington, D.C.: May 6, 2008. www.dhs.gov/xnews/speeches/sp_1210107524856.shtm.

[48] Information in this section is based largely on: *Privacy Impact Statement for the Homeland Security Information Network Database.* Unpublished report of the DHS Office of Operations Coordination, April 5, 2006. www.dhs.gov/xlibrary/assets/privacy/privacy_pia_hsind.pdf.

and preventing terrorism and undertaking incident management activities. The mission of HSIN is to enhance the communication of relevant information among all applicable domestic security actors regardless of jurisdictional, geographic, or agency boundaries. Additionally, HSIN enables these organizations to maintain voice and data communications with one another during incident management. The HSIN is managed by the National Operations Center (NOC).

The system supports its user community by enabling approved users to research and analyze information with a nexus to terrorism. The database within HSIN is populated with information from: Suspicious Activity Reports from law enforcement, governmental agency, or private-sector security officials; law enforcement bulletins and reports from federal, state, county, local, and/or tribal law enforcement, and relevant information from approved HSIN user's communications. Prior to inclusion in the HSIN, information will be reviewed by NOC personnel to ensure a nexus to terrorism. After a nexus is established, the information is put into categories according to sector, subject matter, geography, and need to know.

Data collected for HSIN focuses primarily on activities, rather than on individuals. It consists of reports about what individuals, either law enforcement or other persons, have observed that is out of the ordinary based on their judgment, experience, and the circumstance of their observation. In most but not all cases, such observations will not include PII, but instead, the facts of a situation. In instances where the observation or incident led to PII being obtained, the information will be logged into the HSIN database, and additional safeguards will be used, including masking the information. The data that included names would be available only to those whose roles authorize them to access and collect such information, primarily law enforcement personnel and the Intelligence Community. Other users, such as private-sector security managers, would be able to access only the activity-based information; private and other sensitive data would be masked. If they have the need for more information, private-sector users will either contact the source entity (such as another private-sector entity) or look to local law enforcement for additional information that they might be eligible to receive.

The HSIN database will collect relatively raw suspicious activity information, which generally is provided by individuals who observe the activities of others and deem that activity suspicious, based on the totality of observable circumstances. While the primary focus of the information will be on activities, the personally identifiable information accepted for retention as part of a particular submission may include full name, address, date of birth, place of birth, citizenship, physical description (height, weight, eye and hair color), distinguishing scars, marks, or tattoos, automobile registration information, watch list information, intelligence information including links to terrorism, any criminal and/or incident activity, the date information is submitted, and the name of the contributing/submitting organization. The system has the capability to analyze data in a manner that identifies potential threats to the homeland or trends requiring further analysis.

The following are among the other capabilities of HSIN:

Communications
- Low-cost, always-on connectivity
- End-to-end encrypted communications

Collaboration/Analysis
- Secure e-mail
- Interactive collaboration tool (real-time text or voice)
- Supports requests for information, exchange, and cross-reference
- Search and link/timeline analysis, map/imagery displays

Information
- Daily, periodic, and ongoing report sharing.
- Suspicious incident/pre-incident indicator data.
- Media studies and analysis.
- Mapping and imaging (national, state, county, city).
- Critical Infrastructure Protection repository.
- Strategic analysis of terrorist threats, tactics, and weapons

A long-term goal of the HSIN is to have seamless connectivity among the different portals that serve the law enforcement and homeland security communities.

Homeland Security–State and Local Intelligence Community of Interest (HS SLIC)

To foster collaboration and share best practices and lessons learned within the fusion center network, DHS sponsors the Homeland Security State and Local Intelligence Community of Interest (HS SLIC). This is a virtual community of intelligence analysts who not only share threat information but also analytic techniques. Its membership has grown significantly and now has members representing 43 states, the District of Columbia, and seven federal departments. An HS SLIC Advisory Board, which includes state and local intelligence leaders, advises the I&A leadership on issues relating to intelligence collaboration between the federal government and its state, local, and tribal partners. Through the HS SLIC, intelligence analysts across the country collaborate through weekly SBU/CUI threat teleconferences, biweekly Secret-level secure video teleconferences, and in a virtual community of interest within a restricted portion of the HSIN-Intelligence platform, to share sensitive information in an appropriately secure and privacy sensitive environment. Members are thus able to post intelligence products so that there is effective vertical information-sharing between the states and the Intelligence Community and horizontally between the states.[49]

National Counterterrorism Center (NCTC)[50]

In July 2004, the National Commission On Terrorist Attacks Upon the United States recommended the establishment of a National Counterterrorism Center (NCTC)

[49] Allen, Charles E. *Information Sharing at the Federal, State, and Local Levels. Statement for the Record before the United States Senate Committee on Homeland Security and Governmental Affairs,* July 23, 2008.

[50] The public NCTC web site is www.nctc.gov.

to serve as a center for "... joint operational planning and joint intelligence, staffed by personnel from the various agencies...." On August 27, 2004, the President signed *Executive Order 13354, National Counterterrorism Center,* which established the NCTC and stipulated roles for it and its leadership and reporting relationships between NCTC leadership and NCTC member agencies, as well as with the White House. In December 2004, Congress passed the Intelligence Reform and Terrorism Prevention Act and, like the preceding Executive Order, among many other reform initiatives, the act prescribes roles and responsibilities for the NCTC and its leadership.[51]

NCTC operates as a partnership of organizations that include the Intelligence Community, law enforcement, and government agencies representative of the U.S. critical infrastructure. The NCTC is responsible for managing integrated meetings with its partners related to all aspects of terrorists' threats, both domestically and abroad. The ostensible purpose for the creation of intelligence centers, including the NCTC, is to bring together the disparate elements of the Intelligence Community having different intelligence foci and missions in order to achieve common intelligence and national security objectives.

A critical part of the NCTC mission is to develop intelligence products related to terrorism threats, including the following:

- Daily analytic products for senior U.S. government officials and the broader counterterrorism community
- A daily accounting of threat reporting and actions taken
- In-depth analytic assessments of the full range of terrorist topics
- Analysis providing alternative views on terrorism issues
- Situational awareness reports of terrorist threats, incidents, and reported plots worldwide
- Alerts, advisories, warnings, and assessments on topics of interest that are widely disseminated to domestic and overseas operators and analysts
- Strategic operational plans integrated and synchronized across U.S. Government agencies, describing specific objectives, department/agency roles and responsibilities, tasks, and activities for counterterrorism.[52]

Consistent with applicable law and direction from the President, the NCTC may receive intelligence pertaining exclusively to domestic counterterrorism from any federal, state, local, or tribal government, or other source necessary to fulfill its responsibilities and retain and disseminate such intelligence.[53]

The NCTC serves as the central and shared knowledge bank on known and suspected terrorists and international terror groups; ensures that agencies, as appropriate, have access to and receive all-source intelligence support needed to execute their counterterrorism plans or perform independent, alternative analysis; and ensures that such agencies have access to and receive intelligence needed to accomplish their assigned activities. Any agency authorized to conduct counterterrorism activities may request information from the NCTC to assist it in its activities, consistent with applicable law and guidelines provided for the provision of, and access to, intelligence. The NCTC enables the sharing of a wide

spectrum of terrorism intelligence and related information among thousands of users in the federal counterterrorism community through its secure web site that operates in separate security domains.[54] While SLTLE agencies have access to this information, for the most part that access is limited and accessible through the fusion centers.

Regional Information Sharing System

The Regional Information Sharing System® (RISS) has been in operation since 1973 providing services supporting the investigative and prosecution efforts of law enforcement and criminal justice agencies. The network was founded in response to transjurisdictional crime problems and the need for cooperation and secure information-sharing among law enforcement agencies.

Today, RISS is a national network comprising six multistate centers operating regionally.

- **Middle Atlantic-Great Lakes Organized Crime Law Enforcement Network.**[55] Delaware, Indiana, Maryland, Michigan, New Jersey, New York, Ohio, Pennsylvania, and the District of Columbia. The center also has member agencies in England, Australia, the Canadian provinces of Ontario and Quebec.

The regional approach allows each center to offer support services tailored to the needs of member agencies, although the centers also provide services and products that are national in scope and significance. Typical targets of RISS-member agencies' activities are terrorism, drug trafficking, violent crime, cybercrime, gang activity, and organized crime. While the RISS network is funded by the U.S. Bureau of Justice Assistance, it is controlled by its member agencies; therefore, state and local law enforcement agencies establish priorities as well as decisions related to services, such as secure client e-mail systems.

Traditional support services provided to law enforcement member agencies from the RISS centers include the following:

- Information-sharing resources
- Analytical services
- Loan of specialized investigative equipment
- Confidential funds
- Training conferences
- Technical assistance.

RISS.NET

RISS operates a secure intranet, known as RISS.NET, to facilitate law enforcement communications and information-sharing nationwide. RISS local, state, federal, and tribal law enforcement member agency personnel have online access to share intelligence and coordinate efforts against criminal networks that operate in many locations across jurisdictional lines. In September 2002, the FBI LEO system interconnected with RISS. In October 2003, the RISS/LEO interconnection was recommended in the *National Criminal Intelligence Sharing Plan* as the initial SBU/CUI communications backbone for implementation of a nationwide criminal intelligence-sharing capability. The Plan encourages agencies to connect their systems to RISS/LEO.

[57] www.riss.net/Centers.aspx?9=RMIN

Automated Trusted Information Exchange

In April 2003, RISS expanded its services and implemented what was initially called the Anti-Terrorism Information Exchange and later changed to its current name, the Automated Trusted Information Exchange (ATIX) to provide users with access to homeland security, disaster, and terrorist threat information. RISS member agencies, as well as executives and officials from other first-responder agencies and critical infrastructure entities, can access the system. ATIX consists of a web site and connected services hosted on the RISS network. It is designed for use by officials from government and nongovernment organizations who are responsible for planning and implementing prevention, response, mitigation, and recovery efforts for terrorist attacks and disasters. The ATIX program serves state, county, local, and tribal government executives; federal government executives and agencies; regional emergency management; law enforcement and criminal justice organizations; fire departments; agriculture; disaster relief; special rescue units; and telecommunication and transportation.

The web site features secure e-mail and information such as DHS bulletins and advisories, terrorist threat-level alerts, advisories from different government units such as the Department of Transportation, and has areas where users can post and share data specific to their occupational communities (e.g., law enforcement, military, emergency services, etc.).

In each community section on the web site, users can establish collaborative electronic conference services, virtual bulletin boards, and live chat rooms. Member groups also create most of the ATIX site's content and bulletin board posts. Each conference has a live chat feature where users can post conversation threads and discuss topics. An on-screen paging function permits users to notify others if they need to shift a conversation to the telephone or to a face-to-face discussion.

ATIX is informative, user-friendly, and an important resource for law enforcement agencies of any size. The site requires access to the Internet through a secure portal to permit communications. To obtain access to ATIX, the potential user must contact the applicable RISS center and request enrollment from the appropriate state coordinator.

Drug Enforcement Administration[58]

Since it was established in 1973, the Drug Enforcement Administration (DEA), in coordination with other federal, state, local, and foreign law enforcement organizations, has been responsible for the collection, analysis, and dissemination of drug-related intelligence. The role of intelligence in drug law enforcement is critical. The DEA Intelligence Program helps initiate new investigations of major drug organizations, strengthens ongoing investigations and subsequent prosecutions, develops information that leads to seizures and arrests, and provides policymakers with drug trend information on which they can base programmatic decisions. The specific functions of the DEA's intelligence mission are as follows:

- Collect and produce intelligence in support of the administrator and other federal, state, and local agencies
- Establish and maintain close working relationships with all agencies that produce or use narcotics intelligence
- Increase the efficiency in the reporting, analysis, storage, retrieval, and exchange of such information
- Undertake a continuing review of the narcotics intelligence effort to identify and correct deficiencies.

The DEA's Intelligence Program has grown significantly since its inception. From only a handful of intelligence analysts in the domestic offices and Headquarters in 1973, the number of intelligence analysts worldwide is now more than 680. DEA's Intelligence Program consists of several entities that are staffed by both intelligence analysts and special agents: intelligence groups and functions in the domestic field divisions, district, resident, and foreign offices, the El Paso Intelligence Center, and the Intelligence Division at DEA Headquarters. Program responsibility for the DEA's intelligence mission rests with the DEA Assistant Administrator for Intelligence.

Legislation and presidential directives and orders have expanded the role of the Intelligence Community and the Department of Defense in the antidrug effort. DEA interaction with both components occurs daily in the foreign field and at Headquarters. At the strategic intelligence level, the Intelligence Division participates in a wide range of interagency assessment and targeting groups that incorporate drug intelligence from the antidrug community to provide policymakers with all-source drug trend and trafficking reporting.

With analytical support from the Intelligence Program, the DEA has disrupted major trafficking organizations or put them entirely out of business. The DEA Intelligence Division also cooperates a great deal with state and local law enforcement and will soon provide intelligence training for state, local, federal, and foreign agencies. This training will be held at the Justice Training Center in Quantico, Virginia, and will address the full spectrum of drug intelligence training needs. The best practices and theories of all partners involved in the drug issue will be solicited and incorporated into the training. Academic programs, the exchange of federal, state, and local drug experience, and the sharing of, and

[58] A number of DEA strategic intelligence reports are available online at www.dea.gov/pubs/intel.htm. For other intelligence reports and related information, contact your nearest DEA Field Office www.dea.gov/agency/domestic.htm.

exposure to, new ideas will result in more effective application of drug intelligence resources at all levels.

The DEA divides drug intelligence into three broad categories: tactical, investigative, and strategic.

1. Tactical intelligence is evaluated information on which immediate enforcement action—arrests, seizures, and interdictions—can be based.
2. Investigative intelligence provides analytical support to investigations and prosecutions to dismantle criminal organizations and gain resources.
3. Strategic intelligence focuses on the current picture of drug trafficking from cultivation to distribution that can be used for management decision-making, resource deployment, and policy planning.

In February 2006, the DEA's Office of National Security Intelligence officially became the 16th member of the Intelligence Community.[59] The designation was necessary because of the DEA's global presence and the fact that terrorists have financed some operations through illegal drug sales. Intelligence Community responsibilities of the DEA are coordinated through the new DEA National Security Branch which is in the Office of Intelligence.[60]

Intelligence Products. Tactical and investigative intelligence is available to SLTLE agencies through local DEA field offices. In addition, intelligence can be shared with SLTLE agencies through secure e-mail. Many strategic intelligence reports are available on the DEA web site.[61] Reports that are law enforcement sensitive"can be obtained through the local DEA office.

El Paso Intelligence Center[62]

The El Paso Intelligence Center (EPIC) was established in 1974 in response to a Department of Justice study that detailed drug and border enforcement strategy and programs. The study proposed the establishment of a southwest border intelligence service center staffed by representatives of the Immigration and Naturalization Service, the U.S. Customs Service, and the DEA. The original EPIC staff comprised 17 employees from the three founding agencies. Initially, EPIC focused on the U.S.-Mexico border and its primary interest was drug movement and immigration violations.

Today, EPIC still concentrates primarily on drug movement and immigration violations. Because these criminal activities are seldom limited to one geographic area, EPIC's focus has broadened to include all of the United States and the Western Hemisphere where drug and alien movements are directed toward the United States. Staffing at the DEA-led center has increased to more than 300 analysts, agents, and support personnel from 15 federal agencies, the Texas Department of Public Safety, and the Texas Air National Guard. Information-sharing agreements with other federal law enforcement agencies, the Royal Canadian Mounted Police, and each of the 50 states ensure that EPIC support is available to those who need it. A telephone call, fax, or e-mail from any of these agencies provides the requestor with real-time information from different federal databases, plus EPIC's own internal database.

[59] Office of the Director of National Intelligence. *Drug Enforcement Administration Element Becomes 16th Intelligence Community Member.* Press Release #6-06, February 17, 2006.

[60] Office of the Inspector General. Audit Division. *The Drug Enforcement Administration Use of Intelligence Analysts. Audit Report 08-23.* Washington, D.C.: U.S. Department of Justice, May 2008. www.fas.org/irp/agency/doj/oig/dea-intel.pdf.

[61] See www.usdoj.gov/dea/pubs/intel.htm.

[62] See www.dea.gov/programs/epic.htm.

In addition to these services, a number of EPIC programs are dedicated to post-seizure analysis and the establishment of links between recent enforcement actions and ongoing investigations. EPIC also coordinates training for state and local officers in the methods of highway drug and drug currency interdiction through its Operation Pipeline program. In addition, EPIC personnel coordinate and conduct training seminars throughout the United States on such topics as indicators of trafficking and concealment methods used by couriers.

In a continuing effort to stay abreast of changing trends, EPIC has developed the National Clandestine Laboratory Seizure Database. EPIC's future course will be driven by the *General Counterdrug Intelligence Plan,* as well. As a major national center in the new drug intelligence architecture, EPIC will serve as a clearinghouse for the High Intensity Drug Trafficking Area's (HIDTA) Intelligence Centers, gathering state and local law enforcement drug information and providing drug intelligence back to the HIDTA Intelligence Centers.

National Drug Intelligence Center[63]

The National Drug Intelligence Center (NDIC), established in 1993, is a component of the U.S. Department of Justice and a member of the Intelligence Community. The *General Counterdrug Intelligence Plan,* implemented in February 2000, designated NDIC as the nation's principal center for strategic domestic counterdrug intelligence. The intent of NDIC is to meet three fundamental missions:

1. Support national policymakers and law enforcement decision-makers with strategic domestic drug intelligence.
2. Support Intelligence Community counterdrug efforts.
3. Produce national, regional, and state drug threat assessments.

The Intelligence Division consists of six geographic units and four specialized units. The six geographic units correspond to the regions of the Department of Justice Organized Crime Drug Enforcement Task Force (OCDETF)[64] program and concentrate on drug trafficking and abuse. The four specialized units include the Drug Trends Unit, the Organized Crime and Violence Unit, the National Drug Threat Assessment Unit, and the National Interdiction Support Unit.

Within the geographic units, NDIC intelligence analysts cover each state and various U.S. territories. Intelligence analysts maintain extensive contacts with federal, state, and local law enforcement and Intelligence Community personnel in all 50 states, the District of Columbia, Puerto Rico, the Virgin Islands, and the Pacific territories of Guam, American Samoa, and the Northern Mariana Islands. NDIC collaborates with other agencies such as the DEA, FBI, U.S. Coast Guard, Bureau of Alcohol, Tobacco, Firearms and Explosives (ATF), the Bureau of Prisons, and the Office of National Drug Control Policy (ONDCP). NDIC is one of four national intelligence centers including the EPIC, the U.S. Department of the Treasury's Financial Crimes Enforcement Network (FinCEN), and the Director of Central Intelligence Crime and Narcotics Center. NDIC also works closely with the HIDTAs and the OCDETF.

[63] See www.usdoj.gov/ndic.

[64] While the OCDETFs are operational entities, not intelligence entities, they are both consumers of intelligence and sources for information collection. For more information see www.usdoj.gov/dea/programs/ocdetf.htm.

Intelligence Products

Threat assessments, NDIC's primary intelligence products, provide policymakers and counterdrug executives with timely, predictive reports of the threat posed by illicit drugs in the United States.

- The *National Drug Threat Assessment,* NDIC's major intelligence product, is a comprehensive annual report on national drug trafficking and abuse trends within the United States. The assessment identifies the primary drug threat to the nation, monitors fluctuations in consumption levels, tracks drug availability by geographic market, and analyzes trafficking and distribution patterns. The report highlights the most current quantitative and qualitative information about availability, demand, production and cultivation, transportation, and distribution, as well as the effects of a particular drug on abusers and on society as a whole.
- *State Drug Threat Assessment* provides a detailed threat assessment of drug trends within a particular state. Each report identifies the primary drug threat in the state and gives a detailed overview of the most current trends by drug type.
- *Information Bulletins* are developed in response to new trends or high-priority drug issues. They are relayed quickly to the law enforcement and intelligence communities and are intended to warn law enforcement officials of emerging trends.

High Intensity Drug Trafficking Areas[65]

The High Intensity Drug Trafficking Areas (HIDTA) Intelligence System has more than 1,500 law enforcement personnel, mostly criminal intelligence analysts, participating full time in more than 60 intelligence initiatives in the 28 HIDTA designated areas throughout the United States. While HIDTA is a counterdrug program, the intelligence centers operate in a general criminal intelligence environment, thereby leveraging all criminal intelligence information for the program's primary mission.[66]

The HIDTA Intelligence System, a core element in the creation and growth of many SLTLE intelligence programs, largely depends on HIDTA program mandates. Each HIDTA must establish an intelligence center co-managed by both a federal and a state or local law enforcement agency. The core mission of each HIDTA Intelligence Center is to provide tactical, operational, and strategic intelligence support to its HIDTA executive board, a group of participating law enforcement agency principals responsible for the daily management of their respective HIDTAs, HIDTA-funded task forces, and other regional HIDTAs. Developing regional threat assessments and providing event and target deconfliction are also among the centers' core missions. These core functions are critical to building trust and breaking down parochialism between and among the participating local, state, and federal law enforcement agencies.

The plan to connect all HIDTA Intelligence Centers through RISS.net was initiated by the HIDTA Program Office at ONDCP in 1999 and completed in mid-2003. The HIDTA Program Office has commissioned interagency and interdisciplinary working committees to develop a national information-sharing plan, focusing on issues relating to legal, agency policy, privacy, technical, and logistical information-sharing matters. HIDTA program and committee personnel are

[65] See www.whitehousedrugpolicy.gov/hidta for HIDTA points of contact.

[66] policechiefmagazine.org/magazine/index.cfm?fuseaction=display_arch&article_id=139&issue_id=11200

coordinating with, and implementing recommendations made by, other information-sharing initiatives such as the Global Justice Information Sharing Initiative and federally sponsored intelligence programs.[67]

Bureau of Alcohol, Tobacco, Firearms and Explosives[68]

The Intelligence Division of Bureau of Alcohol, Tobacco, Firearms and Explosives (ATF) has evolved rapidly as an important tool for the diverse responsibilities of the bureau. Several activities in particular demonstrate the intelligence capability and resources of the ATF.

The ATF, which is now an agency of the Department of Justice, has developed Field Intelligence Groups at each of its 23 Field Divisions strategically located throughout the United States. These intelligence groups meld the training and experience of special agents, intelligence research specialists, industry operations inspectors, and support staff that focus on providing tactical intelligence support for their respective field divisions and their external law enforcement partners. Each Field Intelligence Group works under the authority of a supervisory special agent. The intelligence group supervisors are coordinated by, and work in conjunction with, the Intelligence Division to form a bureau-wide intelligence infrastructure. The Intelligence Division provides indoctrination and training for all Field Intelligence Group supervisors, intelligence officers, and intelligence research specialists.

The ATF maintains intelligence partnerships with the NDIC, EPIC, FinCEN, INTERPOL, the FBI's Counter Terrorism Center, and other international intelligence sources. Furthermore, the ATF maintains an MOU with the six RISSs that represent thousands of SLTLE agencies, pledging to share unique and vital intelligence resources. These external partners are key components of the ATF's *Strategic Intelligence Plan* and the means by which the ATF ensures a maximum contribution to the nation's law enforcement and intelligence communities.

During FY 2000, the Intelligence Division spearheaded the formulation of an MOU with the FBI to collaborate on investigations conducted by Joint Terrorism Task Forces (JTTF) located throughout the United States. This MOU brings ATF's unique knowledge and skills of explosives and firearms violations to the FBI's expertise in terrorism. Among the resources provided by ATF are the online Arson and Explosives National Registry and the Federal Firearms License (FFL) registry.

The Intelligence Division has implemented a state-of-the-art automated case management/intelligence reporting system called N-FOCIS (National Field Office Case Information System). The system consists of two companion applications: N-FORCE for special agents and N-SPECT for industry operations inspectors. Both eliminate redundant manual data entry on hard copy forms and provide a comprehensive reporting and information management application in a secure electronic environment.

[67] As an illustration of the comprehensive and integrated nature of the HIDTA programs and intelligence centers, see www.ncjrs.gov/ondcppubs/publications/enforce/hidta2001/ca-fs.html.

[68] Contact your local ATF Field Office for intelligence products and resources. Offices and contact information can be found at www.atf.gov/field.

N-FOCIS constitutes an online case-management system and electronic central information repository that allows the ATF to analyze and fully exploit investigative intelligence. N-FOCIS epitomizes the strength and unique value of the ATF's combined criminal and industry operations enforcement missions. The Intelligence Division has provided in-service training to many ATF field division special agents, investigative assistants, and inspectors on the use of the N-FOCIS applications. The ATF is planning to expand the N-FOCIS functionality and to integrate N-FOCIS with several key ATF applications including the National Revenue Center, the National Tracing Center, National Arson and Explosive Repository, and the Intelligence Division's Text Management System. This integration plan establishes N-FOCIS as the bureau's information backbone.

The Intelligence Division prepares a wide range of strategic intelligence reports related to the ATF mission that are available to SLTLE. In addition, intelligence is shared with state and local agencies through RISS and the JTTFs. In addition, ATF will readily respond to inquiries wherein SBU/CUI information may be shared.

ATF has also created a series of Regional Crime Gun Centers. The intent of the centers is to integrate gun tracing with ATF intelligence and with the HIDTA Regional Intelligence Centers to suppress gun-related crime.[69]

Federal Protective Service Secure Portal[70]

The DHS's Federal Protective Service (FPS) provides law enforcement and security services to more than 1 million tenants and daily visitors to federally owned and leased facilities nationwide. The FPS protection services focus directly on the interior security of the nation, and require close coordination and intelligence-sharing with the investigative functions within DHS. FPS is a full-service agency with comprehensive law enforcement, response, and communications components.[71]

To support their broad, nationwide role, FPS saw the need to develop a comprehensive online resource to aid in security, threat assessment, law enforcement, and protection of federal buildings, workers, and visitors. From this need, the FPS developed its Secure Portal. The web-based portal supports inter- and intra-agency secure information sharing and collaboration through compartmentalized collaboration tools, document libraries, secure messaging, and community calendars. Custom plug-ins facilitate geospatial awareness of officer safety, homeland security issues, incident reporting, and management of operations.

SLTLE agencies can gain access to the FPS Secure Portal by contacting a local FPS office or going to fps.esportals.net/signup/index.cfm and e-mailing the help desk link for registration.

Financial Crimes Enforcement Network[72]

The Financial Crimes Enforcement Network (FinCEN) brings agencies, investigators, and information together to fight the complex problem of money laundering. Since its creation in 1990, FinCEN has worked to maximize

[69] As an illustration see www.atf.gov/field/newyork/rcgc/index.htm.

[70] fps.esportals.net (Membership required)

[71] www.dhs.gov/xnews/releases/press_release_0154.shtm

[72] See www.fincen.gov.

information sharing among law enforcement agencies and other partners in the regulatory and financial communities. Through cooperation and partnerships, FinCEN's network approach encourages cost-effective and efficient measures to combat money laundering domestically and internationally.

The network supports federal, state, local, tribal, and international law enforcement by analyzing information required under the Bank Secrecy Act (BSA), one of the nation's most important tools in the fight against money laundering. The BSA's record-keeping and reporting requirements establish a financial trail for investigators to follow as they track criminals, their activities, and their assets. Over the years, FinCEN staff has developed its expertise in adding value to the information collected under the BSA by uncovering leads and exposing unknown information contained in the complexities of money laundering schemes.

Illicit financial transactions can take many routes—some complex, some simple, but all increasingly inventive—with the ultimate goal of disguising its source. The money can move through banks, check cashers, money transmitters, businesses, or casinos, and is often sent overseas to become "clean." The tools of the money launderer can range from complicated financial transactions carried out through webs of wire transfers and networks of shell companies, to old-fashioned currency smuggling.

Intelligence research specialists and law enforcement support staff research and analyze this information and other critical forms of intelligence to support financial criminal investigations. The ability to network with a variety of databases provides FinCEN with one of the largest repositories of information available to law enforcement in the country. Safeguarding the privacy of the data it collects is an overriding responsibility of the agency and its employees—a responsibility that strongly imprints all of its data management functions and operations.

FinCEN's information sources fall into three categories:

1. *Financial Database:* The financial database consists of reports that must be filed with the BSA, such as data on large currency transactions conducted at financial institutions or casinos, suspicious transactions, and international movements of currency or negotiable monetary instruments. This information often provides invaluable assistance for investigators because it is not readily available from any other source and preserves a financial paper trail for investigators to track criminals' proceeds and their assets.
2. *Commercial Databases:* Information from commercially available sources plays an increasingly vital role in criminal investigations. Commercial databases include information such as state, corporation, property, and people-locator records, as well as professional licenses and vehicle registrations.
3. *Law Enforcement Databases:* FinCEN is able to access various law enforcement databases through a written agreement with each agency.

FinCEN works closely with the IACP, National Association of Attorneys General, National White Collar Crime Center, and other organizations to inform law enforcement about the information available at FinCEN and how to use the information to attack criminal proceeds.

High-Risk Money Laundering and Related Financial Crimes Areas[73]

High Intensity Financial Crime Areas (HIFCA) were first announced in the 1999 National Money Laundering Strategy and were conceived in the Money Laundering and Financial Crimes Strategy Act of 1998 as a means of concentrating law enforcement efforts at the federal, state, and local levels in high-intensity money laundering zones. HIFCAs may be defined geographically or they can be created to address money laundering in an industry sector, a financial institution, or group of financial institutions.

To implement the goal of concentrating efforts, a money laundering action team will be created or identified within each HIFCA to spearhead a coordinated federal, state, and local anti-money laundering effort. Each action team will be composed of all relevant federal, state, and local enforcement authorities, prosecutors, and financial regulators who will concentrate on the following:

- Focus on tracing funds to the HIFCA from other areas, and from the HIFCA to other areas so that related investigations can be undertaken
- Focus on collaborative investigative techniques, both within the HIFCA and between the HIFCA and other areas
- Ensure a more systemic exchange of information about money laundering between HIFCA participants
- Include an asset forfeiture component as part of its work.

Gateway

FinCEN's Gateway system enables federal, state, and local law enforcement agencies to access online records filed under the BSA. The system saves investigative time and money by enabling investigators to conduct their own research and analysis of BSA data rather than relying on the resources of an intermediary agency to obtain financial records. A unique feature of Gateway is the "query alert" mechanism that automatically signals FinCEN when two or more agencies have an interest in the same subject. In this way, FinCEN is able to assist participating agencies in coordinating their investigations.

Virtually every criminal enterprise and terrorist organization is involved in some dimension of money laundering. The complexities of forensic accounting, often complicated by jurisdictional barriers, reinforces the need for intelligence personnel to be aware of the resources and expertise available through FinCEN.

Essential to effective intelligence is the ability to access and share information readily. A number of resources and systems are available to SLTLE agencies that permit access to federal intelligence products, regional and local intelligence products, current news and events, and secure e-mail. Many resources are available to law enforcement organizations for a minimal, if any, fee. Regardless of the degree of sophistication of a system, it is essential that a law enforcement organization have some form of secure e-mail and access to an SBU/CUI network to receive current advisories that maximize information sharing

[73] See www.fincen.gov/le_hifcadesign.html.

International Justice and Public Safety Network[74]

The International Justice and Public Safety Network (formerly the National Law Enforcement Telecommunication System [NLETS]) was created by state law enforcement agencies nearly 35 years ago as a primary means of integrating data related to traffic enforcement. Since its founding, the NLETS role has evolved from being primarily an interstate telecommunications service for law enforcement to a more broad-based network servicing the justice community at the local, state, and federal levels. It is now a broad-based interstate law enforcement network for the exchange of law enforcement and related justice information. Its purpose is to provide, within a secure environment, an international criminal justice telecommunications capability that will benefit to the highest degree the safety, security, and preservation of human life and the protection of property. NLETS will assist national and international governmental agencies and other organizations with similar missions who enforce or aid in enforcing local, state, federal, or international laws or ordinances.

NLETS is a nonprofit corporation chartered by the states and funded by user fees collected from the membership and managed by a board of directors consisting of state police executives. Primary services include access to key state databases, particularly drivers' licenses and motor vehicle records, criminal histories, and sex offender registries. The system also has access to special databases such as Canadian files, hazardous materials archives, U.S. General Services Administration fleet, immigration records, FAA registrations, NDPIX,[75] vehicle impounds, and import/export files. The system also includes terminal-to-terminal messaging and broadcast capabilities (such as an Amber Alert).

Accelerated Information Sharing for Law Enforcement

The next generation of NLETS is Accelerated Information Sharing for Law Enforcement (AISLE). The intent of AISLE is to accelerate information sharing for the entire U.S. law enforcement community by adopting and deploying XML[76] Web Services technology for interstate inquiries and responses. Like the Global Justice Information Sharing Initiative, it also seeks to promote the common XML standard for law enforcement information systems. Essentially, AISLE seeks to move NLETS completely into the most advanced realms of networking to enhance information sharing.

Operation Archangel and the Automated Critical Asset Management System

While the discussion of resources and systems has largely been avoided, discussion of state and local systems—the Automated Critical Asset Management System (ACAMS)—is an exception. While locally developed, it is becoming a national system with the support of the DHS.

ACAMS is a component of a broader initiative, Operation Archangel, that was developed by the Los Angeles Police Department. Building on local

[74] For contact information and more details, see www.nlets.org/default.asp.

[75] NDPIX is the National Drug Pointer Index, discussed in detail in Chapter 11.

[76] Internet web pages are typically written in Hypertext Markup Language (HTML) which aids in formatting and integrating diverse resources. The second generation is XML, Extensible Mark-up Language, which has all the features of HTML and provides significantly increased searching and comparison characteristics.

responsibilities for protecting Critical Infrastructure and Key Resources (as discussed in Chapter 9), the intent of Archangel is to identify and protect Critical Infrastructure and Key Resources in the Los Angeles metropolitan area. Its purpose is to defend likely targets against catastrophic terrorist attacks, relying on the guiding principle that local agencies are most knowledgeable about their own critical assets. The system was born out of a need to engender interagency/departmental cooperation and coordination to facilitate the strategic application and management of information and resources for the prevention, deterrence, mitigation, and response to critical incidents, including terrorism. Primarily focused on prevention, Archangel has been designed to identify critical threat locations and plan multiagency/disciplinary prevention, deterrence, mitigation and response efforts.[77]

A number of flexible components of Archangel make it a scalable model that is exportable across the United States. The following are among Archangel's initiatives:

- *Identification and Prioritization of Critical Assets*
- *Critical Asset Assessments* using a three-tiered template:
    1. Conducting appropriate vulnerability assessments to determine and reduce a location's degree of vulnerability.
    2. Harvesting detailed location-specific information (i.e., names, phone numbers, floor plans, site postings, etc.) All for use by pre-incident planners and on-scene incident commanders through web-based delivery during critical incidents.
    3. Drafting site-specific, pre-incident security enhancement plans and post-occurrence action plans designed to provide tactical guidance and insight to planners and/or to incident commanders in the field.
- *Critical Asset Assessment Teams* that conduct an on-site threat and vulnerability assessment.
- *Protective Security Task Force (PSTF),* is a plainclothes, low-profile team of personnel specifically trained and equipped with state-of-the-art technology to provide a comprehensive cloak of security to a threatened asset. Primarily, the PSTF will be deployed when intelligence indicates that a threat may be directed at a critical asset and/or event. In the absence of intelligence, the PSTF will deploy to critical assets throughout the area of responsibility, providing low-key but visible enhancements to the resident security measures.
- *Security Officer Terrorism Awareness Course (SOTAC),* is a 4-hour block of instruction designed specifically for the security industry professional to enhance awareness of current terrorist trends and methodologies for attack.
- *Automated Critical Asset Management System (ACAMS).* Archangel has partnered with U.S. DHS to develop ACAMS, a secure interoperable web-based system to manage critical asset information. ACAMS coordinates the following:
    - Critical Asset Inventory and Prioritization Modeling
    - Asset Manager Questionnaires (promotes public/private partnerships)
    - Critical Asset Assessments

[77] www.lapdonline.org/emergency_services_division/content_basic_view/33044

- Site Specific Pre-Incident Security Enhancement Plans
- Buffer Zone Plans
- Building Inventories
- Site Specific Post-Occurrence/Response Plans.[78]

ACAMS also includes any predeveloped response plans for specific incidents[79] and site-specific pre-incident security enhancement plans for use by strategists to prevent and deter incidents from occurring.[80]

Constellation/Automated Critical Asset Management System

The DHS has embraced the Constellation/Automated Critical Asset Management System (C/ACAMS) that is explicitly intended to support fusion centers and other information-sharing partners in support of the DHS mission of protecting critical infrastructure. C/ACAMS provides state, local, and private-sector partners with a set of resources for collecting and managing information related to critical infrastructures and to inject infrastructure information into fusion center analysis. This information, when combined with terrorism threat streams, provides fusion center analysts and private-sector infrastructure owners and operators with a context for understanding risk and to target protection resources against those assets or systems that have the highest risk profiles. Currently, C/ACAMS is deployed to fusion centers across the United States and is used by more than 2,000 state and local infrastructure protection analysts. The data they have collected on more than 38,000 unique infrastructure assets are vital to the national effort to enable prevention, protection, response, and recovery activities.[81]

Law Enforcement Intelligence Unit[82]

Founded in 1956, the Law Enforcement Intelligence Unit (LEIU) is an independent professional association of U.S. and international law enforcement intelligence professionals who gather, record, and exchange confidential information not available through regular law enforcement channels, concerning organized crime and terrorism. It is an association of U.S. and international law enforcement professionals, similar in many respects to numerous other associations serving professionals. LEIU has no staff, other than an executive director, and no capability as an entity to conduct an investigation or law enforcement activity. Each member agency is bound by, and acts pursuant to, local law and its own agency regulations.

The organization is divided geographically into four zones: Eastern, Central, Northwestern, and Southwestern. Each zone elects a chair and vice chair to serve as zone officers. Internationally, LEIU elects a general chair, vice general chair, and designates a secretary-treasurer and a legal advisor who serve as international officers. The international officers, zone officers, past general chair, and two representatives from the Central Coordinating Agency (i.e., the California Department of Justice which houses LEIU data) make up the executive board. The board is the governing body of LEIU and, as such, establishes policy and passes on the admission of all members, and is governed by a constitution and bylaws.

[80] Leson, Joel. *Assessing and Managing the Terrorism Threat.* Washington, D.C.: Bureau of Justice Assistance, U.S. Department of Justice, 2005, p. 19. Also see www.dhs/gov/acams.

[81] Allen, Charles E. *Information Sharing at the Federal, State and Local Levels. Statement for the Record before the United States Senate Committee on Homeland Security and Governmental Affairs,* July 23, 2008, 11.

[82] For more information on LEIU see www.leiu-homepage.org/index.html. For contact information concerning LEIU membership, e-mail leiu@doj.ca.gov. LEIU, California Department of Justice, P.O. Box 163029, Sacramento, CA 95816-3029.

LEIU membership is limited to law enforcement agencies of general jurisdiction having an intelligence function. To become a member, an agency head submits a written application. The applying agencies must be sponsored by an LEIU member. Each member agency head appoints an LEIU representative as the contact for the LEIU.

Virtually any kind of information that may be lawfully retained in law enforcement intelligence records may be exchanged as long as the recipient meets the need-to-know and right-to-know standards. It is important to keep intelligence records consistent with legal standards. LEIU is not a computer system where members can make queries; rather, it is a network where information is exchanged between members, albeit in electronic form.

Information Sharing

To submit an inquiry about a suspected criminal to the LEIU automated system, a member agency enters the subject information through a secure intranet that is stored on RISS.net. The subject information includes, among other items, the person's identity, criminal activity, and criminal associates. All information submitted to the LEIU automated file must meet LEIU File Guidelines (See Appendix C) and comply with 28 CFR, Part 23. The submitting agency must certify that the subject meets established criteria, including criminal predicate. The Central Coordinating Agency manages this automated file.

International Criminal Police Organization[83]

The International Criminal Police Organization (INTERPOL) was founded in 1923 to serve as a clearinghouse for information on transnational criminals. It receives, stores, analyzes, and disseminates criminal data in cooperation with its 181 member countries on a 24/7/365 basis in its four official languages (English, French, Spanish, and Arabic). Interpol deals only with international crimes. Its four core functions are to provide member states with the following:

1. *Secure global police communication services.* INTERPOL runs a global police communications system called I-24/7, which provides police around the world with a common platform through which they can share crucial information about criminals and criminality.
2. *Operational data services and databases for police.* INTERPOL's databases and services ensure that police worldwide have access to the information and services they need to prevent and investigate crimes. Databases include information such as names, fingerprints and DNA profiles, and stolen property such as passports, vehicles, and works of art.
3. *Operational police support services.* INTERPOL supports law enforcement officials in the field with emergency support and operational activities, especially in its priority crime areas of fugitives, public safety and terrorism, drugs and organized crime, trafficking in human beings, and financial and high-tech crime. A Command and Coordination Centre operates 24 hours a day, 7 days a week.
4. *Police training and development.* INTERPOL provides focused police training initiatives for national police forces, and also offers on-demand advice, guidance, and support in building dedicated crime-fighting components. The aim is to enhance the capacity of member countries to effectively combat serious transnational crime and terrorism.[84]

[83] The INTERPOL General Secretariat site is www.interpol.int.

[84] www.interpol.int

Criminal intelligence analysts at INTERPOL are uniquely placed to recognize and detect patterns and criminal trends from a global perspective, and have the resources to assist with specific international crime cases.

In the United States, the contact point for Interpol is the U.S. National Central Bureau (USNCB) which operates within the guidelines prescribed by the Department of Justice, in conjunction with the DHS. The mission of the USNCB is to facilitate international law enforcement cooperation as the United States representative to INTERPOL.

When INTERPOL is seeking specific information or seeking a person, it issues a color-coded notice, with each color representing a different type of action from the recipient agencies. While these notices are rarely encountered by SLTLE officers, it is nonetheless of value to be familiar with them should the issue arise.

U.S. law enforcement officers can gain access to INTERPOL reports and make international inquiries through their state point of contact (usually within the state law enforcement or intelligence agency) who will query the USNCB. The USNCB address and web site are: U.S. Department of Justice, INTERPOL, United States National Central Bureau, Washington, DC 20530 www.usdoj.gov/usncb.

Summary

As demonstrated in this chapter, the amount of information and intelligence being generated by federal law enforcement agencies and national law enforcement entities is significant. If that information is not being used, its value is lost. Not only are these resources responsible for making information available to SLTLE agencies in an accessible and consumable form, nonfederal law enforcement must develop the mechanisms for receiving the information and be good consumers of it.

One of the ongoing controversies is the problem of dealing with classified information. This chapter explained the classification process as well as the initiatives that are being undertaken to deal with this issue. One measure is to increase the number of security clearances for SLTLE personnel. The other measure is for the FBI to write intelligence reports so that they are unclassified, but remain as CUI to give SLTLE personnel access.

By gaining access to secure networking (e.g., LEO, RISS.net, ATIX), interacting on a regular basis with the FBI Field Intelligence Group, and proactively interacting with other federal law enforcement intelligence offices, SLTLE can have access to the types of critical intelligence necessary to protect their communities.

A Summary of Selected Intelligence Networks and Applications

A wide and diverse array of information systems that support the law enforcement intelligence function have been discussed thus far.[85] Many other systems exist at the federal level; however, most law enforcement officers will not have access to them unless they are assigned to a fusion center or major urban area law enforcement intelligence unit. Nevertheless, there is value in having a summary knowledge of some of these systems. Those previously discussed in this chapter are not included in the following summaries.

Classified Networks

- *C Local Area Network (Top Secret Network).* This network, commonly referred to as the C-LAN, is used within DHS to communicate Top Secret information with the Intelligence Community. It provides connectivity to the Department of Defense's Joint Worldwide Intelligence Communications System to access, receive, and share intelligence information.
- *Sensitive Compartmental Information Operational Network (Top Secret Network).* This network, also known as SCION, is used to transport top secret counterterrorism data, including intelligence and warning information. It provides an interface with the Department of Defense's Joint Worldwide Intelligence Communications System that allows FBI agents and analysts to exchange Top Secret intelligence information with other members of the Intelligence Community.
- *Federal Bureau of Investigation Network (Secret Network).* Commonly referred to as the FBINET, it is a global-wide area network used for communicating Secret information, including investigative case files and intelligence pertaining to national security. It also runs administrative applications.
- *Homeland Secure Data Network (Secret Network).* Also known as HSDN, this network transmits homeland security data in support of activities including intelligence, investigations, and inspections that are classified at the Secret level. HSDN provides Secret connectivity to civilian agencies and will provide Secret connectivity in the future for civilian agencies currently using the Department of Defense's Secret Internet Protocol Router Network. It is used, for example, to transmit intelligence summaries, secure messaging, and e-mail correspondence.

SBU/CUI Networks

- *Critical Infrastructure Warning Information Network.* Also known as CWIN, the network is used to transmit voice and data on infrastructure protection, communication and coordination, alert, and notification. In the event that a significant attack disrupts telecommunications networks or the Internet, the CWIN will provide secure capability for communications across key government network operations centers, the private and public sectors, and trusted foreign partners. According to the DHS, the CWIN is the critical, survivable network connecting the DHS with the vital sectors that are essential in restoring the nation's infrastructure during incidents of national significance.

[85]The value, use, and application of many of these systems are discussed in: *Information Technology: Numerous Federal Networks Used to Support Homeland Security Need to Be Better Coordinated with Key State and Local Information-Sharing Initiatives. A report to the Chairman, Committee on Homeland Security, U.S. House of Representatives.* Washington, D.C.: General Accountability Office, April 2007.

- *Criminal Justice Information Services Wide Area Network*. Also known as the CJIS WAN, it provides secure electronic connectivity to information on individuals, vehicles, and property associated with crimes or terrorist organizations to state, local, tribal, and federal law enforcement agencies. It is also used to identify individuals from submitted fingerprints and to exchange deoxyribonucleic acid (DNA) information, background-check information, and criminal history information.
- *Customs and Border Protection Network*. Commonly referred to as the CBP Network, it is used to transmit SBU/CUI data related to Customs and Border Protection's support of homeland security functions, such as protecting the nation's borders from terrorists and regulating and facilitating the lawful movement of goods and persons across U.S. borders.
- *DHS Core Network*. Also known as the DCN, the network transmits SBU/CUI data related to the DHS homeland security mission in areas such as customs, border patrol, and intelligence.
- *FBI Unclassified Network*. Commonly known as UNet, this is a national wide area network that provides the FBI with access to SBU/CUI intelligence and law-enforcement sensitive information. It provides bureau agents with access to secure mail and LEO.
- *Justice Consolidated Network*. Known as the JCN, this network transmits fingerprint, arrest records, and other data relating to the investigation and prosecution of crimes and terrorist activities among DOJ components.
- *Justice Unified Telecommunications Network*. This network, also known as JUTNet, transmits SBU/CUI information (such as fingerprint and arrest information) pertaining to the investigation and prosecution of crimes and terrorist activities. In addition, it supports video conferencing and certain Voice over Internet Protocol services.
- *Immigration and Customs Enforcement Network*. Also known as ICENet, this network supports the data transmission needs of the DHS Immigration and Customs Enforcement component. Major programs dependent on this network include the Office of Investigations, the Detention and Removal Office, the Federal Protective Services Office, and the Intelligence Office.
- *Secret Service Wide Area Network*. Commonly referred to as the Secret Service WAN, this network supports the homeland security mission by providing security and protection to our nation's leaders and financial systems
- *Transportation Security Administration Network*. This network, also known as TSANet, is a global network used for security operations, intelligence, and law enforcement information-sharing. It is used to transmit alerts, fingerprints, and information from the Transportation Security Administration's mission-critical applications.
- *ONENet*. A single network using dual carriers to support interoperability and data sharing in all DHS mission areas and between all DHS components. The DHS is deploying ONENet to DHS components and it will consolidate the following seven networks: 1. Coast Guard Data Network Plus; 2. Customs and Border Protection Network; 3. DHS Core Network; 4. Federal Emergency Management Agency Switched Network; 5. Immigration and Customs Enforcement Network; 6. Secret Service Wide Area Network; and 7. Transportation Security Administration Network.

SBU/CUI Network Applications

Bomb Arson Tracking System. Commonly referred to as BATS, this application is a partnership among DOJ, the ATF's Bomb Data Center, and members of the nation's fire and post-blast investigative communities. It provides these organizations with a comprehensive incident-based information-sharing system.

eTrace. The eTrace application is a web-based firearm trace submission system and trace analysis module for use by approved law enforcement agencies. The eTrace application improves the efficiency of the firearm tracing process and provides for the secure exchange of firearms trace-related information between the law enforcement community and the ATF.

Federal Emergency Management Agency Switched Network. This network, commonly known as the FEMA Switched Network, provides support for emergency coordination of federal, state, and local operations, disaster assistance, and government recovery efforts. For example, it is used to provide information about disaster victims and logistics for disasters, in addition to normal business.

Conclusion

If effective information sharing is one of the critical goals of contemporary law enforcement intelligence, then networks and systems are the critical tools to reach that goal. As has been seen throughout this chapter, there has been significant growth in the capability of law enforcement agencies to share information. The growth has been a product of new initiatives following 9/11, the availability of new networking technologies that reduce interoperability conflicts, and the commitment of American law enforcement at all levels of government to facilitate information-sharing processes. These factors are in a dynamic state. Systems and networks will change; therefore, it is incumbent on the intelligence manager to carefully monitor trends to stay current.

Chapter 13:

Management and Human Resource Issues for the Intelligence Function

Management and Human Resource Issues for the Intelligence Function

The basic principles and applications of management—leadership, accountability, span of control, chain of command, labor relations, program evaluation, to name a few—apply to the intelligence function in the same manner as they would apply to any other organizational entity. The extensive literature of police administration and management is a solid resource for these issues when managing an intelligence unit. This chapter will focus on selected issues relating to the development and management of the intelligence function.

While most American law enforcement agencies might not have a formal intelligence unit, they still have an intelligence function to manage. With the increasing symbiosis among federal and state, local, and tribal law enforcement (SLTLE), adoption of the *National Criminal Intelligence Sharing Plan* (NCISP), the growth of networked intelligence information systems, and the responsibility of keeping the homeland secure, virtually every law enforcement agency in the country needs to develop some kind of intelligence capacity. That capacity may be a full-scale unit or one person who serves part time as an agency's point of contact for receiving and disseminating critical information. In some form, an intelligence capacity has become a de facto requirement for American law enforcement agencies. As a result, new intelligence processes for law enforcement present challenges such as the following:

- Reengineering some of the organization's structure and processes
- Developing a shared vision of the terrorist or criminal threat within the agency as well as with the broader law enforcement community
- Participating in intelligence processes and following through with information sharing
- Committing resources, time, and energy to the intelligence function
- Developing a proactive spirit and creative thought to identify "what we don't know" about terrorism and international organized crime
- Developing a culture within the law enforcement agency that is able to think globally and act locally
- Developing a culture of information sharing
- Providing vigilance, patience, and entrepreneurial leadership.

To put these components into operation in a functional intelligence mechanism, SLTLE agencies of all sizes need, at a minimum, fundamental operational components, such as these:

- A person designated as the intelligence point of contact to whom external agencies may direct inquiries, warnings, and advisories, and from whom information and questions may be sent. He or she must have sufficient training to understand the language, processes, and regulations incumbent on the law enforcement Intelligence Community.
- A secure electronic communications system for sending and receiving information that is Sensitive But Unclassified/Controlled Unclassified Information (SBU/CUI). Several systems are available, including Law

Enforcement Online (LEO), the Regional Information Sharing System Network (RISS.NET), Automated Trusted information Exchange (ATIX) (originally the Anti-Terrorism Information Exchange)—some of which are available at no charge to the user. With the growth of the Global Justice Extensible Markup Language Data Model (GJXDM) standard[1], access to these systems will be essential for the most accurate information-sharing.

- Established policies for information collection, reporting, and dissemination.
- Established ability to determine the kinds of information and intelligence that is needed to effectively prevent terrorism and disrupt criminal enterprises. This is a difficult challenge requiring a significant labor investment. Understanding the threats and targets within a community and developing responses to neutralize those threats is essential. American law enforcement must discover the evidence of threats that may be in its backyard.

Beyond these factors, a number of management factors may be considered when developing an intelligence capacity. A common question asked by law enforcement executives and those responsible for developing an intelligence capacity, is "Where do I start?" Providing a succinct response is not easy because the starting place will vary depending on agency size, the chief executive's vision, the geographic location of the jurisdiction, the presence of factors that make the jurisdiction a terrorist or criminal target, and other variables unique to the jurisdiction and agency. The first part of the answer is to provide a list of factors to consider when developing or reengineering the intelligence capacity of a law enforcement agency. The second part of the answer is to develop a Concept of Operations (ConOps) for the intelligence unit to refine how the intelligence function is envisioned to integrate it into the agency's other activities. Finally, attention will be given to selected intelligence management issues.

A Checklist of Considerations in Developing or Reengineering the Law Enforcement Intelligence Capacity

The following is a list of questions and variables to consider when developing the intelligence capacity. Not every factor will apply to every agency, although collectively these factors will give a perspective on the intelligence function as it exists within the organizational environment. The list provides a straightforward perspective of the management responsibilities required to accomplish the task. Many of the factors will be discussed in greater detail later in the chapter. (See also Table13-1.)

Administration and Management

- The chief executive must have a vision for the role of the intelligence function.
  - What activities are expected of the intelligence function?
    - Clearinghouse of information?
    - Tactical analysis?
    - Strategic analysis/forecasting?

[1] For information about the Global Justice XML Data Model, see it.ojp.gov/jxdm.

        - Threat assessments?
        - Pointer and deconfliction activities?
        - Other? Make sure this is articulated.
    - Does the chief executive's vision include incorporating the Intelligence-Led Policing (ILP) philosophy throughout the law enforcement agency?
        - If not, what is the envisioned relationship of intelligence to other departmental activities?
            - This should be clearly articulated by the chief executive.
    - If intelligence is one of several responsibilities assigned to one person or unit, what is its priority/relationship to other responsibilities?
    - What crimes are to be the focus (i.e., strategic priorities) of the intelligence function?
    - Will "all hazards" be included?
    - If so, how will it be defined for the intelligence function?
    - What outputs and activities are expected of the intelligence function?
    - Question: Does the chief executive and/or command staff need to be briefed (i.e., trained) on contemporary law enforcement intelligence?
        - If so, how do you propose to suggest or accomplish this?
- The chief executive must demonstrate commitment and support for the intelligence function.
    - This includes allocation of people and adequate resources.
- Obtain budget parameters.
    - How much funding will be available to establish the intelligence unit?
- Will the intelligence supervisor be organizationally responsible directly to the chief executive or to another commander (e.g., the criminal investigations division commander or operations division commander)?
    - There are advantages to both direct reporting to the chief executive and reporting to another commander.
        - If the intelligence unit supervisor answers directly to the chief executive:
            - Advantage: More direct information flow and operational responses regarding threats.
            - Disadvantage: There may be jealousies among those of higher rank with respect to the intelligence supervisor's access to the chief executive.
        - If the unit is assigned under another division commander:
            - Advantage: It helps shield the unit from criticisms of secrecy, which often becomes an issue.
            - Disadvantage: A filtering effect of critical information can occur.
    - While other advantages and disadvantages can occur, they will be dependent on the culture of the law enforcement organization.

Develop the Intelligence Unit's Infrastructure

- Mission, goal(s), and objectives of the intelligence function must be articulated.
- Develop necessary policies and procedures (See Table 13-1 for a list of areas in which to consider developing policy for the intelligence function. The need for policy will be related directly to the mission, goals, and objectives.)
  - Develop a privacy policy that is consistent with federal privacy guidelines.[2]
  - Develop a policy and procedures for your criminal intelligence records system that is 28 CFR Part 23-compliant.
    - The Law Enforcement Intelligence Unit (LEIU) *File Guidelines*[3] serves as a court-tested model.
    - The criminal intelligence records policy should include:
      - Collection standard of a criminal predicate.
      - Retention guidelines.
        - Temporary files should have a time limit for retaining information and standards for review and purging.
      - Review of records in the criminal intelligence records system.
      - Purging requirements and processes.
      - Dissemination criteria.
      - Nondiscrimination statement.
- Select an office location.
  - Will the unit be colocated with CID, narcotics, organized crime, or other unit?
    - If so, be certain that the physical location will be able to meet the security requirements needed for intelligence records.
  - If the intelligence unit is at an off-site location, it is preferable to have a stand-alone office, not with other businesses.
  - Ideally, the intelligence unit's office will be centrally located.
  - Develop your work environment
    - Get access to intelligence products and networks.
    - Lockable filing cabinets.
    - Dedicated computer.
    - All personnel, supplies, and services necessary to fulfill the vision.
- Purchase or obtain the unit's vehicles
  - Undercover vehicles in a variety of styles and colors.

[2] it.ojp.gov/default.aspx?area=globalJustice&page=1151.

[3] it.ojp.gov/documents/LEIU_Crim_Intell_File_Guidelines.pdf.

Table 13-1: Sample Issues for Intelligence Unit Policy Development[4]

- Intelligence unit organization, role, and responsibilities
- Intelligence unit staff position requirements, selection, and training
- Privacy policy (consistent with the federal Information Sharing Environment (ISE) *Privacy Guidelines*)
- Intelligence unit records management
  - 28 CFR Part 23 compliant file guidelines (including standards and processes collection, retention, review, purging, and disseminating)
  - Quality control procedures for data and information accuracy
- Handling of SBU/CUI information
- Access, documentation, dissemination, and of use of information form
  - Intelligence records systems (i.e., RISS.NET, LEO, Homeland Security Information Network [HSIN])
  - Contacting other agencies and jurisdictions (i.e., fusion centers, FBI Field Intelligence Group [FIG], and other law enforcement agencies)
  - Contacting International Criminal Police Organization (INTERPOL)
  - Contacting El Paso Intelligence Center (EPIC)
- Types of intelligence products to be produced
  - Marking and dissemination policy for intelligence products
- Intelligence unit reporting procedures and dissemination
- Suspicious Activity Reporting and field interview procedures and reporting
- Classification and security system for the agency and/or intelligence unit
  - Rules for violations of the security system
- Procedures and accountability when operating under a memorandum of agreement
- Intelligence unit processes and responsibilities during critical incidents
- Surveillance operations (processes, documentation, limitations)
- Access to equipment and resources in support of intelligence activities
- Use of criminal informants
  - Guidelines for payments to criminal informants
- Undercover operations in support of the intelligence function
  - Undercover reporting procedure
  - Investigative and undercover expense fund accountability
  - Consumption of alcoholic beverages during undercover operations and surveillance
  - Narcotic simulation during undercover narcotic investigations
- Information release and media policy
- Intelligence unit performance evaluation and review

[4] A number of sample *Intelligence Policy Manuals* are available online at the DHS Fusion Process Technical Assistance Program at www.llis.dhs.gov. In addition, sample policies are available at the National Criminal intelligence Resource Center web site accessible through the RISS.NET portal and LEO. As will be seen, there is a wide variation of structures and approaches to these manuals. Each needs to be tailored to a specific agency's needs, but the samples provide good guidance. In addition, the International Association of Chiefs of Police prepared a document under BJA funding that provides guidance on developing policies and procedures: Orrick, W. Dwayne. *Best Practices Guide: Developing a Police Department Policy-Procedure Manual.* Alexandria, Virginia: International Association of Chiefs of Police, undated.

Staffing

- Select personnel: Intelligence officers
  - Consider languages and education.
  - Consider how the officers get along with other agencies.
  - Consider a past officer/deputy with undercover experience.
  - Consider policing style.
    - A person who is aggressive in making arrests and kicking in doors typically will not be a good fit in an intelligence unit.
    - Personal characteristics most suited to the intelligence unit include:
      - Maturity.
      - Dependability.
      - Works well without supervision.
      - Self-motivator.
      - A team player.
  - In the selection of officers for the intelligence unit, be certain they are able to obtain a security clearance, if required for the position.
    - For law enforcement officers, one of the more common factors that prohibits them from receiving a clearance is poor credit.
  - Consider knowledge of your special needs, such as gangs, computers, surveillance techniques, tactical surveillance equipment, etc.
- Select personnel: Analysts
  - The analyst's position and role should be viewed as a practicing professional of equal organizational stature to officers, not treated as support staff.
  - Desirable characteristics of an analyst include:
    - Highly motivated.
    - Critical thinker.
    - Strong computer skills.
    - Willing to help all with cases.
    - Ability to obtain a security clearance.
- Once personnel have been selected, contact the local FBI office to apply for security clearances for your new personnel[5]
  - In most cases, a Secret-level clearance will be sufficient. The process takes several months.

Training

- Training
  - Get the added training you need to further your strategic plan.
    - Includes training on your specific policies/procedures.
  - Remember, training includes both the intelligence discipline and training on crimes that are the focus of the intelligence unit.
- Ensure that all training meets the standards of:

[5] See www.fbi.gov/clearance/securityclearance.htm.

- Minimum Criminal Intelligence Training Standards.[6]
- *National Criminal Intelligence Sharing Plan.*[7]

- Conduct a training needs assessment and enroll your personnel in the training they need (Below are examples. Training will be discussed later in the chapter).
  - Training on the discipline and processes of intelligence.
  - Analytic training.
  - Intelligence records management, including 28 CFR Part 23.
  - Analysts will need many other courses to become proficient.
    - Certified Intelligence Analyst certificates.
    - Crime mapping.
    - HIDTA Programs (Analytical Investigative Techniques I and II).
    - FINCEN.
  - Join open-source networks.
- Be certain to monitor the Bureau of Justice Assistance "Criminal Intelligence Master Training Calendar."[8]

Information Management and Information-Sharing

- In light of the chief's vision of intelligence products:
  - Identify the types of intelligence products to produce.
  - Identify the dissemination table of intelligence products.
    - Internal dissemination only?
    - If external dissemination will be included, define:
      - Dissemination criteria (What are the characteristics of recipients who receive the products).
      - Will the Third Agency Rule be applied?
      - Must products be approved for dissemination prior to being sent?
      - What is the mechanism for disseminating products?
      - Will there be an audit trail for disseminated products?
      - What types of products will not be disseminated outside of the agency?
- Select computer databases to store information and intelligence records:
  - Must be kept separate from your agency's regular Records Management System.
  - Must be able to purge records from the system so they are destroyed and not accessible in the future.
  - Secure and audited access to computers and systems.
- Obtain individual computers for your personnel.
  - Analysts need a more powerful and diverse system than needed by officers and deputies.

[6] it.ojp.gov/documents/min_crim_intel_stand.pdf.

[7] it.ojp.gov/documents/NCISP_Plan.pdf.

[8] mastercalendar.ncirc.gov.

- Basic software needs:[9]
  - Word processing program.
  - Spreadsheet program.
  - Relational database.
  - Presentation software.
  - Flowcharting software.
  - Link analysis software.
  - Database reporting/visualization software.
  - Mapping software.
  - Photo enhancement software.
  - Telephone analysis software.
  - Analytic charting.
  - Portable Document Format (PDF) creation software.
  - Security software (virus, adware, spyware software; firewall, and Virtual Private Network [VPN] security).
  - Publication software.
  - Statistical analysis software.
  - Text mining software.
- Budget for analytical tools and commercial databases, including membership in the Regional Information Sharing System (RISS) center and commercial data base search system.
- Full Internet access.
- Stand-alone computer for covert operations.

- Develop a report and intelligence product numbering system.
  - Keep an audit and control log of issued numbers that can be accessed by unit members.
  - Develop a system that easily permits identification of unit, date, and application of the bulletin.
- Organize monthly meetings among all area analysts to discuss and share issues and analytic methods.
- Organize and host a monthly intelligence meeting with other area law enforcement agencies.
  - Meetings should include analysts and officers.
    - Creates a trusting environment with others.
    - Face-to-face contact is critical.
    - Sharing information is critical.
    - Creates a contact list to handle situations quickly.
  - Also invite specific trusted/vetted individuals from appropriate private-sector companies that can assist in your goals, as applicable.
  - Invite federal agencies such as the Joint Terrorism Task Force (JTTF) or Immigration and Customs Enforcement.

[9] Resource: Global Justice Information Sharing Initiative. *Analyst Toolbox. A Toolbox for the Intelligence Analyst.* Washington, D.C.:, U.S. Department of Justice, Global Justice information Sharing Initiative, Intelligence Working Group, November 2006. it.ojp.gov/documents/analyst_toolbox.pdf.

Implementation and Assessment

- Start the process:
  - Test your system and be prepared to adjust it.
  - Identify critical processes and procedures to collect data for assessment.
  - Ask the consumers of the intelligence function if it is working.
  - Seek suggestions for improvement.
- Implement an audit process.
  - Intelligence Guide Audit Model.
  - LEIU Audit Checklist for the Criminal Intelligence Function.
- Strive for continuous quality improvement.

The points in this list are food for thought in developing the agency's intelligence structure. These factors are intended to help identify issues that need to be addressed in planning for the intelligence function. The next step is to integrate these factors into a cohesive vision of how the intelligence structure will actually operate within an agency. The next step, therefore, is to mold these factors into a ConOps.

Developing the Concept of Operations

The Concept of Operations (ConOps) is a user-oriented document that describes the characteristics of a proposed program, initiative, or system from the viewpoints of how staff and users will interact with the proposed initiative.[10] The ConOps is used to communicate overall characteristics of the new organizational entity—in this case, a new intelligence structure—to management, staff, and users. Ideally, the ConOps is prepared in conjunction with a business plan. While the ConOps describes the organization, mission, and organizational objectives from an integrated systems point of view, the business plan describes the proposed system or situation from an investment and process point of view.

The ConOps provides an analysis that bridges the gap between the operational needs and visions and the technical aspects of a functioning organization, in this case, an intelligence unit. The ConOps should also document a program's characteristics and the user's operational needs in a manner that can be confirmed by the user without requiring any technical knowledge beyond that required to perform normal job functions. Management and users, for example, need to understand how the intelligence unit will function and the products it will produce, but do not need to know how to conduct specific types of analysis or access specific systems.

The ConOps documents the visions and expectations of management and users alike without requiring the provision of quantified, testable specifications until later in the system life cycle. The ConOps also provides a mechanism for management and users to express thoughts and concerns about possible issues, strategies, and processes before actual implementation of the system.

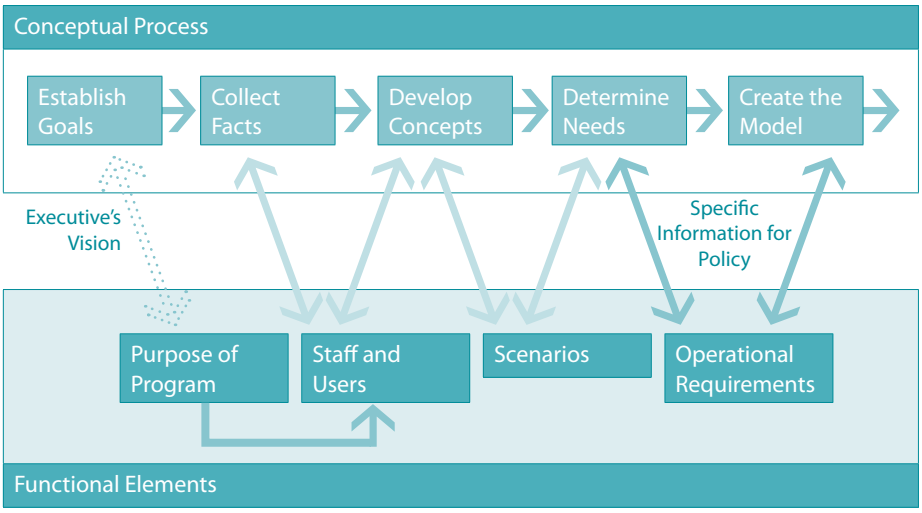
The ConOps represents a process for developing a new functional concept of an organizational activity. It seeks to represent the needs of the organization,

[10] To review different law enforcement agency ConOps, after registering for the DHS Lessons Learned Information Sharing (LLIS) system – www/llis.dhs.gov – go to the Fusion Process Technical Assistance Resource Center and search the "channel" for "ConOps."

needs of the users/consumers of intelligence, and embraces lessons learned or best practices of other organizations, all tailored to meet the needs of the law enforcement agency.

Figure 13-1 illustrates the development process. The series of progressive activities, illustrated on the top row, are intended to clarify the operational concept of a new organizational activity, in this case, a new intelligence structure. The bottom row represents functional components required to develop the concept. More specifically, in order to establish goals, one needs to know the intended purpose of the program, which will be strongly directed by the chief executive's vision of the program. This vision must be shared with the staff who will actually develop and operate the program. Once the goals are clear, the ConOps can move forward to develop an intelligence structure that can accomplish those goals.

Figure 13-1: Process for the Development of a Concept of Operations



The next conceptual step is to gather information related to the goals, for example, national standards (such as the NCISP and *Fusion Center Guidelines)*, lessons learned and best practices from other agencies, legal issues, and other factors that may be specifically idiosyncratic to the jurisdiction. The latter information often has to be gained from staff and potential users of the new (or reengineered) intelligence structure. Based on the collective analysis of these facts, the concept of how the new intelligence structure will work begins to take shape. Once again, two-way discussion with staff and users is essential to ensure that the concept will work. One of the effective mechanisms for testing this is to develop different information-sharing and analytic scenarios to illustrate the concept. For example, if a new Suspicious Activity Reporting mechanism is to be part of the new intelligence structure, different scenarios of how the system would work can be developed with feedback from staff and users on the strengths, weaknesses, and constraints of the system.

Relevant Definitions

- *Concept of Operations:* Articulates the concept and vision of a new organizational entity.
- *Business Plan:* Takes the ConOps to the next step. The business plan establishes functional processes, implementation strategies, and daily operations of the organizational entity.
- *Implementation:* The actual process of making the concept a reality through the use of the business plan.

By developing scenarios for all aspects of the new intelligence enterprise, specific changes to, or needs for, the system can be identified and built into the concept. These needs will help define the operational requirements for the new intelligence structure to be successful—everything from office space to training to new report forms. Once they have been identified, the final model, represented by the ConOps, can be prepared for review and consideration. The culmination of this process needs to be placed in written form to fully communicate the new operational concept.

Contents of a Concept of Operations

There are different models of ConOps, each of which will always need some degree of adaption to meet the unique needs of a given agency or fusion center. The following model, which is broadly based on a model used by the U.S. Department of Health and Human Services,[11] provides a blending of the more common elements found in a ConOps as used by a law enforcement agency.

Title Page
Contents
Figures
Tables

1. *Introduction:* Summarize the purpose of the document, the scope of activities that resulted in its development, its relationship to other relevant plans or standards, the intended audience for the ConOps, and expected evolution of the document. Also describe any security or privacy considerations associated with use of the ConOps.
2. *Referenced Documents:* Provide identifying information for all documents referenced within the ConOps document (e.g., NCISP, *Fusion Center Guidelines*, 28 CFR Part 23, as well as legislation, feasibility studies, or any other relevant documentation.)
3. *Current System or Situation:* Describe the intelligence structure as it currently exists. If there is no current intelligence structure on which to base changes, then describe the situation that motivates development of the proposed intelligence unit.

   3.1 Background, Objectives, and Scope

   Provide an overview of the current intelligence structure including, as applicable, background, mission, goals, objectives, scope, and responsibilities for the current intelligence structure.

[11] www.cms.hhs.gov/SystemLifecycleFramework/Downloads/ConOps.pdf.

3.2 Operational Policies and Constraints

Describe the operational policies and constraints affecting the operations of the current intelligence structure. Operational policies are predetermined management decisions regarding the operations of the current system, normally in the form of general statements or understandings that guide or limit decision-making activities, but allow for some discretion. Operational constraints are limitations placed on the operations of the current system (e.g., available hours of intelligence unit operation, available number of personnel to work in the unit, networking constraints, etc.).

3.3 Description of Current System or Situation

Describe the current intelligence structure or situation that is simple and clear enough that all intended readers of the document can fully understand it. Provide a graphical overview of the current system or situation in the form of a context diagram, a top-level object diagram, or some other kind of diagram that depicts the system and its environment. The description should include the following, as appropriate:

- The operational environment and its characteristics (e.g., facilities, equipment, computing hardware, software, communications links, personnel, and operational procedures used to operate the existing system)
- Major system components and the interconnection among those components
- Interfaces to external systems or procedures
- Capabilities, functions, and features of the current intelligence structure, including types of products that are produced
- Charts and accompanying descriptions depicting inputs, outputs, data flows, control flows, and manual and automated processes sufficient to understand the current system or situation from the user's point of view
- Cost of system operations
- Operational risk factors
- Performance characteristics, such as speed, throughput, volume, frequency
- Quality attributes, such as availability, correctness, efficiency, expandability, flexibility, interoperability, maintainability, portability, reliability, reusability, supportability, survivability, and usability
- Provisions for safety, security, privacy, integrity, and continuity of operations in emergencies that exert influence on the operation or operational environment of the current system.

3.4 Current Modes of Operation

Describe the various modes of operation for the current intelligence structure (e.g., normal, imminent threat, emergency event, natural disaster) including strengths and weaknesses.

3.5 Current Users and Stakeholders

A user class is distinguished by the ways in which users interact with the current intelligence structure. Include descriptions of both internal and external intelligence users, how these users were identified, feedback from the users, and demands from users to which the intelligence structure is currently unable to respond.

3.6 Current Support Environment

Describe the support environment for the current intelligence structure, including support organizations or units; facilities; equipment; support software; and any other aspect of support. For external partners of the intelligence structure, describe the roles, responsibilities, and if a memorandum of understanding (MOU) is in place.

4. *Justification and Description of Changes:* Describe briefly the shortcomings or limitations of the current intelligence structure or the circumstances that motivated development of a new or modified intelligence structure. If there is no current intelligence structure on which to base changes, then so indicate and provide justification for the new structure.

4.1 Justification of Changes

Summarize briefly new or modified aspects of the intelligence unit's operations, including the types of analysis, products, changes, or modified mission and the reasons for those changes. Changes may be based on new national standards, a new MOU, new strategic priorities of the executive, external funding requirements, legislation, or any of a variety of factors.

It is important to articulate the reasons for change to ensure that the explicit conditions or mandates for the change are being met.

4.2 Description of Desired Changes

Summarize the new or modified capabilities, functions, processes, products, and other changes needed to respond to the factors identified in 4.1. Changes should be based on the current intelligence structure described in Section 3. If there is no existing intelligence structure on which to base changes, summarize the capabilities that a new structure will provide. The description should include the following, as appropriate:

- Capability changes
- Information processing changes
- Product changes
- Personnel changes
- Priority changes
- Partnership changes
- Support changes
- Other changes.

4.3 Priorities among Changes

Identify priorities among the desired changes and new features. Each change should be classified as essential, desirable, or optional, and a reason provided for the classification.

4.4 Changes Considered but not Included

Identify desired changes and new features considered but not included in section 4.2, and the rationale for not including them.

5. *Proposed System or Situation:* Describe the concepts for the proposed intelligence structure that results from the desired changes specified in Section 4. The description should be at a high level, indicating the operational features that will be provided without specifying design details. The description should be of sufficient detail to fully explain how the proposed system is envisioned to operate in fulfilling users' needs and the law enforcement agency's business requirements. The ConOps may contain some examples of typical design strategies for the purpose of clarifying operational details of the proposed system, but should not contain design specifications.

   5.1 Background, Objectives, and Scope

   Provide an overview of the proposed intelligence structure including, as applicable, background, mission, goals, objectives, scope, business drivers, and motivation.

   5.2 Operational Policies and Constraints

   Describe the operational policies and constraints affecting the operations of the proposed system. Operational policies are predetermined management decisions regarding the operations of the proposed system, normally in the form of general statements or understandings that guide or limit decision-making activities, but allow for some discretion.

   Operational constraints are limitations placed on the operations of the proposed system (e.g., available hours of system operation, available number of personnel to operate the system, computer hardware, and operational facilities constraints).

   5.3 Description of the Proposed Intelligence Structure

   Describe the proposed intelligence structure that is simple and clear enough that all intended readers of the document can fully understand it. Provide a graphical overview of the proposed structure in the form of a context diagram, a top-level object diagram, relationship to other intelligence entities (particularly as applied to fusion centers), structure within an agency of governmental entity, or some other type of diagram that depicts the structure and its environment. The description should include the following, as appropriate:

   - The intelligence unit's environment and its characteristics (e.g., facilities, equipment, computing hardware, software, communications links, personnel, and operational procedures used for the unit's operations)
   - Major law enforcement intelligence systems for which access is needed (e.g., RISSNET, LEO, HSIN, National Law Enforcement Telecommunication System)
   - Capabilities, functions, and features of the analytic capability including skills of analysts, analytic software, and special skills needed
   - Charts and accompanying descriptions depicting inputs, outputs, data flows, control flows, and manual and automated processes sufficient to understand the two-way information flow for the intelligence structure
   - Cost of the intelligence structure's operations
   - Operational risk factors including civil rights and privacy issues
   - Performance characteristics, such as speed, throughput, volume, frequency

- Quality attributes, such as availability, correctness, efficiency, expandability, flexibility, interoperability, reliability, and usability of intelligence products
- Provisions for security, privacy, integrity, accuracy, and continuity of operations in emergencies for the new intelligence structure.

5.4 Proposed Modes of Operation

Describe the various modes of operation for the proposed intelligence structure (e.g., normal, emergency, special threat). The intelligence structure's processes, procedures, and capabilities or functions should be related to each mode, as appropriate, perhaps using a cross-reference matrix.

5.5 Anticipated Users and Stakeholders

Specify the planned user class for the intelligence structure.

A user class is distinguished by the ways in which users interact with the proposed intelligence structure. Factors that distinguish a user class include common responsibilities, skill levels, work activities, and modes of interaction with the system.

In this context, a user is anyone who interacts with the proposed intelligence structure, including analysts, research specialists, reports officers, investigators, management decision-makers, patrol officers, trainers, and perhaps certain segments of the private sector.

5.6 Proposed Support Environment

Describe the support concepts and support environment for the intelligence structure, including partner organizations, facilities, equipment, support software, and the information-sharing environment of the intelligence structure.

6. *Operational Scenarios:* Provide step-by-step descriptions of how the intelligence structure should operate and interact with its users under a diverse set of circumstances (e.g., development of specific intelligence products as a result of a user's request; how Suspicious Activity Reports are processed through the intelligence structure; how and to whom imminent threat information would be confirmed and disseminated). The scenarios should be described in a manner that will allow readers to walk through them and gain an understanding of how all the various parts of the proposed intelligence structure functions

   The scenarios tie together all parts of the system, the users, and other entities by describing how they interact, and may also be used to describe what the system should not do. The scenarios can be presented in several different ways: for each major intelligence activity or function of the proposed structure; thread-based, where each scenario follows one type of transaction type through the proposed structure, or following the information flow through the system.

7. *Summary of Impacts:* Describe the anticipated operational and organizational impacts of the proposed intelligence structure on the staff, users/consumers, and management. Also describe the temporary impacts on the staff, users/consumers, and management during the time when the new intelligence structure is being conceptualized, during the development of the structure, while the project is being implemented, and when training is being provided. This information will allow all affected organizations and organizational units to prepare for the changes that will be brought about by the new structure and to plan for the impacts during development and transition to the new structure.

7.1 Operational Impacts

Describe the operational impacts of the proposed system on the users, system developers, and the support and maintenance organizations. The impacts to consider include the following:

- Information-sharing with primary or alternative information sources and/or systems
- Changes in procedures
- Use of new analytic methods and resources
- Changes in quantity, type, and timing of data to be entered into the system
- Changes in intelligence requirements
- New modes of operation based on imminent threats and emergencies
- New processes for responding to user analytic requests
- Changes in the operational budget.

7.2. Organizational Impacts

Describe the anticipated organizational impacts of the proposed intelligence structure, compared with current impacts, on staff, management, personnel, partners, and other users of the intelligence structure.

7.3. Impacts During Development

Describe the anticipated impacts on staff, management, personnel, partners, and other users of the intelligence structure during the development of the new intelligence structure. The impacts to consider include the following:

- Involvement in studies, meetings, and discussions prior to implementation of the new structure
- User and support involvement in testing and review of new processes and methods, including training
- Parallel operation of the new and existing structure during transition.

8. *Analysis of the Proposed Intelligence Structure:* Provide an analysis of the benefits, limitations, advantages, disadvantages, and alternatives and trade-offs considered for the proposed intelligence structure.

8.1. Summary of Improvements

Provide a qualitative (and to the extent possible, quantitative) summary of the benefits that the proposed intelligence structure will provide.

8.2. Disadvantages and Limitations

Provide a qualitative (and to the extent possible, quantitative) summary of the disadvantages and/or limitations of the proposed intelligence structure. Disadvantages might include the need to retrain personnel or change to a new style of information-sharing. Limitations might include products and services desired by users but not included as part of the new intelligence structure.

8.3. Alternatives and Trade-Offs Considered

Describe major alternatives considered, the trade-offs among them, and rationale for the decisions reached. In the context of the ConOps, alternatives are operational alternatives. For example, using shared or contract intelligence analysts, limiting the intelligence structure to only strategic or tactical analysis, or colocating the new structure with another agency, etc.

Appendixes

Use appendixes to facilitate ease of use and maintenance of the ConOps document. Each appendix should be referenced in the main body of the document where that information would normally have been provided; for example, samples of new report forms or new policy and procedures.

Glossary

Provide clear and concise definitions for terms used in the ConOps that may be unfamiliar to readers of the document.

The ConOps Next Step

As the name implies, the ConOps is intended to describe how the intelligence vision of the chief executive is conceptualized in an operational form; that is, the ConOps translates the vision into a functional model. The intent is to permit stakeholders—staff, users, management, and relevant external parties—to understand the intended dynamics and comment on different aspects of the envisioned operations. Feedback by stakeholders may be used to fine-tune the concept, as long as it stays true to its vision. The next step is to use the ConOps as a road map to implement the new intelligence structure.

Implementing and Managing the Intelligence Structure

As noted previously, the principles of management apply to the intelligence function of an agency just as they apply to any other organizational entity. The following management discussion focuses on selected elements related to the intelligence function. As will be seen, many of the issues in the following discussions will be applicable to preparing the ConOps.

Establishing an Organizational Framework

Just as any other function in a law enforcement agency, organizational attention must be given to the administrative structure of the intelligence function. Administrators and managers must examine these concerns:

- The need for the intelligence function as it relates to strategic priorities of the agency
- How the intelligence structure functions on a daily basis
- Issues of resource acquisition, deployment, and management
- Future agency requirements for the intelligence function.

Properly organized and staffed, the intelligence function serves as an internal consultant to management for resource deployment. It should be designed as an integrated and organic element of the law enforcement organization, not a distinct function. Indeed, this approach supports the effective implementation of ILP. Intelligence defines the scope and dimensions of complex criminality—including terrorism—facing the jurisdiction and provides alternatives for policy responses to those problems. Also important, it serves as a focal point for information sharing and dissemination to maximize community safety.

Some law enforcement agencies have been reluctant to fully develop an intelligence structure—including both tactical and strategic activities—for several reasons. Perhaps at the top of the list is the past abuses and subsequent lawsuits from poorly organized and managed intelligence activities. In many cases, law enforcement executives eliminated the intelligence function to reduce liability and to minimize criticism from persons in the community who did not understand the intelligence role and/or generally opposed law enforcement intelligence for philosophical reasons. Similarly, the need and value of an intelligence function has not been fully recognized by managers who often do not understand that the intelligence function can be an important resource for agency planning and operations. Intelligence analysts, for example, are frequently assigned clerical tasks such as responding to requests to check names or doing a records search of a person's background, in addition to their analytic duties, largely because the manager does not understand the value that is lost to the organization if the analyst does not have the time to devote to his or her function.

As a consequence of several factors, the zeitgeist—or spirit of the times—is now present for American law enforcement to embrace law enforcement intelligence of the 21st century. Many SLTLE agencies have established a legacy of proactive law enforcement through the use of community policing and its activities of problem solving, CompStat, crime analysis, effective internal and external communications, multidisciplinary responses to crime, and a bottom-up approach to operational direction. Moreover, since 9/11, there has been a greater development of resources and training to make intelligence activities more easily adapted and functional. Finally, the law enforcement intelligence function has become professionalized through greater involvement of academic institutions, federal initiatives, and long-standing activities by groups such as the International Association of Law Enforcement Intelligence Analysts, Inc. (IALEIA) and the LEIU.[12]

Chartering an Intelligence Unit

One of the first steps in creating an intelligence structure is to charter the function through the following steps:

- Determine its organizational structural priority and placement
- Allocate resources
- Define its mission and goals
- Establish the unit's authority and responsibility.

[12] For more information about these organizations, see their respective web pages at www.ialeia.org and www.leiu-homepage.org.

A number of publications describe these processes.[13] The current discussion will identify specific points related to the intelligence function.

The creation of an intelligence function should be based on a needs assessment.[14] This includes identifying current intelligence-related competencies of the law enforcement agency and desired competencies. One of the main outcomes of an effective needs assessment is identifying how an intelligence structure can influence the drive toward greater efficiency and responsiveness. Also important, the needs assessment will define personnel and resource needs.

Resource allocation is always a difficult process because it typically involves diminishing one function to develop another. In most cases, the creation of a new unit will not come with a new appropriation of funding to fully staff and operationalize it; therefore, part of the resource allocation process is to determine where the intelligence function fits in the organizational priorities of the law enforcement agency.

The mission of the intelligence function is the role that the unit fulfills in support of the agency's overall mission. It specifies in general language what the unit is intended to accomplish and establishes the direction and responsibility for the intelligence structure for which all other administrative actions and activities are designed to fulfill. Table 13-2 presents a sample mission statement for a law enforcement agency's intelligence unit.

A goal is the end to which all activity in the unit is directed. It is broad-based, yet functionally oriented. Important, too, the goal must be mission-related, that is, accomplishing goals supports the broader mission of the law enforcement agency. Moreover, the goals will give the unit direction in support of the mission. Since the mission of an intelligence unit will be comprehensive and incorporate diverse functions, several goals will be stipulated. The purpose of goals is to not only provide operational direction but to also serve as performance standards.[15] The environment of the community will change over time as will crime patterns and problems; therefore, the law enforcement agency should review goal statements annually and change or revise them to reflect current issues and trends. (Table 13-2 also includes an illustration of intelligence goals for a law enforcement agency.)

Authority is the right to act or command others to act toward the attainment of organizational goals. Operational authority includes decisions that must be made concerning the degree and type of activities the intelligence function may perform without seeking administrative authorization, financial flexibility of the unit to fulfill its objectives, and the degree of direction or precedence the intelligence structure can exercise over other departmental units. These factors have significant organizational implications and must be developed conceptually and stipulated by policy.

Responsibility reflects how the authority of a unit or individual is used for determining if goals have been accomplished and the mission fulfilled in a manner that is consistent with the defined limits of authority. The unit and its members must be held accountable for its charge and administrative mechanisms must be set in place to assess the degree to which the unit is meeting its responsibilities.

[13] Most police management textbooks describe these processes in detail. Perhaps of particular value are publications available from the International City Management Association bookstore.icma.org.

[14] A good illustration of a law enforcement needs assessment and how it can be performed, which includes multiple applications, is: Healy, J.J. *Needs Assessment in a Multinational Context: A Police Training Program,* Chapter 20. Superintendent, International Training and Peacekeeping Branch, Royal Canadian Mounted Police. www.rcmp-learning.org/docs/ecdd1134.htm.

[15] Performance standards are often characterized as effectiveness and efficiency, wherein effectiveness is "Doing the right job," and efficiency is "Doing the job right."

IACP Model Policy on Criminal Intelligence

The International Association of Chiefs of Police (IACP) has taken a proactive role in all aspects of developing a contemporary intelligence capacity in America's law enforcement agencies. The IACP *Model Policy*[16] on criminal intelligence contains a policy statement and procedures that are of particular benefit to a small agency. As in the case of all models, the language of the IACP policy needs to be adjusted to meet the needs of different jurisdictions. Nonetheless, it provides a sound foundation for starting the process.

Table 13-2: Sample Mission Statement and Goals of an LEI Unit

Sample Intelligence Mission Statement
The mission of the Intelligence Unit of the Hypothetical Police Department is to collect, evaluate, analyze, and disseminate intelligence data regarding criminal activity in this city/county and any criminal activity in other jurisdictions that may have an adverse effect on this city/county. This includes providing processes for collating and analyzing information collected by operational units of the law enforcement agency. The Intelligence Unit will furnish the chief of police with the necessary information so that operations units charged with the arrest responsibility can take the necessary enforcement action.
Sample Intelligence Goals
• The Intelligence Unit shall supply the chief of police with accurate and current strategic intelligence data so that the chief will be kept informed of changing criminal activity in the jurisdiction. • The Intelligence Unit shall provide a descriptive analysis of organized crime systems operating within the jurisdiction to provide operational units with the necessary data to identify organized crime groups and individuals working as criminal enterprises. • The Intelligence Unit will concentrate its expertise on the following crimes: » Islamic extremists in support of terrorism—activities, participants, funding, and logistical support, all of which are of a criminal nature. » Domestic extremists in support of criminal acts— activities, participants, funding, and logistical support, all of which are of a criminal nature. » Labor/strike activity—monitor and gather strategic intelligence to be supplied to the Operations Bureau with regard to this activity. » Organized crime—identify crimes and participants, including new and emerging criminal enterprises. » Major narcotics traffickers—provide tactical intelligence and information analysis to the Operations Bureau on persons identified as being involved in narcotics trafficking enterprises. The Intelligence Unit recognizes the delicate balance between the individual rights of citizens and the legitimate needs of law enforcement. In light of this recognition, the unit will perform its intelligence activities in a manner that is consistent with, and upholds, the civil rights privacy and lawful expressive activity of all persons.

[16] www.cops.usdoj.gov/Files/RIC/CDROMS/LEIntelGuide/pubs/IACP_Criminal_Intel_Model_Policy.pdf.

Auditing the Intelligence Function

An important tool for managing the intelligence function is to perform regular audits. The audit will provide an accountability mechanism that can help maximize efficiency and effectiveness while verifying adherence to policies and procedures. In addition, the audit can serve as a benchmarking tool to measure changes in performance of the intelligence function which, in turn, leads to continuous quality improvement.

The audit is not only an important management tool; it can also serve as a means of demonstrating accountability to the community. It is a structured method for tracking and measuring critical issues related to the intelligence function and provides assurances that the intelligence function is operating in a manner that is consistent with good management practices and within lawful constraints.

There are different kinds of audits, depending on the needs or issues associated with the intelligence function. In all likelihood, a law enforcement agency should perform diverse kinds of audits, such as the following, on a periodic basis.

- *Financial audit*. To ensure that the expenditure of funds is consistent with policy and allowable expenses, including appropriated funds and grant funds. In addition, if there is an undercover/informant budget, this should be audited on a regular basis.
- *Process audit*. To ensure that all intelligence activities are being performed in a manner that is consistent with the law enforcement agency's internal policies and procedures. This includes not only line personnel but also ensuring that supervisors are adequately performing their supervisory function.
- *Compliance audit*. To ensure that intelligence operations are consistent with law and regulations that are external to the organization, such as 28 CFR Part 23, legal mandates, and grant regulations
- *Outcome audit*. To ensure that the intelligence function is accomplishing its goals and objectives.
- *Service audit*. To ensure that the intelligence function is meeting the needs of its consumers.

The person(s) conducting the audit may be somewhat dependent on the nature of the issues associated with the intelligence function, both internal and external to the law enforcement agency. If no controversies are associated with the intelligence function, an audit by a supervisor should suffice, but if controversial issues are related to the intelligence operations, an external auditor would be preferable. Someone who has recognized integrity, such as a retired judge or a recognized business person who is a community leader, would serve well as an auditor. While the intelligence staff will need to provide the raw information to the auditor, an independent party asking questions, making judgments, and drawing conclusions about performance can serve an important role.

Appendix B is an audit checklist developed by the author and used at law enforcement agencies to ensure compliance with court orders. Appendix C is the Audit Checklist developed by the Law Enforcement Intelligence Unit.

Establishing and Managing Partnerships

The nature of the intelligence function requires that a law enforcement agency enter into partnerships. Critical information is shared through collaboration, typically with other law enforcement agencies, but often with other organizations ranging from the private sector (as discussed in Chapter 9) to nonlaw enforcement government agencies, such as public health, the fire service, or emergency operations. These various relationships have different dynamics related to needs, responsibilities, and limitations on access to information. As such, the parameters of each formal partnership should be articulated in a formal partnership agreement.

Broadly speaking, two types of partnerships are related to the intelligence function.

1. *Users.* Organizations and individuals with which information and/or intelligence products are shared. Users are consumers.
2. *Participants.* Organizations and individuals that provide resources and actively contribute to the intelligence activity, such as a regional fusion center. Participants have a shared responsibility for operations.

A formal agreement is simply sound management because it articulates mutually agreed-on operational provisions related to resource management, clear identification of responsibilities and accountability, adherence to legal standards, and conditions associated with liability. Certainly these agreements apply to a wide range of law enforcement activities or services; however, the current discussion is limited to the intelligence function. While the language varies between states, as a general rule there are three forms of written partnerships:

1. *Memorandum of Agreement (MOA).* Users/consumers of an intelligence unit or system, including a records system, that use the system on an ongoing basis would typically sign the MOA. Essentially, the MOA acknowledges that the user will abide by the rules established for the system or activity, aid in cost recovery, and adhere to legal and accountability standards. Obviously, the character of the activity will dictate more detail. As an example, if one agency's intelligence records system can be accessed by another agency, the user may have to agree to pay a monthly fee, adhere to 28 CFR Part 23, and agree to the Third Agency Rule. Failure to meet these standards would result in ending access to the system.
2. *Mutual Aid Pact (MAP).* The MAP is an agreement that is in place to deal with special circumstances, rather than an ongoing service, and establishes the agreed-on conditions when one agency would provide assistance to another. Often, assistance is reciprocal, except for real costs that may be incurred in extended activities. As an intelligence-related example, two law enforcement agencies may agree to aid each other when conducting a surveillance.
3. *Memorandum of Understanding (MOU).* The MOU is more detailed and involves a partnership in an activity. Essentially a contract, the MOU would specify all obligations and responsibilities and typically share liabilities in the endeavor. For example, if multiple agencies agree to develop a fusion center, the MOU may be a fairly detailed document outlining all aspects of governance, management, structure, funding, accountability, and operations of the center.

A key element to understand is that, regardless of the nature of the agreement, its content and detail is to ensure that all parties understand their obligations. Table 13-3 identifies some of the provisions that may be included in a partnership agreement. While not all of these provisions will be required of every agreement, it is important to have a formal document that clearly defines expectations and responsibilities.

Table 13-3: Sample Provisions for a Partnership Agreement

- Activities
- Civil liability/indemnification
- Dispute resolution
- Funding
- Governance
- Information – access and use
- Information – adherence to 28 CFR Part 23
- Information – dissemination to Third Agency
- Information – entry into a system
- Information – ownership
- Location
- Mission, purpose, goals
- Operating procedures
- Payments and costs
- Personnel assignment
- Personnel evaluation
- Personnel removal
- Physical plant considerations
- Property – purchase and maintenance
- Reports to be prepared
- Security clearances of staff
- Security of information
- Security of the facility
- Time limit/term of the agreement

Sources for Intelligence Management and Resource Trends

Effective management of an intelligence unit requires that the manager be constantly informed of emerging issues, technologies, and trends. This is a difficult process; however, one of the more effective methods is to monitor online newsletters of reliable organizations. Topics can range from emerging issues to best practices to new products and new policy and legislation. As an illustration (not an endorsement), some of the more substantive newsletters include (in alphabetical order) the following:

- Center for Digital Government (three newsletters; one specifically on homeland security) www.centerdigitalgov.com.
- *Federal Computer Week* www.fcw.com.
- Federation of American Scientists: Secrecy News www.fas.org/sgp/news/secrecy.
- Foundation for Defense of Democracies: *Weekly Update* www.defenddemocracy.org.
- *Government Computer News* www.gcn.com.
- *Government Computing* www.kable.co.uk.
- *Government Technology* www.govtech.net.
- *Homeland Security Institute Newsletter*: www.homelandsecurity.org.

- *Homeland Security Update* (DFI International) www.dfi-intl.com.
- *Homeland Security Week* www.govexec.com.
- *Homeland Security Weekly Newsletter* www.homelandsecurityweekly.com.

As is the case with any information, and as noted in Chapter 11 on open sources, a newsletter will reflect the agenda of its sponsor. Keeping this in mind, valuable information can be gained for an intelligence manager to remain current on the issues for which he or she is responsible.

Human Resource Issues

Who should perform the intelligence function in an SLTLE agency and what qualifications should that person have? This question is impossible to answer conclusively because it depends on myriad variables tied to the attributes of a given law enforcement agency. The agency's size, jurisdiction, geographic location, the priority intelligence is given, resource flexibility, competing crime and calls for service issues and collective bargaining agreements must be calculated into the formula. Rather than provide for the ideal situation, this discussion will present issues, and guidelines that will enable the law enforcement executive to make an informed decision about options available for staffing the intelligence function.

Staffing

Clerical and support staffing decisions can be made for the intelligence function just as for any other assignment in the agency, taking into consideration professional staff workloads, service demands, nonprofessional work activities (e.g., data entry, clerical work), and budget, among others. The key positions are with the professional staff.[17]

The Intelligence Analyst

The intelligence analyst is a professional who collects various facts and documents circumstances, evidence, interviews, and other material related to a crime and places them in a logical, related framework to develop a criminal case, explain a criminal phenomenon, or describe crime and crime trends. The analyst should have at least a baccalaureate degree and receive training in the intelligence process, criminal law and procedure, statistical analysis, and factual and evidentiary analysis. The analyst should be an objective, analytic thinker with good writing and presentation skills. This is a professional position that should be compensated accordingly. Remember: Executives and managers make important operational and resource decisions based on the analysis of issues; therefore, the best qualified and best trained analysts are essential.

An ongoing issue is whether the intelligence analyst will be sworn or nonsworn. Different agencies use different models, each with its advantages and disadvantages.[18] Those who advocate that the intelligence analyst position would

[17] For more detail, see: Wells, Ian, "Staffing the Intelligence Unit," in *Intelligence 2000: Revising the Basic Elements: A Guide for Intelligence Professionals,* ed. Marilyn B. Peterson, Bob Morehouse, and Dick Wright. Lawrenceville, New Jersey: Law Enforcement Intelligence Unit and the International Association of Law Enforcement Intelligence Analysts, 2000: 53–66.

[18] The *General Counterdrug Intelligence Plan* discusses issues related to human resources in *Section E: Analytic Personnel Development and Training.* While not specifically addressing the issues in this discussion, nonetheless it provides some observations and recommendations that are germane to the issues presented herein. See ftp.fas.org/irp/ops/le/docs/gcip/index.html.

What Characteristics Are Desired in a Good Analyst?

- General factors (modified from Frost, C. and J. Morris. *Police Intelligence Reports.* Orangevale, California: Palmer Press, 1983.)
  - » Impeccable standards of honesty and integrity
  - » A thorough understanding of the concepts of :
    - Intelligence
    - Civil liberties
    - Criminal law enforcement
  - » The capacity to think in a logical and rational manner
  - » Capacity to approach situations from broad and divergent perspectives
  - » The ability to comprehend complex masses of data and communicating its contents to others
- Background factors
  - » Broad range of interests
  - » Developed research ability (library, qualitative, quantitative)
  - » Helpful previous experience (law enforcement, military, security)
- Mental traits
  - » Intellectual curiosity
  - » Rapid assimilation of information
  - » Keen recall of information
  - » Tenacity
  - » Willingness and capacity to make judgments
- Communication skills
  - » Developed writing ability
  - » Skill in oral briefing
  - » Interviewing and interrogating skills
  - » Eliciting information from officers
- Liberal arts skills
  - » Good writing ability
  - » Fluency in a second language desirable
  - » Good knowledge of geography
- Work style
  - » Initiative and self-direction
  - » Effective personal interaction
  - » Disciplined intellectual courage

be best served by a nonsworn employee argue that the nonsworn analyst's characteristics and background may provide a more creative and less restrictive view of data when compared to sworn personnel. Further, a sworn employee is likely to be either transferred or promoted out of the intelligence unit, thereby reducing the unit's overall efficiency. Advocates of having a nonsworn employee argue that the position does not require law enforcement authority; therefore

placing a sworn person in an analyst's position may be viewed as an ineffective use of personnel. Finally, the role of an analyst is highly experiential: Over the years, the experienced analysts accumulate a mental repository of names, locations, businesses, and so forth that can be highly useful in an analysis. If this person is a sworn employee who is transferred out of the unit, that accumulated knowledge is lost.

Conversely, opponents argue that nonsworn employees do not have the substantive knowledge and experience for conducting investigations nor do they understand, with the same degree of insight, the life of the street where many intelligence targets live and operate. The analyst builds his or her expertise and knowledge cumulatively throughout his or her work life. Much of this expertise is substantive knowledge and information (persons, crime patterns, locations, and so forth) learned while working on a variety of criminal cases. The analyst needs to view crime problems from the big picture—a picture that is most precisely focused with years of law enforcement street experience.

Other factors not related to the conceptual responsibilities will enter the equation such as the compensation package, collective bargaining agreement provisions, civil service regulations, organizational culture, the candidate pool, and so forth. This is a critical position requiring an effective analytic capability and care should be taken to hire the right person to fit the agency's needs. It should not be, as has too often been the case, an appointment of convenience or a reward appointment to a good clerical person who has worked hard for the department. Professional output from the intelligence unit will occur only if the position is filled by a professional analyst.

Training

The Bureau of Justice Assistance-funded Criminal Intelligence Training Coordination Strategy Working Group conducted a needs assessment of intelligence training in the spring of 2004. Among the findings were the following:

- Training is lacking in all training classifications, but respondents rated intelligence analyst and intelligence manager as the classes most lacking in adequate training. Surprisingly, 62 percent of respondents stated that they are receiving adequate training, but more than one-third (36 percent) indicated that they were not receiving adequate training.
- The majority of respondents cited lack of funding as the primary impediment of training, but respondents also rated as high the difficulty of *finding good trainers, travel and lodging costs,* and *unsure of available training*. Only a handful of respondents selected unsure of appropriate training for personnel as an impediment. *One respondent indicated that, in order to support the tenets of the NCISP, additional training guidelines and opportunities are needed.* Other respondents indicated that training can be sporadic, which dovetails into the need for core minimum standards that can be used consistently nationwide. Other respondents indicated that their agency has not needed intelligence training because they do not have the staff or resources to engage in an intelligence function.[19] (Emphasis in original).

[19] Bureau of Justice Assistance, Criminal Intelligence Training Coordination Strategy Working Group. *Survey of Law Enforcement on Intelligence Training.* Unpublished staff report, 2004.

As a result, the *Minimum Criminal Intelligence Training Standards*[20] were created, and revised in 2007. The standards were designed to "…provide perspective and guidance for the development and delivery of law enforcement intelligence training."[21] The report goes on to note:

> …It is recognized that any type of "standard" can be debated based on an individual's personal philosophy, professional priorities, and life experiences. In order to minimize bias or atypical context, the development process for these standards used a consensual approach reflecting the cumulative judgment of law enforcement intelligence practitioners, managers, executives, trainers, and scholars from all levels of government. The standards reflect the collective judgment of these subject matter experts with respect to the minimum training needed in each noted classification to provide the basic knowledge, skills, and abilities for personnel in each classification in order for them to perform their intelligence duties.[22]

Clearly, intelligence training currently represents the proverbial mixed bag of content, availability, and structure. The content or subject matter of law enforcement intelligence can be divided in two broad categories. The first category is protocols and methodology of the intelligence process. It includes subjects such as information-collection methodologies, laws and regulations associated with intelligence records systems, analytic methods and tools, intelligence reporting structures and processes, and intelligence dissemination. Essentially, these elements constitute the discipline of law enforcement intelligence.

The second category is somewhat more amorphous. Broadly speaking, the category is subject matter expertise. It includes understanding the motives, methods, targets, and/or commodities of criminal intelligence targets. Intelligence researchers and analysts must have subject matter knowledge of the types of enterprises that are being investigated and the context within which these enterprises occur. Whether the target crime is terrorism, drug trafficking, money laundering, or the trafficking of stolen arts and antiquities, the intelligence analyst must be a subject matter expert on the genre of criminality being investigated, both broadly speaking, as well as with the unique facts associated with a specific investigation.

An intelligence analyst working on cases of terrorism by Islamic extremists, for example, needs to substantively understand the distinctions between Shiite and Sunni Muslims, the role of sectarian extremism (notably as related to Palestine), the different Islamic terrorist groups (e.g., al-Qaida, HAMAS, Hezbollah, Islamic Jihad), and their methods, the culture of Muslim nations, different leaders, methods of funding, and so forth. Such substantive knowledge is essential for an analyst to be effective.

[20] it.ojp.gov/documents/min_crim_intel_stand.pdf

[21] Intelligence Training Coordination Working Group. *Minimum Criminal Intelligence Training Standards.* Washington, D.C.: Global Intelligence Working Group, 2007, p. 1.

[22] Ibid.

All training programs currently available contain some aspect of the protocols and methodology of the intelligence process, although most programs for nonanalysts provided an overview of these issues rather than detailed instruction. Fewer programs contained subject matter information for intelligence as part of the training. For those that did provide this information, it was typically because the agency sponsoring the training had a specific jurisdictional responsibility (e.g., the Regional Counterdrug Training Academy's[23] Operational Intelligence course integrates "intelligence concepts" with more specific "drug intelligence indicators").

Training programs continue to emerge on intelligence related topics, most notably funded by the Bureau of Justice Assistance, U.S. Department of Justice, and the Office of Training and Exercise Integration (TEI), Federal Emergency Management Agency, U.S. Department of Homeland Security.[24] Perhaps the best single source for monitoring training programs of all types is through the National Criminal Intelligence Resource Center Master Criminal Intelligence Training Calendar.[25]

[23] www.rcta.org

[24] For example, the Michigan State University School of Criminal Justice has grants from the DHS to offer intelligence training for state, local, and tribal law enforcement agencies nationwide at no cost. For more information see intellprogram.msu.edu.

[25] mastercalendar.ncirc.gov

Table 13-4: Intelligence Training Categories and Descriptions

Training	Description
Awareness	The broadest, most diverse types of intelligence training could best be described as "awareness" training. These programs, which vary in length from 2 hours to 4 days, tend to include information about the intelligence discipline (i.e., definitions, methods, processes, etc.) as integrated with a specific subject matter (e.g., drugs, terrorism, auto theft, etc.). The Bureau of Justice Assistance State and Local Anti-Terrorism Training (SLATT), Federal Law Enforcement Training Center (FLETC), and other groups offer this training throughout the U.S.
Intelligence Analyst	Intelligence analysts training programs have a reasonable degree of consistency in the subject matter topics; however, the hours of training on each topic have more variability. In some cases, the curricula include substantive modules on subject matter: For example, the FBI Center for Intelligence Training program integrates intelligence methods specifically with crimes within FBI jurisdiction. Similarly, Drug Enforcement Administration (DEA) curricula integrates intelligence methods with material on drug trafficking. The most widely used analytic training program is the Foundations of Intelligence Analysis Training offered by the National White Collar Crime Center (NW3C), the International Association of Law Enforcement Intelligence Analysts, and the Law Enforcement Intelligence Unit.
Investigators and Intelligence Unit Researchers	Some intelligence training programs lack the depth of training found in the Analyst curricula, but are more detailed than simply "awareness" training. It appears that the intended audience for these programs is investigators, investigative analysts, or intelligence researchers. In each case, the curricula are similar. Notable among these courses are the 2-week DEA Federal Law Enforcement Analysts Training (FLEAT) course and the FLETC intelligence course.
Executive and Management Issues for Intelligence	Two programs funded by the Bureau of Justice Assistance are in the category: *Criminal Intelligence for the Chief Executive* and the *Intelligence Commanders Course.* In addition, the FLETC offers chief executive training, and an intelligence course at the FBI National Academy is designed for SLTLE enforcement managers.
Specialized Training	This training focuses on a narrow aspect of the entire intelligence process. The best known of these courses is the *Criminal Intelligence Analysis* course offered by Anacapa Sciences, Inc.,[27] that focuses exclusively on the "analysis" component of the intelligence cycle. Other courses that fall into this category are generally software courses such as classes on how to use a particular type of intelligence software (typically either analytic software or databases).

[26] NW3C also offers the course, *Advanced Criminal Intelligence Analysis to Prevent Terrorism*.

[27] Anacapa is a private company. This reference should not be considered an endorsement of the product by the author, the Department of Justice, or any of its components. It is used only as a descriptive illustration.

Categories of Currently Available Intelligence Training Programs

A wide range of programs has been developed on various aspects of law enforcement intelligence. Virtually all were developed before the standards and specifications in the *National Criminal Intelligence Sharing Plan* were established. Table 13-4 describes the five categories of available training programs.

A few law enforcement intelligence training programs serve as core programs because of their consistency and the expertise they offer. A great deal of experience and thought has served as the basis for their development and, as such, they provide models for good practice. For example, the *Intelligence Toolbox* that is offered nationwide by Michigan State University and funded by the Department of Homeland Security, FEMA/TEI, is a comprehensive training program designed to provide a law enforcement agency with all the tools needed to develop a contemporary intelligence capacity that meets all national standards.[28] The following summary descriptions of the most notable programs will provide more insight.

Federal Bureau of Investigation Center for Intelligence Studies[29]

After the terrorists' attacks of 9/11, the Attorney General mandated the FBI to focus on terrorism as its top priority. This necessitated a number of changes in the FBI, including expanding its law enforcement intelligence capability and working closely with state and local law enforcement agencies on terrorism investigations through Joint Terrorism Task Forces (JTTF) and Field Intelligence Groups (FIG). Among the needs precipitated by these changes was a significant broadening of the capacity for intelligence analysis among FBI personnel as well as among state and local JTTF and FIG intelligence staff. The FBI's Center for Intelligence Training, created in 2002 (formerly the College of Analytic Studies) and located at the FBI Academy, offers a range of courses for FBI agents, FBI intelligence analysts, the FBI National Academy, and courses for state, local, and tribal law enforcement.

Drug Enforcement Administration[30]

The DEA has long been recognized for the quality of training it provides through the Intelligence Training Unit of the DEA Academy at Quantico, Virginia. DEA intelligence training focuses on information research and intelligence analysis through the 9-to-10-week (it varies) *Basic Intelligence Research Specialist* (BIRS) program. DEA also offers an advanced intelligence training program as well as specialized programs related to the use of different databases and the classified DEA proprietary intelligence computer system, MERLIN.

Because of the DEA's historic role of working with state and local law enforcement agencies, and the inherent need for intelligence in the Organized Crime Drug Enforcement Task Force and the High Intensity Drug Trafficking Areas (HIDTA), DEA developed its 4-week FLEAT program specifically directed toward state and local law enforcement agencies. The program is offered in different cities throughout the U.S. to enhance the ability of state and local agencies to send intelligence

[28] intellprogram.msu.edu

[29] For enrollment information, contact the training coordinator at your local FBI Field Office. See www.fbi.gov/contact/fo/fo.htm or the FBI Academy www.fbi.gov/hq/td/academy/academy.htm.

[30] For further information on DEA training see www.usdoj.gov/dea/programs/training.htm.

personnel to this tuition-free program. While the program has historically focused exclusively on drug enforcement and money laundering, it is being revised to include a component related to both domestic and international terrorism.

Federal Law Enforcement Training Center[31]

Serving 72 federal law enforcement agencies, FLETC has a massive training responsibility. Predominantly through the Center for State and Local Law Enforcement Training, FLETC offers three courses:

1. *Intelligence Awareness for Law Enforcement Executives Training Program.*
2. *Introductory Intelligence Analyst Training Program.*
3. *Anti-Terrorism Intelligence Awareness Training Program.*

In addition, there is a wide range of other courses related to intelligence and counterterrorism. All information on courses and enrollment is listed on the FLETC web site.[32]

Other Programs and Training Resources

Law enforcement intelligence training continues to evolve, and a number of important initiatives are now underway to deliver improved basic and specialized training at the state and local levels. In addition to the programs described so far, intelligence training initiatives include the National White Collar Crime Center's *Analyst Training Partnership,*[33] HIDTA,[34] and the SLATT[35] program, have both direct and indirect intelligence awareness training.

Beyond these programs, several COPS Office Regional Community Policing Institutes (RCPI) offer a range of counterterrorism training programs, some of which include components of intelligence awareness training. Agencies should contact the RCPI in their region to determine training program offerings.[36]

For a comprehensive view of current intelligence training, including the relationship to the minimum training standards, see *Law Enforcement Intelligence Training: A Mission-Critical Element of Domestic Security* by Merle Manzi.[37]

Intelligence Courses in Higher Education

In recent years, there has been increasing recognition in the academic community of the need for coursework in intelligence that incorporates broad multidisciplinary issues, research, and a philosophical approach to intelligence issues. Increasing numbers of colleges and universities are offering courses and degrees in intelligence studies. Indeed, growth has been so significant that a new organization was formed to represent them, the International Association for Intelligence Education.[38] Most focus on the national security Intelligence Community.

Acknowledging the author's prerogative, there is one higher education program that focuses exclusively on law enforcement intelligence. The nation's oldest criminal justice degree program at Michigan State University (MSU) has offered a cross-listed undergraduate/graduate course entitled *Law Enforcement Intelligence*

[31] FLETC is part of the Department of Homeland Security. For details and contact information see www.fletc.gov/about-fletc.

[32] See www.fletc.gov/training.

[33] This includes the International Association of Law Enforcement Intelligence Analysts, the Law Enforcement Intelligence Unit, and the Regional Information Sharing Systems. For training opportunities see www.nw3c.com/ocr/courses_desc.cfm.

[34] A number of the HIDTA initiatives have intelligence-related training programs. See www.whitehousedrugpolicy.gov/hidta to find an HIDTA office. In addition, the Washington-Baltimore HIDTA often lists a wide range of training programs, including those that are intelligence-related. See www.hidta.org/training/law_enforcement.asp.

[35] See www.iir.com/slatt/training.htm.

[36] To find an RCPI near you, call the COPS Office Response Center at 800.421.6770.

[37] Manzi, Merle. *Law Enforcement Intelligence Training: A Mission-Critical Element of Domestic Security. Intelligence Police Papers Series.* East Lansing, Michigan: Intelligence Program, School of Criminal Justice, Michigan State University, January 2008. intellprogram.msu.edu/resources/policy-papers.php.

[38] www.iafie.org

Operations for approximately 20 years. As a result of a partnership created with DEA, MSU developed a master's degree in law enforcement intelligence and analysis.[39] The degree program, offered completely online, is taught by regular MSU criminal justice faculty members, and is designed as a terminal degree, much like a master of business administration. In addition, MSU offers a certificate program in different aspects of intelligence, many of which are available for academic credit. Clearly, the demand for academic preparation for an intelligence career is a growing market.

Conclusion

This chapter provided an overview of selected issues in the management of the law enforcement intelligence function. As a rule, the application of management principles may be applied generally, regardless of the unit or assignment within a law enforcement agency. The intelligence unit checklist and the ConOps discussion were particularly directed to assist SLTLE agencies to develop or reengineer their intelligence capacity to meet current national standards.

Criminal investigation commanders need to understand caseload differentials for crimes, patrol commanders must know minimum staffing requirements to handle calls for service, and traffic commanders must understand traffic analysis and its application to selective enforcement. It is no different with the intelligence commander. This chapter identified critical substantive elements of the intelligence function that will aid the law enforcement manager to manage this activity more effectively.

[39] www.cj.msu.edu

Chapter Annex 13-1
10 Simple Steps to Help Your Agency Become Part of the National Criminal Intelligence Sharing Plan[40]

1. Recognize your responsibilities and lead by example.

   Recognize the value of sharing intelligence information within your own agency, and encourage the practice of sharing information with other law enforcement and public safety agencies. Use the guidelines and action steps outlined in the *National Criminal Intelligence Sharing Plan* ("Plan") to implement or enhance your organization's intelligence function.

2. Establish a mission statement and a policy to address developing and sharing information and intelligence data within your agency.

   The Plan provides model policies and guidelines for implementing or reviewing an agency's intelligence function. Examples include Criminal Intelligence Systems Operating Policies federal regulation 28 CFR Part 23, the International Association of Chiefs of Police's *Model Policy for Criminal Intelligence*, and the Law Enforcement Intelligence Unit's (LEIU) *Criminal Intelligence File Guidelines.*

3. Connect to your state criminal justice network and regional intelligence databases, and participate in information-sharing initiatives.

   Many states provide access to other government databases, including motor vehicles, corrections, and others. Regional intelligence databases and sharing initiatives promote communication and collaboration by providing access to other agencies' and organizations' investigative and intelligence data.

4. Ensure that privacy issues are protected in policy and practice.

   The protection of individuals' privacy and constitutional rights is an obligation of government officials and is crucial to the long-term success of criminal intelligence sharing. The Plan provides guidelines that support policies which will protect privacy and constitutional rights while not hindering the intelligence process. Implementing and supporting privacy policies and practices within your agency will also reduce your organization's liability concerns.

5. Access law enforcement web sites, subscribe to law enforcement listservs, and use the Internet as an information resource.

   Many web sites on the Internet and others on closed networks provide valuable intelligence assessments and news. Listservs provide instant and widespread communication for investigators, and allow both the receipt and distribution of intelligence information. The Internet provides a wealth of open-source information, including government information and access to private agencies that share with law enforcement.

6. Provide your agency members with appropriate training on the criminal intelligence process.

   Some training models or modules are already found in Internet-based and interactive CD-ROMs, such as the International Association of Law Enforcement Intelligence Analysts (IALEIA), National White Collar Crime Center, and LEIU "Turn Key Intelligence." A listing of available intelligence training sources and specifically scheduled classes is found on the IALEIA Web site: www.ialeia.org. This listing allows individuals to directly contact training source agencies and organizations for more information on classes and schedules.

[40] Bureau of Justice Assistance. *10 Simple Steps to Help your Agency Become Part of the National Criminal Intelligence Sharing Plan.* Washington, D.C.: 2005.

7. Become a member of your in-region Regional Information Sharing Systems® (RISS) center.

   RISS operates the only secure web-based nationwide network for communication and exchange of criminal intelligence information by participating local, state, federal, and tribal law enforcement member agencies. RISS partners with other law enforcement systems to electronically connect them to RISSNET, including High Intensity Drug Trafficking Areas (HIDTA) Investigative Support centers, and other federal and state agency systems.

8. Become a member of the FBI's Law Enforcement Online (LEO) system.

   The FBI's LEO system is a sensitive but unclassified, real-time information-sharing communications system for all levels of the law enforcement community available at no cost to its approximately 40,000 users. LEO provides secure e-mail capability, a national alert mechanism, and access to more than 125 special-interest groups for sharing information by providing access to other networks, systems, databases, and other services.

9. Partner with public and private infrastructure sectors.

   Regular communication with the entities that control America's critical infrastructures such as energy, agriculture, transportation, and shipping is critically important to ensuring the safety and security of the citizens in your community.

10. Participate in local, state, and national intelligence organizations.

    In most areas of the country, there are locally based intelligence organizations that welcome participation from all agencies and are often affiliated with state and national organizations.

Chapter Annex 13-2
Why Law Enforcement Agencies Need an Analytic Function[41]

1. Helps solve criminal investigations.

   The analytical function develops a variety of intelligence products to assist investigators in detecting, preventing, and responding to criminal and terrorism activities. Analytical personnel initiate inquiries, conduct information searches, and act as a central point for information gathered.

2. Increases the ability to prosecute criminals.

   Personnel assigned to the analytical function develop summary tables, charts, maps, and other graphics for use in a grand jury or trial. Analysts provide factual and expert testimony and organize evidence for presentation in court.

3. Supports the chief executive and the agency's mission.

   By maximizing the analytical function, the chief executive can obtain important information and intelligence to possibly prevent future criminal activities. Personnel can prepare materials to assist in allocating resources; developing budget and resource requests; and preparing departmental reports, investigative briefings, and press releases.

4. Proactively informs law enforcement officers of crime trends and develops threat, vulnerability, and risk assessments.

   The analytical function provides support to tactical and strategic operations. Personnel analyze crime reports, identify crime hot spots, develop crime bulletins and summaries, study serial crime data, and forecast future crime. The analytical function develops proactive intelligence products that assess the potential threats of crime groups or criminal activities and recommends methods to intervene in these threats.

5. Trains law enforcement and other intelligence personnel.

   Staff develop course modules on intelligence and analytic methods and provide awareness and methodology training to agency members, executives, and managers.

6. Assists in the development of computerized databases to organize information and intelligence.

   Personnel within the analytical function help in the development and maintenance of systems that collect, collate, retrieve, and disseminate information. Analytical staff participate in departmental testing and acquisition of investigative, intelligence, and analytical software.

7. Fosters meaningful relationships with other law enforcement personnel.

   Analytical staff interact with other law enforcement agencies and build relationships with peers, allowing them to quickly obtain information and efficiently assist in multijurisdictional or complex cases. Through contact with national programs and professional associations, personnel are able to ascertain national issues that may affect local agencies.

[41] Bureau of Justice Assistance. *Why Law Enforcement Agencies Need an Analytical Function.* Washington, D.C.: Bureau of Justice Assistance, October 2005.

8. Ensures compliance with local, state, tribal, and federal laws and regulations.

   Analytical personnel provide expertise and knowledge in the development of protocols to ensure compliance with local, state, tribal, and federal laws and rules that govern intelligence sharing, privacy, and civil liberties.

9. Provides support to fusion centers.

   Personnel provide support to local, state, or regional fusion centers by performing intelligence services such as crime-pattern, association, telephone-toll, and financial analysis. They create intelligence reports, briefs, threat assessments, and other intelligence products to aid in the prevention and deterrence of crime, including terrorism.

Chapter 14:

Summary, Conclusions, and Next Steps

Summary, Conclusions, and Next Steps

Effective law enforcement intelligence operations are sometimes confusing to understand, frequently controversial, and often challenging to implement. Yet, intelligence operations can be an effective tool for community safety.

Intelligence is *confusing* because many people do not make the distinction between law enforcement intelligence and national security intelligence. Moreover, the term is used generically to describe a wide body of activities, thereby contributing to the confusion. Added to this is the development of the Information Sharing Environment, which is not only changing our information-sharing relationships, but also making the demarcation between law enforcement and national security somewhat more difficult to discern on matters of terrorism. One purpose of this guide was to provide consistent and clear definitions and processes that are accepted by law enforcement intelligence professionals and reflect national standards and initiatives in intelligence to help reduce the confusion.

Law enforcement intelligence operations are *controversial* both because of the checkered history of intelligence activities as well as the concern of many today that in the zeal to prevent terrorism, citizens' civil rights will be abridged. There is no doubt that law enforcement suffered setbacks as a result of lawsuits against law enforcement intelligence practices of the 1950s and 1960s. With those setbacks, however, important lessons were learned that not only set the stage for 28 CFR Part 23, but helped lay the foundation for law enforcement intelligence as a profession. Further controversies face law enforcement today as concerned citizens and civil rights groups, who often do not fully understand the intelligence function, fear that law enforcement agencies will gather and keep information about citizens who have not committed crimes but are exercising their constitutional rights on controversial issues. The lessons law enforcement has learned from public education and community policing initiatives can help eliminate these fears—not only through the practice of ethical policing[1] but also by reaching out to diverse communities to explain police practices, responding to questions, and establishing open, trusted lines of communication.[2]

Intelligence operations are *difficult,* as well. It requires changes in processes and changes in interagency relationships to establish links with different law enforcement organizations and groups to maximize effective information sharing. It also requires a redistribution of resources to make the intelligence function perform effectively and to meet operational and training standards set out in the *National Criminal Intelligence Sharing Plan* and the *Minimum Criminal Intelligence Training Standards.* A change in culture is required for Intelligence-Led Policing to become a reality and a realignment of priorities may be needed to accomplish new goals. There is always resistance to change and always legitimate competing interests that must be weighed.

Finally, law enforcement intelligence processes can be *effective*. Intelligence can help identify threats to a community whether from terrorists, organized crime, or even noncriminal hazards. It takes diverse and often disparate information,

[1] The COPS Office Regional Community Policing Institutes (RCPI) have a variety of training curricula for executives and line officers on different aspects of ethical policing. Agencies should contact the RCPI in their region for training opportunities. For more information about an RCPI near you, call the COPS Office Response Center at 800.421.6770.

[2] The COPS Office sponsored an executive session with the Police Executive Research Forum that examined this topic. The resulting document is a valuable resource: Davies, Heather J., Murphy, Gerard R., et al. *Protecting Your Community from Terrorism: Strategies for Local Law Enforcement. Volume 2: Working with Diverse Communities.* Washington, D.C.: U.S. Department of Justice Office of Community Oriented Policing Services and the Police Executive Research Forum, March 2004. www.cops.usdoj.gov/RIC/ResourceDetail.aspx?RID=168.

integrated into a cohesive package, to provide insight that might otherwise be lost. Increasingly, law enforcement intelligence is more thorough, of higher quality, and disseminated more effectively as a result of cooperative initiatives by the Criminal Intelligence Coordinating Council, the Global Intelligence Working Group, and the Counterterrorism Training Coordination Working Group, as well as various cooperative initiatives in the Department of Justice, notably the Office of Community Oriented Policing Services and the Bureau of Justice Assistance, as well as the Department of Homeland Security (DHS) through the Intelligence and Analysis Directorate, and the Federal Emergency Management Agency through its Offices of Training and Exercise Integration/Training Operations. Similarly, there is a greater emphasis on law enforcement intelligence, punctuated by the creation of the fusion centers, and a renewed spirit of partnership between the FBI and state, local, and tribal law enforcement (SLTLE) agencies that is already bearing fruit. FBI and DHS personnel are working side-by-side with SLTLE personnel in many fusion centers to cooperatively resolve criminal threats facing our communities. The end result of all of these initiatives is to make our communities safer. The investment pays important dividends for protecting our citizens.

Challenges for the Future

When examining challenges for the future, the most effective method is to use a strategic approach that takes a macro view of critical trends and determines their impact on the law enforcement environment. An interesting and relevant study comes from the Intelligence Community as a project from the Office of the Director of National Intelligence (ODNI) that seeks to identify trends that threaten U.S. sovereign principles during the coming decade. The report observed the following:

> [m]any drivers and trends are shaping the future global environment in which the Intelligence Community must operate —demographic and social change, increased economic integration and competition, rapid technological innovation and diffusion, environmental pressures and growing energy demand, broad geopolitical changes, and new forms of governance. Each driver and trend independently produces unique changes and challenges; those points where factors intersect often reinforce and amplify the effects of change and create a series of complex and often unpredictable threats and risks that **transcend geographic borders and organizational boundaries.**[3] (Emphasis in original.)

These same trends that have potential effects on national security will also affect our local communities. At the least, they have an impact on public order and most likely influence major crime trends that are diverse and transjurisdictional in nature.

> The ODNI report goes on to observe:
>
> To these persistent threats we add a growing array of emerging missions that expands the list of national security (and hence, intelligence) concerns to include infectious diseases, science and technology surprises,

[3] McConnell, J. M. *Vision 2015: A Globally Networked and Integrated Intelligence Enterprise.* Washington, D.C.: Office of the Director of National Intelligence, 2008, p. 4.

> financial contagions, economic competition, environmental issues, energy interdependence and security, cyber attacks, threats to global commerce, and transnational crime. Foremost among these challenges is the **blurring** of lines that once separated **foreign and domestic intelligence,** and the increased importance of homeland security. By necessity, we must be involved with numerous new partners in interactive relationships, but we must also **respect and maintain the privacy and civil liberties of all Americans.**[4] (Emphasis in original.)

Thus, like the Intelligence Community, law enforcement intelligence will have increasing responsibility to manage all-hazards types of threats while working in a broadened environment of information sharing. The challenges are not only to learn to deal with these new threats and new disciplines but to do so while ensuring the constitutional guarantees of all people.

These are sobering challenges that we must begin to confront now. The safety of American society cannot wait to react; rather, we must be proactive. This, of course, is difficult to do. The challenges of handling current problems on a much broader scale than ever, while at the same time experiencing proportionately smaller budgets, requires creativity and new ways of solving problems.

While law enforcement and the Intelligence Community have made significant, and necessary, investments in technology, success in the production and application of intelligence relies on people. Law enforcement needs to recognize that the creativity to solve the complex problems of the future will require "the best and brightest" to work in government service. Effective and creative analysis of problems can help lead to interventions and solutions. Not only must law enforcement leaders explore the problems of the future, it must also examine the law enforcement culture of today. Analysts must be compensated and treated as equal professionals in law enforcement organizations. The changes that are required to prepare our organizations must begin now, because the process can be long and challenging. One approach is to use a model the author refers to as R-cubed.

Implementing Change: The R-Cubed Approach[5]

Implementing new intelligence initiatives can be difficult. As a road map to accomplish this, the author recommends a process referred to as "R-cubed": Reassessing, Refocusing, and Reallocating (R^3).

The intent of the R^3 exercise is to provide a framework for organizational change as related to intelligence responsibilities. It requires a critical self-assessment of responsibilities and resources, objectivity absent special interests, realistic perspectives, tactical and strategic considerations of traditional and new policing responsibilities, and methods (including financing) of how all police responsibilities will be accomplished. This is a labor-intensive, difficult process that cannot be rushed and should be inclusive; that is, consideration of the inputs of others—employees, community members, elected officials, other agencies—should be included in the process. Final decisions, however, remain with law

[4] Ibid.

[5] Carter, David L. *The Police and Community.* 7th Ed. Englewood Cliffs, New Jersey: Prentice Hall, Inc., 2000.

enforcement executives to make changes as best determined by their collective judgment of responsibilities, priorities, and available resources. A number of factors may be included in each component of the R^3 exercise.

Reassessing

Examine both current priorities and new priorities for intelligence and homeland security to determine what activities need to be continued to maintain community safety and fulfill the law enforcement mission related to crime, order maintenance, and counterterrorism. This assessment should include consideration of a number of variables, such as the following:

- The number of calls for service received by a law enforcement agency and the ability to handle them.
- Specialization currently in the police department, e.g., gangs, narcotics, school programs, initiatives directed toward senior citizens, traffic, etc., and the true demand or need for each specialization.
- Objectivity is critical because special interests can skew priorities.
- Specialization that needs to be developed, e.g., intelligence capacity, first-responder (including weapons of mass destruction), computer crime/cyberterrorism prevention and investigative expertise, investigative capacity for terrorism, obligation to assign personnel to the Joint Terrorism Task Force, and expertise in all-hazards threats that can effect public safety and public order.
- Resources that can be used to help with police responsibilities of all forms, e.g., police reserves, volunteers, expertise in other agencies, community organizations.
- Objective assessment of threats and potential targets within the community and within the region. The latter includes how multijurisdictional crime and terrorist threats would affect an agency directly and indirectly, including mutual aid obligations.
- Current intelligence expertise and practices, including information sharing, and the need to modify these practices, including adding a private-sector component for critical infrastructure.
- Political mandates from elected officials and/or the community that should not be ignored because expectations and concerns of these groups must be taken into account in any assessment process.

Refocusing

Guided by the results of the reassessment, a department must develop a plan of change that incorporates its new priorities, as appropriate. Virtually all of the department's current tasks will continue in some form, but the amount of emphasis and proportion of resources devoted to those tasks will differ, notably in light of added homeland security responsibilities.

Refocusing first requires the department to establish its new priorities by reassessing and evaluating its responsibilities. From there it can it can refocus on its priorities, if needed. While reassessment involves information gathering and analysis, refocusing is the development and implementation of policy steps to make the changes operational.

Second, each area of responsibility must be weighted (i.e., weight constitutes the amount of emphasis given to each broad area of tasks and determines which area receives the greatest amount of attention.) The author does not suggest that intelligence should be the top priority; indeed, in most police agencies managing calls for service will remain the top priority. Instead, this is a realistic expectation that priorities will change with the addition of intelligence/homeland security and that all responsibilities will be affected to some degree. To determine this realignment, responsibilities and weights must be stipulated.

Third, these changes are actually implemented through the issuance of updated (and new, when applicable) policies, procedures, and orders. Implementation also requires communication and, in some cases, in-service training, to explain and clarify the changes.

Reallocating

Once refocusing decisions have been made, the department must reallocate its resources to meet adjusted priorities. This includes personnel, operating expenses, equipment (from cars to radios to computers) and office space, as needed. There is always the possibility that the department will receive an increased appropriation for homeland security in its budget, but it should not be counted on. If so, most likely it will be only a proportion of actual resource needs. The difficult process of reallocation is a necessity that will produce some alienation and, in all likelihood, political rifts within the organization. Reallocation, therefore, also requires effective leadership to guide the organization and motivate personnel to understand the necessity of the changes and the concomitant benefits to the community.

There is no explicit recipe for change in an organization. This is particularly true with intelligence where a renewed emphasis is given to a process that is largely not understood by most personnel. There is little guidance and, despite the best plans, time will be needed for experimentation. Agencies should take the time to carefully consider all new responsibilities, balance them with legitimate competing demands within the agency, and make a clear step toward adjusting the organization.

Conclusion

As demonstrated throughout this guide, America's law enforcement agencies are facing a new challenge. Throughout the history of policing, challenges have been faced, they have been met with resolute determination, and America has been safer as a result. This new challenge is no different. The intent of this *Guide* has been to help America's state, local, and tribal law enforcement agencies make this journey.

Appendix A: Glossary of Terms for Law Enforcement Intelligence

Law enforcement agencies at all levels are working together more than ever to support information sharing. It is important to note that a tremendous effort is under way to streamline intelligence terms to facilitate information sharing. As a result, criminal intelligence terminology is changing. The definitions contained herein are provided from the perspective of law enforcement/criminal intelligence. Further, some words and phrases will have alternative or additional meanings when used in the context of national security intelligence, the military, or business. The definitions are intended to be merely descriptive of an entity, issue, or process that may be encountered by those working with the criminal intelligence function. Definitions may differ according to state statutes or local rules.

Glossary Of Law Enforcement Intelligence Terms

Actionable: Intelligence and information with sufficient specificity and detail that explicit responses to prevent a crime or terrorist attack can be implemented.

Administrative Analysis: The analysis of economic, geographic, demographic, census, or behavioral data to identify trends and conditions useful to aid administrators in making policy and/or resource allocation decisions.

All-Hazards Intelligence: The collection and analysis of information concerned with noncriminal domestic threats to critical infrastructure, community health, and public safety for the purpose of preventing the threat or mitigating the effects of the threat. (Same as Homeland Security Intelligence).

Allocation: Collection and analysis of information that shows relationships among varied individuals suspected of being involved in criminal activity that may provide insight into the criminal operation and which investigative strategies might work best.

Analysis: That activity whereby meaning, actual or suggested, is derived through organizing and systematically examining diverse information and applying inductive or deductive logic for the purposes of criminal investigation or assessment.

Archiving (Records): The maintenance of records in remote storage after a case has been closed or disposed of, as a matter of contingency, should the records be needed for later reference.

Association Analysis: The entry of critical investigative and/or assessment variables into a two-axis matrix to examine the relationships and patterns that emerge as the variables are correlated in the matrix.

Automated Trusted Information Exchange (ATIX): Operated by the Regional Information Sharing Systems, ATIX is a secure means of disseminating national security or terrorist threat information to law enforcement and other first responders through the ATIX electronic bulletin board, secure web site, and secure e-mail.

Bias/Hate Crime: Any criminal act directed toward a person or group because of that person's race, ethnicity, religious affiliation, or sexual preference.

C3: An intelligence application concept initially used by military intelligence that stands for command, control, and communication as the hallmark for effective intelligence operations.

Clandestine Activity: An activity that is usually extensive and goal-oriented, planned, and executed to conceal the existence of the operation. Only participants and the agency sponsoring the activity are intended to know about the operation. Storefront operations, stings, and certain concentrated undercover investigations (such as ABSCAM) can be classified as clandestine collections.

Classified Information/Intelligence: A uniform system for classifying, safeguarding, and declassifying national security information, including information relating to defense against transnational terrorism, to ensure that certain information is maintained in confidence to protect citizens, U.S. democratic institutions, U.S. homeland security, and U.S. interactions with foreign nations and entities.

- *Top Secret Classification*: Applied to information, the unauthorized disclosure of which reasonably could be expected to cause exceptionally grave damage to the national security that the original classification authority is able to identify or describe (Executive Order 12958, March 25, 2003).
- *Secret Classification*: Applied to information, the unauthorized disclosure of which reasonably could be expected to cause serious damage to the national security that the original classification authority is able to identify or describe (Executive Order 12958, March 25, 2003).
- *Confidential Classification*: Applied to information, the unauthorized disclosure of which reasonably could be expected to cause damage to the national security that the original classification authority is able to identify or describe (Executive Order 12958, March 25, 2003).

Collation (of information): A review of collected and evaluated information to determine its substantive applicability to a case or problem at issue and placement of useful information into a form or system that permits easy and rapid access and retrieval.

Collection (of information): The identification, location, and recording/storing of information, typically from an original source and using both human and technological means, for input into the Intelligence Cycle for the purpose of meeting a defined tactical or strategic intelligence goal.

Collection Plan: The preliminary step toward completing an assessment of intelligence requirements to determine what type of information needs to be collected, alternatives for how to collect the information, and a timeline for collecting the information.

Command and Control: Command and control functions are performed through an arrangement of personnel, equipment, communications, facilities, and procedures used by a commander in planning, directing, coordinating, and controlling forces and operations in the accomplishment of a mission.

Commodity (Illegal): Any item or substance that is inherently unlawful to possess (contraband) or materials which, if not contraband, are themselves being distributed, transacted, or marketed in an unlawful manner.

Commodity Flow Analysis: Graphic depictions and descriptions of transactions, shipment, and distribution of contraband goods and money derived from unlawful activities in order to aid in the disruption of the unlawful activities and apprehend those persons involved in all aspects of the unlawful activities.

Communications Intelligence (COMINT): The capture of information, either encrypted or in plaintext, exchanged between intelligence targets or transmitted by a known or suspected intelligence target for the purposes of tracking communications patterns and protocols (traffic analysis), establishing links between intercommunicating parties or groups, and/or analysis of the substantive meaning of the communication.

Conclusion: A definitive statement about a suspect, action, or state of nature based on the analysis of information.

Confidential: *See* Classified Information/Intelligence, Confidential Classification.

Continuing Criminal Enterprise: Any individual, partnership, corporation, association, or other legal entity and any union or group of individuals associated in fact, although not a legal entity, that are involved in a continuing or perpetuating criminal activity.

Controlled Unclassified Information (CUI) : The term Controlled Unclassified Information or CUI is a categorical designation that refers to unclassified information that does not meet the standards for National Security Classification under Executive Order 12958, as amended, but is (i) pertinent to the national interests of the United States or to the important interests of entities outside the federal government, and (ii) under law or policy requires protection from unauthorized disclosure, special handling safeguards, or prescribed limits on exchange or dissemination. The designation CUI replaces Sensitive But Unclassified (SBU). There are three types of CUI:

- *Controlled with Standard Dissemination:* The information requires standard safeguarding measures that reduce the risks of unauthorized or inadvertent disclosure. Dissemination is permitted to the extent that it is reasonably believed that it would further the execution of a lawful or official purpose.
- *Controlled with Specified Dissemination:* The information requires safeguarding measures that reduce the risks of unauthorized or inadvertent disclosure. Material contains additional instructions on what dissemination is permitted.
- *Controlled Enhanced with Specified Dissemination:* The information requires safeguarding measures more stringent than those normally required because the inadvertent or unauthorized disclosure would create risk of substantial harm. Material contains additional instructions on what dissemination is permitted.

Coordination: The process of interrelating work functions, responsibilities, duties, resources, and initiatives directed toward goal attainment.

Counterintelligence: Information compiled, analyzed, and/or disseminated in an effort to investigate espionage, sedition, or subversion that is related to national security concerns. It also is defined as a national security intelligence activity that involves blocking or developing a strategic response to other groups, governments, or individuals through the identification, neutralization, and manipulation of their intelligence services.

Covert Intelligence: An activity that is planned and executed to conceal the collection of information and/or to conceal the identity of an officer or agent participating in the activity.

Critical Infrastructure: Certain national infrastructures that are so vital that their incapacity or destruction would have a debilitating impact on the defense or economic security of the United States. These critical infrastructures are:

- Telecommunications
- Electrical power systems
- Gas and oil storage and transportation
- Banking and finance
- Transportation
- Water supply systems
- Emergency services (including medical, police, fire, and rescue)
- Continuity of government.

Crime Analysis: The process of analyzing information collected about crimes and police service delivery variables in order to give direction for police officer deployment, resource allocation, and policing strategies as a means of maximizing crime-prevention activities and the cost-effective operation of the police department.

Crime-Pattern Analysis: An assessment of the nature, extent, and changes of crime based on the characteristics of the criminal incident, including modus operandi, temporal, and geographic variables.

Criminal History Record Information (CHRI): Information collected by criminal justice agencies on individuals. It consists of identifiable descriptions and notations of arrests, detentions, indictments, information, or other formal criminal charges and any disposition arising from them, including sentencing, correctional supervision, and/or release. The term does not include identification information, such as fingerprint records, to the extent that such information does not indicate involvement of the individual in the criminal justice system.

Criminal Informant: *See* Informant.

Criminal Intelligence: The end product (output) of an analytic process that collects and assesses information about crimes and/or criminal enterprises with the purpose of making judgments and inferences about community conditions, potential problems, and criminal activity with the intent to pursue criminal prosecution or project crime trends or support informed decision-making by management. *Same as* Law Enforcement Intelligence.

Criminal Investigative Analysis: An analytic process that studies serial offenders, victims, and crime scenes in order to assess characteristics and behaviors of offender(s) with the intent to identify or aid in the identification of the offender(s).

Criminal Predicate: Information about an individual or his or her behavior that may be collected and stored in a law enforcement intelligence records system only when there is reasonable suspicion that the individual is involved in criminal conduct or activity and the information is relevant to that criminal conduct or activity.

Cryptanalysis: The process of deciphering encrypted communications of an intelligence target.

Cryptography: The creation of a communications code/encryption system for communication transmission with the intent of precluding the consumption and interpretation of one's own messages.

Cryptology: The study of communications encryption methods that deal with the development of "codes" and the "scrambling" of communications to prevent an unauthorized or unintended party from intercepting the communications.

Data Element: A field within a database that describes or defines a specific characteristic or attribute.

Data Owner: The agency that originally enters information or data into a law enforcement records system.

Data Quality: Controls implemented to ensure that all information in a law enforcement agency's records system is complete, accurate, and secure.

Deconfliction: The process or system used to determine whether multiple law enforcement agencies are investigating the same person or crime. The system provides notification to each agency involved of the shared interest in the case and also provides contact information. This is an information and intelligence sharing process that seeks to minimize conflicts between agencies and maximize the effectiveness of an investigation.

Deductive Logic: The reasoning process of taking information and arriving at conclusions from within that information.

Deployment: The short-term assignment of personnel to address specific crime problems or police service demands.

Designated State and/or Major Urban Area Fusion Center: The fusion center in each state designated as the primary or lead fusion center for the information-sharing environment.

Dissemination (of Intelligence): The process of effectively distributing analyzed intelligence utilizing certain protocols in the most appropriate format to those in need of the information to facilitate their accomplishment of organizational goals.

Due Process: Fundamental fairness during the course of the criminal justice process, including adherence to legal standards and the civil rights of the police constituency; the adherence to principles that are fundamental to justice.

El Paso Intelligence Center (EPIC): A cooperative intelligence center serving as a clearinghouse and intelligence resource for local, state, and federal law enforcement agencies. Primary concern is drug trafficking. EPIC also manages intelligence on other crimes.

Enterprise: Any individual, partnership, corporation, association, or other legal entity and any union or group of individuals associated in fact, although not a legal entity.

Estimate: *See* Intelligence Estimate.

Evaluation (of Information): All information collected for the intelligence cycle is reviewed for its quality, with an assessment of the validity and reliability of the information.

Event Flow Analysis: Graphic depictions and descriptions of incidents, behaviors, and people involved in an unlawful event, intended to help understand how an event occurred as a tool to aid in prosecution as well as prevention of future unlawful events.

Exemptions (to the Freedom of Information Act): Circumstances wherein a law enforcement agency is not required to disclose information from a Freedom of Information Act (FOIA) request.

Field Intelligence Group (FIG): The centralized intelligence component in a Federal Bureau of Investigation (FBI) field office that is responsible for the management, execution, and coordination of intelligence functions within the field office region.

Field Intelligence Report (FIR): An officer-initiated interview of a person believed by the officer to be acting in a suspicious manner that may be indicative of planning or preparing to conduct criminal activity.

Financial Analysis: A review and analysis of financial data to ascertain the presence of criminal activity. It can include bank record analysis, net worth analysis, financial profiles, source and applications of funds, financial statement analysis, and/or Bank Secrecy Act record analysis. It can also show destinations of the proceeds of crime and be used to support prosecutions.

Flow Analysis: The review of raw data to determine the sequence of events or interactions that may reflect criminal activity. It can include timelines, event flow analysis, commodity flow analysis, and activity flow analysis. May show missing actions or events that need further investigation.

For Official Use Only (FOUO): A designation applied to unclassified sensitive information that may be exempt from mandatory release to the public under the FOIA.

Forecast (as related to Criminal Intelligence): The product of an analytic process that provides a probability of future crimes and crime patterns based on a comprehensive, integrated analysis of past, current, and developing trends.

Freedom of Information Act (FOIA): The Freedom of Information Act, 5 U.S.C. 552, enacted in 1966, statutorily provides that any person has a right, enforceable in court, to access federal agency records, except to the extent that such records (or portions thereof) are protected from disclosure by one of nine exemptions.

Fusion Center: The physical location of the law enforcement intelligence fusion process.

Fusion Center Guidelines: A series of nationally recognized standards developed by law enforcement intelligence subject matter experts designed for the good practice of developing and managing an intelligence fusion center.

Fusion Process: The overarching process of managing the flow of information and intelligence across levels and sectors of government.

Granularity: Considers the specific details and pieces of information, including nuances and situational inferences that constitute the elements on which intelligence is developed through analysis.

Guidelines: *See* Intelligence Records Guidelines.

Homeland Security Advisory System: An information and communications structure designed by the U.S. Government for disseminating information to all levels of government and the American people regarding the risk of terrorist attacks and for providing a framework to assess the risk at five levels: Low, Guarded, Elevated, High, and Severe.

Homeland Security Intelligence: The collection and analysis of information concerned with noncriminal domestic threats to critical infrastructure, community health, and public safety for the purpose of preventing the threat or mitigating the effects of the threat. (Same as All Hazards Intelligence).

Human Intelligence (HUMINT): Intelligence-gathering methods that require human interaction or observation of the target or targeted environment. The intelligence is collected through the use of one's direct senses or the optical and/or audio enhancement of the senses.

Hypothesis (from Criminal Intelligence Analysis): An interim conclusion regarding persons, events, and/or commodities based on the accumulation and analysis of intelligence information that is to be proven or disproved by further investigation and analysis.

Imagery: The representation of an object or locale produced on any medium by optical or electronic means. The nature of the image will be dependent on the sensing media and sensing platform.

Indicator: Generally defined and observable actions that, based on an analysis of past known behaviors and characteristics, collectively suggest that a person may be committing, may be preparing to commit, or has committed an unlawful act.

Inductive Logic: The reasoning process of taking diverse pieces of specific information and inferring a broader meaning of the information through the course of hypothesis development.

Inference Development: The creation of a probabilistic conclusion, estimate, or prediction related to an intelligence target based on the use of inductive or deductive logic in the analysis of raw information related to the target.

Informant: An individual not affiliated with a law enforcement agency who provides information about criminal behavior to a law enforcement agency. An informant may be a community member, a businessperson, or a criminal informant who seeks to protect himself or herself from prosecution and/or provide the information in exchange for payment.

Information: Pieces of raw, unanalyzed data that identify persons, evidence, or events, or illustrate processes that indicate the incidence of a criminal event or witnesses or evidence of a criminal event.

Information Classification: *See* Classified Information/Intelligence.

Information Evaluation: *See* Evaluation (of Information).

Information Sharing Environment: A trusted partnership among all levels of government, the private sector, and foreign partners to detect, prevent, preempt, and mitigate the effects of terrorism against the territory, people, and interests of the United States of America. This partnership enables the trusted, secure, and appropriate exchange of terrorism information, in the first instance, across the five federal communities; to and from state, local, and tribal governments, foreign allies, and the private sector; and at all levels of security classifications.

Information Sharing System: An integrated and secure methodology, whether computerized or manual, designed to efficiently and effectively distribute critical information about offenders, crimes, and/or events in order to enhance prevention and apprehension activities by law enforcement.

Information System: An organized means, whether manual or electronic, of collecting, processing, storing, and retrieving information about individual entities for purposes of record and reference.

Intelligence Analyst: A professional position in which the incumbent is responsible for taking the varied facts, documentation of circumstances, evidence, interviews, and any other material related to a crime and organizing them into a logical and related framework for the purposes of developing a criminal case, explaining a criminal phenomenon, describing crime and crime trends, and/or preparing materials for court and prosecution, or arriving at an assessment of a crime problem or crime group.

Intelligence Assessment: A comprehensive report on an intelligence issue related to criminal or national security threats available to local, state, tribal, and federal law enforcement agencies.

Intelligence Bulletins: A finished intelligence product in article format that describes new developments and evolving trends. The bulletins are typically Sensitive But Unclassified (SBU) and available for distribution to local, state, tribal, and federal law enforcement.

Intelligence Community: Agencies of the U.S. government, including the military, that have the responsibility of preventing breeches in U.S. national security and responding to national security threats.

Intelligence Cycle: An organized process by which information is gathered, assessed, and distributed to fulfill the goals of the intelligence function. It is a method of performing analytic activities and placing the analysis in a useable form.

Intelligence Estimate: The appraisal, expressed in writing or orally, of available intelligence relating to a specific situation or condition with a view to determining the courses of action open to criminal offenders and terrorists and the order of probability of their adoption. It includes strategic projections about the economic, human, and/or quantitative criminal impact of the crime or issue that is subject to analysis.

Intelligence Function: The activity within a law enforcement agency responsible for some aspect of law enforcement intelligence, whether collection, analysis, and/or dissemination.

Intelligence Gap: An unanswered question about a cyber, criminal, or national security issue or threat.

Intelligence Information Reports (IIR): Raw, unevaluated intelligence concerning perishable or time-limited information about criminal or national security issues. While the full IIR may be classified, local, state, and tribal law enforcement agencies will have access to SBU information in the report under the tear line.

Intelligence-Led Policing: The dynamic use of intelligence to guide operational law enforcement activities to targets, commodities, or threats for both tactical responses and strategic decision-making for resource allocation and/or strategic responses.

Intelligence Mission: The role that the intelligence function of a law enforcement agency fulfills in support of the overall mission of the agency. It specifies in general language what the function is intended to accomplish.

Intelligence Mutual Aid Pact (IMAP): A formal agreement between law enforcement agencies designed to expedite the process of sharing information in intelligence records.

Intelligence Officer: A law enforcement officer assigned to an agency's intelligence function for purposes of investigation, liaison, or other intelligence-related activity that requires or benefits from having a sworn officer perform the activity.

Intelligence Products: Reports or documents that contain assessments, forecasts, associations, links, and other outputs from the analytic process that may be disseminated for use by law enforcement agencies for prevention of crimes, target hardening, apprehension of offenders, and prosecution.

Intelligence Records (Files): Stored information about the activities and associations of individuals, organizations, businesses, and groups who are suspected (reasonable suspicion) of being involved in the actual or attempted planning, organizing, financing, or commissioning of criminal acts, or are suspected of being or having been involved in criminal activities with known or suspected crime figures.

Intelligence Records Guidelines: Derived from the federal regulation 28 CFR Part 23, these are guidelines/standards for the development of records management policies and procedures used by law enforcement agencies.

International Criminal Police Organization (INTERPOL): INTERPOL is a worldwide law enforcement organization established for mutual assistance in the prevention, detection, and deterrence of international crimes. It houses international police databases, provides secure international communications between member countries for the exchange of routine criminal investigative information, and is an information clearinghouse concerning international criminals/fugitives and stolen properties.

Investigatory Value (of Information): Intelligence or information that is disseminated in the law enforcement community for surveillance, apprehension, or furtherance of an investigation.

Key Resources: Publicly or privately controlled resources essential to the minimal operations of the economy and government.

Key Word In Context (KWIC): An automated system that indexes selected key words that represent the evidence or information being stored.

Law Enforcement Intelligence (LAWINT): The end product (output) of an analytic process that collects and assesses information about crimes and/or criminal enterprises. Its purpose is to make judgments and inferences about community conditions, potential problems, and criminal activity with the intent to pursue criminal prosecution or project crime trends or support informed decision-making by management. Same as Criminal Intelligence.

Law Enforcement Sensitive (LES): Sensitive But Nnclassified information specifically compiled for law enforcement purposes that, if not protected from unauthorized access, could reasonably be expected to 1. Interfere with law enforcement proceedings, 2. Deprive a person of a right to a fair trial or impartial adjudication, 3. Constitute an unwarranted invasion of the personal privacy of others, 4. Disclose the identity of a confidential source, 5. Disclose investigative techniques and procedures, and/or 6. Endanger the life or physical safety of an individual.

Methods: These are the methodologies (e.g., electronic surveillance or undercover operations) by which critical information is obtained and recorded.

Micro-Intelligence: Intelligence activities focusing on current problems and crimes for either case development or resource allocation.

Money Laundering: The practice of using multiple unlawful transactions of money and/or negotiable instruments gained through illegal activities with the intent of hiding the origin of the income, those who have been "paid" from the income, and/or the location of the unlawful income.

National Central Bureau (NCB or USNCB): The United States headquarters of INTERPOL, located in Washington, D.C.

National Criminal Intelligence Resource Center (NCIRC): An Internet web site that contains information regarding law enforcement intelligence operations and practices and provides criminal justice professionals with a centralized resource information bank through which they can access a multitude of criminal intelligence resources to help law enforcement agencies develop, implement, and retain a lawful and effective intelligence capacity.

National Criminal Intelligence Sharing Plan (NCISP): A formal intelligence-sharing initiative, supported by the U.S. Department of Justice, Office of Justice Programs, that securely links local, state, tribal, and federal law enforcement agencies, and facilitates the exchange of critical intelligence information. The NCISP contains model policies and standards and is a blueprint for law enforcement administrators to follow when enhancing or building an intelligence function. It describes a nationwide communications capability that will link all levels of law enforcement personnel, including officers on the street, intelligence analysts, unit commanders, and police executives.

National Security Intelligence: The collection and analysis of information concerned with the relationship and equilibrium of the United States with foreign powers, organizations, and persons with regard to political and economic factors, as well as the maintenance of the United States' sovereign principles.

Need to Know: As a result of jurisdictional, organizational, or operational necessities, intelligence or sensitive information is disseminated to further an investigation.

Network: A structure of interconnecting components designed to communicate with each other and perform a function or functions as a unit in a specified manner.

Open Communications (OPCOM): The collection of open or publicly available communications, broadcasts, audio or video recordings, propaganda, published statements, and other distributed written or recorded material for purposes of analyzing the information.

Open-Source Information (*or* Intelligence): Individual data, records, reports, and assessments that may shed light on an investigatory target or event which do not require any legal process or any type of clandestine collection techniques for a law enforcement agency to obtain. Rather, it is obtained through means that meet copyright and commercial requirements of vendors, as well as being free of legal restrictions to access by anyone who seeks that information.

Operational Analysis: An assessment of the methodology of a criminal enterprise or terrorist organization that depicts how the enterprise performs its activities, including communications, philosophy, compensation, security, and other variables that are essential for the enterprise to exist.

Operational Intelligence: Information is evaluated and systematically organized on an active or potential target, such as groups of or individual criminals, relevant premises, contact points, and methods of communication. This process is developmental in nature wherein there are sufficient articulated reasons to suspect criminal activity. Intelligence activities explore the basis of those reasons and newly developed information in order to develop a case for arrest or indictment.

Outcome Evaluation: The process of determining the value or amount of success in achieving a predetermined objective. This is done by defining the objective in qualitative or quantitative measurable terms, identifying the proper criteria (or variables) used in measuring the success of attaining the objective, determining and explaining the degree of success, and making recommendations for further program actions to attain the desired objectives/outcomes.

Personal Identifying Information: Any information or data from which a reasonable person may identify a specific individual. When Personal Identifying Information is collected, civil rights protections and privacy standards must be afforded to the document or report that contains the information

Planning: The preparation for future situations, estimating organizational demands and resources needed to attend to those situations, and initiating strategies to respond to those situations.

Pointer System or Index: A system that stores information designed to identify individuals, organizations, and/or crime methodologies with the purpose of linking law enforcement agencies that have similar investigative and/or intelligence interests in the entity defined by the system.

Policy: The principles and values that guide the performance of a duty. A policy is not a statement of what must be done in a particular situation; rather, it is a statement of guiding principles that should be followed in activities that are directed toward attaining goals.

Prediction: The projection of future criminal actions or changes in the nature of crime trends or a criminal enterprise based on an analysis of information depicting historical trends from which a forecast is based.

Preventive Intelligence: Intelligence that can be used to interdict or forestall a crime or terrorist attack.

Privacy (Information): The assurance that legal and constitutional restrictions on the collection, maintenance, use, and disclosure of personally identifiable information will be adhered to by criminal justice agencies. Use of such information is strictly limited to circumstances in which legal process permits use of the personally identifiable information.

Privacy (Personal): The assurance that legal and constitutional restrictions on the collection, maintenance, use, and disclosure of behaviors of an individual—including his or her communications, associations, and transactions—will be adhered to by criminal justice agencies, with use of such information strictly limited to circumstances in which legal process authorizes surveillance and investigation.

Privacy Act: Legislation that allows an individual to review almost all federal files (and state files under the auspices of the respective state privacy acts) pertaining to him or her, places restrictions on the disclosure of personally identifiable information, specifies that there are no secret records systems about individuals, and compels the government to reveal its information sources.

Proactive: Taking action that anticipates a problem or situation, with the intent to eliminate or mitigate the effect of the incident.

Procedural Due Process: Mandates and guarantees of law that ensure that the procedures employed to deprive a person of life, liberty, or property during the course of the criminal justice process meet constitutional standards.

Procedures: A method of performing an operation or a manner of proceeding on a course of action. It differs from policy by directing action in a particular situation to perform a specific task within the guidelines of policy. Both policies and procedures are goal-oriented, but policy establishes limits to action while procedure directs responses within those limits.

Profile/Criminal Profile: An investigative technique for identifying and defining the major personality and behavioral characteristics of the criminal offender through an analysis of the crime(s) he or she has committed.

Protocol (of Intelligence Collection): Information collection procedures employed for obtaining verbal and written information, including on the actions of people, and physical evidence required for strategic and tactical intelligence analysis.

Public Value (of Information): Intelligence or information can be released to the public when there is a need to know and a right to know the information because of the value that may be derived from public dissemination, to 1. Aid in locating targets/suspects and 2. For public safety purposes (i.e., hardening targets, taking precautions).

Purging (Records): Removing and/or destroying records because they are deemed to be of no further value or that further access to the records would serve no legitimate government interest.

Qualitative (Methods): Research methods that collect and analyze information that is described in narrative or rhetorical form, with conclusions drawn based on the cumulative interpreted meaning of that information.

Quantitative (Methods): Research methods that collect and analyze information that can be counted or placed on a scale of measurement that can be statistically analyzed.

Racketeer Influenced and Corrupt Organizations Act of 1970 (RICO) or similar state statutes: Title IX of the Organized Crime Control Act of 1970 (18 U.S.C. Sections 1961–1968) provides civil and criminal penalties for persons who engage in a pattern of racketeering activity or collection of an unlawful debt that has a specified relationship to an enterprise that affects interstate commerce.

Racketeering Activity: State felonies involving murder, robbery, extortion, and several other serious offenses and more than 30 serious federal offenses, including extortion, interstate theft offenses, narcotics violations, mail fraud, and securities fraud.

Reasonable Suspicion: When information exists that establishes sufficient facts to give a trained law enforcement or criminal investigative agency officer, investigator, or employee a basis for believing that there is a reasonable possibility that an individual or organization is involved in a definable criminal activity or enterprise:.

Recommendations: Suggestions for actions to be taken based on the findings of an analysis.

Records (Intelligence): *See* Intelligence Records (Files).

Records System: A group of records from which information is retrieved by reference to a name or other personal identifier, such as a social security number.

Red Team: A technique for assessing vulnerability that involves viewing a potential target from the perspective of an attacker to identify its hidden vulnerabilities and to anticipate possible modes of attack.

Regional Information Sharing Systems (RISS): RISS is composed of six regional intelligence centers that provide secure communications, information-sharing resources, and investigative support to combat multijurisdictional crime and terrorist threats to more than 8,000 local, state, tribal, and federal member law enforcement agencies in all 50 states, the District of Columbia, U.S. territories, Australia, Canada, and England.

Reliability: Asks the question, "Is the source of the information consistent and dependable?"

Reporting: Depending on the type of intelligence, the process of placing analyzed information into the proper form to ensure the most effective consumption.

Requirements (Intelligence): The types of intelligence that operational law enforcement elements need from the intelligence function within an agency or other intelligence-producing organizations to enable law enforcement officers to maximize protection and preventive efforts as well as identify and arrest persons who are criminally liable.

Responsibility: Responsibility reflects how the authority of a unit or individual is used and determines whether goals have been accomplished and the mission fulfilled in a manner that is consistent with the defined limits of authority.

Right to Know: Based on having legal authority, one's official position, legal mandates, or official agreements, allowing the individual to receive intelligence reports.

Risk Assessment: An analysis of a target, illegal commodity, or victim to identify the probability of being attacked or criminally compromised and to analyze vulnerabilities.

Risk Management-Based Intelligence: An approach to intelligence analysis that has as its object the calculation of the risk attributable to a threat source or acts threatened by a threat source. It is a means of providing strategic intelligence for planning and policymaking, especially regarding vulnerabilities and countermeasures designed to prevent criminal acts and a means of providing tactical or operational intelligence in support of operations against a specific threat source, capability, or modality. It can be quantitative if a proper database exists to measure likelihood and impact and calculate risk; it can be qualitative and subjective and still deliver a reasonably reliable ranking of risk for resource allocation and other decision-making in strategic planning and for operations in tactical situations.

Rules: A specific requirement or prohibition that is stated to prevent deviations from policy or procedure. A violation of a rule typically results in an internal investigation and may result in disciplinary action.

SCI (Sensitive Compartmented Information): Classified information concerning or derived from intelligence sources, methods, or analytical processes that is required to be handled within formal access control systems.

SCIF (Sensitive Compartmented Information Facility): An accredited area, room, group of rooms, buildings, or an installation where SCI may be stored, used, discussed, and/or processed.

Sealing (Records): Records are stored by an agency but cannot be accessed, referenced, or used without a court order or statutory authority based on a showing of evidence that there is a legitimate government interest to review the sealed information.

Security: A series of procedures and measures that, when combined, provide protection of people from harm, information from improper disclosure or alteration, and assets from theft or damage. (Criminal Justice Commission, 1995.).

Sensitive But Unclassified (SBU) Information: Information that has not been classified by a federal law enforcement agency which pertains to significant law enforcement cases under investigation and criminal intelligence reports that require dissemination criteria to only those persons necessary to further the investigation or to prevent a crime or terrorist act.

Sensitive Homeland Security Information (SHSI): Any information created or received by an agency or any local, county, state, or tribal government that the loss, misuse, unauthorized disclosure, modification of, or the unauthorized access to could reasonably be expected to impair significantly the capabilities and/or efforts of agencies and/or local, county, state, and tribal personnel to predict, analyze, investigate, deter, prevent, protect against, mitigate the effects of, or recover from acts of terrorism. SHSI does not include any information that is: 1. Classified as national security information pursuant to Executive Order 12958, as amended, or any successor order; 2. Designated by Executive Order 12951, any successor order, or the Atomic Energy Act of 1954 (42 U.S.C. § 2011), to require protection against unauthorized disclosure; 3. Protected Critical Infrastructure Information (PCII) as defined in 6 Code of Federal Regulations (CFR) § 29.2; 4. Sensitive Security Information (SSI) as defined in 49 CFR Part 1520.

Signal Intelligence (SIGINT): The interception of various radio frequency signals, microwave signals, satellite audio communications, nonimagery infrared and coherent light signals, and transmissions from surreptitiously placed audio microtransmitters in support of the communications intelligence activity.

Sources: From an intelligence perspective, these are persons (human intelligence or HUMINT) who collect or possess critical information needed for intelligence analysis.

Spatial Analysis: The process of using a geographic information system in combination with crime-analysis techniques to assess the geographic context of offenders, crimes, and other law enforcement activity.

Statistical System: An organized means of collecting, processing, storing, and retrieving aggregate information for purposes of analysis, research, and reference. No individual records are stored in a statistical system.

Strategic Intelligence: An assessment of targeted crime patterns, crime trends, criminal organizations, and/or unlawful commodity transactions for purposes of planning, decision-making, and resource allocation; the focused examination of unique, pervasive, and/or complex crime problems.

Substantive Due Process: Guarantees persons against arbitrary, unreasonable, or capricious laws, and it acts as a limitation against arbitrary governmental actions so that no government agency may exercise powers beyond those authorized by the Constitution.

Surveillance: The observation of activities, behaviors, and associations of a LAWINT target (individual or group) with the intent to gather incriminating information, or "lead" information, which is used for the furtherance of a criminal investigation.

Suspicious Activity Report: A report and process wherein criminal indicators and behaviors that appear to have a criminal nexus are documented and processed through a law enforcement organization to determine if a crime is being planned, in the process of being committed or has been committed.

Tactical Intelligence: Evaluated information on which immediate enforcement action can be based; intelligence activity focused specifically on developing an active case.

Target: Any person, organization, group, crime or criminal series, or commodity being subject to investigation and intelligence analysis.

Target Profile: A profile that is person-specific and contains sufficient detail to initiate a target operation or support an ongoing operation against an individual or networked group of individuals.

Targeting: The identification of crimes, crime trends, and crime patterns that have discernable characteristics which make collection and analysis of intelligence information an efficient and effective method for identifying, apprehending, and prosecuting those who are criminally responsible.

Tear-Line Report: A report containing classified intelligence or information that is prepared in such a manner that data relating to intelligence sources and methods are easily removed from the report to protect sources and methods from disclosure. Typically, the information below the "tear line" can be released as Sensitive But Unclassified.

Telemetry: The collection and processing of information derived from noncommunications electromagnetic radiations emitting from sources such as radio navigation systems (e.g., transponders), radar systems, and information/data signals emitted from monitoring equipment in a vehicle or device.

Telephone Record (Toll)/Communications Analysis: An assessment of telephone call activity associated with investigatory targets including telephone numbers called and/or received, the frequency of calls between numbers, the dates of calls, length of calls, and patterns of use.

Third Agency Rule: An agreement wherein a source agency releases information under the condition that the receiving agency does not release the information to any other agency—that is, a third agency.

Threat Assessment: An assessment of a criminal or terrorist presence within a jurisdiction integrated with an assessment of potential targets of that presence and a statement of probability that the criminal or terrorist will commit an unlawful act. The assessment focuses on the criminal's or terrorist's opportunity, capability, and willingness to fulfill the threat.

Threat Inventory: An information and intelligence-based survey within the region of a law enforcement agency to identify potential individuals or groups that pose a criminal or terrorist threat without a judgment of the kind of threat they pose. The inventory is simply to determine their presence.

Undercover Investigation: Active infiltration of or an attempt to infiltrate a group believed to be involved in criminal activity and/or the interaction with a LAWINT target with the intent to gather incriminating information or lead information that is used for the furtherance of a criminal investigation.

Validity: Asks the question, "Does the information actually represent what we believe it represents?"

Variable: Any characteristic on which individuals, groups, items, or incidents differ.

Vet: To subject a proposal, work product, or concept to an appraisal by command personnel and/or experts to ascertain the product's accuracy, consistency with philosophy, and/or feasibility before proceeding.

Violent Criminal Apprehension Program (VICAP): A nationwide data information center operated by the FBI's National Center for the Analysis of Violent Crime, designed to collect, collate, and analyze specific crimes of violence.

Vulnerability Assessment: An assessment of possible criminal or terrorist group targets within a jurisdiction integrated with an assessment of the target's weaknesses, likelihood of being attacked, and ability to withstand an attack.

Warning: To notify in advance of possible harm or victimization as a result of information and intelligence gained concerning the probability of a crime or terrorist attack.

Appendix B: Intelligence Unit Management Audit

These audit criteria focus on the management of the intelligence unit. They were developed by the author for use in auditing a police department for compliance with a settlement agreement in a federal civil rights case.

Audit Criteria for the Law Enforcement Intelligence Function Version 2.0

Section A: Meeting National Standards

1. Does the police department subscribe to the tenets and standards of the Global Justice Information Sharing Initiative?
   ☐ Yes ☐ No
2. Does the police department subscribe to the standards of the National Criminal Intelligence Sharing Plan?
   ☐ Yes ☐ No
3. Does the police department subscribe to the guidelines for information and intelligence sharing of the Office of Domestic Preparedness Guidelines for Homeland Security?
   ☐ Yes ☐ No
4. Does the police department subscribe to the guidelines of the Commission on Accreditation for Law Enforcement Agencies (CALEA) Standard 51.1.1 Criminal Intelligence?
   ☐ Yes ☐ No
5. Does the police department subscribe to the provisions of the International Association of Chiefs of Police (IACP) Model Criminal Intelligence Policy?
   ☐ Yes ☐ No
6. Does the police department subscribe to the standards of the Law Enforcement Intelligence Unit (LEIU) Criminal Intelligence File Guidelines?
7. Does the police department subscribe to the IACP Code of Ethics or have an articulated Code of Ethics?
   ☐ Yes ☐ No
8. Does the police department subscribe to the IACP Code of Conduct[9]or have an articulated Code of Conduct?
   ☐ Yes ☐ No
9. Does the police department have an articulated Statement of Values?
   ☐ Yes ☐ No
10. Does the police department adhere to the regulations of 28 CFR Part 23 for its Criminal Intelligence Records System?
    ☐ Yes ☐ No
    a. Does the police department operate a federally funded multi-jurisdictional criminal intelligence records system?
       ☐ Yes ☐ No
11. Does the police department subscribe to the tenets of the Justice Information Privacy Guidelines?
    ☐ Yes ☐ No
12. Does the police department subscribe to the tenets for information system security defined in the report, Applying Security Practices to Justice Information Sharing?
    ☐ Yes ☐ No

13. Does the law enforcement agency subscribe to the philosophy of Intelligence-Led Policing?
    ☐ Yes ☐ No
14. Are defined activities for the intelligence unit designed exclusively to prevent and control crime with no political, religious or doctrinal purpose?
    ☐ Yes ☐ No

Section B: Management issues

1. Has a mission statement been written for the Intelligence Unit?
   ☐ Yes ☐ No
2. Is the purpose and role of the Unit clearly articulated and related to the Police Department's Mission Statement?
   ☐ Yes ☐ No
3. Have priorities been established for the types of crimes the Unit will address?
   ☐ Yes ☐ No
   a. Is any written rationale provided for these priorities?
      ☐ Yes ☐ No
4. Are expected activities of the unit articulated?
   ☐ Yes ☐ No
5. Does the mission statement express ethical standards?
   ☐ Yes ☐ No
6. Does the mission statement express the importance of protecting citizens' rights?
   ☐ Yes ☐ No

<u>1. Policies and Procedures</u>

1. Are there written and officially articulated policies and procedures for management of the intelligence function?
   ☐ Yes ☐ No
2. Have intelligence policies been formed to minimize the discretion of information collectors?
   ☐ Yes ☐ No If Yes, describe:
3. Is there a policy and procedures on "Information Collection"?
   ☐ Yes ☐ No If Yes, describe:

<u>2. Management of Information: Definitional Standards</u>

1. Are there standard terms used in intelligence activities that have been operationally defined in writing so that all persons in the department know the explicit meaning and implications of the terms?
   ☐ Yes ☐ No
2. What is the source of the definitions?
   ☐ NCISP ☐ Federal Agency
   ☐ Mixed ☐ N/A

3. Has the department articulated standards for classifying information in the Intelligence Unit?[1]
   ☐ Yes ☐ No
4. How are those standards monitored and enforced?
   ☐ Superior ☐ Other
5. Does the department have a system for assessing the reliability of sources that provide information that will be retained in the Intelligence Records System?
   ☐ Yes ☐ No
6. Are there standardized definitions of the reliability scale?
   ☐ Yes ☐ No
7. Does the department have a system for assessing the validity of the information that will be retained in the Intelligence Records System?
   ☐ Yes ☐ No
8. Are there standardized definitions of the validity scale?
   ☐ Yes ☐ No
9. Does the Intelligence Unit have operational definitions that can be applied to a person under investigation or a series of related crimes where the perpetrator is not identifiable in order to classify the case file as either a "permanent file" or a "temporary file"?
   ☐ Yes ☐ No

   If Yes...

   a. Are the types of identifying information that should be placed in the file articulated?
      ☐ Yes ☐ No
   b. Is there a procedure for requiring the articulation of the criminal predicate for the permanent file?
      ☐ Yes ☐ No
   c. Is there a procedure articulating the conditions wherein a temporary file may be created?
      ☐ Yes ☐ No
   d. Does the procedure specify a time limit that the temporary file can be kept?
      ☐ Yes ☐ No

[1]

Priority	Classification	Description	Release Authority
Highest Level	Sensitive	Current corruption case; complex criminality; confidential informants	Deptartment Executive or Intelligence Commander
Medium Level	Confidential	Nonsensitive information through intelligence channels; law enforcement only	Intelligence Unit Commander or Supervisor
Lowest Level	Restricted	LE use but no need for high security	Intell Unit Personnel
Unclassified	Public Access	Information that may be released to public and media	Intell Unit Personnel

e. Is there an operational definition of "Non-Criminal Identifying Information" and procedures for recording and retaining this information?
☐ Yes ☐ No

f. Are there clear procedures that describe the types of information that should not be entered into the Intelligence Records System?
☐ Yes ☐ No

3. Management of Information: Source Documents

1. Does the department have a written directive explaining the different types of source documents that will be entered in the Intelligence Records System?
☐ Yes ☐ No
2. What types of source documents are entered into the Intelligence Records System?
Describe:
3. Does the police department have a written directive that the rationale for each source document entered into the Intelligence Records System must be articulated in a report or notation?
☐ Yes ☐ No

4. Management of Information: Data Entry

1. Who is responsible for entering information into the Intelligence Records System?
Position/Classification:
2. Who supervises the information entry process?
Position/Classification:

5. Management of Information: Accountability

1. Who is the Custodian of the Intelligence Records System that ensures all regulations, law, policy and procedures are being followed?
Position/Classification:
2. Is there a person external to the Intelligence Unit who is designated to monitor the Intelligence Records System and related processes?
☐ Yes ☐ No If Yes, Position/Classification:
3. Does the department have written procedures for the retention of records in the Intelligence Records System?
☐ Yes ☐ No

6. Management of Information: Retention and Purging of Records

1. Does the retention process adhere to the guidelines of 28 CFR Part 23?
☐ Yes ☐ No
2. Does the retention policy and procedure include written criteria for purging information?
☐ Yes ☐ No
3. How often does a review and purge process occur?
Frequency:
4. What is the purge process?
Describe:

5. Does the purge process include a system review of information to confirm its continuing propriety, accuracy, and relevancy?
   □ Yes □ No
6. Does the purge process require destruction of the source document and removal of all references to the document to be purged if the information is no longer appropriate for retention?
   □ Yes □ No
7. What is the destruction process for purged hard copy records?
   Describe:
8. After information has been purged from a computerized Intelligence Records System, is free space on the hard drive and/or specific purged files electronically "wiped"?
   □ Yes □ No
   a. Are backups wiped?
      □ Yes □ No
   b. What is the accountability system for purging backups?
      Describe:
9. Does the purge process require the elimination of partial information that is no longer appropriate if the source document is to be kept because the remaining information in the source documents merits retention?
   □ Yes □ No
10. What is the process for purging partial information from hard copy source documents?
    Describe:
11. Who is responsible for ensuring compliance of the purge process?
    Position/Classification:

7. Management of Information: Personal/Individually-Held Records and Files

1. Is there an intelligence unit policy and procedures concerning the retention of individual notes and records that identifies persons wherein criminality is suspected but is not in either a temporary or permanent file and is not entered into any formal records system or database?
   □ Yes □ No
   a. How is the possession of personal records monitored?
      □ Yes □ No
   b. How is the policy enforced?
      □ Yes □ No

8. Management of Information: Accessing Intelligence Records

1. Is access to the Intelligence Records limited?
   □ Yes □ No
2. If yes, who may access the Intelligence Records System?
   □ Yes □ No
3. What security controls exist for accessing computerized records?
   □ Yes □ No

4. Can the computerized records system be accessed through remote access?
   □ Yes □ No
   a. If so, what security controls exist for remote access?
      Describe:
5. How are physical records stored?
   Describe:
6. Who grants access privileges to Intelligence Records?
   Position/Classification:
7. Who has access to records?
   □ Yes □ No
8. Does the police department apply the Third Agency Rule to information that is shared with other agencies?
   □ Yes □ No
9. What audit process is in place for access to computerized records?
   Describe:
10. What audit process is in place for access to physical records?
    Describe:
11. How are physical records secured?
    Describe:
12. What process is in place to handle unauthorized access to intelligence physical records?
    Describe:
13. What sanctions are in place for a police department employee who accesses and/or disseminates intelligence records without authorization?
    Describe:

<u>9. Physical Location of the Intelligence Unit and Records</u>

1. Sufficiency: Is the Intelligence Unit in a physical location that has sufficient space to perform all of its responsibilities?
   □ Yes □ No
2. Security: Is the Intelligence Unit in a physical location wherein the entire workspace may be completely secured?
   □ Yes □ No
   a. Is there adequate secured storage cabinets (or a vault) for (1) documents classified by the intelligence unit and (2) sensitive records storage within the intelligence unit's physical location?
      □ Yes □ No
   b. Is there adequate security and segregated storage for federally classified documents within the Intelligence Unit?
      □ Yes □ No
      1. Is that storage accessible only by persons with a federal Top Secret security clearance?
         □ Yes □ No
3. Convenience: Is the Intelligence Unit in a physical location that is convenient to the people, equipment, and resources necessary to maximize efficiency and effectiveness of operations?
   □ Yes □ No

10. Tangential Policy Issues: Criminal Informants and Undercover Operations

1. Is there a formally articulated policy and procedures for managing criminal informants?
   ☐ Yes ☐ No
   a. Is a background investigation conducted and a comprehensive descriptive file completed on each confidential informant?
      ☐ Yes ☐ No
   b. Are informant files secured separately from intelligence files?
      ☐ Yes ☐ No
2. Is there a formally articulated policy and procedures concerning undercover operations that apply to members of the Intelligence Unit?
   ☐ Yes ☐ No
3. Does the police department have a policy on alcohol consumption for officers working undercover?
   ☐ Yes ☐ No
   a. Does the police department have a policy requiring designated drivers for undercover officers who have consumed alcohol?
      ☐ Yes ☐ No
4. Does the police department have a "narcotics simulation" policy and training for undercover officers?
   ☐ Yes ☐ No
5. Does the police department have a policy for the issuance of fictitious identification for undercover officers and the proper use of such fictitious identification?
   ☐ Yes ☐ No
6. Do undercover officers receive training specifically related to proper conduct and information collection while working in an undercover capacity?
   ☐ Yes ☐ No
7. With respect to undercover operating funds:
   a. Is there a 1-tier or 2-tier process to approve use of the funds?
      ☐ 1-Tier ☐ 2-Tier
   b. Is a written report required to document expenditure of the funds?
      ☐ Yes ☐ No
   c. What is the maximum time that may pass between the expenditure of funds and personnel accountability for the funds?
      ☐ Yes ☐ No
   d. Is there a regular external audit of undercover funds?
      ☐ Yes (How Often) ☐ No

Section C: Personnel

1. Is a position classification plan in place that provides a clear job description for each position in the Unit?
   ☐ Yes ☐ No
2. Is a position classification plan in place that articulates Knowledge, Skills, and Abilities (KSAs) for each position?
   ☐ Yes ☐ No
3. Is there sufficient hierarchical staff (managers/supervisors) assigned to the Unit to effectively perform supervisory responsibilities?
   ☐ Yes ☐ No

4. Is there sufficient functional staff (analysts and/or investigators) to effectively fulfill defined unit responsibilities?
   ☐ Yes ☐ No
5. Is there sufficient support staff (secretaries, clerks) to effectively support the unit's activities?
   ☐ Yes ☐ No
6. Does the screening process for nonsworn employees of the Intelligence Unit require:
   a. Fingerprint check
      ☐ Yes ☐ No
   b. Background investigation
      ☐ Yes ☐ No
7. If the Intelligence Unit has non-police department employees assigned to it—e.g., National Guard analysts, personnel from the state or local law enforcement agencies—would there be a screening process for those persons?
   ☐ Yes ☐ No If Yes, Describe:

1. Training

1. What types of training do preservice and newly assigned personnel receive?
   ☐ None ☐ Some - Describe:
   a. Are newly assigned sworn employees to the Intelligence Unit required to attend 28 CFR Part 23 training?
      ☐ Yes ☐ No
   b. Are newly hired or assigned nonsworn employees required to attend 28 CFR Part 23 training?
      ☐ Yes ☐ No
2. What types of training do in-service personnel receive?
   ☐ None ☐ Some - Describe:
3. Have members of the Intelligence Unit attended any of the following federal government intelligence training programs which are open to state and local law enforcement officers.
   a. DEA Federal Law Enforcement Analyst Training (FLEAT)
      ☐ Yes ☐ No
   b. FBI College of Analytic Studies
      ☐ Yes ☐ No
   c. Federal Law Enforcement Training Center (FLETC) Criminal Intelligence Analysis Training Course
      ☐ Yes ☐ No
   d. National Drug Intelligence Center Basic Intelligence Analysis Course
      ☐ Yes ☐ No
   e. National White Collar Crime Center Foundations of Intelligence Analysis
      ☐ Yes ☐ No
   f. Regional Counterdrug Training Academy Intelligence Operations Course
      ☐ Yes ☐ No

2. Supervision

1. Does supervision effectively monitor adherence to written procedures?
   ☐ Yes ☐ No
2. Does supervision effectively monitor adherence to guidelines adopted by the department?
   ☐ Yes ☐ No
3. Are performance evaluations tied directly to the job descriptions?
   ☐ Yes ☐ No
4. Does supervision effectively monitor the performance of required duties (Including the quality of performance)?
   ☐ Yes ☐ No
5. Is supervision effectively monitoring personnel to ensure civil rights allegations cannot be made with respect to negligent:
   a. Failure to train
      ☐ Yes ☐ No
   b. Hiring
      ☐ Yes ☐ No
   c. Failure to supervise
      ☐ Yes ☐ No
   d. Assignment
      ☐ Yes ☐ No
   e. Failure to direct
      ☐ Yes ☐ No
   f. Failure to discipline
      ☐ Yes ☐ No
   g. Entrustment
      ☐ Yes ☐ No
6. Is there effective supervision of the Intelligence Unit throughout the chain of command external to the Intelligence Unit?
   ☐ Yes ☐ No

Section D: Fiscal Management

1. Is the budget sufficient to fulfill the stated mission?
   ☐ Yes ☐ No
2. Does the Intelligence Commander have input into the budget planning process?
   ☐ Yes ☐ No
3. Is there over-reliance on "soft money" to operate the Unit?
   ☐ Yes ☐ No
4. Are equipment and personnel line items assigned directly to the Intelligence Unit?
   ☐ Yes ☐ No
5. Is there an established process for reliably monitoring credit cards assigned to personnel?
   ☐ Yes ☐ No

Section E: Unit Evaluation

1. As a whole, is the Unit effective with respect to:

   a. Providing information to prevent crime?
      ☐ Yes ☐ No

   b. Providing information to apprehend criminals?
      ☐ Yes ☐ No

   c. Effectively analyzing information to identify criminal enterprises, crime trends, criminal anomalies, etc.?
      ☐ Yes ☐ No

2. Are data collected on the following factors and reported in an annual report as indicators of the intelligence Unit's productivity as an organizational entity?

   a. Number and type of analytic products delivered for investigative purposes
      ☐ Yes ☐ No ☐ N/A

   b. Number and type of analytic products that led to arrest
      ☐ Yes ☐ No ☐ N/A

   c. Assets seized from illegal activities wherein intelligence contributed to the arrest and/or seizure
      ☐ Yes ☐ No ☐ N/A

   d. Number and types of strategic intelligence products delivered to the command staff
      ☐ Yes ☐ No ☐ N/A

   e. Number of intelligence sharing meeting attended by Unit staff
      ☐ Yes ☐ No ☐ N/A

   f. Number of briefings provided by the intelligence staff
      ☐ Yes ☐ No ☐ N/A

   g. Total number of queries into the intelligence database
      ☐ Yes ☐ No ☐ N/A

   h. Number of permanent files opened
      ☐ Yes ☐ No ☐ N/A

   i. Number of temporary files investigated
      ☐ Yes ☐ No ☐ N/A

   j. Number of requests for information to the unit from outside agencies
      ☐ Yes ☐ No ☐ N/A

3. Are products produced by the Intelligence Unit:

   a. In a consistent format?
      ☐ Yes ☐ No

   b. Easily consumed and used (i.e., understandable and actionable)?
      ☐ Yes ☐ No

   c. Contain timely information and disseminated in a timely manner?
      ☐ Yes ☐ No

   d. Have substantive contact to aid in preventing or controlling crime?
      ☐ Yes ☐ No

4. Given the confidential nature of the information contained in the Intelligence Unit, is there a policy and procedures if a city, county, state, or federal fiscal or program auditor seeks to audit the Intelligence Unit?
   ☐ Yes ☐ No If Yes, Describe:

Section F: Collection

1. Is there an articulated collection plan for the Intelligence Unit?
   ☐ Yes ☐ No
   a. How often and when is the plan updated?
      ☐ Yes ☐ No
2. Have the following activities been performed by the Intelligence Unit:
   a. An inventory of threats in the region posed by criminal enterprises, terrorists, and criminal extremists.
      ☐ Yes ☐ No
   b. An assessment of the threats with respect to their probability of posing a criminal or terrorist threat to the region.
      ☐ Yes ☐ No
   c. A target or criminal commodity analysis of the region.
      ☐ Yes ☐ No
   d. A target or criminal commodity vulnerability assessment in the region.
      ☐ Yes ☐ No
3. For each identified threat, have intelligence requirements been articulated?
   ☐ Yes ☐ No
   a. If Yes, describe the methods of collection that will be used to fulfill those intelligence requirements.
      ☐ Yes ☐ No

Section G: Technology and Networking

1. Are any members of the Intelligence Unit subscribed members of the FBI's secure e-mail system Law Enforcement Online (LEO)?
   ☐ Yes - All ☐ Yes - Some ☐ No
2. Are any members of the Intelligence Unit subscribed members of the secure Regional Information Sharing System (RISS) e-mail system riss.net?
   ☐ Yes - All ☐ Yes - Some ☐ No
   a. If yes, are the RISS databases (e.g., RISS.gang, ATIX, etc.) regularly used?
      ☐ Yes ☐ No
3. Is the police department a member of the Regional Information Sharing System?
   ☐ Yes ☐ No
4. Is a systematic procedure in place to ensure that advisories and notifications transmitted via the National Law Enforcement Teletype System (NLETS) are forwarded to the Intelligence Unit?
   ☐ Yes ☐ No
5. Are you connected to any state-operated intelligence or information networks?
   ☐ Yes ☐ No If Yes, Describe:
6. Are you connected to any regional intelligence or information networks (including HIDTA)?
   ☐ Yes ☐ No
7. Does the intelligence have access and use the National Virtual Pointer System (NVPS)?
   ☐ Yes ☐ No

8. Is there a formal approval process for entering into a Memorandum of Understanding (MOU) for information and intelligence sharing with other law enforcement agencies or law enforcement intelligence entities?
   ☐ Yes ☐ No If Yes, describe the process:
   Who must approve the MOU?

Section H: Legal Issues

1. Is there a designated person in the police department who reviews Freedom of Information Act requests directed to the intelligence unit?
   ☐ Yes ☐ No
2. Is there a designated person in the police department who responds to Privacy Act inquiries directed to the Intelligence Unit?
   ☐ Yes ☐ No
3. Is there a designated person the police department contacts in response to a subpoena for a file in the Intelligence Records System?
   ☐ Yes ☐ No
4. Does the Intelligence Unit Commander have a legal resource for advice to help protect intelligence records from objectionable access?
   ☐ Yes ☐ No
5. Does the Intelligence Unit Commander have a legal resource for advice on matters related to criminal procedure and civil rights?
   ☐ Yes ☐ No
6. Does the Intelligence Unit Commander have a legal resource for advice on matters related to questions of civil liability as it relates to all aspects of the intelligence function?
   ☐ Yes ☐ No
7. Has legal counsel reviewed and approved all policies and procedures of the intelligence unit?
   ☐ Yes ☐ No

Appendix C:
LEIU Audit Checklist for the Criminal Intelligence Function

The Law Enforcement Intelligence Unit (LEIU) is the premier organization for law enforcement intelligence. The organization has established a solid reputation for professionalism, objectivity, and promoting intelligence activities that protect the constitutional rights and privacy of all Americans. This checklist was prepared to aid in the professional management of a state, local, and tribal law enforcement intelligence function. Additional materials, including a description of how the checklist was prepared, are available in the original LEIU Audit Checklist document, it.ojp.gov/documents/LEIU_audit_checklist.pdf.

This checklist provides law enforcement executives and senior- to mid-level law enforcement managers with a tool for conducting an audit or evaluation of their agency's criminal intelligence function. Specifically, this audit tool can help an agency ensure that it is carrying out the criminal intelligence function in accordance with applicable laws, regulations, and guidelines. The principles found in the checklist apply most directly to municipal, county, and state law enforcement agencies. Several introductory comments are appropriate.

This checklist should be applied only to criminal intelligence files, not to other types of law enforcement records. Some law enforcement officials fail to make the distinction between criminal intelligence files and other types of law enforcement records (e.g., investigative files). In the law enforcement context, however, these differences are important and must be recognized.

Investigation generally refers to the systematic examination of facts to determine if a crime has occurred and, if so, develop a case for prosecution. Generally, the term "investigative files" refers to information collected in the course of an investigation where there are reasonable grounds to suspect that a person has committed specific criminal acts.

On the other hand, the criminal intelligence process is an ongoing activity, and is not necessarily triggered by the investigation of any specific offense. While investigation tends to be reactive in nature, criminal intelligence is proactive and used to identify and understand criminals operating in a particular area. Once individuals or groups are identified and their habits known, law enforcement authorities may begin to assess current trends in crime and to forecast, and possibly prevent, future criminal activities. Intelligence provides the knowledge on which to base decisions, and select appropriate targets (subjects, criminal groups or businesses) for investigations. Although criminal intelligence may be used to assist in investigations, surveillance operations, and prosecution of cases, it also provides law enforcement agencies with the ability to effectively manage resources, budget, and meet their responsibility to forecast community threats to prevent crime.

Criminal intelligence consists of pieces of raw information that when collected, evaluated, collated, and analyzed, form meaningful and useful judgments that are both accurate and timely. Taking this raw information and turning it into intelligence can be described as a sequential process with multiple distinct phases. Following appropriate planning, the first phase is collection, when raw information is obtained from various sources. Evaluation then occurs, which determines the reliability of the source and the validity of the information. The third phase is collation and involves indexing, cross-referencing, and filing of information. The fourth phase is analysis, which identifies trends, future developments, and case building. The fifth phase is dissemination, which involves the actual dispensing of the intelligence information. A unit that does not complete each of these phases is not a criminal intelligence unit.

Ideally, this checklist is designed to be utilized by senior law enforcement managers who are not directly involved in the day-to-day operations of the agency's criminal intelligence function. This helps ensure that the audit is objective, and accurately identifies the function's strengths and weaknesses. The checklist can also be used as a self-assessment tool by personnel who are directly involved with the agency's criminal intelligence function. This type of effort will help determine if the unit is acting in accordance with the standard practices and procedures established by LEIU.

Historically, criminal intelligence units have experienced problems in the areas of unit operating procedures, collection, collation, and dissemination; this checklist focuses on these areas.

Unit Operating Procedures

1. Does the criminal intelligence unit have a mission statement? If no, go to question 10.
   ☐ Yes ☐ No
2. Does the mission statement contain a concise, well-defined mandate describing the criminal intelligence unit?
   ☐ Yes ☐ No
3. Does the mission statement describe the use of the intelligence process in support of the criminal intelligence unit?
   ☐ Yes ☐ No
4. Does the statement focus toward criminal predicate?
   ☐ Yes ☐ No
5. Does the statement indicate that the criminal intelligence unit will provide the Chief Executive with criminal information and resulting analysis to counter and control criminal activities?
   ☐ Yes ☐ No
6. Does the statement identify the criminal intelligence unit's expected results?
   ☐ Yes ☐ No
7. Is the criminal intelligence unit staying within its mission?
   ☐ Yes ☐ No
8. Is the criminal intelligence unit assuming work beyond the authorized crime areas?
   ☐ Yes ☐ No
9. Is the statement reviewed on a periodic basis to insure that it is meeting the needs of the agency/organization?
   ☐ Yes ☐ No
10. Does the criminal intelligence unit have policy and procedures guidelines? If no, go to question 18.
    ☐ Yes ☐ No
11. Do the guidelines describe the criminal intelligence unit's operations?
    ☐ Yes ☐ No
12. Do the guidelines provide the criminal intelligence unit's mission statement?
    ☐ Yes ☐ No
13. Do the guidelines detail the criminal intelligence unit's methods of operation?
    ☐ Yes ☐ No
14. Do the guidelines outline the criminal intelligence unit's file guidelines?
    ☐ Yes ☐ No
15. Do the guidelines establish the criminal intelligence unit's security procedures?
    ☐ Yes ☐ No
16. Do the guidelines describe personnel responsibilities and assigned duties?
    ☐ Yes ☐ No
17. Have the guidelines been provided to personnel?
    ☐ Yes ☐ No

18. Are periodic security updates conducted for intelligence personnel on a regular basis?
    ☐ Yes ☐ No
19. Is the criminal intelligence unit located in a physically secure location?
    ☐ Yes ☐ No
20. Are unauthorized persons prevented from accessing the criminal intelligence unit's location?
    ☐ Yes ☐ No
21. Is access terminated when personnel are on leave or cease to work in an intelligence capacity?
    ☐ Yes ☐ No
22. Are there guidelines for transferring material to or from floppy disks?
    ☐ Yes ☐ No
23. Does the criminal intelligence unit have access to the Chief Executive?
    ☐ Yes ☐ No
24. Does the unit provide the Chief Executive with recommendations?
    ☐ Yes ☐ No
25. Does the unit provide the agency with valuable strategic and tactical products?
    ☐ Yes ☐ No
26. Do personnel receive appropriate training?
    ☐ Yes ☐ No
27. Are there clear lines of responsibility and accountability for the functions of the intelligence unit?
28. ☐ Yes ☐ No
29. Is a regular security risk review of the intelligence unit and its systems conducted?
    ☐ Yes ☐ No
30. Are procedures in place governing the criminal intelligence unit's use of special funds?
    ☐ Yes ☐ No
31. Is the criminal intelligence unit's mission achievable with the number of assigned staff?
    ☐ Yes ☐ No

Collection

31. Does a collection effort begin with the development of a written plan?
    ☐ Yes ☐ No
32. Does the collection plan include a set of information requirements that specifies what data are needed by the agency or investigator (s)?
    ☐ Yes ☐ No
33. Does the collection plan comply with applicable local, state, and federal statutes and case law?
    ☐ Yes ☐ No
34. Is the collection plan focused on identifying the nature and extent of criminal activity?
    ☐ Yes ☐ No
35. Does the collection plan utilize all known available sources?
    ☐ Yes ☐ No
36. Are the plan's objectives and requirements communicated to criminal intelligence unit staff?
    ☐ Yes ☐ No
37. Has the Criminal Intelligence Function encouraged the development of a close working relationship between analysts and investigators?
    ☐ Yes ☐ No
38. Have those assigned to the Criminal Intelligence Function received training in the right to privacy?
    ☐ Yes ☐ No

39. Does the state in which your agency resides have laws that address the collection of criminal intelligence data?
    ☐ Yes ☐ No
40. Do the methods used by information collectors fall within legal guidelines?
    ☐ Yes ☐ No
41. Does your agency have informant guidelines in place? If no, go to question 44.
    ☐ Yes ☐ No
42. Do these guidelines address informant control and management?
    ☐ Yes ☐ No
43. Do these guidelines address the maintenance of informant files?
    ☐ Yes ☐ No

Collation

44. Does the unit have criminal intelligence file guidelines?
    ☐ Yes ☐ No
45. Is the criminal intelligence unit operating within the guidelines?
    ☐ Yes ☐ No
46. Are files kept ONLY on individuals who are suspected of being involved in actual or attempted criminal acts; or suspected of being involved in criminal activities with known or suspected crime figures?
    ☐ Yes ☐ No
47. Are files kept ONLY on organizations, businesses, and groups that are suspected of being involved in actual or attempted criminal acts; or are suspected of being operated, controlled, financed, or infiltrated by known or suspected crime figures?
    ☐ Yes ☐ No
48. Do files include information that relates ONLY to a criminal predicate?
    ☐ Yes ☐ No
49. Do the guidelines clearly delineate criteria for determining if information should be entered and retained in the files?
    ☐ Yes ☐ No
50. Is the information stored in criminal intelligence files evaluated according to source reliability and content validity before it is included in a criminal intelligence file?
    ☐ Yes ☐ No
51. Is there a clearly articulated system for assessing source reliability and content validity?
    ☐ Yes ☐ No
52. Is a distinction made between permanent, temporary, and working files along with appropriate retention periods?
    ☐ Yes ☐ No
53. Is the information stored in criminal intelligence files classified in order to protect sources, investigators, and the individual's right to privacy?
    ☐ Yes ☐ No
54. Are files clearly marked with appropriate classification?
    ☐ Yes ☐ No
55. Is information maintained in the criminal intelligence file reviewed for reclassification or purge on a periodic basis to ensure that it is current, accurate, safeguards an individual's right to privacy, and is classified at an appropriate security level?
    ☐ Yes ☐ No

56. Is information maintained in the criminal intelligence file reviewed on a periodic basis for utility, timeliness, appropriateness, accuracy, and completeness?
    ☐ Yes ☐ No
57. Do the criminal intelligence unit's purge policies comply with local, and/or state law regarding records retention?
    ☐ Yes ☐ No
58. Is there a specific staff member(s) who is responsible for purging files?
    ☐ Yes ☐ No
59. Are procedures in place to govern the storage, handling, and security of hard copy source material?
    ☐ Yes ☐ No
60. Does the criminal intelligence unit retain hard copies of source documents? If no, go to question 63.
    ☐ Yes ☐ No
61. Are these documents stored in a safe and secure location?
    ☐ Yes ☐ No
62. Is access to these documents restricted?
    ☐ Yes ☐ No
63. Are procedures in place to govern the storage, handling, and security of source material in an electronic database?
    ☐ Yes ☐ No
64. Is access to the file database restricted?
    ☐ Yes ☐ No
65. Is a specific employee(s) responsible for controlling automated access?
    ☐ Yes ☐ No
66. Are automated access audits conducted periodically?
    ☐ Yes ☐ No
67. Is a record of audits maintained?
    ☐ Yes ☐ No
68. Is automated access immediately deleted when personnel leave or transfer?
    ☐ Yes ☐ No
69. Are files adequately safeguarded through back-up and recovery routines, and off-site storage of critical files, programs, and systems?
    ☐ Yes ☐ No
70. Is the system isolated from other networks or protected by a firewall to restrict unauthorized access?
    ☐ Yes ☐ No
71. Are files (either hard or electronic copy) indexed in an organized fashion?
    ☐ Yes ☐ No
72. Is a file locator system in place?
    ☐ Yes ☐ No
73. Is a particular employee(s) responsible for overseeing the criminal intelligence file system so that it is operating within the guidelines of all applicable laws?
    ☐ Yes ☐ No
74. Are purged documents destroyed in a secure and appropriate manner according to all applicable laws?
    ☐ Yes ☐ No

Dissemination

75. Are procedures in place for responding to requests for information?
    ☐ Yes ☐ No
76. Are records kept of requests for information and responses? If no, go to question 79.
    ☐ Yes ☐ No
77. Are these records audited periodically?
    ☐ Yes ☐ No
78. Are there procedures in place governing the methods of enveloping, dispatching, and recording the dissemination of law enforcement sensitive material?
    ☐ Yes ☐ No
79. Is criminal intelligence information released only to those who have demonstrated a right to know and a need to know?
    ☐ Yes ☐ No
80. Is there an audit trail to determine who has accessed criminal intelligence files?
    ☐ Yes ☐ No
81. Has the criminal intelligence unit established a policy prohibiting third-party dissemination?
    ☐ Yes ☐ No
82. Has the agency identified legal resources that are familiar with criminal intelligence issues and procedures and can adequately represent the agency in legal matters?
    ☐ Yes ☐ No

David L. Carter (Ph.D., Sam Houston State University) is a Professor in the School of Criminal Justice and Director of the Intelligence Program at Michigan State University. A former Kansas City, Missouri, police officer, Dr. Carter was Chairman of the Department of Criminal Justice at the University of Texas-Pan American in Edinburg, Texas, for 9 years prior to his appointment at Michigan State in 1985. He has served as a trainer, consultant, and advisor for many law enforcement agencies throughout the U.S., Europe, and Asia on matters associated with officer behavior, community policing, law enforcement intelligence, and computer crime. In addition, he has presented training sessions at the FBI National Academy, the FBI Law Enforcement Executive Development Seminar (LEEDS), the International Law Enforcement Academy in Budapest, Hungary; the United Nations Asia and Far East Institute (UNAFEI) in Tokyo; police "command colleges" of Texas, Florida, Ohio, Massachusetts, Wisconsin, and Kentucky; and served at the FBI Academy's Behavioral Science Services Unit, the first academic faculty exchange with the Bureau. Dr. Carter is an Instructor in the Bureau of Justice Assistance SLATT program, author of the COPS-funded publication, *Law Enforcement Intelligence: A Guide for State, Local and Tribal Law Enforcement*, and Project Director for three multimillion-dollar intelligence training programs funded by the Department of Homeland Security. He is an Academic Fellow of the Foundation for Defending Democracies wherein he studied terrorism in Israel. Dr. Carter is also a member of the Justice Department's Counterterrorism Training Coordination Working Group and the Intelligence Training Coordination Working Group. In addition to teaching graduate and undergraduate courses at Michigan State, Dr. Carter is Director of the Criminal Justice Overseas Study Program to England. He is the author or coauthor of five books and numerous articles and monographs on policing issues and is a member of the editorial boards of various professional publications. His most recent book is the seventh edition of the widely-used community relations textbook, *The Police and Community*, published by Prentice Hall, Inc.
